The society whose influence will be greatest is not necessarily that which has the largest number of members holding elevated positions, but rather that whose endeavours are greatest in uplifting the status and encouraging the young engineer, by giving facilities for intercommunication between aspiring pupils, assistants and elders, by giving opportunities to those who form the saplings of the profession to extend their knowledge and become interested in their calling, by cultivating a spirit of activity and competition. Such a society must succeed in improving the status of the rising generation of engineers. And such is the sole intent and purpose of this Institution of Municipal Engineers. This institution is a bureau for information. Any member can obtain information at any time on any subject by sending his enquiry to the secretary. The institution's lending library is also for the use of members, and volumes are dispatched to all parts of the country. The student requiring information on a given subject receives the latest and best literature thereon, besides (if desired) information gathered from other members who have had to do with works of the nature of that forming the subject of enquiry. It is extremely gratifying to note that the forward steps taken by the institution in purchasing a lending library have so extensively been taken advantage of by its members.

The student who will study a given subject, by gathering together notes of the views of different authors, will be enabled to draw his own deductions and conclusions in actual practice, it being remembered that engineering productions are susceptible of many variations in character, and their utility is capable of being estimated from the ingenuity and skill of the designer and executor.

Having this in mind, the institution has adopted a broad view of the question of examinations, with the intention of infusing a wholehearted interest into the studies of its members. The student is encouraged to master specialised subjects, and to make a success of such branches of the profession as may particularly appeal to the individual. One subject must naturally lead to another, so that in due course the student attains a high standard by a soundly developed and practical insight into the depth of his profession.

For all that I have said with regard to the important position which the engineer occupies, together with the immense amount of cultivation he has to undergo in becoming fit and suitable to improve the conditions under which a crowded nation lives in these progressive days, it is much to be deplored that there is a tendency, and an ever-growing tendency, in every direction, to underestimate the value of the engineer's labours. While this unsatisfactory condition exists the profession is being undermined, and its progress belittled, and its followers are losing the respect and worth which are so essential to encourage those high ideals which lead to the best results.

It cannot be expected that a man struggling for a bare existence can devote much of his scanty earnings to the interests of his professional instincts and inclinations. He lives in a sphere of uncertainty in neither being protected by State nor assured as to his prospects in life, while, on the other hand, his energies are not backed up by superannuation. The municipal engineer has to live among the work for which he is responsible. The slightest pinhole for agitation will be taken advantage of by an ever-clamouring section of the public. The whole business is surrounded with difficulties and worries which would be ameliorated, if not entirely overcome, by statutory measures to afford protection and security of tenure.

An official who is honestly conducting the affairs entrusted to his care is deserving of every respect and consideration, in fact, assuming he has been well educated, trained, and proved he is a professional man of status; but if some councils will not appoint men who are qualified and approved by engineering societies, and bound by their rules, the profession must suffer. The tendency of public opinion is to go with the lowest and most discreditable example, whose interest is better served in being free than fettered by the rules of an accomplished society.

It will be seen by referring to the institution's *Journal* of December, 1909, that members are asked to report to the institution all cases of unfair or unjust treatment wherein an official's honour is affected. Many cases have been so reported, and these, together with the outcome of every case, so far as it has been possible to follow, have been filed. It is becoming more important every day that the claims of municipal engineers to protection by security of tenure should become an established fact, and it is evident that a record of some of the glaring cases by which surveyors are sometimes persecuted should be kept by the institution, and, if necessary, referred to in urging the just claim to which the profession is entitled.

I cannot too strongly emphasise the fact that every engineer has a moral obligation to perform in maintaining the status of his profession. This obligation is sometimes more honoured in the breach than in the observance, in trading on the privilege of taking premium pupils. In the first place, no pupil should be admitted without showing proof of a sound education. When a vacancy occurs for a pupil the applicants might be called upon to sit for competitive examination, or, in the case of only one applicant, he should show sufficient proof of education.

My own experience has been that many aspiring candidates fail to attain the standard necessary in general education to qualify them to become pupils to the profession, and unless, therefore, they continue their ordinary educational studies after entering an office, their success must be extremely doubtful. There is even another important aspect: the majority of pupils are articled for a period of three years only. Where is the pupil who in three years could consider himself capable? Five or six years, according to their age, until they reach their majority, should be the rule, and, in order to encourage the longer period, the premium should be refunded as an incentive to the acquisition of extended knowledge by attending meetings, classes, lectures and visits beyond their own sphere of training. The engineer who is responsible for the training of pupils has in return a great deal of assistance and useful work from the hands of his pupils to fully compensate him for his pains. Besides, by extending a pupil's period of training a less number of pupils would be admitted, and hence there would be far less of the present-day overcrowding of the profession, which has such a detrimental influence from the point of view of remuneration.

I would here observe that the population of a town does not always indicate the extent of the duties and practical nature of the experience to be obtained therefrom. The engineer of a comparatively small town may have a more responsible position to hold in the discharge of his valuable duties, than those associated with the surveyor's office in much larger towns. It is advantageous in many comparatively small towns to engage an official who will be responsible for all departments of work, such as water supply, sewerage, harbours and docks, sea defences, buildings, roads, bridges and permanent way, and architectural work in erecting hospitals, baths, market buildings, pavilions, &c., besides being responsible for the ever-varying routine and correspondence associated with a many-sided office and for wages and much financial work. There is nothing overdrawn in this allusion, and the official will be a very busy man, and must be particularly smart in his profession. Where is the large town where such variety would not be specialised and placed under separate management and spread over several individual departments?

It is, therefore, often erroneous to measure the opportunities for a pupil's training by mere calculation of area and population, and I will go further, and say that it is equally a misconception among professional societies to set down rules and regulations based on similar calculations with a view to arriving at an engineer's worth or status. The actual work and responsibilities of every engineer are the only sure proofs as to his active capabilities.

I think I have addressed you rationally and to the point of my own convictions, and should I have overstepped the mark by inadvertently expressing myself in terms that may in any respect hurt the susceptibilities of any member of the profession, I must certainly express my regret; but I have spoken purely in the interests of the profession I love, and must disclaim any intention of wounding or trespassing upon the susceptibilities of any member of it.

VOTES OF THANKS.

Mr. A. E. Prescott moved a vote of thanks to the president for the excellent address they had listened to. Having occupied the presidential chair himself, he could truly say that the president-elect always found very great difficulty in preparing an address, inasmuch as it was not easy to cover new ground. When they came to consider the number of kindred institutions in existence, each with a president, and each president giving an annual address, the difficulty became apparent of producing an address that would prove interesting. For some time past Mr. Latham had written papers on municipal engineering and other scientific subjects for other institutions, and it was not, therefore, a difficult matter for him to prepare an address on this occasion; and he thought they would agree that the one they had listened to was brimful of interest. Unfortunately, or fortunately, they could not discuss a presidential address, and there were many things in Mr. Latham's address that they could discuss till to-morrow morning if they had the opportunity. A remark had been made by the Mayor of Penzance about public officials and criticism. Public officials were not afraid of criticism, but on the contrary welcomed it. Unfortunately, a good many ignorant people looked upon a municipal surveyor as an official of no importance. If they took the town clerk they would find that whether it was that he looked wise or felt wise, or because he possessed legal knowledge, councillors were sometimes afraid to tackle him. The same thing applied to the medical officer of health. In the case of the surveyor they found that some builder, on the strength of having laid a few drain pipes, immediately felt justified in discussing and criticising some large drainage scheme upon which thousands of pounds were to be spent, and to criticise the action of the surveyor in connection therewith simply because he was the surveyor. It reminded him of the Irishman who, on being told that certain work was being carried out by the board of health, remarked that "he had often heard of the board of health, but shure he'd niver seen it before." It was an illustration of the ignorance prevailing with respect to the work which municipalities carried on. The municipal engineer was brought in touch with a mass of varied work, and he was not afraid of criticism—he believed it was the best thing for him. All they asked was that it should be fair and honest. He was very pleased to see Mr. Frank Latham in the chair, and they were all pleased to welcome his uncle, Mr. Baldwin Latham, amongst them. If the nephew succeeded in making a name like his uncle he would be able to look back with interest to his term of office as president of this institution. He (Mr. Prescott) wished him a happy and successful year of office, and he was sure the interests of the institution would not suffer in his hands.

Mr. H. C. H. Shenton (Westminster) seconded the proposition, and remarked that the members were to be congratulated upon having Mr. Latham as their new president. There were differences of opinion with respect to what was called the hereditary principle. Mr. Latham came of an engineering family, and they had with them that day his uncle, Mr. Baldwin Latham, for whom they had all feelings of regard, and he might say affection, because in their student days they had read his works on sanitary engineering.

and probably consulted them when designing their works, while it was also probable that later they had made his acquaintance personally. Mr. Frank Latham had started life with what might be called reflected glory. He had proved he would have made his mark if he had not had such an advantage, and he (Mr. Shenton) thought the institution was in for a good time, because he was sure that under his guidance they would advance and do great things.

Mr. Baldwin Latham said it afforded him great pleasure to be present and to see his nephew occupying the position of president of that institution. He (Mr. Baldwin Latham) had occupied the position of surveyor in more than one town, and one of the things he tried while he was at Croydon was to induce the surveyors of the country to form themselves into such an association as this. He did not succeed; surveyors at that time were not ripe for combining, and since then many had bitterly regretted the failure of the proposal. He thought it was very important this institution should look after the interests of municipal surveyors, and it was equally important that the question of security of tenure should be seriously considered, and provision made for old age. The country had been induced to give an old age pension to many who probably never deserved it, but surveyors and inspectors of nuisances, who were intimately associated with the maintenance of the public health, were entirely neglected. The time was not long before it must be recognised that this neglect should cease. The profession of municipal surveyor was no doubt very important, and he always pitied the surveyor just before election time, because he knew from experience how often a certain class of ratepayers were desirous of bringing themselves prominently before their fellow-ratepayers by harassing officials, and promising to do great things when they were elected. As soon as the election was over things gravitated back to their normal position, and the surveyor had peace, and was able to carry out his duty. With reference to the question of architecture, he did not think he would ever have made an architect, but his brother, Mr. Frank Latham's father, had a decided call in that direction, and he had no doubt the mantle would fall upon his son. His (Mr. Baldwin Latham's) *forte* had always been investigating. He was still a pupil, still learning, and always carrying out some experiment or other. He had been carrying out experiments all over the country with respect to underground water, which was one of the most important matters of the present day with regard to public health. He knew Mr. Frank Latham was very fond of investigating and experiments, and it was only by investigation that progress could be made. He was glad to be with them and to support his nephew in the honourable position to which they had elected him.

The President, in reply, expressed his entire willingness to do everything in his power to forward the interests of municipal engineers, and especially the interests of this institution. They had had four years of uphill work, but such was his interest in the institution that scarcely a day had passed during that time but what the secretary had heard from him in his position as hon. treasurer; in fact, he believed Mr. Wyand had sometimes had two letters from him daily. He had to thank his uncle (Mr. Baldwin Latham) for the kind manner in which he had spoken; it was a great pleasure to him to see him present representing the family.

Mr. Horace Boot (Westminster) proposed a hearty and sincere vote of thanks to the retiring president. All of them who had worked with Mr. Stickland could not but admire the energy, ability and diplomacy with which he had managed the affairs of the institution during his term of office. Many times at council meetings he had been struck with Mr. Stickland's conduct in the chair. At these meetings members did not always see eye to eye, but the wonderful way in which Mr. Stickland managed to hold a meeting together and bring the members to one mind represented one of the highest forms of diplomacy which a surveyor could show. It had been a very busy year with them, and for the reason for this they must look to their retiring president. What, it might be asked, were the qualifications of a good president of their institution? Clearly one must be popularity, another progressive ideas, and there must also be engineering ability and tact. Mr. Stickland had displayed all these qualities. Among the many meetings he had attended was the aviation meeting at Hendon, which was the first of its kind ever held by any institution or society in the world. On that occasion they saw their president flying, and all of them hoped it might not be long before they found him flying from Windsor to a position of far greater importance.

Mr. H. C. Adams (London) seconded. Mr. Stickland when he took office declared that he intended to devote himself heart and soul to the business of the institution, and he had done so. He had not spared himself in anything, and it was to be hoped that now he had left the chair he would not be content with taking the rest he had so well earned, but that after he had completed his three years' term as a member of the council he would continue to render them all the assistance in his power for the rest of his life. During the year they had held many good meetings, but they had rather consolidated their position than opened up much that was new. They had had a tremendous lot of work to do on the council, and many things to consider, especially the organising of the districts. These were working smoothly, but the distances dividing the members were so great that it was a matter of some difficulty to bring them together. The question of superannuation and security of tenure had also been up, and the president had given them the benefit of his advice. Mr. Stickland had, in fact, been of the greatest service to the institution, and he was sure they were sorry to lose him from his presidential position.

Mr. A. E. Stickland thanked the members cordially for the appreciation they had shown of his services and their approbation of his conduct in the chair. He had sought to be broad-minded and fair, and to see that everybody had exactly the same kind of treatment: he did not believe in one person receiving one sort of treatment and another person another sort. With respect to the aviation meeting he did not wish to take credit for that. Mr. Wyand, the secretary, was the chief instigator of that gathering, and the credit was rightly due to him. When they were looking for new members he trusted they would be as broad-minded as possible, for there were many professional men who, in twenty or thirty years' time, they would regret had not been with them as members of the institution.

The Secretary, alluding to the aviation meeting, stated that as a matter of fact Mr. Stickland mentioned the subject of aviation in his address, and he afterwards discussed it with him.

ELECTION OF COUNCIL.

It was announced that the election for president, vice-presidents, treasurer and council had resulted as follows:—

President: Mr. Frank Latham, M.Inst.C.E.I., borough engineer and surveyor, Penzance.

Past-Presidents: John T. Pegge, city engineer and surveyor, Durham; A. Ernest Prescott, borough engineer and surveyor, Eastbourne; Ernest Albert Stickland, Assoc.M.Inst.C.E., borough surveyor, Windsor.

Vice-Presidents: Messrs. Henry C. Adams, Assoc.M.Inst.C.E., M.I.Mech.E., A.M.I.E.E., consulting municipal engineer, 60 Queen Victoria-street, E.C.; Horace L. P. Boot, M.I.E.E., M.I.Mech.E., consulting engineer, Tunbridge Wells Corporation electricity works; Arthur Bowes, Assoc.M.Inst.C.E., surveyor, Newton-in-Makerfield Urban District Council; H. J. Farmer, borough surveyor, Christchurch, and W. H. Matthews Jones, city engineer and surveyor, Chester.

Hon. Treasurer: Mr. Thos. Mundy [illegible], borough engineer, Woolwich.

Ordinary Members: Messrs. Jerrold Abbott, surveyor, Ashbourne Urban District Council; T. C. Barralet, surveyor, Godstone Rural District Council; Willie Bevan, borough surveyor and waterworks engineer Haverfordwest; A. R. Bleazard, borough engineer Clitheroe; Walter Louis Carr, engineer and surveyor, Ruislip-Northwood Urban District Council; Alfred H. Carrell, county road surveyor, Leicester County Council; Reginald G. Coates, district surveyor, Norfolk County Council; Frank Cutler, deputy borough surveyor, Deptford, S.E.; John Davison, borough surveyor, Morpeth; Arthur James Elson, deputy engineer and surveyor, Penge Urban District Council; Frank E. Ennals, surveyor, Billericay Rural District Council; Douglas C. Fidler, surveyor, Hayes Urban District Council; William Finch, county surveyor and bridgemaster, Cumberland County Council; Fredk. Hatcher, deputy borough engineer and surveyor, Neath; Ernest W. Hearn, borough surveyor, Chard; Henry Hulse, borough surveyor and engineer, Droitwich; R. Williams Jones, county surveyor, Carmarthen (Western); John Lewis, surveyor, Yiewsley

Urban District Council; Colin H. Macfarlane, burgh engineer, Rutherglen; H. W. Marsden, borough surveyor, Richmond, Yorks; John R. Mead, deputy borough engineer and surveyor, St. Helens; J. W. Moncur, M.INST.C.E., borough engineer and surveyor, Sunderland; A. W. Nye, surveyor, Shoreham Urban District Council; Ernest E. Ryder, surveyor, Bushey Urban District Council; H. C. H. Shenton, civil engineer, 28 Victoria-street S.W.; J. Taylor, sanitary surveyor, Uckfield Rural District Council; W. T. Unwin, town and district surveyor and architect, March Urban District Council; Ernest W. Veale, surveyor, Farnham Rural District Council; Henry J. Weaver, consulting engineer, Northgate Mansions, Gloucester, and Edward Whitwell, engineer and surveyor, Abersychan Urban District Council.

A number of letters of regret for inability to attend were received, and Mr J. T. Pegge, city engineer of Durham, first president, telegraphed hearty wishes to the new president during his year of office. The town clerk of Penzance, Mr. T. H. Cornish, and other official colleagues of Mr. Latham, also forwarded a telegram on behalf of the town hall staff offering hearty congratulations to the president upon the well-deserved compliment paid to him by the members of the institution. Mr. Cornish added that he deeply regretted being unable to attend the meeting.

In the evening a reception was held in the Throne Room of the Holborn Restaurant, Mr. and Mrs. Frank Latham and the Mayor and Mayoress of Penzance receiving the members and their friends. At the social evening which followed, some 120 being present, Mr. Latham occupied the chair and an excellent musical programme was given.

Mr. Latham welcomed his guests in a few words, explaining that it was an unwritten law of the institution that, on occasions of the present nature, speeches should be dispensed with.

An interesting departure from the rule took place during the interval, when Mr. Latham, on behalf of the institution, presented the Mayoress of Penzance with a silver clock as some expression of appreciation of the kindness of herself and the Mayor in undertaking the long journey they had for the sole purpose of attending that day's meeting.

The musical programme was thoroughly appreciated, every item, without exception, being distinctively good, and marked by a determined encore. The evening concluded at about 11.30, and the party dispersed to make its way home as best it could in the dense fog which had by then descended.

(To be continued.)

EASTERN DISTRICT MEETING AT CODMANCHESTER.

A meeting of the Eastern District of the institution was held at Godmanchester on Tuesday, when the members were received by the mayor, Councillor J. P. L. Durrell Stables. Some thirty attended, and the day was spent in a round of visits to the various works of the borough, under the conduct of Mr. C. Mayfield, the borough surveyor. Pressure of space prevents a full report of the proceedings, but it is hoped that this will be given next week.

Cleansing Work at Manchester.—Mr. R. Williamson, superintendent of the Manchester Cleansing Department, has this week issued the annual report of the work done. The gross expenditure of the department for the year ended March 31, 1912, was £218,000, and the gross income £73.132, the nett cost of the department being £145.000. From 141,057 dwelling houses, 4.511 lock-up shops and 4.371 workshops within the city there were collected and disposed of during the year 139.702 tons of ashes, 31,373 tons of nightsoil and pail contents, 16,544 tons of warehouse and trade refuse, 6 368 tons of slaughter-house refuse, 5.504 tons of stable manure, and 2.491 tons of fish refuse. The length of streets cleansed by the department was 542 miles, and during the year 709,000.000 sq. yds. of footpath and carriageway and 404.385 courts and passages were swept, 397,572 grids were opened, and 96.019 barrels of water and 3 444 tons of sand and chippings were used on the streets. The principal streets are swept every day, and afterwards kept in order by a staff of orderly youths. From the city thoroughfares and markets 81 551 tons of street sweepings and 4 293 tons of market garbage were collected and disposed of. The total weight of refuse collected and disposed of by the department during the year exceeded 290.000 tons, or nearly 1,000 tons each working day.

THE NORFOLK FLOODS.

DAMAGE IN THE CITY OF NORWICH.

Following upon the recent inundations in Norfolk, an exhaustive report as to floods and their prevention has been prepared by Mr. Arthur E. Collins, M.INST.C.E., the city engineer of Norwich. While we regret that, as the document in question has not yet been presented to the council, a copy is not available for publication, Mr. Collins has favoured us with the following statement as to the damage done in Norwich:—

"I may say the public works of the city, excepting the electricity works, suffered but very little from the flood. Some £700 worth of wood blocks were floated up from the streets and lost. I also had about £100 worth of cement spoiled, and a considerable amount of disinfectant, and so forth. None of the public buildings were injured, nor the bridges, public river-walls, and such like. Considerable damage was done to private structures abutting on the river or which got flooded by reason of the river flood, or by reason of the intense rains running down the walls and getting into the foundations.

"There were some cases of broken sewers due to subsidences from similar causes. In the chalk formation here trouble is often experienced by reason of collapse of ground over pipes or gaults in the chalk—that is to say, natural shafts in the chalk which gradually become filled by the falling away of the ground above until at last the caving-in extends through to the surface. Many previously unknown weak spots of this sort were found out by the flood, and holes many feet in diameter and several feet deep were formed. I have known the basement of a house to collapse into a place of this sort, leaving the house, which was one of a terrace, hanging up by its front and back walls, which abutted on to the adjoining property.

"The basement of the Technical Institute was flooded to a depth of about 8 ft. The windows of this basement, which overlook the river, were purposely made to withstand the pressure of water of a flood 18 in. higher than the historic flood of 1878, but the recent flood rose several feet higher than that, and the final damage was done by a barge washing down the river striking the window and breaking it, so that the building very rapidly became flooded. Not much damage was done beyond the ungluing of some furniture and covering the place with mud.

"The condition of some of the privately owned riverside buildings is very serious. The Norwich Mercury Printing Works, a comparatively modern building, with steam machinery and a tall furnace chimney, had its river foundation washed out and the end was caused to collapse to such an extent that pulling down operations on a large scale had to be carried out to prevent public danger. The adjoining building, a malting belonging to Messrs. Bullard's Brewery Company, suffered in much the same manner, and on the opposite side of the river one of the buildings of a large clothing factory was similarly affected. Lower down a smaller factory had its gable end washed away. Private river-walls along the river have suffered very serious damage.

"The damage to the county of Norfolk bridges has been of a very extensive character, and resulted almost entirely from the washing out of the foundations, which were not carried sufficiently deep; curiously enough, as far as I can see, the damage has been chiefly to bridges constructed from a quarter to half a century since, and not to old bridges nor yet to new ones. The Great Eastern Railway Company have suffered very serious damage from the washing out of bridges and from the flooding of their lines in the marshes. This flooding has not entirely cleared away yet, although sufficiently to allow traffic to be resumed."

The Concrete Institute.—A course of six educational lectures on "Concrete: Its Properties and Manufacture," will be given by Mr. H. Kempton Dyson, secretary of the Concrete Institute, at 5.30 p.m. on the following Tuesdays: November 12th, 19th, 26th, December 3rd, 10th and 17th. The lectures, which will be given in the lecture hall of the Concrete Institute, at Denison House, 296 Vauxhall Bridge-road, Westminster (close to Victoria Station), will be of approximately one hour's duration, and will be illustrated by diagrams, photographs, specimens and apparatus. There is no fee for the course; admission will be by ticket, obtainable on application from the secretary, the Concrete Institute.

The Local Government Report on the Intercepting Trap.*

By H. C. H. SHENTON.

The report of the Departmental Committee appointed by the President of the Local Government Board to inquire and report with regard to the use of the intercepting trap in house drains, deserves the close attention of the municipal engineer, and may be usefully discussed. It is probable that as a result of the evidence brought forward the Local Government Board will alter their Model By-laws to the extent of permitting, or even of demanding, the omission of intercepting traps in house drains. It is not the author's object to review the report, but merely to start a discussion among members of the municipal engineering profession, who collectively must possess far more knowledge of the subject than any other body of men.

The sanitary expert and the engineer in private practice view the matter from a special standpoint. Their knowledge is to a great extent limited to the drainage of the better-class houses, and they have, as a rule, a very limited knowledge of the conditions which exist in the mass of houses of the working classes. Neither have they the drainage of whole towns and districts under their control. They are, therefore, more likely to be surprised at the conclusions of the report than those men who have for years made a daily study of the conditions which exist in the sewers and drains of a town taken as a whole.

The private engineer who is a sanitary expert may design systems of drains perfectly, and may see to it that these are absolutely well constructed, properly ventilated and flushed. Moreover, he will very likely be able to see that they are cleaned periodically, and that they are frequently inspected. He may take special steps to avoid the troubles which are mentioned in the report. He may regard the blocking of an intercepting trap on his system as a thing never likely to occur, and, moreover, he will, without doubt, take such steps as will prevent any possibility of nuisance or danger to health, even if the trap does get clogged.

It is also quite reasonable to imagine that the owner of property who has carried out such a scheme on his drainage system would object to allow the sewers, which are not as clean as his drains, to be ventilated through them, but such cases are the exception and not the rule. The sanitary expert is better acquainted with these cases than with the drainage system of ordinary houses, and arguments in favour of the intercepting trap, which are based on the existence of the perfect system, designed regardless of cost, have practically no bearing upon the present case.

A considerable section of the report is devoted to the demonstration of the fact that the importance of sewer ventilation, and even of drain ventilation, is not as great as is generally supposed. Apparently there is no reason to omit the intercepting trap for the better ventilation of sewers. We are told that "if, therefore, the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection."

It is, moreover, evident that if sewer gas is noxious we do not want outlets close to our houses. If, on the other hand, the sewers do not require this ventilation, one great argument in favour of the abolition of the intercepting trap falls to the ground.

There also appears to be no doubt that the intercepting trap is effective, for one of the conclusions contains the statement that "it seems to be established that the trap does serve as an effectual barrier to the entry of sewer air into the house drain, which is the fundamental advantage claimed for it. It is not liable to be forced and rendered useless, as has been supposed to be the case, by pressure of air from the sewer."

There is, however, one great and absolute objection to the trap, and that is its liability to become stopped up. The evidence brought forward in the report that this is overwhelming, and herein lies the need for alteration in the general practice. It is unnecessary at a meeting of municipal engineers to dwell upon the dangers resulting from a stopped drain. It would, however, be interesting to receive fresh evidence from the members present as to the prevalence of the stoppage of traps.

There is one point with which the report deals somewhat too lightly in the author's opinion, and that is the value of the trap as a barrier against rats. The report tells us that Mr. Patten Barber gave evidence to the effect that he had seen rats chased into the inspection chamber of a drain, where they escaped into the sewer through the trap, and conversely that Mr. Woods, sanitary inspector of Willesden, saw three or four rats come up from a sewer through an intercepting trap.

The author has recently had experience in Kensington of rats coming up through holes in the ground on the sewer side of a house interceptor. The examination proved that the connection was an old brick barrel of a defective nature, through which the sewer rats came. Although it was evident that the rats came up close to the interceptor, it did not appear that they had entered the house drains. The connection has now been repaired, and it has been assumed that the trap will exclude the rats from the house drains. If rats come through traps, how is it that they are practically unknown in London houses except where the drains are untrapped? . . .

Again, though the author has frequently seen rats in sewers, he has never, during twenty years' experience on and off of house drains, seen a rat on the house side of the interceptor, though in untrapped drains he has seen them.

The fact that rats have been known to pass through traps under certain conditions does not prove that the trap is, under ordinary circumstances, an ineffective barrier. . . . If the intercepting trap is not an effective barrier, neither is the gully or water-closet trap, and there is therefore every reason to expect that where there are many rats in the sewer, they will come into the houses. We know from experience that this is not so. The inefficiency of the intercepting trap as a barrier against rats, as stated in this report, is therefore a point upon which further evidence is desirable.

Another question, and perhaps the most important of all, is the manner in which to act when it is finally established that intercepting traps are to be done away with. The Model By-laws having been altered, and the local authority having decided to act upon them, what will then be the position? Houses situated in positions far apart will have to be drained. Are these houses alone to be new points at which the sewers are to be ventilated? It may well be that in a town where there are many houses without intercepting traps the ample ventilation given prevents the likelihood of any nuisance due to the escape of an unduly large volume of sewer gas or smell at one point, but when, say, one house drain on a long length of sewer is to be made to ventilate that sewer, may there not be a considerable nuisance at that point? It is common experience that when a new system of sewers is put into operation smells occur at unexpected points. Smell escapes and is noticeable at some open cover, and the inhabitants are not slow to complain. This is quite as likely to happen at an open cover near a vent shaft as elsewhere. Theoretical principles do not seem to prevent the inlet ventilator from acting as an outlet, or to prevent the bulk of the smell issuing at some point not intended instead of at several ventilators placed for its special accommodation. Is not the same thing very likely to occur if one or two house vent pipes are used for sewer ventilation at houses, and may not the municipal engineer have to deal with complaints, imaginary or otherwise, from local residents who are alarmed? The author, having had considerable trouble from objections raised to purely imaginary smells from sewer vent shafts, cannot avoid the impression that there must be possibilities of trouble for the municipal engineer in the application of the new method.

Again, would it be possible to remove all the traps in the town? It would be easy to make them inoperative as traps by removing the cleaning eyes, but this would not do away with the chief danger—viz., that of stoppage. However, it would be desirable to remove all cleaning eyes as a start, rather than to make a few house drain vent pipes the only new sewer ventilators.

The chief point, therefore, which the author wishes to raise for discussion is how best to apply the teachings of the report.

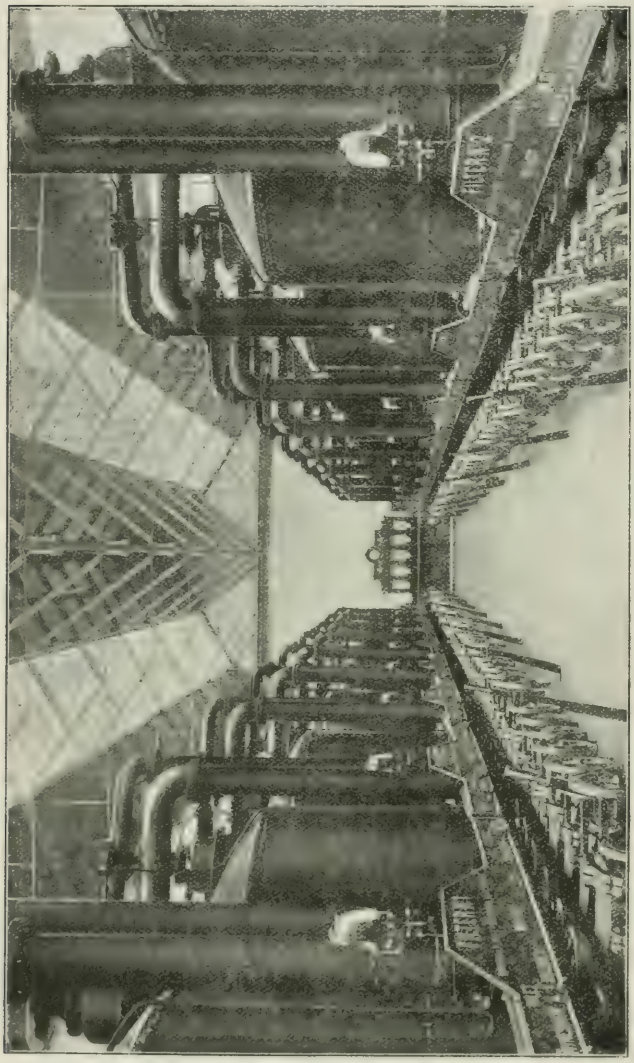
ASHTON-UNDER-LYNE, STALYBRIDGE AND DUKINFIELD WATERWORKS.

INSTALLATION OF PRESSURE FILTERS.

For the past fourteen or fifteen years the Ashton-under-Lyne, Stalybridge and Dukinfield (District) Waterworks Joint Committee have been treating certain water in the Swineshaw Valley with a neutralising reagent for the purpose of rendering the water non-plumbo solvent, but as the discoloration and turbidity was not in any way removed under this method of treatment, the joint committee decided, the period under observation were so satisfactory that the joint committee decided to take steps to deal with all the water supplied in their district. The joint committee visited and inspected similar plants installed by other water authorities, and, after careful consideration, decided to instal in both valleys mechanical filters of Messrs. Mather & Platt's well-known pressure type, fitted with patent washing apparatus.

The site of the filter house at Ashway Gap, Greenfield, being already fixed by the existence of the experimental plant, it was only necessary to extend the existing building by about 75 ft.

In the case of the filter house for the Swineshaw Valley supply, it was desirable to select a site conveniently situated to control all the three reservoirs in the Swineshaw Valley used for domestic and trade purposes. The site decided upon was at the toe of the Brushes reservoir embankment, owing to its sheltered and accessible position from an administrative point of view.



Interior of Brushes Filter House.

The two installations comprise thirty-six pressure filters, designed to purify collectively 5,352,000 gallons of water per day, and together form one of the largest pressure-filtration schemes in the country.

Each installation consists of two major parts—viz., the filters and the chemical plant.

Each of the filters consists of a closed cylinder, having parallel sides with dished ends top and bottom, and is constructed of riveted steel plates. The Ashway Gap cylinders were tested under a hydraulic pressure equal to 150 lb. per square inch, applied continuously for a period of one hour, and in the case of the Brushes cylinders the test was equal to 250 lb. per square inch, applied continuously for a period of three hours. The filtering medium, which is of an average thickness of 3 ft. 6 in., consisting of specially graded quartz crystals, rests on a steel false bottom, riveted to the shell of the filter, and fitted with circular phosphor bronze nozzles screwed in from the underside. Ready access to the nozzles can be obtained by means of the manhole placed in the collecting chamber, where they may be inspected or replaced without removing the quartz bed. The object of the nozzles is to ensure the effective use of the filtering bed; also to prevent particles of the filtering medium getting into the filtered water mains and to ensure the proper distribution of the water used for washing out the filter.

The unfiltered water enters at the top of the filter, and is evenly distributed over the bed, and after percolating through the filtering material, flows into the collecting chamber, and is then delivered into the filtered water mains, and thence direct to the service pipes for consumption.

For cleansing the filtering material a vertical tube is fixed in the centre of the bed, extending to within a few inches of the top level of the filtering material. Suspended in the tube is a steel shaft, on which are

to make extensive enquiries as to a more up-to-date plant by which the process of mechanical filtration and chemical treatment could be advantageously applied.

The results of the investigations were incorporated in a report presented by the engineer, when the joint committee immediately decided to put down a small experimental plant at Ashway Gap, for the treatment of the water from the Greenfield reservoir. Three pressure filters with a chemical apparatus capable of dealing with a maximum flow of 432,000 gallons per twenty-four hours were installed in June, 1909, under Messrs. Mather & Platt's patent.

The results given by the experimental plant during

fixed, a short distance above the top of the tube, two jets connected with the filtered-water main, and a propeller situated in the upper end of the tube. The shaft is driven from outside the filter by means of belting.

When it is required to wash the bed filtered water is admitted to the underside of the false bottom, and, rising through the nozzles, puts the bed in suspension. The shaft with the jets and propeller thereon is then caused to revolve at a high speed, and the quartz is thoroughly cleansed by being drawn up the vertical tube and passed over the top, where it comes in contact with clean filtered water issuing from the jets at a high velocity. The filtering medium then sinks in the filter, and the floating impurities are carried away with the wash water through the wash-out discharge pipe at the top of the filter.

The chemical apparatus consists of small vertical ram pumps in duplicate, driven by rotary water motors placed at the end of the filter-house on the unfiltered water mains; alumina tanks (built in ferro-concrete) provided with dissolving trays and hand agitating gear; and lime tanks (built of steel riveted plates) provided with agitating gear driven by a small Pelton wheel. The water motors driving the chemical pumps are specially designed to vary the speed in the same ratio as the rate of flow in the filters. Consequently the quantity of chemical solution pumped into the main is always in proportion to the quantity of water passing. The pumps are fed from the chemical tanks and deliver the solutions into the water on the inlet side of the water motor. A thorough mixing of the solutions with the water is thus ensured.

The Ashway Gap installation consists of eighteen filters, three 8 ft. 6 in. diameter and fifteen 8 ft. diameter, with chemical apparatus, housed in a building 111 ft. long by 36 ft. wide.

The water is conveyed to the filters by two 15-in. mains, one from Yeoman Hey reservoir, under a head of 20 lb. per square inch, and the other from Greenfield reservoir, under a head of 75 lb. per square inch.

The motive power used for driving the washing gear of the filters is obtained from a Gilkes Vortex turbine, working under a head of 130 ft., and driven by water taken from the compensation supply.

A runway for the conveyance of chemicals traverses the whole length of the house, and so allows the chemical tanks to be fed from the chemical stores in the basement by the use of a false bottom skip which discharges into hoppers fixed on the chemical tanks.

A sedimentation tank, with a capacity of 25,000 gallons, is provided outside the filter-house, and into this all wash water is discharged. After sedimentation the water is decanted automatically by means of a syphonic floating outlet, and the clear water is discharged into the compensation basin, while the sludge is pumped on to the land by a belt-driven 6-in. ram pump. The wash water as it comes from the filters is registered through a 6-in. Kent's waste-water meter.

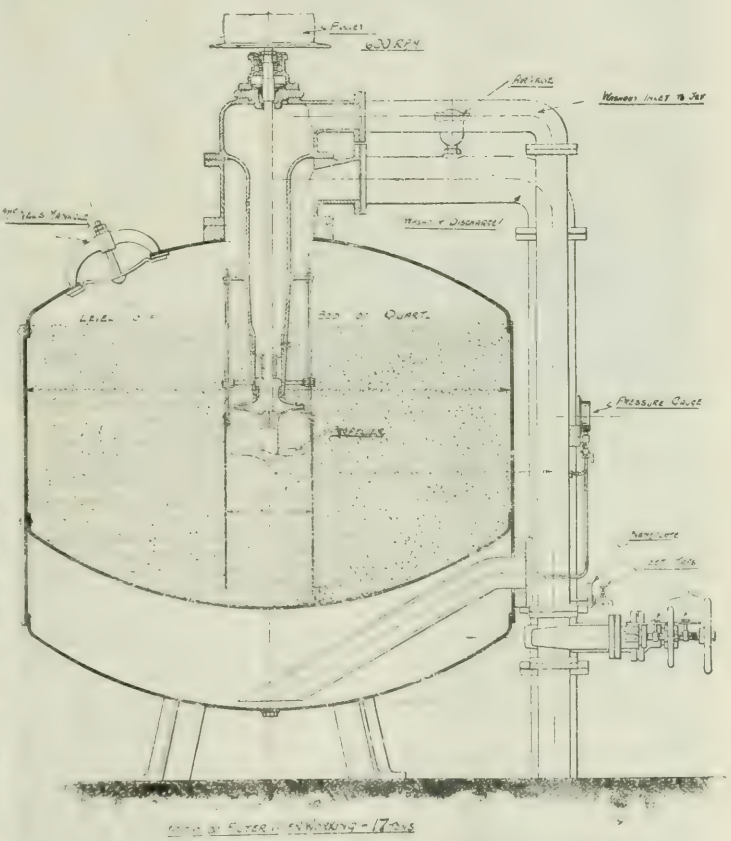
The plant is capable of filtering and treating 2,760,000 gallons of water per twenty-four hours.

The Brushes installation consists of eighteen filters, 8 ft. diameter, with chemical apparatus, housed in a building 126 ft. long by 36 ft. wide.

The water is conveyed to the filters by a 24-in. main from Brushes reservoir under a head of 20 lb. per square inch, and an 18-in. main from Swineshaw reservoirs under a head of 130 lb. per square inch. The motive power used for driving the washing gear of the filters is obtained from a "Gunther" Pelton wheel supplied in duplicate, working under a head of 300 ft., and driven by water taken from the compensation supply. The water, after it leaves the tail race, is registered over a V notch by a "Lea Recorder."

The capacity of the installation is equal to 2,592,000 gallons per twenty-four hours.

The estimated cost of the whole scheme is £30,000.



Sectional View of 8-ft. Diameter Mather & Platt Pressure Filter.

The works have been designed and supervised by the engineer for the joint committee, Mr. Fred J. Dixon, F.G.S., Assoc.M.Inst.C.E.; Mr. C. H. George, Assoc.M.Inst.C.E., has acted as assistant engineer.

The whole of the machinery and plant has been designed and the installation carried out by the contractors, Messrs. Mather & Platt, Limited, Manchester.

Professional Defence.—The question of forming a Board of Professional Defence for the purpose of advising and if necessary assisting members in cases involving matters of general interest to the profession on points of practice has been carefully considered by the council of the Society of Architects, with the result that an Advisory Committee has been formed. An adequate sum has been earmarked to form the nucleus of a Defence Fund. Cases submitted to the secretary will be brought before the board, who will advise the council as to the course to be adopted.

The Modernising of Building By-Laws.*

By FREDERICK W. PLATT.

The recent circular letter of the Local Government Board to local authorities directing attention to the need of reviewing the existing codes of by-laws in operation in the various local governing centres of England and Wales is deserving of much attention.

By this letter the board recognise that the use of modern materials and modern methods of construction is neither adequately nor precisely sanctioned in the Model Code, which was first issued in 1877, and has from time to time been extended and revised, but is still mainly in its phrasing identical with the original issue.

That the board have until now shown reluctance to modify or revise their code, upon which great care and forethought had been expended, is not to be wondered at; for anyone whose duty it has been to draft a building by-law will know how difficult it is to find words which, while being precise and fulfilling the conditions of statute law, furnish that *via media* which reasonable persons feel they can support. The Model Code has, on the whole, been serviceable. It now needs modernising, and the intention of the board to do so is greatly welcomed.

By-laws dealing with new streets and buildings may be made under sec. 157, Public Health Act, 1875; sec. 23, Public Health Acts Amendment Act, 1890; and sec. 24, Public Health Acts Amendment Act, 1907.

The object of making rules or by-laws might shortly be said to be this: That every individual who decides to lay out any land for building purposes or to erect buildings thereon shall, in such laying out and subsequent development, provide at each building a quota of open space for traffic purposes and for domestic purposes, shall construct each building so as to provide against fire, be healthy in itself, be properly drained, be responsible for its share of the outfall sewer, so that all would collectively form a properly developed town.

That by-laws can be drafted which will be sufficiently comprehensive and explicit to furnish all the guidance needed to attain this is certain. They will not check building, as is popularly supposed. They will ensure good building!

The authors of the Model Code in drafting the earlier forms of by-laws had regard mainly to buildings of stone or brick construction, and apart from what is considered their respective character they are inappropriate to types of construction now in use, such as buildings of hollow blocks or slabs of terra-cotta, concrete, reinforced brickwork, &c.; for hollow or half-timbered walls, and steel or other framed walls hung with tiles, slates, &c., filled in where necessary with incombustible materials; for buildings where piers are employed, and where large window openings are needed; or for the thickness of walls of outbuildings.

Again, the ordinary clauses for the laying out of roads do not permit of the class of roads which have been designed in some garden cities, neither do they differentiate between the type of paving needed for varying grades of roads or for exceptional arrangements which are demanded in certain cases by the configuration of the ground. In a few words it might be said that the Code is voluminous without being comprehensive, and is too restrictive. It deals with details rather than types.

What form should modernising take? Take the question of walls, floors and roofs—that is, to ensure "due stability" in them! Should not the knowledge of the behaviour of materials be utilised in determining the various sizes of the respective parts rather than tabulated sizes of the thickness of each wall or of the materials being set out in the form of a by-law? For example, the present Model Code prescribes that buildings shall be enclosed with walls termed external, party, cross or return walls constructed of hard incombustible materials such as good bricks, &c., and then proceeds to give the thicknesses of the walls according to the particular height the wall is to be erected, neglecting entirely whether any loads were to be transmitted to such walls from floors or subsequent loading when in use.

In this matter of loading it is common practice to find that the joists of buildings of the cottage type were rarely built into party walls, but often are supported upon a wall half-brick in thickness and an external wall, the thinner wall thus carrying a greater proportion of the weight of the building than the thicker external wall. Obviously such an external wall, if built of the by-law thickness, might be either too thick when not loaded or too thin when loaded. The Code does not recognise a wall half-brick in thickness, nor does it, under such conditions as here mentioned, prohibit its use. Another fallacy is where almost the whole of a storey is required as an opening. The Code here requires sufficient piers to be provided, or in some cases storey posts, but never states what a sufficient pier or storey post is, or how such is to be determined.

Again, modern buildings of the warehouse type are rarely simple in construction. They are often built upon highly valuable land which leads to a varying distribution of the loads supported by the floors, whose strength has to be determined by the loading circumstances of each particular case. To apply a model code based upon a universal system of high loading to such buildings would result in unnecessary expense being incurred in the thickness of the walls or strength of the floors, without necessarily providing uniformity of strength throughout the building.

Therefore, if full advantage is to be taken of this opportunity to revise an existing code of by-laws, consideration should be given to the desirability of including in the revised code power to determine that the various parts of at least buildings of the "public" or "warehouse" class should be so designed that when loaded as intended the buildings would be in equilibrium throughout. Obviously much care would be needed to draft governing regulations. The following points, however, might form the subject of consideration:—

(1) The type of building and the purpose for which it would be erected.

(2) The type of material to be used in its erection.

(3) The maximum stresses permitted in such materials.

(4) The method of calculation to be followed in determining the resistance of the materials, and the effect of the loading on the various parts for the determining of both external and internal forces.

(5) The extent of the details required from the building owner to enable the local authority to be satisfied that due stability would be obtained, and the nature of the declaration that the building would be duly supervised during construction.

(6) The nature, type and extent of the tests to be made during and after erection to ascertain that the above conditions were fulfilled.

(7) The guarantee that the building would not be internally stressed to an extent exceeding the designed resistance.

Some such regulations would at once provide all the power that a local authority needed to ensure "due stability" in every portion of buildings other than those of the domestic type, and would remove from the Code all those cumbrous rules respecting thickness of walls and their attendant variations, consequent upon some contingency often more or less remote.

In matters of means of egress, disposition of seating in public assembly rooms, position of staircases, situation and type of sanitary accommodation in buildings, all could be more usefully regulated by taking into account the type of construction of the building as well as the nature of the business or undertaking to be carried on therein. What always obtains under the Model Code is that a minimum of structural stability, based upon an ordinary use, is prescribed; and this becomes in practice an actual maximum.

Domestic buildings would require different treatment to public or warehouse buildings. They are subject to greater changes and different usage. Yet modernising even in their "structural stability" by-laws is possible. Why should walls require footings if resting upon sufficient concrete or rock foundation? Why should parapet walls be needed, with all the risk

* Paper read at the Fourth Autumn Country Meeting of the Institution of Municipal Engineers.

of conveying moisture into the houses? Why should window frames be required to be set back 4½ in. from the face line of buildings? Why should overhanging eaves be prohibited, considering all the protection from dampness they afford to the walls beneath them? Many other questions could be usefully asked by those revising by-laws.

And the inquisition could be carried on throughout those by-laws which are made for "purposes of health." Why should isolating traps with their ground level inlets be demanded? Why should not power be obtained to enable a regulation to be made governing the cubic contents of a room, and prescribing the ratio between height, length and width of all living-rooms instead of the present one dealing only with height? Should not a regulation be possible requiring all dwelling houses to be provided with a pantry or larder, and also that all living-rooms should have at least one window in them through which the sunlight can pass every day the sun shines? By-laws dealing with the construction, direction, width, length and paving of streets should be carefully modernised. Should not regulations be made enabling the owners of streets to complete them with dustless paving rather than with the ordinary sett paving, which is often laid with open insanitary joints?

The limitation of the number of houses or other buildings in a row should be considered, and rules prescribed to direct that the course of streets should be such as to enable the maximum amount of sunlight to pass into the buildings erected upon their sides; and to further make provision for the encouragement of open spaces at the front in addition to the land set apart for street purposes, the latter of which might be reduced in width if additional space were provided for use as garden land in front of buildings. Some balancing clause, whereby this type of laying-out would be made possible, would have an encouraging effect upon the minds of persons who would be considering the development of land, especially if the effect of the clause would be to reduce the cost of street works, which oftentimes are greater than the value of the land for which the works are undertaken.

Many other points might be adduced to show the need of modernising, but one question should be kept foremost in the mind of those considering the subject, and this is it: That the local circumstances should be fully considered before determining the phrasing of any particular regulation.

While much might be learned by a careful perusal of other local authorities' by-laws, it would not be wise to blindly follow a by-law made for similar purposes by another authority, unless it was found to precisely and definitely express the exact needs of the authority desiring to adopt it. For experience does not confirm the desirability of accepting without question a by-law or regulation made by another authority upon some subject which is under consideration. This, together with a code of by-laws framed upon the knowledge obtained of the behaviour of materials under modern loading, would place a local authority in possession of by-laws freed from the objectionable features attributed to the present Code—namely, their elasticity and applicability only to stereotyped forms of construction. Some local authorities might urge that a code based upon these suggestions would be expensive to administer, because a technically trained staff would be required for the work; but as buildings in themselves are an essential indication of a town's prosperity, and are vitally necessary not only for the town's business but also for the housing of the population engaged in such business, it is not unreasonable to claim first importance for the subject. That men in the service of local authorities are capable of administering a code of by-laws based upon technical knowledge is beyond doubt; and it is not too much to say that such a code would receive the approval not only of the members of professional societies engaged in construction, but also of all whose desire it is to have well-developed towns with soundly constructed buildings therein.

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

SANATORIA AND ISOLATION HOSPITALS.

"PERMA" BUILDINGS.

As the passing of the National Insurance Act will, in many parts of the country, necessitate the erection of additional buildings for use as sanatoria and isolation hospitals, not a few authorities will have to consider whether a suitable building cannot be obtained that, while not being so expensive as a finished brick structure, will be permanent, warm in winter and cool in summer, and will generally meet the needs for which such buildings are intended.

Mr. Lloyd George gave the probable cost at about £100 per bed, but the claim is made that what are known as "Perma" buildings can be erected at one-half this expenditure. These buildings are constructed of "Hy-Rib" reinforced-steel sheets with cemented surfaces, the exterior walls being finished with pebble dash. The roofs are covered with red asbestos slates, laid diagonally, plastered underneath, and interlined with inodorous felt, with half-timbered gable ends. The floors may be constructed of pitch-pine blocks and laid on a concrete foundation. The buildings

Type of "Perma" Building.

are well ventilated. All the interior partitions are constructed in a similar manner to the exterior walls. The interiors are decorated with "Walpamur" or "Alabastine" water paint, and finished to selected art tints.

The special advantages of these buildings are stated to be: (1) Low cost, as they can be erected complete at an outlay of about £50 per bed; (2) they are warm in winter and cool in summer, owing to cavity walls; (3) they can be speedily erected, and are artistic in appearance; (4) they are permanent, and absolutely rigid; (5) the Local Government Board will advance twenty years' redemption loan on this construction; (6) they are perfectly sanitary and well ventilated.

The buildings will be erected in any part of the country by Messrs. F. H. Heath, Limited, 22 Bridge-street, Manchester, who will be pleased to answer all enquiries, and to give any further information required.

Messrs. Heath also erect these and other buildings in composite asbestos and wood and iron.

Alterations at the London Guildhall.—The Corporation of the City of London have decided to proceed with the rebuilding of the structures on the east side of Guildhall-yard, including the art gallery, at an estimated cost of £68,000.

South American Water and Drainage Contracts.—In connection with the extension of the waterworks and drainage system, embracing an area of more than 38,500 acres in the northern and western limits of the city of Buenos Ayres, contracts have been awarded the Cleveland Bridge and Engineering Company (Limited), Darlington, for the manufacture and erection at Caballito, Buenos Ayres, of an elevated water reservoir, composed of three tiers of wrought-iron tanks supported on cast-iron quadruple columns. This reservoir will have a capacity of 16,000,000 gallons, and in its construction more than 15,000 tons of cast iron and steel work will be used. The contract for mild steel pipes, varying from 4 ft. to 5 ft. 1 in. in diameter, required for this reservoir, has been given to Messrs. Head, Wrightson & Co. (Limited), Thornaby-on-Tees, who have also received an order for the metallic lining for the main sewer of the new system.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

ANNUAL MEETING AT TWICKENHAM.

The annual meeting of the Lower Thames Valley District Surveyors' Association was held at the Town Hall, Twickenham, on Saturday, the 5th inst., when there was a good attendance.

The following gentlemen were appointed as officers for the ensuing year: Messrs. H. F. Coales, Assoc.M. Inst.C.E. (surveyor to Sunbury-on-Thames Urban District Council), president; R. Wilds (surveyor to Walton-on-Thames Urban District Council), vice-president; J. W. Croxford (surveyor to Brentford Urban District Council), honorary secretary and treasurer; J. A. Webb (surveyor to Hendon Rural District Council) and F. Sadler (surveyor to Acton Urban District Council) honorary auditors.

A vote of thanks was passed to the retiring president, Mr. E. Willis, Assoc.M.Inst.C.E., surveyor to the Chiswick Urban District Council, for the excellent work which he had done during his year of office in furthering the status of the association.

The honorary secretary's report for the past year was then read. This mentioned, *inter alia*, that during the session the association had held seven meetings and five visits in all, the undertakings inspected including Surbiton sewage disposal works (in course of construction), the Metropolitan Electric Supply Company's works at Willesden, Willesden Isolation Hospital, the sewage recorder at Willesden, and the Brentford gasworks.

The association felt some regret that none of their members were elected to the council of the parent institution—the Institution of Municipal and County Engineers—as had been the case in previous years, though this could be attributed to the new mode of election. It was noted with satisfaction, however, that at the Eastern District meeting of the institution held at Grays, Mr. E. Willis, the ex-president, Mr. A. Gladwell and Mr. S. H. Chambers, all members of the association, were elected to act on the District Executive Committee. Mr. W. R. Hicks, of Ealing, who is chief assistant to Mr. Charles Jones, a member of the association, was also elected on this committee.

During the season three most interesting papers were read and discussed—*viz.*: "Notes on the Latest Sewer and Drain Definitions Approved by Parliament," by Mr. Willis; "A Few Notes on Drainage and Sewage Disposal for Small Towns and Villages," by Mr. J. A. Webb, of Hendon; "Some Notes on the Laying Out, Making Up and Construction of Private Streets," by Mr. R. H. Jeffes, of Malden. Other topics which had been raised, briefly summarised, were as follows: Clinker concrete, Ceresit, labour and wages, accident on highway due to hot ashes, procedure in connection with audit of accounts, the raising of loans, subsoil in private streets, kerbing existing in private roads, various points raised by architects under by-laws, treatment of road surfaces, tradesmen's signs, apportionment of private streets, motor-omnibus traffic, and the question as to whether a [illegible] can be regarded as a sewer.

The association, it is suggested, should congratulate itself as being, if not the first, at least one of the first, to take up that all-important matter of the excessive wear and tear to roads due to motor-omnibus traffic, and that a great deal of the energy now being directed by public bodies to this matter can be indirectly traced to the action taken by the association, who, throughout the whole of the session, have had this matter under very serious consideration, and in January last passed resolutions in regard to the matter, copies of which were forwarded to the Institution of Municipal and County Engineers, and regret is expressed that the institution could not see its way to take action in the matter upon the [illegible] by the association. A deputation waited upon the committee, who had this matter under consideration, and, after a conference of considerably over an hour, the committee regretted that they were unable to advise the institution to act [illegible]

[illegible]

local authorities enabling them to define the route (other than county main roads) to be taken by any service of motor omnibuses or other motor vehicles licensed for hire or for the carriage of goods into or through their respective districts."

(2) "That a copy of the above resolution be sent to the Institution of Municipal and County Engineers, and that the council of the institution be requested to consider the subject-matter of such resolution, and take such action as they may deem necessary."

The thanks of the association were tendered to Mr. F. W. Pearce, of Twickenham, for the assistance he had given the association in the arrangement of meetings and so forth; to the president and vice-president for the arrangements made during the session; to the president, Mr. Webb, and Mr. Jeffes for the excellent papers given; and to the honorary secretary for work done in connection with the association during the year.

Further business, dealing with means of escape in case of fire from factories, and the laying out of large estates by trustees, and considering how the by-laws relating to roads, streets and drains would be affected, was considered.

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesie."
—Geo. Herbert, *"The Temple."*

TOWN PLANNING: WHOSE WORK?

To the Editor of The Surveyor.

Sir,—The letter on town planning by Mr. Wilkes in your issue of the 4th inst. deserves the careful consideration of all municipal engineers, for undoubtedly the persistent claim of the architectural profession to be alone considered capable of producing a satisfactory town planning scheme is one that municipal engineers should contest.

While there can be no doubt that in any large scheme there is room for the combined efforts of the engineer and architect, the main question to decide is, whose is the more important part? and if one only is to be entrusted to design and lay out a scheme, should that one be the engineer or the architect?

Speaking broadly, the engineer is admittedly the more practical and scientific, while the architect is stronger ideally and artistically. Each has the defects of his virtues, and though there are a few men in each profession who possess both the necessary scientific and artistic qualifications, it can be laid down as a general rule that the engineer is weak æsthetically and the architect is weak constructionally.

Which, then, is the more important side of this question, the practical or ornamental? Each town planning scheme of any size must primarily make provision for its water supply, sewerage and sewage disposal, laying out and construction of roads, bridges and tramways, lighting by gas or electricity, supplying hydraulic or other forms of power, laying out parks, recreation grounds and open spaces. All these are essentially the work of the municipal engineer, and it is only when these, wholly or in part, have been carried out that the architect is called upon to play his part of providing the various buildings for residential, industrial or other purposes.

The town planning schemes carried out in this country on any large scale are chiefly the work of the engineer, for the greater number of so-called town planning schemes for which competitions have been held, with few exceptions, have been confined to the laying out and development of a building estate by some enterprising landlord or building company.

The main features of most of the garden "city" or garden "suburb" schemes is the effort to cheapen road making. While one can sympathise with their efforts to lower the cost of road making, there is no doubt that in many cases the roads are being made ridiculously narrow, and with materials which would disgust the merest tyro in road engineering. These schemes are essentially promoted by building speculators, and the competitors nearly all belong to the [illegible] profession, [illegible] is hardly likely to find his ideas square with those of the architectural assessor.

Almost the only complete town planning schemes on large scale which have taken place in recent years are those for the laying out of Delhi and the Federal Capital of Australia.

That the Government did not agree with the claim

The Surveyor
And Municipal and County Engineer.

set up by the architectural profession was shown by their selection of the city engineer of Liverpool as the man to start the work of laying out Delhi; and anyone who knows Mr. Brodie will agree that his will not be the least important part in carrying out this scheme.

The winning schemes for the Australian Capital afford an interesting study, as they evidently owe their selection to the architectural influence among the assessors. The engineering chairman of the board did not agree with the selection of any of the three premiated schemes, and it is difficult to see how they could appeal to an engineer, for each of the schemes largely ignores the physical difficulties of the site in the laying out.

The winning design scored over the other competitors by submitting a scheme for a population three times larger than that asked for in the conditions issued to competitors, which conditions appear to have been strictly adhered to by the other competitors. Instead of being submitted on the contour map to a scale of 400 ft. to an inch issued by the Federal Government, which covered an area of 4 miles square, the winning design covered an area of some 9 miles by 7 miles, and the industrial and residential areas were to a large extent outside the required map. There can be little doubt that in an English competition this scheme would have been immediately ruled out.

The scheme is a clever one in many respects, but it is one which looks better on paper than it will look when laid out. From an English point of view the American gridiron system has not much to recommend it, especially when in several cases it appears as if a "rack" railway will be necessary to negotiate the gradients in some of the streets. The position of the railway, fixed by the local engineers with a proper regard to the levels of the ground and due economy, has been altered to a position necessitating deep cuttings or sharp gradients and a large number of bridges, and is grotesquely extravagant from an engineering and economic point of view. The same disregard for engineering difficulties is to be seen in the construction of the circular lakes which form so important a part of this scheme. The bed of the Molonglo river in this, and, to some extent, in the second scheme, is utilised for roads, railway cuttings and building sites; and the natural beauties of the wooded river are sacrificed to and swamped by the miniature Lake Michigans which the author has designed as the result of his Chicago experience.

Space forbids my enlarging on other objectionable features of these schemes, but I hope I have said enough to show that the architect is no more likely to be successful in town planning than the engineer, and that, taken on the whole, there is no one so well fitted by training and experience to carry out this work as the municipal engineer.—Yours, &c.,

A. J. Price.

Lytham.
October 16, 1912.

SEWAGE DISTRIBUTION AT ILKESTON.

To the Editor of The Surveyor.

Sir,—In your report of the discussion at the East Midland District meeting of the Institution of Municipal and County Engineers at Ilkeston on the 28th ult., you state that I mentioned that the system of distribution on the beds at Croydon is similar to that adopted at Ilkeston. The purport of my remarks was to point out that exactly the contrary to this was the case, that the works at Ilkeston were the only ones that I was aware of where the distribution had been carried out by electrically driven distributors in this way, hence they were in contrast to those with which most of us are familiar—*i.e.*, revolving sprinklers actuated by their own head, in a similar way to those seen at a previous meeting at Croydon, and at many other works elsewhere.

The system of distribution as adopted at Ilkeston is extremely interesting. Of course, it is an innovation, and, like every other such, must be given the test of time, and I have no doubt that many who were present at the inspection of the works will look forward with interest to another inspection in the future when the distributors have been some years in operation.—Yours, &c.,

E. Witton Booth.

25 Cross-street,
Manchester.
October 11, 1912.

NON-SLIPPERY WHINSTONE.

To the Editor of The Surveyor.

Sir,—I notice in your issue of the 11th inst. that Mr. Howard-Smith expresses the opinion that the Corporation of Portsmouth are to be congratulated if they have discovered what he considers a *rara avis* in whinstone—*viz.*, a non-slippery one. As Mr. Smith claims that his experience of this class of paving material has been fairly wide, I can only conclude that he has been singularly unfortunate in the choice of whinstones. The writer has seen many miles of streets paved with whinstone setts during the last thirty years, but has never observed slipperiness to be one of the defects of such paving.

The term "Scotch granite," as applied to whinstone, is known only south of the Border, and he must be ignorant indeed who cannot tell Scotch whinstone from Scotch granite.—Yours, &c.,

"Scotch Whinstone."

October 15, 1912.

THE CROMPTON PAVEMENT.

To the Editor of The Surveyor.

Sir,—Referring to the first paragraph in the letter from Mr. Cecil Nathan under this heading in your current issue, why my expression of doubt as to the utility of mixing cement and liquid "bitumen" (*i.e.*, British) should have raised the ire of that gentleman I cannot imagine.

Mr. Nathan wishes to impress us that he knows everything, or next to everything, about bitumen. Surely evidence of this by a direct answer to my question would have been more to the point than an exhibition of mere perspicacity!—Yours, &c.,

W. J. Howard-Smith.

Westminster.
October 16, 1912.

National Association of Local Government Officers.—At the seventh annual meeting of the National Council of this body on Saturday last, at the London Guildhall, approval was given to a resolution requesting the council to take all necessary steps to secure the introduction of a superannuation Bill and to press forward its promotion. Sir Homewood Crawford, the city solicitor, who presided, said he considered it was in the interests of the ratepayers generally that officers should be entitled to superannuation, as it added to efficiency. At the annual banquet, held in the evening at De Keyser's Royal Hotel, the association was congratulated on its increase in membership in the past six years from 6,000 to 32,000.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The following books have been chosen in respect of the September premium:—

Mr. F. E. Yewdall, of Richmond, elected to have "Essentials in Architecture," by John Belcher, R.A. (Batsford).

"Town Scavenging," by Hugh Watson (St. Bride's Press).

"Chadwick Lectures," session 1907-8, by W. D. Scott-Moncrieff (St. Bride's Press).

Mr. Isaac W. Smith, of Clapham Junction, decided upon

"Mechanics Applied to Engineering," by Prof. Goodman (Longmans).

"Foundations and Concrete Work," by E. Dobson (Crosby Lockwood).

These books have been duly forwarded.

QUESTIONS.

This week answers are invited to the following questions:—

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

277. Sewage Disposal.—What main principles should be kept in mind in arranging the sewage disposal of the following: (*a*) A village of 800 inhabitants (purely agricultural)? (*b*) A town of 2,000 inhabitants (industrial)? (*c*) An infectious diseases hospital of 100 beds? ("Charger.")

278. Mechanics.—Give an expression for the tension of the bucket rod or piston rod in a common suction pump. The barrel of the pump is 8 in. diameter, and the stroke of the bucket or piston is 10 in. Find the work done per stroke in ft.-lbs. when the spout is 16 ft. above the surface of the water in the well. (A.M.I.C.E., October, 1901.)

279. Paving.—What is the best material for paving carriageways of steep gradient? Give reasons. ("Muneng.")

280. Building Construction.—The walls at the base of a high brick tower are 3 ft. 9 in. thick. Describe, with drawing, what footings should be provided, the thickness of concrete, and the distance below the surface. (T. R.)

281. Surveying.—Upon what trigonometrical rule does triangulation depend? Prove that the sides of a triangle are proportional to the sines of the angles opposite to them.

Design for a Highway Bridge.

F. N. (*Dornoch*) submits the following designs and calculations for a highway bridge, in reinforced concrete, assumed to be loaded with two 12-ton road rollers over a clear span of 33 ft. 6 in., and would be glad to receive the views of readers of the Assistants' and Students' Section who are experts in this class of construction.

Calculations for Floor Slab.

[Note.—5 tons is the assumed weight of the front rollers and 3·5 tons the weight of either of the hind rollers.]

Dead weight of slab = $\frac{8}{12} \times 156$ lb. = 104 per ft. super. of slab.

" " macadam = $\frac{9}{12} \times 100$ lb. = 75 " "

superimposed load = $\frac{5 \text{ tons}}{4·33}$ = 2,587 " "

2,766 Total load in lb. per ft. super.

$$\text{B.M.} = \frac{2{,}766 \times 4·33 \times 4·33 \times 12}{12} = 51{,}863 \text{ inch-lb.}$$

Neutral axis from compression face =

$$\frac{*·5625}{12}\left(\sqrt{\frac{30 \times 7 \times 12}{·5625} + 225} - 15\right) = 2·5 \text{ in.}$$

$$\text{Radius arm} = 7 - \frac{2·5}{3} = 6·17 \text{ in.}$$

$$\text{Compression in concrete} = \frac{2 \times 51{,}863}{6·17 \times 12 \times 2·5} = 560 \text{ lb. per sq.-in.}$$

$$\text{Tension in steel} = \frac{51{,}863}{6·17 \times ·5625} = 15{,}000 \text{ nearly (lb.).}$$

[*Note.—·5625 = the calculated sectional area of steel in one foot run, short way of mesh, expanded metal, sheet No. 30 in company's trade list. Had sheet No. 31—*viz.*, ·5 sq.-in. per foot run—been used the stresses in concrete and steel would have been 581 lb. and 16,730 lb. respectively. Tension strips, 2 ft. wide, of same sectional area as reinforcement in lower portion of slab, are provided. See Fig. No. 4.]

Calculations for Beams of T-shaped Cross-section, as shown in Fig. 4.

Assuming the greatest super. load that would come over each of the central beams to be as shown in Figs. Nos. 2 and 3—*viz.*, front rollers of 12-ton roller, say 5 tons, and ½ of each hind roller, 3·5 tons—then the diagram of bending moments shows the greatest bending moment to be 10 × 5·66 tons = 56·6 tons under the 5-ton load.

Therefore the equivalent distributed will be:—

$$\frac{56·6 \times 8}{35·5} = 12·76 \text{ tons.}$$

Dead weight of floor slab = $\frac{8}{12} \times 4·33 \times 156$ lb. = 443 lb. per ft.

" " " macadam = $\frac{9}{12} \times 4·33 \times 100$ lb. = 325 "

" " " beam = $1 \times \frac{26}{12} \times \frac{13}{12} \times 156$ lb. = 366 "

Super. load = $\frac{12·76 \times 2{,}240}{35·5}$ = 805 "

1,939 "

$$\text{B.M.} = \frac{1{,}939 \times 35·5 \times 35·5 \times 12}{8} = 3{,}665{,}437 \text{ inch-lb.}$$

Depth of beam from centre of steel to compression face = 32 in.

Since the depth of the neutral axis from the compression face falls below the thickness of the floor slab, I have taken the radius arm as:—

$$\text{Radius arm} = 32 - (·4 \times 8) = 28·8 \text{ in.}$$

$$\text{Area of steel required} = \frac{3{,}665{,}437}{28·8 \times 16{,}000} = 7·96 \text{ sq.-in., say 8.}$$

$$\text{Compression in concrete} = \frac{2 \times 3{,}665{,}437}{52 \times 8 \times 28·8} = 612 \text{ lb. per sq.-in.}$$

$$\text{Neutral axis} = \frac{8}{52}\left(\sqrt{\frac{30 \times 32 \times 52}{8} + 225} - 15\right) = 10·08 \text{ in.}$$

Calculations for shearing stress in beam:—

$$\text{Total shearing stress} = \frac{1{,}939 \times 35·5}{2} = 34{,}417$$

Therefore

Area of steel per foot run required

$$= \frac{(34{,}417 - 40 \times 32 \times 13)\ 12}{28·8 \times 16{,}000} = ·5 \text{ sq.-in. nearly.}$$

Say, for reinforcement in beam, 4 bars in number:—

2 square bars 1·5 diameter, placed at outer side of beam and each provided with expanded metal web 24 in. wide, the web to have an area of ·25 square in. per foot run.

Two 1·5 diameter squares = 4·500 square in.

" 1·5 " rounds = 3·534 " "

Total 8·034 " "

[Query: The bridge consists of four spans, 33 ft. 6 in., 33 ft. 6 in., 30 ft. 6 in. and 20 ft. respectively, over three ashlar (granite) masonry piers, each 5 ft., what objections would there be to making the beams continuous throughout and calculating for a

$$\text{B.M.} = \frac{\text{WL}}{12}?$$

[None; if the piers can be relied upon not to settle materially.—Ed.]

F. N. would be glad to have readers' opinions as to the following design and calculations also:—

Figures 1a to 6a show an alternative scheme of recon-

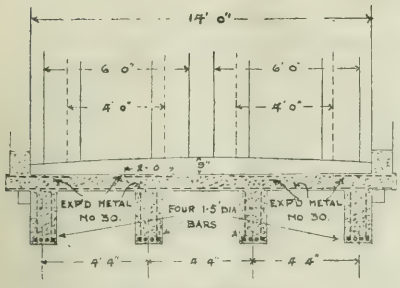

Fig 1.—Cross Section.

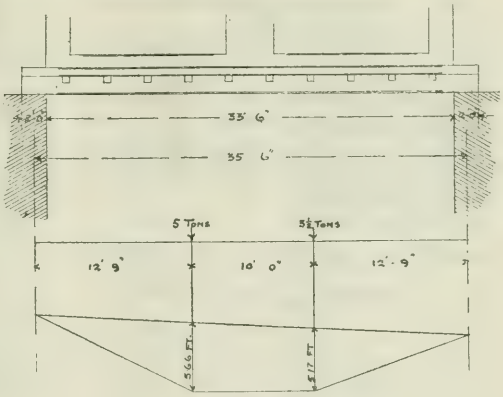

Fig. 2.—Elevation.

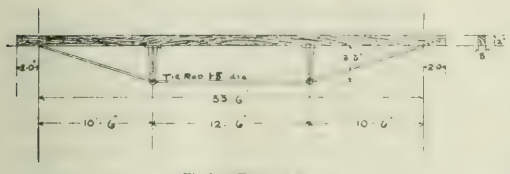

Fig. 1a.—Existing Beam.

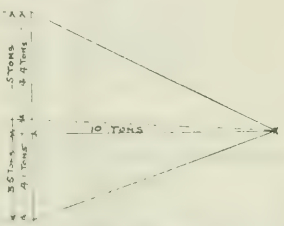

Fig. 3.—B.M. Diagram.

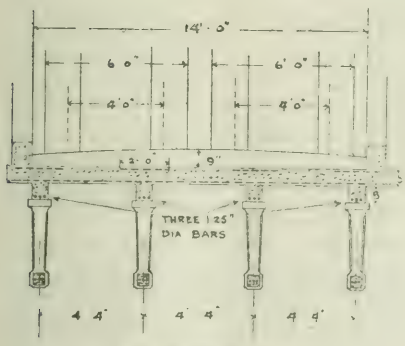

Fig. 2a.—Cross Section AB.

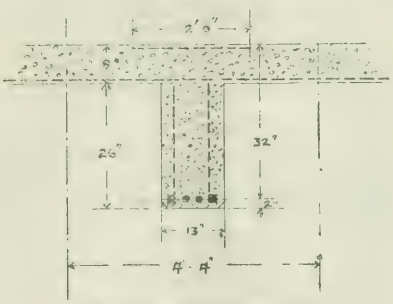

Fig. 4.—Section of T Beam.

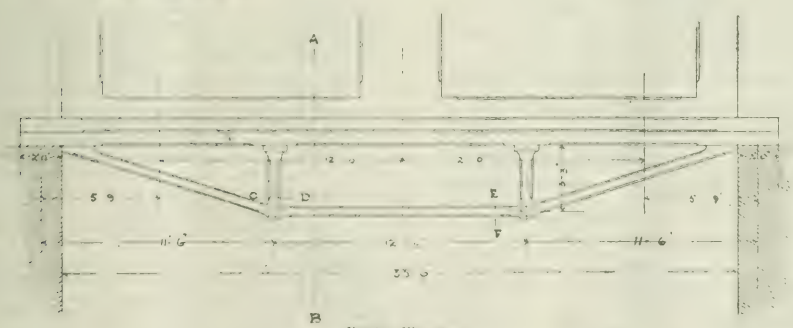

Fig. 3a.—Elevation.

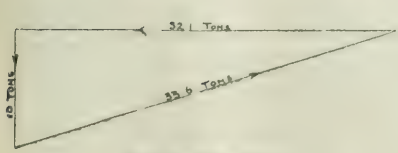

Fig. 4a.—Stress Diagram.

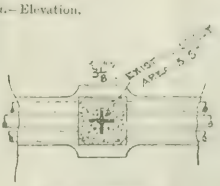

Fig. 5a.—Section C D.

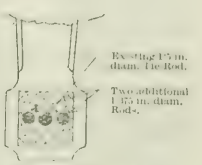

Fig. 6a.—Section E F.

Design for Highway Bridge.

struction in reinforced concrete, span and loading assumed to be the same as in the foregoing article.

Fig. 1a shows the existing trussed wood beam of the bridge to be reconstructed, with 12-in. × 8-in. timber top member; cast steel struts as shown in Fig. 5a, the minimum area of strut being 3·5 in. and single tie rod of 1·5 in. diameter (round) as shown in Fig. 6a. Fig. 2a and 3a show the proposed design and dimensions of reconstruction, incorporating all existing steel.

Floor slab to be same as calculated in preceding article—*viz.*, 8-in. thick and reinforced with ·5625 square in. of steel per foot run (expanded metal, sheet No. 30), with tension strips of same proportion.

Calculations for beams :—

$$\text{Dead weight of floor slab} = \frac{8}{12} \times 4{\cdot}33 \times 156 \text{ lb.} = 443 \text{ lb. per ft.}$$

$$\text{,, ,, ,, macadam} = \frac{9}{12} \times 4{\cdot}33 \times 100 \text{ lb.} = 325 \text{ ,,}$$

$$\text{,, ,, ,, beam} = 1 \times \frac{8}{12} \times \frac{8}{12} \times 156 \text{ lb.} = 69 \text{ ,,}$$

$$\text{,, ,, ,, existing steel in tie rods and struts} = 45 \times 6{\cdot}008 \text{ lb.} \times \frac{1}{35{\cdot}5} = 13 \text{ ,,}$$

$$\text{,, ,, ,, additional steel in tie rods} = 45 \times 2 \times 5{\cdot}049 \text{lb.} \times \frac{1}{35{\cdot}5} = 8 \text{ ,,}$$

$$\text{,, ,, ,, concrete in ties and struts} = 45 \times \tfrac{1}{2} \times \tfrac{1}{2} \times 156 \text{ lb.} \times \frac{1}{35{\cdot}5} = 50 \text{ ,,}$$

$$908 \text{ ,,}$$

$$\text{Total distributed dead load} = \frac{908 \times 35{\cdot}5}{2{,}240} = 14{\cdot}4 \text{ tons.}$$

Super. ,, load (from preceding article) 12·76 tons
Total ,, ,, ... 27·16 tons

Therefore the loading at either of the struts to the total load will be in ratio as their position is to the total span :—

$$\text{Load at struts} = \frac{12}{35{\cdot}5} \times 27{\cdot}16 \text{ tons} = 9{\cdot}20 \text{ tons, say 10 tons.}$$

$$\text{,, ,, ,, ,,} = 9{\cdot}20 \text{ ,,}$$

$$\text{,, abutments} = \frac{27{\cdot}16 - (9{\cdot}2 + 9{\cdot}2)}{2} = 4{\cdot}38 \text{ ,,}$$

$$\text{,, ,, ,,} = 4{\cdot}38 \text{ ,,}$$

Total ... 27·16 ,,

Scaling a load line (Fig. 4a), 10 tons, equal to the loading over either strut and completing the polygon with its sides parallel to the top member of the beam and the inclination of the tie rod, the stress diagram gives the strain on the various members thus :—

Compression on beam = 32·1 tons.
,, ,, struts = 10·0 ,,
Tension on horizontal portion of tie rod = 32·1 ,,
,, ,, inclined ,, ,, ,, = 33·6 ,,

$$\text{Compression on concrete per sq.-in. of beam} = \frac{32{\cdot}1 \times 2{,}240}{16 \times 8} = 562 \text{ lb.}$$

This gives an easy compression in beam without considering any portion of floor slab at either side of beam.

$$\text{Area of steel required in tie rods} = \frac{33{\cdot}6 \times 2{,}240}{16{,}000} = 4{\cdot}704 \text{ sq.-in.}$$

Existing tie rod (round) 1·5 in. diam. = 1·767 ,,
Required 2 bars (round) 1·375 in. diam. = 2·953 ,,
Total area of steel ... 4·720 ,,

Calculation of stresses in portion of beam between struts, *viz.*, 12 ft. – 6 in. span.

Dead weight of floor slab = 443 lb. per ft. run.
,, ,, macadam = 325 ,, ,,
,, ,, beam = 69 ,, ,,

Super load, say 5 tons at centre,
i.e., 10 tons distributed

$$\frac{10 \times 2{,}240}{12 \cdot 5} = 1{,}792 \text{ ,, ,,}$$

$$2{,}629 \text{ ,, ,,}$$

$$\text{B.M.} = \frac{2{,}629 \times 12{\cdot}5 \times 12 \cdot 5 \times 12}{8} = 616{,}172 \text{ inch-lb.}$$

$$\text{Lever arm} = 14{\cdot}5 - (4 \times 8) = 11{\cdot}3 \text{ in.}$$

$$\text{Compression on concrete} = \frac{2 \times 616{,}172}{11{\cdot}3 \times 24 \times 8} = 568 \text{ lb. per sq.-in.}$$

$$\text{Area of steel required} = \frac{616{,}172}{11{\cdot}3 \times 16{,}000} = 3{\cdot}41 \text{ sq.-in.,}$$

say 3 – 1¼ in. diam. round bars.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Chester-le-Street R.D.C. (October 9th. Mr. W. H. Collin).—£12,200 and £630 for the purposes of a scheme under Part III. of the Housing of the Working Classes Act, 1890, for the provision of working-class dwellings in the township of Great and Little Usworth.—Mr. J. Turnbull, representing the council, said the money was required to take over fifty houses built by the county council in 1906, and to build an additional fifty-seven. There was a great and urgent need for the additional houses, as many men were having to walk long distances from their homes to work. The scheme would be self-supporting, and the houses would be let at 6s. 6d., 5s. 8d. and 5s. 4d. per week. Each one would be self-contained, would have a garden, a bath, and hot and cold water. Dr. Hill, county medical officer of health, had condemned about seventy houses, and there were others not scheduled, but not fit to be inhabited. A miner stated that 250 men had to walk from 4 to 6 miles to work at Usworth owing to lack of houses.

Bridlington T.C. (October 8th. Mr. W. H. Collin).—£4,700 for the erection of workmen's dwellings in Bridlington.—There was considerable opposition. One objector stated that the scarcity of workmen's houses was due in some measure to rural workers being unable to secure cottages near their work, and that bicycles enabled them to cover the few miles between their work and their homes in Bridlington. One councillor advocated cheap back-to-back houses, as the rents proposed, from 4s. 6d. to 5s. 6d., could not be paid by the poor people dispossessed through the council condemning the cottage homes in which they now live.

Dudley T.C. (October 8th. Mr. R. H. Bicknell).—£1,136 for works of sewerage and surface drainage, the erection of boundary walls in Gads-lane, and the provision of buildings and plant at Russell's Hall for the manufacture of tar-macadam.—Mr. J. S. Morris, deputy town clerk, stated that the loan for which sanction was now required was made up as follows: £100 for sewerage works, £122 surface-water drainage, £825 building and plant for the manufacture of tar-macadam, £64 boundary walls in Gad's-lane, and £24 cost of obtaining loans. The amount required for the manufacture of tar-macadam was made up of £533 for buildings and £290 for plant.

Forehoe R.D.C. (October 1st. Mr. W. H. Collin).—£1,500 for the purchase of land and the erection of working-class dwellings.—In the course of the proceedings the inspector pointed out that the scheme was going to involve the district in about £24 a year. Explaining the figures in detail, he mentioned incidentally that he had struck an average for repairs on the whole of the loan period of sixty years, and that worked out at about 30s. a year per house. Mr. Tofts thought that was excessive, this being a class of house which required very little upkeep. The inspector pointed out that with only £1 a year allowed for repairs there was still a deficit of at least £20 a year. Practically £3 a house was coming out of the ratepayers' pockets. It was just a question whether a smaller house would not better answer the purpose. He did not mean a house with fewer bed-rooms. Mr. Tofts said there was an objection to smaller houses. Many of the houses were too small already. The inspector: If the ratepayers do not object to pay £25 a year for this present scheme, and another £20 for the further instalment of the scheme, it is nothing to do with me.

Hornsey T.C. (September 24th. Mr. R. H. Bicknell).—£2,500 for the construction of additional works at the Burghley-road sewage pumping works.—Mr. E. J. Lovegrove, borough engineer and surveyor, said that the work it was proposed to carry out under the loan was an improved arrangement for lifting into the outfall sewer the sewage of a low-lying area at the north-eastern corner of the borough. The new plant comprised two ejectors, each 150 gallons per minute, with a total capacity of 432,000 gallons per twenty-four hours. The storage tanks capacity was 261,000 gallons. There were also two 6-horse power electrically driven air compressors, with automatic controlling gear for maintaining a pressure of about 13 lb. per square inch. It was estimated that the new intercepting sewer and ejector chamber would cost £1,520, and the machinery, including two pneumatic

ejectors, two air compressors with automatic controlling gear, and so forth, £980, making a total of £2,500.

Neath R.D.C. (September 26th. Mr. H. R. Hooper).—£11,229 for purposes of drainage in the parishes of Neath Higher, Blaengwrach, and Cwmgwrach.—Mr. Edward Powell appeared on behalf of the district council, and there was no opposition to the scheme.

Rochdale T.C. (October 4th. Mr. P. M. Crosthwaite).—£2,049 for the construction of the sewer from Collinge-street to the main sewer in Valley-road.—The application was the sequel to certain difficulties encountered and penalties incurred in carrying a sewer under the canal at Hartley Bridge. The borough surveyor, Mr. S. S. Platt, explained the details of the work, and the inspector visited the site.

Saltburn U.D.C. (October 8th. Major C. E. Norton).—£3,500 for the purchase of the Brine Baths.—These were erected in 1890, at a cost of over £7,000, and the council have decided, subject to the approval of the Local Government Board, to purchase them for £2,500, and use them as a town's undertaking. Several of the councillors, who are unanimously in favour of the scheme, gave evidence as to the advisability of the council acquiring the baths.

APPLICATIONS FOR LOANS.

Beckenham U.D.C. £600 for a road improvement scheme.

Gravesend T.C.—£550 for road widening.

Heywood T.C.—£6,375 for granite paving works.

Kirkby U.D.C.—£11,810 for sewage outfall extension works.

Luton R.D.C.—£2,000 for a sewerage scheme.

Newport (Mon.) T.C. £3,220 for electricity supply purposes.

Northam U.D.C.—£350 for works of road making.

Pembroke T.C.—£1,500 for a new engine and pump at the Milton station.

Skegness U.D.C.—£1,100 for a sewage disposal scheme.

Stone R.D.C.—£2,800 for works of sewerage.

LOANS SANCTIONED.

Barnsley T.C. £800 for the improvement of the cattle market.

Barrow-in-Furness T.C.—£21,484 for the extension of the electricity works.

Birkenhead T.C.—£34,421 for new gas retorts and £3,500 for foundations.

Birmingham, Tame and Rea Drainage Board.—£6,000 for additional bacteria beds.

Buxton U.D.C.—£2,875 for alterations at the pumping station.

Cambridge T.C. £3,583 for the improvement of Market-hill.

Chingford U.D.C.—£1,230 for making up roads.

Darwen T.C.—£250 for a new humus tank at the sewage works.

Driffield R.D.C.—£835 for a motor fire engine.

Essex C.C.—£14,295, the council's share of the cost of the new bridge at Colchester.

Harrington U.D.C.—£8,500 for the gasworks extensions.

Harrogate T.C.—£4,170 for waterworks and £1,682 for alterations to the Victoria Baths.

Headington R.D.C.—£920 for street improvement works.

Isle of Wight R.D.C. £1,047 for a sewage disposal scheme.

Kingstown U.D.C.—£3,750 for work of tar-macadamising.

Loughborough T.C.—£700 for destructor buildings.

Nelson T.C. £21,225 in respect of the gasworks undertaking.

Rotherham T.C.—£14,000 for laying water mains.

Wednesbury T.C.—£1,800 for the provision of open spaces.

Winchester T.C.—£4,361 for the provision of a cemetery.

Yarmouth T.C.—£4,990 for police station and fire station extension.

FORTHCOMING INQUIRIES.

The Late Mr. Eedes Eachus.—On Monday evening last, at Edmonton Town Hall, Mr. H. T. Wakelam, M.INST.C.E., county engineer of Middlesex, unveiled in the presence of a large gathering a portrait in oils of the late Mr. G. Eedes Eachus, formerly engineer to the urban district council. In performing the ceremony Mr. Wakelam said he had the privilege of knowing Mr. Eachus for some twenty-five years, during twelve of which he was associated with him in his work there, and he had many opportunities, therefore, of realising the extreme kindness of heart which was one of his characteristics. Mr. Eachus's appointment dated back to the 'seventies, when Edmonton and Southgate were under one authority, and the many important works which he carried out during his connection with the district had proved of the greatest benefit. When he (Mr. Wakelam) first attended the meetings of the Institution of Municipal and County Engineers Mr. Eachus was one of the most prominent members of that body, and he remembered how attentively his observations on different subjects were received. He was a man of great engineering ability—one who could not only formulate schemes but carry them out—and his attainments were such that it might very appropriately be said of him: *Si monumentum requiris, circumspice.* A tribute to the qualities of the deceased official was also paid by Mr. W. H. Prescott, engineer and surveyor to the Tottenham Urban District Council, who said that, speaking as a neighbouring engineer, and on behalf of the profession of which Mr. Eachus was so distinguished a member, he would like to say how deeply grateful municipal engineers were to those who had been responsible for arranging such a worthy memorial to one of their number. Mr. Eachus had the deepest sense of honour, and his sole endeavour throughout had been to do his duty to the community he served. He was one of the most sound and cautious of engineers he (Mr. Prescott) had ever met, and it would be difficult, if not impossible, to find one with a greater capacity for taking infinite pains.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Boston £6,650, Cambridge £14,000, Easington £12,000, Folkestone £20,000, Lancaster £16,000, Wood Green £6,428; housing and town planning—Swansea; roads and materials—Newcastle-on-Tyne; sewerage and sewage disposal—Bentley £12,458, Cheltenham £16,567, Stockport £61,000; water, gas and electricity—Newton Abbot, Thakeham. Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Altrincham U.D.C.—Plans have been approved for a shelter for the Broadheath Recreation Ground, at an estimated cost of £350.

Barry (Glamorgan) U.D.C.—Shelters are to be provided by covering the roof of the bathing-houses, at an estimated cost of £1,200, and it has been decided to apply for powers to erect a sea-wall and promenade.

Bishop Stortford U.D.C.—A swimming bath is to be erected at South Mill, at a cost not exceeding £1,000.

Boston T.C.—The cost of the new Town Bridge is estimated to be £6,650, towards which the Holland County Council will contribute £2,000, leaving £4,650 to be met by the town council.

Bournemouth T.C.—The tender of Messrs. Jones & Seward, at £2,434, has been accepted for the erection of a new fire station.

Bradford T.C.—The Health Committee recommend the council to extend the accommodation of the new milk depot and infant consultation premises at an estimated cost of £1,500.

Brixham (Devon) U.D.C.—The tender of Messrs. W. Hill & Co., at £40,096, has been accepted for the extension of the breakwater. Towards the cost the Development Commissioners will make a grant of £10,000, and grant a loan for the remainder at 2½ per cent interest.—The tenders of Messrs. W. Hill & Co., at £291 and £208 respectively, have been accepted for erecting a new landing stage at the outer pier, and fender piling the end of the pier.

Cambridge T.C.—It has been decided to carry out extensions to the town hall at an estimated cost of £14,000.

Cardiff T.C.—The Finance Committee have approved the construction of a footbridge over the canal at the Old Sea Lock, at an estimated cost of £200.

Coalville U.D.C.—The surveyor, Mr. L. L. Baldwin, has received instructions to report upon the question of providing a mortuary.

Easington R.D.C.—Designs for a new hospital have been prepared by Mr. H. Hedley, of Sunderland. The estimated cost of the building is £12,000.

Ellesmere Port U.D.C.—It has been decided to limit the number of houses built hereafter to twenty-four to the acre. The present average in streets within the district is forty.

Folkestone T.C.—The General Purposes Committee recommend that prizes of 100 guineas, 50 guineas and 25 guineas respectively be offered to designers for the best set of plans placed first, second and third by the adjudicator for a band pavilion to be erected on the Leas. The maximum cost of the building is specified at £20,000.

Hampton U.D.C.—The surveyor, Mr. S. H. Chambers, is preparing, for the consideration of a committee, plans for a reading room to be erected on land adjoining the fire station.

Harrogate T.C.—It is proposed to build a shelter in the Valley Gardens.

Lancaster T.C.—A school for 960 children, and containing provision for cookery, laundry and manual training classes, has been opened. The total cost is £16,000, or £2,000 less than the original estimate.

Louth T.C.—The tender of Messrs. Mawer Brothers, at £128, has been accepted for the erection of a new 14 ft. span bridge in Hubbard's Valley.

Lynn T.C.—The question of spending a sum of £2,300 in one instance, and £1,500 in another for providing new baths is under consideration.

Mold U.D.C.—The new town hall, constructed at a cost of £5,000, has been formally opened.

Monaghan C.C.—The county surveyor, Mr. J. J. Hannigan, has received instructions to prepare an estimate of the probable cost of converting the old fever hospital at Monaghan into a county sanatorium, and of the cost of acquiring new ground and building a new sanatorium.

Penzance T.C.—The borough surveyor, Mr. F. Latham, has prepared a plan for the improvement of the convenience near to the Davy Monument, the estimated cost being £110.

Rochdale T.C.—A band stand, to cost £380, is to be built in Falinge Park.

South Shields T.C.—The borough engineer, Mr. L. Roseveare, has prepared plans for a tuberculosis dispensary, estimated to cost £350.

Staffs C.C.—The Education Committee have accepted the tender of Mr. W. Alcock, of Cheadle, at £3,923, for the erection of a school at Cheadle.

Sutton Coldfield T.C.—The tender of Mr. J. C. Hill, at £478, has been accepted for the erection of a lodge at Boldemere entrance to the park.

West Riding C.C.—The Public Health and Housing Committee have been authorised to purchase a site for a sanatorium at an estimate cost of £5,000.

Wood Green U.D.C.—Extensions to the town hall are contemplated at an estimated cost of £6,428.

Yarmouth T.C.—The tender of Mr. J. E. Pestell, at £4,526, has been accepted for carrying out extensions to the police and fire stations.

HOUSING AND TOWN PLANNING.

Neath U.D.C.—A letter has been received from the Local Government Board drawing the attention of the council to the scarcity of working-class houses in the council's area. The board understood that there was overcrowding, and inquired if the council had taken into consideration the Housing of the Working Classes Act (1890). The board also pointed out that the medical officer's report did not contain the necessary information required by the district regulations, and requesting that these statements be supplied. The matter is to be considered by the General Purposes Committee.

Northwich U.D.C.—The question of promoting a housing scheme is under consideration.

Prestatyn U.D.C.—The surveyor, Mr. F. Wilkinson, has been instructed to take the levels of three sites offered for the erection of workmen's dwellings.

Rhymney U.D.C.—The plans for the proposed housing scheme, which is estimated to cost £6,800, have been approved by the Local Government Board.

Swansea T.C.—It is intended to build between 200 and 300 workmen's dwellings provided official sanction is given to the purchase of the necessary land.

REFUSE COLLECTION AND DISPOSAL.

Bangor T.C.—A contract for horse scavenging at £312 a year has been accepted.

ROADS AND MATERIALS.

Bristol T.C.—It has been agreed to carry out street widenings in various parts of the city at an estimated cost of £1,612.

Chester-le-Street U.D.C.—The tender of Messrs. Thompson & Son, at £2,657, has been accepted for works of private street improvement.

Dawlish U.D.C.—A High-street improvement scheme is to be carried out at a cost of £229.

Dewsbury T.C.—The borough surveyor, Mr. H. Dearden, has been authorised to carry out several footpath improvements.

Durham T.C.—The tender of Mr. H. Meredith, at £420, has been accepted for works of street improvement.

Edinburgh T.C.—A street widening improvement is to be carried out at Redbraes, Broughton-road.

Hanwell U.D.C.—The tender of the Improved Wood Pavement Company, at £452, has been accepted for wood paving Boston-road, and the surveyor, Mr. Sidney Barnes, has been instructed to prepare a plan for the general widening of the same road.

Horsham U.D.C.—The scheme of the surveyor, Mr. R. Renwick, for making up East-street and West-street, at a cost of £446, has been approved.

Lynn T.C.—The borough surveyor, Mr. A. J. Smith, has received instructions to prepare a plan showing the laying out of part of the council's estate at the Loke-road end of the proposed new road for building purposes.

Monaghan U.D.C.—At the meeting last week, the surveyor, Mr. McCarthy, in his quarterly report, stated that he had discovered that the Great Northern Railway Company was responsible for the maintenance of a large portion of the streets of the town surrounding their premises. They should have maintained the road from the time the station was opened in Monaghan, but it was only lately it was discovered, and now they were looking after it. The warmest thanks of the council were given to Mr. McCarthy for having made this discovery and saved the ratepayers from a great burden.

Newcastle-on-Tyne T.C.—The question of laying out Eldon-square, at an estimated cost of £3,600, is under consideration.

Steyning East R.D.C.—Upon the recommendation of the surveyor, Mr. G. W. Warr, it has been agreed to seek urban powers for the purpose of making up the portion of Dyke-road between Tongdean-road and Tongdean-lane, in order to enable the widened portion of the highway to be made up at the expense of the frontagers.

Tavistock R.D.C.—With respect to the detailed work of road maintenance a resolution has been adopted that the rural district council act in as close co-operation with the county council surveyors (Messrs. S. Nigram and C. G. S. Acock) as possible, and accept their suggestions.

Teddington U.D.C.—The tenders of Messrs. Free & Son, Maidenhead, for the High-street and Twickenham and Manor roads improvements have been accepted—*viz.*, High-street, £376; Twickenham and Manor roads, road work, £123, tar paving, £29.—A bicycle has been bought for £8 for the use of the road foreman.

SEWERAGE AND SEWAGE DISPOSAL.

Andover T.C.—The tender of Messrs. Parkinson & Hodgens, at £5,128, has been accepted for alterations and extensions at the sewage disposal works.

Bentley (Yorks) U.D.C.—The council have accepted a tender for the construction of new sewerage and sewage disposal works. The price is £12,458, and includes the making of new works on the Tollbar estate, enlargement of the present works in Arkseylane, and the installation of new pumps at Bentley-road. This tender is subject to the approval of the Local Government Board.

Cannock R.D.C.—The scheme of the surveyor, Mr. H. M. Whitehead, at £1,630, has been accepted for sewage treatment at Huntington.

Carrick-on-Suir U.D.C.—The medical officer of health, Dr. Stephenson, reports that there is scarcely a section of the Public Health Acts or By-laws enforced in the town. Nuisances are to be seen in all quarters of the town, in streets and yards, and no notice seems to be taken of them. Notice has been given for the adoption of a housing scheme by the council.

Cheltenham T.C.—The tender of Mr. J. Riley, at £16,567, has been accepted for the construction of three sewage tanks and eight filter beds at the sewage disposal works.

Dartmouth T.C.—A pumping scheme for the remedy of storm floodings, prepared by the surveyor, Mr. J. Silley, is to be carried out at an estimate cost of £235.

Downham Market U.D.C.—The necessary land is to be purchased for a projected sewage disposal scheme.

Leeds T.C.—Negotiations are in progress between the Sewerage Committee and a Canadian firm for the shipment of sludge received at the sewage disposal works to be used as manure in the fruit growing industry. If an agreement can be arrived at it is stated that there will be a yearly saving to the corporation of nearly £1,000. In Leeds every year 35,000 tons of sludge are shipped to a process of mechanical pressing which renders it suitable for manurial purposes. During the winter months there is a demand from farmers for this sludge, but the disposal of the surplus in the summer is still difficult.

Nelson T.C.—An extensive sewerage scheme is to be carried out, including the construction of a high-level sewer.

Stockport T.C.—The sewage works at Cheadle Heath are to be enlarged at a cost of £61.000.

Teddington U.D.C.—Of the twelve tenders received respecting the extension of the sewage disposal works three have been referred for report to the surveyor (Mr. M. Hainsworth) and the consulting engineer (Mr. Wm. Fairley).

Worcester T.C.—Drainage works costing £2 040 are to be carried out at Barbourne and Astwood.

WATER, GAS, AND ELECTRICITY.

Exmouth U.D.C.—Consideration is being given to a report by the surveyor, Mr. S. Hutton, recommending the extension of water mains during the next three to five years, at an estimated cost of £1,200.

Hove T.C.—A proposal is under consideration recommending the council to give notice to the Hove Electric Lighting Company of their intention to exercise their right of purchasing the undertaking.

Howden (Yorks) R.D.C.—It has been agreed to apply for a provisional order to acquire a site in Dale Plantation, near South Newbald, for a new water scheme.

Llanfairfechan U.D.C.—Consideration is being given to a report by Mr. Walton, consulting engineer, Manchester, detailing a proposed scheme for the electric lighting of the town, and for the supply of electric power. The suggested scheme would cost £5.000.

Newport (Mon.) T.C.—The tramway undertaking showed a profit of £1,339 last year.

Newton Abbot U.D.C.—The council have approved of a scheme prepared by Mr. Clark, engineer, for the Newton Abbot and Brixton water supply. The estimated cost is £4,250.

Phillack U.D.C.—The council have accepted the tenders of Mr. C. L. Duke, of Sun Buildings, Plymouth, for laying water mains (£1,285) and constructing reservoirs (£698).

Port Glasgow T.C.—It has been decided to enter into an agreement with Greenock Corporation, by which Port Glasgow Town Council will apply for an Electric Lighting Order authorising them to supply electrical energy for all purposes within the burgh of Port Glasgow. They will ask for power to transfer the Order to the Greenock Corporation within twelve months, Greenock Corporation to undertake to accept such a transfer.

Scunthorpe U.D.C.—The engineer, Mr. C. C. Gray, has been asked to prepare plans for providing the Trentside district with a water supply.

Thakeham R.D.C.—The council have decided to adhere to their resolution to carry out the chalk scheme of water supply for Torrington, at an estimated cost of £5.172, instead of the scheme suggested by the Local Government Board for obtaining the supply from Hythe beds between Storrington and Washington.

MISCELLANEOUS.

Beeston U.D.C.—After a comparison of workmen's wages paid by neighbouring authorities it has been decided to increase the foremen, horsemen and engine-men's wages by 2s. a week, and all the other employees of the council by 1s.

Birmingham T.C.—In a special report the Tramways Committee express an unfavourable opinion with regard to motor omnibuses as a substitute for tramways, but recommend that Parliamentary powers should be obtained to run a service of buses if they are required. The committee unanimously recommend the council definitely to authorise the construction of all the tramways referred to in the new Act, including the proposed Hagley-road lines.

Maldens and Coombe U.D.C.—It has been agreed to purchase a first-aid motor fire engine, with chemical extinguisher and escape, at a cost not to exceed about £700.

Winchester T.C.—A motion has been passed that all contracts for work or supplies of material required by the council above the value of £50 should be open to public tender exception only to be made in cases of urgent necessity; and that contracts above £50 in value should only be accepted subject to confirmation by the council.

PERSONAL.

Mr. D. Edwards, borough surveyor of Taunton, has had his salary increased by £25 per annum.

Mr. B. Archer, assistant surveyor to the Wellingborough Urban District Council, has been voted an increase of salary.

Messrs. Ralph B. Chandler, assistant city engineer, Saskatoon, Sask., Canada, and Wm. C. Cross, ASSOC.M.INST.C.E., Birmingham, have been elected members of the Royal Sanitary Institute.

Mr. F. W. Richardson, who, prior to the absorption of his district by the City of Birmingham, filled the position of borough engineer of Aston Manor, was married recently to Miss A. G. Duggan, of Birmingham.

Mr. A. P. I. Cotterell has been appointed joint engineer with Mr. H. T. Mather, the surveyor to the Surbiton Urban District Council, in connection with and until the completion of the contracts with Messrs. Dick, Kerr & Co., Limited, in relation to the new sewerage and sewage disposal scheme.

Mr. E. P. Richards, whose appointment to the position of chief engineer to the Calcutta Improvement Trust was noted in our issue of August 30th last, took up his new duties on the 17th ult. On leaving Madras Mr. Richards was accorded a most enthusiastic send-off, and his departure, which was much regretted by all who had served under him during his comparatively short stay in the city, was made the occasion of a presentation which took the shape of an exquisite casket of silver, sandalwood and ivory, accompanied by an address. Mr. Richards' salary at Calcutta, which commences at £1,600, will be increased at the end of a year to £1,680, and advance annually by increments of £80 until £2,000 is reached, when, after a further twelve months, fresh terms, it is understood, will be offered.

Mr. William A. Macartney, assistant engineer to the Corporation of Partick, has been appointed burgh surveyor and sanitary inspector of Johnstone, in succession to Mr. John Stevenson, who, it may be remembered, met his death through falling from a train when returning from his holiday. Mr. Macartney is a native of Dunoon, where he received his early training and was chief assistant prior to his appointment as assistant engineer at Partick six years ago. In his capacity as assistant engineer at Dunoon much of the responsibility of the construction of the esplanade, harbour and promenade, which involved a cost of £40,000, devolved upon him. He is an associate member of the Institution of Civil Engineers, and holds the diploma of the Incorporated Sanitary Association of Scotland. He will take up his new duties next month.

FOR OTHER ADVERTISEMENTS

See End of Paper.

BOROUGH OF EALING.
PRIVATE STREET IMPROVEMENTS.

The Town Council of this Borough hereby invites Tenders for the Making Up of the following:—

Haslemere-avenue.
York-road.

The Drawings and Specifications may be seen, and Forms of Tender, together with Schedule of Quantities and other particulars, obtained from Mr. Charles Jones, M.INST.C.E., Borough Engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of 10s. 6d. for each road, which will be returned upon receipt of a *bonâ-fide* Tender.

Sealed Tenders, in the envelopes provided, endorsed "Tender for Making Up," must be delivered at my office not later than 9.30 a.m. on Tuesday, the 5th day of November, 1912.

The Council does not bind itself to accept the lowest or any Tender.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligation arising from his Tender, even though he may not have signed a formal contract.

Dated this 16th day of October, 1912.

(By order of the Council)
GEO. E. BRYDGES.
Town Clerk.

Town Clerk's Office,
Town Hall, Ealing, W.

CITY OF SHEFFIELD.
TO CONTRACTORS, &c.

The Improvement Committee of the City Council are prepared to receive Tenders for the Widening of the South-West Approach of Hillfoot Bridge, Sheffield.

Particulars and Forms of Tender, together with Conditions of Contract, may be obtained from Chas. F. Wike, Esq., M.INST.C.E., City Engineer and Surveyor, Town Hall, Sheffield, on payment of the sum of One Guinea, which will be returned on receipt of a *bonâ-fide* Tender.

Sealed Tenders, in official envelope provided, to be delivered at the City Engineer and Surveyor's Office not later than 10 o'clock a.m. on Thursday, the 31st day of October, 1912.

The Committee do not bind themselves to accept the lowest or any Tender.

Any person or firm sending in a Tender will be required to sign a schedule to such Tender, stating the names of the various classes of labour which he or they intends or intend to employ, together with the places where such labour will be employed and the rates of wages, hours of labour, and conditions of employment to be paid and observed in respect to each class of labour, all of which, as shown in such schedule, shall comply with the City Council's form of clause respecting wages, hours and conditions of labour, and prohibition against assigning or subletting, a copy of which appears in the Conditions of Contract.

(By order)
R. M. PRESCOTT,
Town Clerk.

Town Hall, Sheffield.
October 16, 1912.

BOROUGH OF EALING.

The Town Council of this Borough hereby invites Tenders for the Supply of Iron Fencing.

The Schedule of Quantities and Forms of Tender may be obtained from Mr. Charles Jones, M.INST.C.E., Borough Engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of 10s. 6d., which will be returned upon receipt of a *bonâ-fide* Tender.

Sealed Tenders, in the envelopes provided, endorsed "Tender for Wrought-Iron Unclimbable Fencing," must be delivered at my office not later than 9.30 a.m. on Tuesday, the 5th day of November, 1912.

The Council does not bind itself to accept the lowest or any Tender.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligation arising from his Tender, even though he may not have signed a formal contract.

Dated this 16th day of October, 1912.

(By order of the Council)
GEO. E. BRYDGES.
Town Clerk.

Town Clerk's Office,
Town Hall, Ealing, W.

URBAN DISTRICT OF FINCHLEY.

ENGINEER AND SURVEYOR'S DEPARTMENT.

JUNIOR ENGINEERING ASSISTANT.

The Council of the above-named district invite applications for the post of Junior Engineering Assistant in the above Department, at a commencing salary of £70 per annum.

Candidates must have had previous experience in a similar capacity, and preference will be given to those with some knowledge of Architecture and Town Planning.

Applications, endorsed "Junior Engineering Assistant," on forms provided (which may be obtained from the undersigned), and accompanied by copies of three recent testimonials, must reach me not later than 12 o'clock (noon) on Monday, the 28th instant.

Canvassing, directly or indirectly, will disqualify.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End,
Finchley, N.
October 17, 1912.

The Influence of Town Planning upon the Public Health.*

By W. LOUIS CARR.

I propose to try and explain how a scheme prepared under the Housing and Town Planning Act can influence the public health of a community, such as that of the district of Ruislip-Northwood, in the county of Middlesex, of which I am surveyor. We were the first urban district council to obtain authority from the Local Government Board to prepare a scheme, and now we have on exhibition a draft town planning scheme, including "General Provisions," for the consideration of the various owners included in the area. After due consideration of the objections raised by owners, we shall shortly forward to the Local Government Board for their approval this draft amended as far as may be advisable.

The routine methods of procedure to obtain the sanction of the Local Government Board to prepare a scheme are set out in "Town Planning in Practice" (price 1s.), a booklet issued by the National Housing and Town Planning Council, and as these are of a more or less legal nature I do not propose to deal further with them. The powers given by this Act are intended to be applied to land in any stage of development.

(1) An already developed area—probably a town built many years ago not on satisfactory lines. The Act in this case enables the authority to gradually remodel such town.

(2) Areas partially developed, or ripe for development, where a growth of the population is in evidence. The Act in this case gives power to an authority to frame such "General Provisions" as will ensure the future growth of a district on more satisfactory lines than those haphazard developments which the past has taught us to be expensive, unsatisfactory and insanitary.

The first-mentioned class of land—namely, the already developed areas—I do not intend to touch upon, but will confine myself to the second class—namely, a partially laid out and growing district. A scheme prepared under the Act has a bearing upon the public health of the district as regards the following points among many others:—

(1) Roads (their width, construction, convenience to the community, relaxation of by-laws, &c.).
(2) Sanitation (sewers, refuse collection, &c.).
(3) Cemeteries.
(4) Sewage disposal works.
(5) Sites for public buildings.
(6) Open spaces (private and public).
(7) Building lines.
(8) Space about buildings.
(9) Limitation of numbers of buildings per acre.
(10) Height of buildings.
(11) Character of buildings.
(12) Protection from fire.
(13) Sanitary convenience and amenity (such as offensive trades, advertisement hoardings, fences and trees, streams, &c.).
(14) Allotments.

(1) ROADS.

With regard to item (1), roads can be divided up into—

(*a*) Main trunk and traffic roads.
(*b*) District roads.
(*c*) Local traffic (cross or side roads).
(*d*) Non-traffic or occupation roads.

(*a*) *Main Trunk and Traffic Roads* are means of communication between one large centre and another, and there are main trunk routes throughout the country that have in most cases been constructed many years ago for coach traffic, or in European countries for military purposes, such as the military roads in France and Germany, or the old Roman roads in England. Examples of main traffic roads in this country are the Great North Road, the Holyhead Road and the Bath Road. These main roads in the past were often too narrow, as some portions of the Great North Road still are, but for the future, in view of the increased speed of modern vehicles, no main traffic road should be of a less width than 80 ft.

(*b*) *District Roads.* These roads connect one important part of an authority's district with another, or with the district roads of an adjoining authority, and link up the various railway stations; especially is this so in the case of a large area such as ours, in which we have five stations on different companies' lines. The widths of these roads should not be less than 60 ft.

(*c*) *Local Traffic (Cross or Side Roads).*—These roads connect up one district road with another in the same area, and should be of a width of 40 ft.

(*d*) *Non-Traffic or Occupation Roads.*—These are roads constructed for the convenience of the inhabitants of the houses abutting upon the road, and not for the purpose of either main or through traffic. They may be constructed of a less width than 40 ft.

The influence of roads upon the public health of the community is affected by their width, the material of which they are constructed, their scavenging, and their maintenance. It must not be lost sight of that a road is an open space and a public promenade as well as a means of access and thoroughfare. The metalling that is used for the construction of a road should be of a hard, impervious nature, and the road should be efficiently drained, scavenged and maintained. In dry weather, if the metalled portion is not treated with some dust palliative, such as tar or Akonia, plenty of ordinary street watering should be done. Dust from roads is one of the most serious causes of the spread of disease. Dust infects food with living organisms, causes inflammatory troubles of the nasal organ, eyes, throat and lungs, and, indirectly, is one of the principal causes of infantile diarrhœa.

(2) SANITATION.

Under this head one can secure that necessary drainage is provided for the portion of a district partly sewered and developed, but the great advantage of the provision referred to in Schedule 4 of the Act is seen when, as in my district, one is enabled to schedule a site for a sewage works to serve a particular portion of the area and lay down the principal lines of outfall sewers. I am sure that by so doing a large number of cesspools will remain unbuilt, thus securing better health, and it will enable a builder to so erect his houses or cottages that when the drainage system is constructed no difficulty will be met with in securing sufficient fall for the drainage of such premises. A scheme of this character practically also brings land which, without possible means of drainage, would have lain idle for years into the building market.

(3) CEMETERIES.

Sites for future cemeteries should be appropriated under the scheme. This most important matter should be reported upon by the medical officer of health and surveyor, especially as to securing suitable land with good drainage, aspect, situation, size, &c. It is very difficult to secure a site for interments when a district has commenced developing. The old method of setting aside about an acre or so adjoining a church is now generally unsatisfactory except in country villages, owing to houses being erected abutting on and round such burial grounds.

(4) SEWAGE DISPOSAL WORKS.

Sites for the above should be secured in the most advantageous position according to the contours of the land, for as soon as this is fixed satisfactory development may be obtained.

(5) SITES FOR PUBLIC BUILDINGS AND FOR SPECIAL PURPOSES.

If these can be obtained in a town plan the benefits to posterity are many and obvious. Perhaps the chief beneficiaries under a town-planning scheme are the ratepayers, inasmuch as they will be able to purchase land for the above purposes at a much cheaper rate than when development has taken place. Such matters as sites for places of public worship, institutes, golf links, allotments, storeyards, refuse destructors, and other necessary adjuncts all require careful provision and consideration.

(6) OPEN SPACES: PRIVATE AND PUBLIC.

(*a*) *Private Open Spaces.*—It should be the aim of every local authority to apply the Act to try and secure, when any estate is being laid out, that one-tenth of such lands in a suitable position should be set aside for the purpose of an open space to be maintained by the landowner, with a proviso that in the event of such owner allowing the open space to

* Paper read at the Fourth Annual General Meeting of the Institution of Municipal Engineers.

become untidy and a nuisance the council may take over such open space and keep the same in proper order and repair. Great advantages to any estate may be gained by arranging houses round open greens planted with shrubs, &c. In return for these the council is empowered by the Act to frame relaxed by-laws as to the width of roads, so as to allow an owner to set aside these open spaces without any loss to himself. In woods, for instance, a certain amount of copse may be preserved as an amenity to the whole estate.

(*b*) *Public Open Spaces.*—Under a town planning scheme these open spaces may be obtained at a much lower figure before any rapid development takes place than afterwards. This provision of the Act is one of the many advantages to be derived to a district by preparing a scheme.

(7) BUILDING LINE.

I believe in foreign countries the building line is one of the chief and most important features of their town plan, and bears more relation to the other provisions of a scheme than anything else. On existing main roads, and those the council consider are likely to become main roads in the future, a building line should be fixed and shown on the map, when it can be enforced under the Act. A minimum building line for the whole area to govern the width between buildings should also be defined—probably 60 ft. is the least. As to building lines on any new streets of a width of 40 ft., I suggest that the limitation of the number of buildings per acre is the most satisfactory way of controlling this. For instance, in the case of a 40-ft. road in an area scheduled at eight buildings per acre the building line would probably be 15 ft. from the boundary of the street, 35 ft. from the centre of the road, and 70 ft. between houses on either side. Building lines will also require to be determined for streets over 40 ft. in width, for the projection of shops (in shopping centres), corner sites, bay windows, and certain public buildings to project beyond the general building line.

(8) SPACE ABOUT BUILDINGS.

The proportion of site covered by buildings has to be settled, due regard being given to distinguishing the space to be allowed for a shop, warehouse or dwelling-house. The space at the rear of buildings is a most important health matter, and a considerable amount of thought must be given to it. Reference may be made to the dark and ill-ventilated kitchens to houses, owing to the window opening opposite a high brick wall, perhaps only some 2 ft. away. A clause should be inserted in any town planning scheme which will obviate this. The least distance, in my opinion, should be 5 ft.

(9) LIMITATION OF NUMBER OF BUILDINGS TO THE ACRE.

This is one of the most complex problems arising from any application of the Act, and requires separate consideration for every district. Each district will have to consider its own particular amenities; no standard can be fixed. In a manufacturing district the circumstances will be found entirely different from those of a residential such as mine. At the same time the question of any part of an area at present residential being converted into a large manufacturing centre must be considered. My council are dealing with this question as follows: (*a*) The lands belonging to any owner which are contiguous, and which are not greater than 5 acres in extent, shall form a "land unit" within the several restricted areas. (*b*) In all other cases the lands which belong to the same owner, and which are comprised within each of 5-acre squares, shall form a "land unit" within the several restricted areas. (*c*) Provided that any lands comprised in any such square, which are not greater than 2 acres in extent may, where such lands immediately adjoin other lands belonging to the same owner, be included with, and shall, together with such other lands, form a "land unit," but in no case shall any "land unit" be greater than 7 acres in extent. The several restricted areas in my district are four, six, eight and twelve to the acre, and on 1 acre in a "land unit" not more than twenty buildings may be erected as dwelling-houses, and not more than twenty-four buildings of any other kind. Here is an example. On a 5-acre estate in a restricted area of eight to the acre the owner may, if he wishes, build twenty houses on 1 acre, leaving the remaining twenty to be built on 4 acres. A landowner may take advantage of this very materially; he may have quarry workings, say, and build round the outside of them, and leave the remainder as open space.

(10) HEIGHT OF BUILDINGS.

Provision under this heading should be made governing the measurement of the height of buildings in streets, for corner buildings, and storeys in domestic buildings in restricted areas where the limit exceeds eight to the acre.

(11) CHARACTER OF BUILDINGS.

Areas should be scheduled for warehouse and factory sites, shops and business premises, compulsory and optional. As regards the size of living-rooms and bed-rooms, we are, in our scheme, suggesting that every new dwelling-house shall be provided with at least one living-room having a floor area of not less than 144 sq. ft., and containing not less than 1,152 cub. ft., and one bed-room having a floor area of not less than 135 sq. ft., and containing not less than 1,080 cub. ft. No bed-room or other habitable room in any such dwelling-house shall have a floor area of less than 70 sq. ft., or contain less than 500 cub. ft. In a restricted area above eight to the acre no domestic building shall be constructed for the use of, or be occupied by, more than one family, except in the case of a dwelling-house, or flats or chambers specially planned for the purpose, and every person who shall intend to erect a new domestic building, or alter an existing building within such restricted areas, shall, before commencing to erect or alter such building, deliver to the council a statement in writing declaring whether such building is intended to be constructed for the use of, or occupied by, more than one family. In our "General Provisions" we propose to limit the grouping of buildings to eight erected under one roof, or without a break in building down to the level of the ground level, and no such break shall be of less width than 4 ft.

External elevations to buildings should be governed to a certain extent by the local authority, subject to referring any dispute to the Royal Institute of British Architects.

All the above provisions as to "character of buildings" will tend to stop the miserable housing seen in different parts of England at the present time, and better lighting, ventilation and drainage are to be hoped from such clauses framed under the Act.

(12) PROTECTION FROM FIRE.

More efficient means of escape from buildings occupied by more than one family should be provided, and general provisions framed to cover such a necessity.

(13) SANITARY CONVENIENCE AND AMENITY.

(*a*) *Offensive Trades.*—In any community of any size it is necessary to settle upon certain places in the district where such trades can be carried on. The trades mentioned in sec. 112 of the Public Health Act, 1875, are those especially requiring consideration. These trades, offensive as they are, may be necessary in a district (1) for the purposes of the district itself, (2) for the purpose of manufacturing articles for export from the district; and provision must be made for them. The prevailing winds should be taken into consideration when dealing with the sites. One might say that in a high-class residential district like mine it would be unnecessary to schedule any part for the carrying on of offensive trades, but if all districts refused to allow these trades to be carried on except the purely manufacturing districts, the growth and extension of trade might be seriously retarded.

(*b*) *Advertisement Hoardings.*—Under amenity one is enabled to control the at present most objectionable feature in a district—hoardings painted in hideous colours in all sorts of unsuitable places; for instance, the wooden cows one sees erected in fields quite spoil the surroundings. No bill or advertisement should be exhibited on any hoarding visible from any highway or public waterway or railway, unless so placed as not to disfigure the natural beauty of the landscape.

(*c*) *Fences and Trees.* The height of fences around houses ought to be regulated both in the front (where it abuts possibly on to a street), the rear and the sides. High fences may certainly keep neighbours from overlooking each other's premises, but it also retards the free current of air and the sunlight. I have known many gardens kept in quite a damp condition owing to high fences on either side. Trees are a great amenity to a district, and, if possible, all trees of a certain girth should be retained, provision being made in the case of building operations or other circumstances for trees to be removed.

(*d*) *Streams and Watercourses.*—This question requires

careful consideration, and the surveyor should carefully watch these so that by keeping them clear water can be got away quickly. In a district where the subsoil is clay it is very important that surface drainage be specially attended to. This matter is attenuated when there is a dual system of sewers.

(c) *Food Store.*—A provision should be made for this in every house, so as to prevent food being covered with flies, and in places where no dust can fall upon it. In my inspections I have found food in all manner of places, and it will place no appreciable hardship on the landlord to provide a proper store.

(14) ALLOTMENTS.

I consider provision should be made for these in lieu of the large depth of narrow garden given in some districts such as ours. These gardens are not so suitable, and, further, by this means cheaper cottages may be secured.

AGREEMENTS WITH LANDOWNERS AND OTHERS.

I would now draw attention to one of the most important points in any scheme—that is, the securing of the co-operation of landowners in the district. Ample power is provided by the Act for entering into agreements with them for, say, relaxation of by-laws in return for some concession such as open spaces, wider roads or a wider building line.

RELAXATION OF BY-LAWS AS TO NEW STREETS.

A council should provide for some relaxation of the Model By-laws to apply to all their area, whether town planned or not, and Model By-laws are issued by the Local Government Board, in which may be filled in the desired width and form of construction. Here is an example of a by-law as to construction and lay-out approved in a certain district by the board: 36-ft. street (not greater than 900 ft. in length), with 24-ft. carriageway, 16 ft. metalled; two 6-ft. paths, 5 ft. metalled; turning places for vehicles every 300 ft apart, the space between the metalled portions being suitably laid out with grass, trees or shrubs.

As regards the relaxation of by-laws in a town planning area, these will have to be framed so that they are capable of dealing with all cases of estate development, and by-laws will be put into the "General Provisions" for dealing with these. The width of any new street will be probably determined by its length, allowing for suitable turning places for vehicles, width of metalled roads and paths. A 20-ft. street will probably be laid out with a 14-ft. metalled carriageway and a 24-ft. street with a 16-ft. metalled carriageway. This would allow two vehicles to pass.

In conclusion, I may say I hope that from this paper will have been gleaned some little idea of the advantages that may be gained from a judicious application of the Town Planning Act, and also some idea of the difficulties besetting the path of a local authority starting to prepare a scheme. I would also like to close this very brief paper by impressing upon my audience that the keynote of the Act is for a local authority, in using the power bestowed by the Act, to relax, mitigate or waive immaterial by-laws in return for more material advantages which can be given by the landowner, so that the public may gain certain advantages without anyone being the worse or out of pocket.

It must also be borne in mind that the temptation to a public body to misuse or absolutely apply these new powers is very great, but unless they keep strictly within the bounds of reason and fairness the whole Act will be rendered nugatory and void. It must be remembered that a person developing an estate has to make it a profitable undertaking, and if the profits are unduly taxed by unfavourable impositions, a state of stagnation will arise, or the development of a district will be seriously retarded and hindered, and its last state rendered worse than its first. The aim of all parties must be to give away what is unnecessary if any advantage can thereby accrue to the other parties, and to secure from them some tangible benefit in return; in other words, to obtain a *quid pro quo*.

APPENDIX.

Some particulars of the Ruislip-Northwood town planning scheme:—

Area of district	6,585 acres.
Area in town planning area and scheme	5,690 ,,
,, ,, ,, ,, ...	40 ,,
	outside authority.
Area of excluded portions in town planning area	195 acres.
Areas for proposed open spaces (in restricted area 4 to the acre)	21 acres.
Areas for proposed open spaces (in restricted area 6 to the acre)	None
Areas for proposed open spaces (in restricted area 8 to the acre)	100 acres.
Areas for proposed open spaces (in restricted area 12 to the acre)	56 ,,
Areas for restricted area 4 to the acre, all residential	1,310 ,,
Areas for restricted area 6 to the acre, residential and shops, and factories optional	260 ,,
Areas for restricted area 8 to the acre, residential and shops	2,000 ,,
Areas for restricted area 12 to the acre, small residential, shops and factories optional ...	2,180 ,,
	5,750 acres.

Areas for factories optional, 110 acres.
Areas for shops and business premises optional, 300 acres.
Areas for shops and business premises compulsory, 54 acres.

WORCESTERSHIRE ROADS.

COUNTY SURVEYOR'S REPORT.

The first annual report of Mr. C. F. Gettings, county road surveyor of Worcestershire, has been issued. One of the effects of the recent extension of the city of Birmingham, it appears, was that the county was deprived of some 22 miles of main roads, a change which necessitated the revision of certain districts. The year covered by the report was the first in which work was carried out under Road Board grants, and practically the whole of the strengthening and surface work approved by the board was completed; but owing to the interruption of negotiations for the acquisition of land in connection with some of the improvements, and amended schemes being required, considerable delay ensued, and these were not completed at the end of the year.

The winter proved somewhat disastrous to a number of roads in the county, and especially to those on the northern side, where heavy motor-lorry traffic is rapidly increasing. Although the council have appreciated that it is necessary to increase the estimates to provide for a larger expenditure on foundation work and improved surfaces, Mr. Gettings regrets to say that the amount allowed is insufficient to keep pace with the damage caused by the traffic referred to. He adds that from observations made during the past twelve months he has little doubt that the ordinary water-bound macadam surface is unsuitable for the heavy motor traffic that is applied in many parts of the county.

The report mentions that the Road Board have given grants for resurfacing with improved materials, but the amount allowed is considered to be totally inadequate for the requirements, and the county surveyor observes that unless a much larger sum can be obtained the rate of progress made in this direction will be exceedingly slow.

Consideration, it is stated, has been given to a comprehensive scheme for improving 57 miles of the more important main roads, but this is in abeyance until the programme for the year 1913 is submitted to the Road Board, when Mr. Gettings hopes the board will be in a position to assist some scheme of this description by giving a much larger grant than has hitherto been received. Continuing, the county surveyor remarks that as a result of the increasingly heavy traffic generally, much closer supervision is required in order that the best results may be obtained, and he is of opinion that the additional allowance made to the assistant surveyors for locomotion will be more than recouped in the results that will be obtained.

The total gross estimate for the year amounted to £69,526, and the gross sum expended was £59,149.

A USEFUL REFERENCE WORK.—If you contemplate carrying out some special municipal engineering or architectural work it might be of interest to you to know where work of a similar character has been carried out elsewhere in this country, possibly in districts where the conditions are similar to those in your own district. In such case you will probably find the desired information by referring to "The Civic Engineer's Who's Who," issued by the St. Bride's Press, Limited, of 24 Bride-lane, Fleet-street, London, E.C., at 2s. 6d. net (post-free 2s. 8d. It contains over 200 biographies which are mainly recitals of municipal works carried out in the United Kingdom, grouped under the names of those responsible for such schemes. There is no other book from which such guidance can be readily obtained.

Superannuation and Security of Tenure.*

By A. WINTER GRAY.

In February last it was my privilege to read before the institution in London a paper entitled "Superannuation and Security of Tenure—the National Association of Local Government Officers and its Bill." An attempt was then made to focus attention upon the pressing necessity for a national scheme of superannuation and security of tenure for municipal officers, to give a detailed account of the methods employed by the National Association in its endeavour to secure these concessions, and to indicate how members of the institution, both individually and collectively, could render material and invaluable assistance.

Subsequently, the subject attracted considerable attention, and was discussed at length both at meetings and in the press, but it has reluctantly been admitted by those best qualified to judge that the practical sympathy and support which might reasonably have been expected in regard to a movement of such vital importance to municipal engineers has been withheld by the very individuals whom it is sought to benefit. There are still unmistakable signs of the existence of supineness and lethargy which must be eradicated; it is also apparent that the majority of municipal engineers are content to leave the struggle to the few willing workers. This inaction may eventually prove fatal, as it might conceivably give rise to the erroneous impression that municipal engineers are not unanimous in the desire for superannuation and security of tenure.

Inasmuch as there remains an immense amount of spade work to be performed, the author is emboldened again to bring the whole question to the notice of the members of the institution.

THE INSTITUTION'S ATTITUDE TOWARDS SUPERANNUATION AND SECURITY OF TENURE.

One of the "objects" of the institution as defined by the by-laws is "to take such steps as may be deemed expedient with a view to obtaining security of tenure and superannuation for municipal engineering officials."

From its inception the institution recognised that if it was to rise above the level of a mutual admiration society, in addition to providing educational facilities it must take practical steps towards securing for its members the advantages of a retiring allowance coupled with adequate and effective protection. The first step taken by the institution was that of affiliation to the National Association of Local Government Officers, which association had shortly before been incorporated for the purpose of organising the local government service in an attempt to secure these benefits for every municipal officer in the country.

While the institution has been engrossed in the work of evolution, the National Association has succeeded in bringing the questions of superannuation and security of tenure within the range of practical politics, and it would now appear to be opportune for the institution seriously to consider what practical assistance it should render in the contest which is to be anticipated in the near future. The next stroke of policy should be the appointment of a special committee, comprising some of the most capable and influential members of the institution, for the purpose of (*a*) co-operating with the National Association, (*b*) propaganda work in the several districts, (*c*) constantly impressing upon every individual member the imperative need of ceaseless endeavour, and (*d*) influencing public opinion and educating members of municipal corporations and of Parliament in the interests of the class of local government officers to superannuation and security of tenure.

THE ADMITTED NEED FOR SUPERANNUATION AND SECURITY OF TENURE.

Every member of the profession recognises that the duties performed by a municipal engineer are of a special nature, [illegible] many instances carried out under difficult circumstances and in the face of considerable opposition and prejudice [illegible] generally speaking, the remuneration of municipal engineers compares unfavourably with that obtaining in other professions and commercial offices, while a correspondingly high standard of learning, skill and administrative ability is exacted; that, invariably, he is precluded from augmenting his income by supplementary effort, and that the many calls upon his purse in maintaining a social position commensurate with the dignity of his office in many instances hinder the making of adequate provision for his own future and that of his dependents. Further, it is agreed that the municipal engineer, if he conscientiously discharges his multifarious duties, is often brought into personal conflict with the desires and interests of individuals, and instances have been known where an official has been subjected to vituperation, persecution, and even dismissal, for no other reason than that of fearlessly and honestly performing the duties imposed upon him by statute.

The foregoing are the principal obstacles with which the municipal engineer has to contend, and they can only be removed by granting to him superannuation and security of tenure. In his own mind he is perfectly convinced as to the legality of his claim to these concessions, and it is his duty, as an act of self-preservation, to use every means in his power to impress upon his employers, and upon Parliament, the absolute necessity for the speedy reversal of the unsatisfactory conditions which at present obtain. In this connection it is well to emphasise the fact that it is as much in the interest of the ratepayer as of the officer to establish a superannuation scheme for the latter. The officer in possession of a superannuation scheme experiences a sense of security in times of stress and sickness, and that sense reacts to the advantage of the service. The same remark applies with equal force to the question of security of tenure. If Parliament and local authorities impose certain onerous duties upon the municipal engineer, they should also see that he is not jeopardised in the execution of such duties. Thus protected, the official would be enabled to act freely and impartially to the mutual advantage of his employers and of himself.

It is pleasing to record that in the local government service acts of injustice have been few and far between, but the fact remains, and should not be lost sight of, that in the past municipal officers, and particularly municipal engineers, have been subjected to vindictive and personal attacks, and have even been forced to resignation and loss of office and reputation owing to the absence of effective protection and lack of organisation.

COMBINATION FOR THE PROTECTION OF THE RATEPAYER.

In this connection it should be borne in mind that the very employers of local government officers have combined for the defence of their own interests, and the strength of the County Councils Association, the Association of Municipal Corporations, the Urban and Rural District Councils Associations, and others, is constantly used for the benefit of the ratepayers. These bodies realised many years ago that united action was their only safeguard.

PARTY POLITICS AND THE MUNICIPAL OFFICIAL.

It is also lamentably true that party politics play an important part in municipal administration to the detriment of the local government officer. This is evidenced by the following excerpt from a farewell letter written to his brother officers by an ex-town clerk of one of the largest cities in the provinces. He wrote—

"The conditions of official life, well as I thought I knew them, have proved to be other than I thought. . . . So long as party strife continues in our business affairs, it is hopeless to get the best results. The early recriminations of October are full of prejudice to the welfare of the city. The strife for party votes affects the work of the municipality all the year round. It makes the position of officials still more difficult than their actual duties would do. When men see their efforts handicapped it makes them despair.

"There is a mass resistance year after year for the municipality to undertake wider work, whilst those who are most urgent in their demand are those who cry out most loudly about the salaries paid to the men who are entrusted with the work they deem most important to the public weal.

"At election time the dress-ring with almost others who are receiving certainly no more than, if as much as, they would gain for equal efforts in private affairs. The anxieties of official life, the constant strain, the feeling that a well-earned income is grudged by many of those who think they

* Paper read at the Forty-Ninth Annual General Meeting of the Institution of Municipal Engineers.

pay it, make the position of an official difficult indeed. For me it is intolerable, and I prefer to take the chances of, as it were, beginning life again to continuing in a career where my health was being seriously affected."

That many similar letters must inevitably be indited in the years to come is absolutely certain so long as the average municipal officer is too timid to identify himself with the projects of a powerful association, and is too apathetic to stand shoulder to shoulder with his colleagues to defend the dignity of his service. Until such time as he can muster sufficient courage to support a national movement for mutual protection and legal defence he must remain crying in the wilderness of the unrecognised.

SUGGESTED DISJUNCTION OF "SUPERANNUATION" AND "SECURITY OF TENURE."

In a leading article which appeared some time since in one of the service journals the opinion was expressed that the questions of superannuation and security of tenure were as wide as the poles asunder. With this view the author is, to some extent, in agreement—*i.e.*, national superannuation can only be obtained by means of an Act of Parliament, but security of tenure, if not conferred in this way, can forthwith be effected through the medium of an organisation so powerful and influential as to command respect, so that it would be necessary to think twice before an injustice were done to one of its members.

The example of that powerful organisation the National Union of Teachers is to be commended and emulated. Few associations have been of more practical service to its members than the one in question, and the suggestion to some educational authorities that the strength of the union would be invoked against improper treatment of any of its members has repeatedly had a salutary effect and served to ensure respect.

THE NEED FOR INDIVIDUAL ACTION.

It would, perhaps, be well if every member of the institution were to ask himself what he personally is doing towards the attainment of superannuation and security of tenure; if he is satisfied with the financial support he is affording by his affiliation fee to the National Association of Local Government Officers, paid through the institution. Surely this infinitesimal sum is totally inadequate comparable with the value of the benefits to be derived. If for the next ten years he contributed a guinea per annum, it would not be too great a sacrifice to make in return for superannuation and security of tenure. What a war chest the institution alone—with its 800 odd members—could accumulate in this period!

Again, each member might question himself as to what personal assistance he is rendering. Is he endeavouring, to the best of his ability, to enlist the sympathy and active support of his brother-officers, and, by so doing, assisting towards the consummation of the ideal organisation comprising every member of the local government service, and having for its object the attainment of superannuation, security of tenure, and the betterment of existing conditions? If he is doing little or nothing, it is to be hoped he will see the error of his ways and forthwith realise his responsibilities, and evince that interest and enthusiasm which is imperatively essential if success is to be achieved. He might with advantage realise the truth of the proverbs "Up and be doing is not come on with me" and "Procrastination is the thief of time."

PARLIAMENTARY PROCEDURE.

From correspondence which has recently appeared in the columns of the service journals, it is evident the erroneous impression prevails in some quarters that it is only necessary for municipal engineers to ask for the benefits under review and they will forthwith be obtainable. It may therefore be well to invite attention to the tedious to be adopted in the endeavour to secure such benefits. It is, presumably, what may be termed the constitutional method of, by means of legislation, either by a private member's Bill or by a Government measure.

The difficulties surrounding a private member's Bill are so well known to everyone possessing even an elementary knowledge of Parliamentary procedure as to need no further comment, while in the present congested state of affairs in Parliament it is practically hopeless to expect the Government to render any assistance, notwithstanding the fact that it has recently dealt with the question of superannuation for teachers. A private Bill would doubtless be strenuously opposed by the Association of Municipal Corporations and kindred associations, as the representatives of the ratepayers, although these associations have approved the principle of a national superannuation scheme in preference to the continuance of piecemeal legislation. It should also be borne in mind that superannuation and security of tenure cannot be obtained solely for municipal engineers, and isolated action on the part of any Institution of Municipal Engineers would assuredly prove abortive.

THE NATIONAL ASSOCIATION OF LOCAL GOVERNMENT OFFICERS.

It must not, however, be thought that the interests of local government officers have been neglected in the past. There exists at the present moment an association, the National Association of Local Government Officers, which for years has been striving to obtain for the service superannuation and security of tenure, and in numerous instances has given legal advice and assistance to those requiring the same, including members of the institution.

After having been in existence for about six years the membership of the National Association is well over 30,000, or nearly one-third of the total of local government officers in the country. Here, then, would appear to be the nucleus of the powerful and influential organisation to which reference has been made, and before embarking upon an individual enterprise it might be worth the while of the institution to consider the advisability of furthering the work of the National Association by supporting it financially and by increasing its membership, either directly or by forming local associations where at present no such association exists, for it must be borne in mind that whatever benefits are gained by the minority will be shared by the whole.

The National Association is the only powerful organisation connected with the municipal service known to the author. The association is now engaged upon the promotion of a Bill in Parliament to provide superannuation and security of tenure for its members, as well as for a considerable number of municipal officers who have so far failed to identify themselves with the movement. For years past the association has been wearing down the opposition of its most formidable opponents, and its efforts have not been abortive. At the first favourable opportunity, which cannot long be delayed, the Bill will be presented to Parliament. It may possibly be rejected; in such a contingency it will, from time to time, be reintroduced, and the pertinacity of the National Association must ultimately meet with success.

HOW ASSISTANCE CAN BE RENDERED.

It has already been pointed out that two-thirds of the number of local government officers in the country have yet to be persuaded to join the National Association. It is also known that many members of the institution hold office in districts where local associations do not at present exist. For each of such members there is a field for immediate action, and he is cordially invited to take advantage of the opportunity which presents itself. His first duty should be to convene a meeting of his brother officers with the view of forming a local association, to become affiliated to the National Association. The fullest information how to proceed will, if required, be furnished upon application to the secretary of the institution, or to Mr. L. Hill, the secretary of the National Association, whose address is 24 Bloomsbury-square, London, W.C. Speakers from headquarters, or from neighbouring associations, will, if required, be sent to address meetings.

It may be necessary to state that paucity of numbers should not be a deterrent to the formation of a local association—one grain helps to fill a sack! In some instances, however, it might perhaps be well for several small guilds in adjacent localities to combine in order to ensure the maximum of success. As to the future work of a newly formed local association, means will be devised and advice tendered, which it would be unwise to describe in a paper such as this.

An earnest appeal is made to the chairman and hon. secretary of each district to use his personal influence with every municipal engineer in his locality; to initiate discussion, having for its object the formation of local associations, so that a greater interest may thereby be stimulated, and places may be reached which the National Association could not hope to invade for many years to come. It should readily be realised what a power in the land the National Association would become if every local government officer were a member of it. It might rival, and even sur-

pass, those powerful associations of the doctors, solicitors and teachers, the memberships of which are composed of professional men whose status is not less important than that of the municipal officer. The associations in question are not afraid openly to support the objects of their unions, and who will venture to assert that their action has not reacted to the benefit of their members?

CONCERTED ACTION AND EFFECTUAL ORGANISATION.

The author has endeavoured to adduce a few arguments in favour of superannuation, security of tenure and State protection for local government officers, and to indicate some of the courses of action to be pursued in the attainment of these essentials, the principal being concerted action and effectual organisation. There must be no molly-coddling or cavilling at providing a fund for militant purposes, but, on the other hand, there must be a good deal of back-stiffening and a corresponding desire to furnish financial assistance. By these means, at any rate, the problem of security of tenure can immediately be solved. Success or failure rests with every individual member of the local government service; if he is too "shabby-genteel" to be organised, then he is undeserving of further sympathy.

Local government officers should remember that they possess an immense number of votes which could be placed at the disposal of the political party pledged to confer superannuation, security of tenure and State protection upon members of the service, and this fact might have an important bearing upon the result of a future general election.

Once again the members of the institution are reminded that if they desire to see in substance what is now the shadow, they must not keep their wishbones where their backbones ought to be.

Although the author claims to possess the courage of his convictions, for obvious reasons it may be considered desirable to restrict the publication of this paper to the columns of the Journal.

SOME RECENT PUBLICATIONS.*

The Fire Resistance of Doors and Shutters: Tabulated Results of Tests. Price £2 2s. net. London: The British Fire-Prevention Committee.

The British Fire-Prevention Committee have for some ten years been investigating the fire-resistance of doors and shutters, both those in every-day use and those subject to patent rights. No fewer than fifty-eight doors have been under test, and the expenditure incurred on this work has exceeded £6,000, raised voluntarily, the actual conduct of the tests also being in the hands of voluntary workers.

The results of these fifty-eight tests have now been issued in the form of four tabulated summaries, which present the facts arrived at in concise and illustrated form. These tables are issued as "Journal VII." of the British Fire-Prevention Committee, and should be of great use to both the authorities controlling building construction, as also the many architects and engineers who have to specify structural work. The surveyor, the insurance engineer, and other professional men should also be able to learn much from these summaries, the not least important feature of which are the records of the tests with ordinary doors of different woods, such as deal, pine, mahogany, walnut, teak, pitch pine, the English, Australian and American oak, and Australian jarrah and karri.

The summaries have been prepared jointly by Mr. Edwin O. Sachs, F.R.S.ED., and Mr. Ellis Marsland, respectively chairman and hon. secretary of the British Fire-Prevention Committee, and the importance attached to the subject abroad may be gauged from the fact that the International Fire Service Council are shortly issuing French and German translations of the committee's "Journal VII." here under review.

Lifts. We have received from Messrs. R. Waygood & Co., Limited, Falconbrook, S.E., a copy of a booklet which furnishes abundant proof of that firm's unique experience in the provision of goods and passenger lifts for steam ships. The fact that repeated orders have reached the company from the great shipbuilders of both Great Britain and Germany is eloquent testimony to the excellence of their design and workmanship.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

ROAD MAINTENANCE AND CONTROL.

HEAVY MOTOR TRAFFIC.

On Friday last, at the annual general meeting of the Association of Municipal Corporations in London, the following resolutions, submitted by Mr. H. Sagar, town clerk of Richmond, were referred to the council of that body to take such action as they might deem desirable, the council being at the same time requested to consider the subject of motor traffic generally:—

"(1) That the Government be asked to introduce a proviso in next year's Finance Bill to the effect that in future the proceeds of the petrol tax or any other special tax or charge levied on or in connection with heavy vehicles mechanically propelled, less some small percentage representing the cost of administration, should be paid over to the local authorities on whose roads these vehicles run, in proportion to the use made by such vehicles of the roads."

"(2) That it is urgently necessary, having regard to the increased cost of road maintenance, the risk of serious accidents, the detriment to property, and the loss and inconvenience to tradesmen and others arising from the use of motor omnibuses on highways which, in the judgment of the local authority, are unsuited for traffic of this description, that requisite powers should be conferred upon the local authorities charged with the duty of maintaining and repairing the highways (subject to an appeal to the Local Government Board) to limit and define the routes to be taken by such traffic."

In the course of his remarks Mr. Sagar pointed out that the London General Omnibus Company paid between £65,000 and £70,000 a year under the petrol tax, and he contended that as motor omnibus traffic was purely local in character such money should be allocated to the districts where the traffic actually was.

Lord Derby, who presided, said that there was not a single district, urban or rural, in the United Kingdom that was not being hit by heavy motor traffic, and what that conference had to do was to put forward a scheme that would meet the requirements of all districts or municipalities.

Institution of Mechanical Engineers.—The first monthly general meeting of the coming session will be held in the meeting hall of the institution on Friday, the 25th inst., at 8 p.m.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

APPOINTMENTS OPEN.

SINGAPORE, STRAITS SETTLEMENTS.
MUNICIPAL FIRE DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant Fire Brigade Superintendent under 32 years of age, and of sound constitution. He must have received a good education, a knowledge of Building Construction and Electricity, a regular training in Mechanical Work, have had experience in the maintenance and repair of Motor Appliances, and have served in a Fire Brigade under a Municipal Fire Superintendent. The engagement will be for three years, and each applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination. A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out. The salary will be 200 dollars per month for the first year, 220 dollars the second year, and 240 dollars the third year, paid monthly in dollars, the currency of the Colony (the value of the dollar being two shillings and fourpence sterling), with free unfurnished quarters, uniform, light and water. Should the engagement be renewed the salary would be increased by annual increments of 240 dollars up to 3,600 dollars of a maximum per annum. Applications, stating age, and place of birth, and giving details of education, training, and experience generally, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, are to be lodged with C. C. Lindsay, Esq., M.Inst.C.E., 180 Hope street, Glasgow (who will give further particulars if requested), not later than Tuesday, 22nd October, 1912.

NORTHERN POLYTECHNIC INSTITUTE.
HOLLOWAY, LONDON, N.

The Governors of the above Institute invite applications for the post of Assistant to the Evening Lecturer in Building Construction. Salary 7s. 6d. per evening.—Particulars and application forms to be obtained from the Secretary.

INVINCIBLE TALBOT

If you'll look into a car as well as at it analyse its construction and take into account shrewdly and technically the all-important matters of material and engineering factors of safety and endurance you're bound to be interested in the Invincible Talbot. When you're looking at cars remember—what you can't see is more important than what you can!

Specifications and full particulars on request

The Surveyor

And Municipal and County Engineer.

Vol. XLII. OCTOBER 25, 1912. No. 1,084.

Minutes of Proceedings.

New York Sewage Disposal. The Metropolitan Sewerage Commission of New York, which is engaged upon a study of the collection and disposal of the sewage of that city, has just published a further "Preliminary Report," the fourth of a series of what might be termed interim reports, issued in advance of its final report, in order that their contents may be of early service. The present report deals with a general plan for the main drainage and sewage disposal of one of the four parts into which the area covered by the City of New York is divided. The chief feature of the scheme is the discharge of the sewage, after partial purification, into the large, deep tidal channels in the harbour. This area in question is divided into five sub-divisions, in each of which it is proposed to bring the sewage to a central point for treatment and discharge, the outlets in all cases delivering into deep water and in positions where the currents are found to be most suitable for rapid diffusion of the sewage in the water of the harbour. From the report it appears that, in order to provide the "partial" purification which is considered to be sufficient for the needs of the case, grit chambers are required at all the outfalls, and in addition either fine screening or coarse screening followed by sedimentation. There is nothing in the report to show what are the intentions of the Commission with regard to the disposal of the screenings and sludge from these outfall works. It is probable that the ultimate total volume of sludge will not fall short of that now produced at the two sewage outfalls of the London County Council, with the further disadvantage that the sludge from the New York sewage will be produced at a number of outfalls situated at various points on the shores of the harbour. It is evident that this will form a serious problem, and we look forward with much interest to the solution to be recommended by the commission.

In this connection a paper recently read at a meeting of the American Public Health Association by Mr. George A. Soper, the president of the abovementioned commission, is extremely interesting. In this paper, which we print on another page, Mr. Soper describes the means adopted by the commission to obtain the opinions of a number of sanitary experts as to the desirability of establishing a standard of cleanness for the harbour, and of the provisions which such a standard should contain, in order to assist the commission to decide to what extent the sewage should be purified. The list of experts includes a foreign chemist who contributed to the fifth report of our own Royal Commission on Sewage Disposal, an epidemiologist, a sanitary engineer, a civil engineer, an American chemist, a hygienist, a health officer, and a biologist. The questions submitted to these experts are given in full and their replies are summarised. The conclusions of the commission are also given, and among them the most interesting are those in which it is stated that, except in the immediate vicinity of docks and piers and sewer outfalls, the dissolved oxygen shall not fall below 3 c.c. per litre of water (corresponding to 58 per cent of saturation), and that the quality of the water at points suitable for bathing and oyster culture should conform substantially as to bacterial purity to a drinking-water standard. These are excellent ideals to set up, and it only remains to be seen how and at what cost they are to be attained.

* * *

The Local Government Board and West Hartlepool. The plea for the appointment of whole-time medical officers of health which has been made in these columns from time to time has usually arisen *à propos* of circumstances existing in districts of a rural character. There can be no doubt that the general view to-day is that a medical officer of health who is also engaged in private practice cannot do full justice to himself, to his patients, and to his council, and it is rather startling therefore to learn that there still exists a county borough—West Hartlepool—with a population of nearly 64,000, in which the council are anxious to continue their former policy of engaging a part-time medical officer of health at a salary of £150 a year. It is not surprising that the Local Government Board have declined to sanction the proposed appointment of a new medical officer on these terms, and that they have held an inquiry into the sanitary circumstances and administration of the borough with a view to ascertaining the degree of success which the adoption of this plan has attained in the past. The report of Dr. E. P. Manby, to whom was entrusted the duty of holding this inquiry, contains, as was to be expected, considerable criticisms of the public health administration of West Hartlepool, particularly in regard to the existence of a large number of privy middens. It is only fair to point out, however, that Dr. Manby's report makes it clear that the part-time medical officer is energetic and anxious to carry out his duties properly, but is the victim of his circumstances in being unable to do so, and that if he is to give effective service he should be recognised as the head of the public health department, with all the activities of which he should be in a position to keep in close touch. In this connection, as Dr. Manby says, he must give some attention to detail in regard to the inspection of dwellings, of dairies, cowsheds, and milkshops, of all premises where food for human consumption is prepared or stored, and so on; but in addition there are broad questions to be considered and lines of policy to be evolved in regard to the public health of the district. For example, it is not merely details of sanitary inspection and

the investigation of specific outbreaks of infectious disease which concern the medical officer of health to-day. He must interest himself in the more general questions of possible physical deterioration, of infantile mortality, tuberculosis, housing, occupation diseases, and similar matters, as affecting his particular district. This implies and demands special training and special knowledge. But many of the duties need for their full usefulness cordial co-operation between the medical officer and the local medical practitioners. As long as the medical officer is himself in practice, and thereby in competition with his non-official brethren, it is hardly to be expected that this co-operation will be as wholehearted as it might be in the case of a medical officer not in private practice. We cordially agree that the town council of West Hartlepool would be well advised to employ a whole-time medical officer of health who is a trained and experienced sanitarian.

Sewage Disposal in South Africa.

The recent issue of a special supplement to the journal of the Royal Sanitary Institute dealing solely with subject matter of colonial interest marks a satisfactory step in the progress of the work of the institute in all parts of the empire. Most of the papers printed in this supplement were presented at the first Sanitary Congress held at Cape Town in October of last year, and among them two, dealing with the disposal of sewage, are of particular interest, as they show how the local engineers and others are making use of the experience gained in the Mother Country in devising methods adapted to the needs of local conditions. The opinion expressed in these papers is that the sewage should be subjected to suitable preliminary treatment in tanks and the tank effluent used for irrigation on land, as it is claimed that large tracts of land of a thoroughly suitable character are available in the neighbourhood of nearly all the towns in the Union. This being so, it was natural that considerable space was devoted to the discussion of the most suitable and most profitable crops for such purposes, and it is satisfactory to notice that already warnings are uttered against allowing the interests of the crops to override those of sewage purification. One speaker in the discussion emphasised the statement that the primary object and aim of a sewage farm must be to purify the sewage, and that the growing of crops must be a secondary consideration, even if this should occasionally spoil some of the crops. A warning against the letting of sewage farms to tenants was also timely in view of the unsatisfactory results which ensued in the past when such a course was adopted in this country.

The author of one of the papers apparently favours one particular type of preliminary treatment and speaks of "so-called" bacteria and filter beds, which would appear to indicate that he does not agree with the bacterial theory which is now accepted by practically all the leading sanitarians. It is unfortunate that this controversy should be raised in South Africa, as in this country the crux of the problem is how best to deal with the sludge. From particulars given in the course of the discussion it appears that in consequence of the scarcity of water the sewage is usually very strong, exceeding by two or three times the strongest known in England. On the other hand the evaporation coefficient is 60 in. to 65 in. as compared with 15 in. to 20 in. per annum in the Thames Valley. These factors will have to be taken into serious consideration, especially in the methods adopted for sludge disposal. At present the system of shallow burial in the ground seems to be favoured, and as long as a sufficient area of suitable land can be obtained and the tanks are carefully operated, this will probably meet the requirements of the case, but it will be very interesting to watch developments in this direction and to receive particulars of the results of the various sewage works in operation from time to time.

The Education of Highway Engineers.

At the American Road Congress which was held in Atlantic City in the early part of this month Prof. A. H. Blanchard presented a paper on "Highway Engineering Education," which, though intended primarily for an American audience, is so able a review of the subject generally that we have gladly availed ourselves of the opportunity which Prof. Blanchard has kindly afforded us of reproducing it in full in another part of the present issue. "The consensus of opinion of eminent highway engineers and educators," writes Prof. Blanchard, "is to the effect that the highway engineer of the future requires the broad foundation which the four years' course in civil engineering gives," and we believe that most of our readers will find themselves in accord with the spirit of this opinion, though the form which the four years or so of general civil engineering should take, its actual duration, and the extent to which courses on highway engineering are embodied in it must necessarily depend upon the nature of the work which the engineer will have to perform when he is fully qualified, as well as upon the probable rates of pay which necessarily affect the length of time and the amount of money which can be expended upon the training itself as distinct from partly paid employment. The importance of the civil engineering course relatively to the period of pupilage will, for one thing, depend upon the extent to which road construction will be a feature of the student's future work. In a thickly peopled and highly developed country problems of maintenance predominate, and here an intimate acquaintance with roads, such as can best be gained by a pupilage, when the young man's mind is still in a receptive state, is relatively more important than it is in a country which is at an earlier stage of development. In either case, however, if one were to devise a three years' course, say, in highway engineering alone it would be quite reasonable to defer all mention of roads till the third year, devoting the first two years to such pure mathematics and pure science as can be applied directly in highway work as well as to those sciences and their general applications to engineering problems which will enable the student to deal swiftly and surely with the difficulties that will confront him later in life. Engineers who have received such a training are not among those who pay tribute, here to what is waterproof, there to what is rigid, to-day to what is sticky, to-morrow to what is hard—they estimate the relative importance of each characteristic of available materials and they recognise the natural law on which, in each case, the dominant character of the material depends.

One of the evils of a special as distinct from a broader training is that the student is impelled along a set path instead of being instinctively drawn towards the career for which he is best fitted; a man who would have made a good structural engineer becoming, for instance, a second-rate road engineer. Specialisation should come as a result of knowledge, not knowledge as the result of a predestination to specialise.

* * *

The Functions of Colonel Crompton

Colonel Crompton, the consulting engineer to his Majesty's Road Board, had the honour last week of being made the subject of a "question" in the House of Commons by Mr. T. M. Healy, and of a printed reply thereto by the Chancellor of the Exchequer. Both query and answer are given at length in the body of this issue. Personally, we think Colonel Crompton is to be congratulated on the publicity thus given to his relations with the Road Board. It has "cleared the air" effectively, and one may hope finally. The first point it establishes is the exact remuneration attached to the post, and it is safe to say that hitherto this has been placed by Colonel Crompton's detractors at about four times the moderate figure brought out. We know now, definitely, that Colonel Crompton has "no general or executive duties" in relation to

the Board. "The conditions of his employment are that he is employed only as consulting engineer, his advice being sought on technical questions, within the scope of his knowledge and experience, when considered necessary." The Chancellor's reply to the very detailed question addressed to him is full and frank; we find only one allegation it does not meet, probably—and excusably—because it was unworthy of notice. Mr. Healy, in his inexplicable thirst for knowledge on a subject for which he cannot care twopennyworth of cold tea, asked whether a certain "relative" of Colonel Crompton "is in the employment of one or both of the two companies named in the question." We are able to satisfy Mr. Healy's somewhat feminine curiosity by an answer in the affirmative. The relative is Colonel Crompton's son, who is so employed abroad. Here is the appalling admission in all its bald gravity, and we have nothing to add to it except to congratulate one or both of the companies on having secured for their staff a helper of probity and ability worthy to stamp him as a son of his father. There remains another serious allegation which was brought under the notice of our imperial legislators. Colonel Crompton, it would seem, had invited some road engineers, "who are or may be applicants for grants from the Board," to see the interesting work in Addison-road, and with sinister Machiavellian diplomacy he had further asked them "to remain with him to tea." We suspect there were also shrimps, but Mr. Healy mercifully restrained himself. Doesn't it remind one irresistibly of "Chops! Gracious heavens! and tomato sauce! Gentlemen, is the happiness of a sensitive and confiding female to be trifled away by such shallow artifices as these?" Well, Mr. Healy has delivered himself of his portentous question, and has been answered, and it only remains now for some one to ask him by whom, and in whose interest, he was made a cats-paw in connection with his query.

The Treatment of Soft Wood Paving Blocks: Some French Experiments.

In another part of the present issue there will be found some account of the main results of experiments which were recently carried out in Paris to determine the effects of various treatments of soft wood paving blocks. Though of considerable interest, these experiments are perhaps of not more than secondary importance, since what really determines the life of a wood pavement is not the actual or mean strength of the wood, but the extent to which one part of the pavement differs from another in strength and toughness combined. It is more important that a wood pavement shall wear evenly than it is that it shall wear slowly, since it is the presence of lumps and puddles which finally settles the date of relaying, long before the blocks are worn through. The woods which are now in favour are those which wear most evenly. Even wearing, it may be added, tends to promote slow wearing, since it lessens the number and severity of the blows which the paving receives from wheels. As regards the tests made with soaked specimens, the object of these experiments is not quite clear, since it is, surely, desirable to ensure that the wood is properly seasoned and dried before subjecting it to creosoting or any other treatment intended either to preserve it, antiseptically, from decay, or to prevent the penetration of water. On the whole, the results of the experiments seem to give support to the most recent practice as regards London pavements, which makes the work of the patient investigators, Mr. Labordere and Mr. Anstett, the more welcome on this side of the channel, even if, to English eyes, the tests made seem to have been in some respects a little unpractical.

Sanitation at Oakengates.

In consequence of representations as to housing conditions and the home isolation of infectious diseases, Dr. J. R. Hutchinson, one of the medical inspectors of the Local Government Board, was appointed to hold a local inquiry into the sanitary circumstances and administration of the Oakengates Urban District, Shropshire. It appears that in the autumn of 1911 the district was visited by an outbreak of scarlet fever, when the facilities for the home isolation of patients were found to be totally inadequate. The late medical officer of health thereupon reported to the board that bad housing accommodation and the impossibility of proper isolation were responsible for the repeated occurrence of secondary cases of infectious disease. The investigations of the inspector show that this allegation has substantial proof, and in his report he recommends the provision of adequate hospital accommodation. It is evidently a practical impossibility to prevent the propagation of infectious diseases in such a case, for example, as that mentioned in the report, where there were two patients in a house consisting of a kitchen and two bedrooms (without fireplaces), in which there lived, in addition to the patients, two adults and five other children. This is no doubt hardly an average example, but it does not need the existence of many such houses to demonstrate the necessity for adequate hospital accommodation in order to safeguard the public health. It is to be hoped that the inquiry at Oakengates may lead to prompt and effective action.

The Wrexham Meeting.

The North Wales District meeting of the Institution of Municipal and County Engineers held on Saturday last was a very pleasant and successful function, although it must be said that there was only a very moderate attendance of members. The President of the Institution, Mr. R. J. Thomas, was thoroughly at home, as he is of course a native of the Principality, and a master of the Welsh language In the course of the proceedings, Mr. J. England, the borough engineer, read an interesting paper descriptive of the municipal works of the town; the discussion which followed, although not of great length, raising many points of importance, as will be seen from our report elsewhere in this issue. There can be no doubt that the idea of postponing discussions of papers until after the visits to works has many advantages; but if this course (which, as will be seen, was adopted at Wrexham) is to be followed at future gatherings, we would venture to suggest, for the convenience of those attending meetings from distant parts of the country, who are necessarily obliged to leave at a comparatively early hour, a rather stricter adherence to the time-table than was insisted upon on Saturday.

The Concrete Institute.

The programme of the fifth session of the Concrete Institute has just been issued, and those who have been responsible for its arrangement are to be congratulated on having secured an attractive list of meetings both as regards lectures and subjects. We would particularly draw the attention of our readers to a course of six educational lectures on "Concrete, its Properties and Manufacture," which will be delivered on Tuesdays at 5.30 p.m., commencing on November 12th. The lecturer will be Mr. H. Kempton Dyson, the secretary of the Institute, and lecturer on "Reinforced Concrete and Structural Engineering" at the L.C.C. School of Building, and this fact is a full guarantee for the interest of the lectures. The ordinary meetings will be held as heretofore on Thursday evenings at 7.30, and, judging by the programme, the session should be a very successful one. At the first general meeting Mr. E. P. Wells, J.P., will deliver his presidential address, and at subsequent meetings papers will be read on matters connected with concrete and structural work, variety being afforded by an evening to be devoted to the consideration of "Concrete in its Legal Aspect."

D

Highway Engineering Education.

By ARTHUR H. BLANCHARD, M.AM.SOC.C.E., Professor of Highway Engineering, Columbia University, New York City.

[The subjoined paper, which we comment upon in "Minutes of Proceedings," was presented before the American Road Congress at Atlantic City on October 3rd.]

The educational training of the engineer who may enter that branch of civil engineering devoted to the economics, construction and maintenance of highways should be considered from two standpoints: First, the essentials, which, from an educational point of view, are considered as prerequisite to a successful career in highway engineering; and, second, practical methods of securing this training under American conditions.

The American youth who has expressed the desire to enter the profession of engineering has various channels open to him. The usual course followed is to enrol in one of the four-year engineering courses designated as civilian, mechanical engineering, electrical engineering, chemical engineering, or mining engineering. There are, however, notable deviations. Several institutions and some engineers advocate a broader training for the engineering profession than is possible in the ordinary four-year course, and, in fact, believe that the profession of engineering demands the same type of training as is now universally recognised as desirable for men entering the legal or medical profession.

Usually the American boy, in entering on a technical career, has not fully made up his mind as to the particular field in which he is most interested. In the four-year courses he has in some cases one year, and in others two years, in which to make up his mind as to which of the five general branches of engineering referred to above he wishes to enter. It is self-evident that the ideal training is one which will prepare a student upon graduation to enter any one of the numerous fields of engineering. At least it is possible that a comparatively wide field of activities will be open to a man whichever one of the above courses he takes in the technical school.

Having these general facts in mind, attention will now be riveted upon the situation which confronts the young man who may be one of our future highway engineers. Let us suppose, for example, that he has decided to devote four years to securing a technical education, and that there is offered to him the four-year course in civil engineering and a four-year course designated as highway engineering. Which course should he take? The evils of over-specialisation in the undergraduate engineering course have been fully discussed by the Society for the Promotion of Engineering Education. Suffice it to say in this discussion before the general public interested in highway improvement that the graduate of the civil engineering course on the one hand has before him a large field of activities for all of which he is equally well equipped. For instance, he may enter the field of structural engineering, sanitary engineering, railroad engineering, geodetic engineering, hydraulic engineering, highway engineering, irrigation engineering, and in many cases mechanical, electrical and mining engineering. On the other hand, a graduate from a so-called four-years' course in highway engineering has, if the course is made up of the subjects which the title implies, only a limited field in which he considers that he is particularly proficient.

VALUE OF FOUR-YEARS' COURSE.

The consensus of opinion of eminent highway engineers and educators is to the effect that the highway engineer of the future requires the broad foundation which the four-year course in civil engineering gives. A knowledge of practically all of the subjects included is found of value in the manifold duties imposed in the various positions which he may occupy in the service of municipalities, states, counties, [illegible] estates, contractors' organisations, consulting engineers' offices, and manufacturing companies.

In the consideration of the training received and the subjects covered in the four-year course in civil engineering relating especially to highway engineering it is of interest to note the present status of highway engineering in the civil engineering courses of American universities and technical institutions. An examination of the latest catalogue received from ninety-two institutions in the United States offering courses in civil engineering showed that seventy-eight included a text-book lecture course in highway engineering in the curriculum. The number of recitation lecture hours in the various courses may be arranged approximately in the following groups: Thirteen, 15 hours or less; twenty-eight, 30 hours; seventeen, 45 hours; six, 60 hours; six, 75 hours; three, 90 hours; three, 120 hours; one, 135 hours; and one, 165 hours. Fifteen give some instruction in laboratory work, while ten include special courses in highway surveying. In the case of institutions devoting over ninety hours to highway engineering, the general civil engineering course covers three years, while a highway option is taken in the fourth year. A comparison of the present status of highway engineering education as outlined above with the conditions described by Logan Waller Page in his valuable paper on "Highway Engineering," presented before the Society for the Promotion of Engineering Education in 1909, is certainly encouraging, especially when it is remembered that only three years have elapsed. In 1909, according to Mr. Page, 50 per cent of the institutions investigated did not include a course on highways in the civil engineering curriculum, while it is noted that of the courses in ninety-two institutions examined by the speaker, 85 per cent now give a course in highway engineering.

The importance of the subject of the economics, construction and maintenance of roads and pavements in the United States at the present time demands that more prominence should be given to the course in highway engineering in civil engineering curricula. Having in mind the various component parts which go to make up the curricula, it appears that a well-balanced civil engineering course under present conditions should contain a three-hour course of one year in length devoted to highway engineering.

In such a course lectures and text-book work should cover the following topics: Historical review of the construction of roads and pavements; preliminary investigations incident to construction; principles of surveying and mapping peculiar to highway work; design of highways; drainage and foundations; construction and maintenance of earth, sand, clay, gravel and broken-stone roads, including a consideration of the materials which enter into their construction; general consideration of bituminous materials as such, and their use in the construction of bituminous surfaces, and bituminous macadam, bituminous concrete, sheet asphalt and asphalt-block pavements; the construction and maintenance of wood-block, stone-block, brick and cement-concrete pavements; dust prevention, street cleaning and snow removal; construction of car tracks and pipe systems; comparison of road and pavements; construction of sidewalks, bridges and culverts; and a general treatment of economics, highway administration and highway legislation.

LABORATORY WORK.

Laboratory work should be limited to what is sometimes called lecture demonstration work by the officers of instruction. In other words, although it is advisable that the methods of testing all kinds of bituminous and non-bituminous road materials should be brought to the attention of students in civil engineering by actual demonstrations in the laboratory or lecture-room, it is not considered advisable to devote the time necessary for each student to run through complete tests as is done by students in the laboratories devoted to the testing of structural materials. In two to five afternoons all the fundamental tests employed in the examination of bituminous and non-bituminous road materials could be demonstrated before a group of from twenty-five to thirty men if the laboratory equipment was properly arranged and the work well planned out. Two to three afternoons would suffice if the testing of bituminous materials were covered in a course given by the department of chemistry. Unfortunately at the present time very few instructors in chemistry are familiar with bituminous materials; hence the methods of testing will have to be worked up by civil engineering instructors.

Eventually some of the time now given by the department of chemistry to carbon compounds or quantitative analysis in courses for civil engineering students can be profitably devoted to the chemistry of bituminous materials.

VISITS OF INSPECTION.

A limited number of inspection trips, covering the economics of highway location and the construction and maintenance of various types of roads and pavements, will be of value.

The time devoted to road or street surveys in some institutions, in addition to the regular work in railroad surveying and general surveying, is of questionable merit. Although there are many problems in highway surveying which are different from those encountered in other branches of surveying, it is doubtful if it is necessary or expedient to use up valuable time on this work, considering the number of subjects which it is necessary to include in a broad course in civil engineering. The speaker's experience with civil engineering graduates who have worked under him on highway work has led to the belief that a graduate in civil engineering who has had a good course in railroad surveying and in railroad curves, together with a comprehensive course in highway engineering as outlined above, is admirably equipped to occupy the minor positions in a field party on highway surveys. In these positions he may acquire, either through advanced study or special instruction, the information and practice necessary to occupy the position of chief of party and the higher positions in the highway department connected with the bureau of surveys. It is, however, advisable in certain instances, where practicable, to divide the time devoted to railroad surveying, so that a highway survey outside built-up districts may be added to the course, together with the preparation of plans, cross-sections and estimates.

In further consideration of the special training which will be of benefit to those entering the field of highway engineering, the educational plans which have been evolved to elevate the profession and to equip men thoroughly for this field of engineering work, foreign practice will be given consideration first.

BRITISH PRACTICE.

Great Britain affords an illustration of one method by which well-trained highway engineers may, under favourable circumstances, be secured. Fortunately for the British engineer, his position in highway work is much more permanent than in the United States. There are several reasons why such is the case. Among others may be mentioned the recognition by the British public that the principle of continuity in office of capable engineers results generally in economical and efficacious construction and maintenance of public works. Those American engineers who visited Great Britain at the time of the Brussels International Road Congress in 1910 will, without doubt, find the majority of the prominent highway engineers of England occupying the same positions or higher positions when they attend the Third International Road Congress to be held in London in 1913. This is not a long period, but could the same observation be made in regard to the *personnel* of many of our great state highway departments for a similar period? It should be stated, however, that the subordinate positions in the United States, being in many cases under the Civil Service regulations, are more permanent than those affected by political exigencies. This condition of permanency of position of high officials in Great Britain means that it is possible for young men who are attracted to highway engineering to enter the department of some county or municipal engineer, and, proving capable, to acquire a valuable experience under the continued leadership of an able engineer. In this position a young man of the right calibre may, by hard work, including a large amount of home study, equip himself for the highest positions in highway work in Great Britain. Another safeguard of the British engineer, and an incentive to highway engineers in embryo, is the admirable practice which has been adopted in many cases requiring that applicants for a certain class of positions shall hold certain grades of membership in the Society of Municipal and County Engineers, and in other cases certain grades of membership in the Institution of Civil Engineers of Great Britain.

FRANCE.

France offers an entirely different type of training for men who are going to enter the field of highway engineering. All the important positions in this branch of the public service are occupied by picked men, especially educated and trained for the service. After a preliminary general education, covering as a final period that comparable with the four years' high-school training in this country, men of high standing are admitted to the Ecole Polytechnique, the course in which is practically two years in length. Upon graduation from this school, the men of high standing are allowed to select one of the several national schools, provided openings exist, in which they will secure special training for the public service in a given field. Those who enter the Ecole Nationale des Ponts et Chaussees devote three years to a general course in civil engineering under the leadership of engineers of the highest grade in the Department des Ponts et Chaussees de France. During the vacations these men are alloted to service on the construction of roads and bridges in various parts of France. It is evident that the training thus obtained is admirable, and that the *personnel* of the engineering staff of the department of roads and bridges of France is exceptionally high.

AMERICA.

In America, while in some cases an attempt has been made to give as special instruction in highway engineering a four-years' undergraduate course in this subject, this method has not given particular satisfaction for the reasons previously noted. Excellent work has been done by many universities in several parts of the country in giving extension courses to groups of men interested in various phases of highway improvement. Very little advanced work, however, has been done through the medium of the American university. The United States Office of Public Roads has evolved a scheme by which men may secure a certain amount of advanced instruction and training in that part of highway engineering dealing with highways outside of built-up districts. This plan is to place the student engineers in the charge of men in the service of the office in various parts of the country on different kinds of highway work. When it is impossible to work in the field, the men do a certain amount of office work at Washington, receiving instruction by means of lectures on certain phases of highway engineering, and also do laboratory work on the testing of both bituminous and non-bituminous road materials.

THE COLUMBIA UNIVERSITY COURSE.

In 1911, through the generosity of Charles Henry Davis, president of the National Highways Association, there was founded at Columbia University a graduate course in highway engineering. The object in founding this course was to elevate this branch of the engineering profession, and to provide an opportunity for men engaged in highway work to obtain advanced instruction and training in the various phases of highway engineering under the most favourable conditions. For many reasons it is fortunate that the first course of this character should be found at a university presided over by a president and trustees who look upon the work of the university from an exceptionally liberal standpoint. While maintaining the high character of all degrees conferred, nevertheless these men believe in opening the courses of instruction to any mature man provided he has the prerequisites for any given course, and earnestly seeks information. Likewise, it is fortunate that the administrative authorities allow the introduction of an innovation as far as the period of attendance is concerned, inasmuch as the graduate course referred to is given in the period from December 1st to April 1st. An engineer, therefore, who desires to take all the graduate courses in highway engineering and allied subjects which fulfil the requirements for the Master's Degree, will necessarily be in attendance for two winter periods, the equivalent of one collegiate year. The selection of this period in which to give the instruction was based upon the prevailing idea among leading highway engineers that it would be feasible for many men to obtain a four-months' leave of absence during the dull period of the year. This prediction has been found to be correct.

As this plan is somewhat of an innovation in engineering education, it may be of interest to cite certain facts in connection with the attendance during the winter period of 1911-12, which was the first period under this plan. Although the graduate courses were not brought to the attention of engineers until November, 1911, there were in attendance fifteen men affiliated with highway work, thirteen of whom registered as candidates for the Master's Degree. It is of

interest to note that this group included men connected with state highway departments, contractors' organisations, materials departments, engineering sales departments of manufacturing companies, county highway departments, and consulting engineers' offices. The experience of these men ranged from one to twelve years. They came from widely distributed localities—Connecticut, Massachusetts, New York, Pennsylvania, Maryland, North Carolina, Alabama, Panama and British Columbia being represented.

The curriculum of the graduate work in highway engineering comprises advanced courses in the economics and design of roads and pavements, including a thorough discussion of bituminous surfaces and bituminous pavements; highway bridges and culverts; mechanical appliances used in highway engineering; road and street surveying and highway design; highway laws and systems of administration; management engineering; bituminous and non-bituminous road material laboratory courses; seminars in highway engineering literature; chemistry of bituminous materials; engineering geology; optical mineralogy; and inspection trips covering various types of roads and pavements and manufacturing plants producing highway materials.

A large staff of non-resident lecturers in highway engineering, which includes many of the most prominent highway engineers and chemists in the United States, is employed to give instruction on specified subjects forming an integral part of the various courses. It was decided to throw these special lectures open to the engineering public, and to hold the same during evening sessions in order that this feature of the work may be of maximum benefit to all that may find the university accessible. An attendance of from fifty to one hundred engineers at many of the lectures during the past winter period showed the interest taken in the many problems of highway engineering presented.

INTERESTING INNOVATIONS.

During the 1912-13 winter period a special arrangement will be introduced which is considered of particular interest to practising highway and chemical engineers. Many who cannot secure a four-months' leave of absence have expressed the desire to devote from six to seven weeks at Columbia University in securing information relative to the manufacture and testing of all kinds of bituminous materials, and their use in the construction and maintenance of bituminous surfaces and bituminous pavements. Arrangements have therefore been made so that courses covering the above subjects may be taken either independently or as an integral part of the unified graduate course in highway engineering. During a continuous period of about six weeks, beginning in the latter part of December and ending during the first week of February, three courses will be offered as follows: Two weeks will be devoted to a demonstration lecture course on the mining, manufacture and testing of all kinds of bituminous materials; the next two weeks will be devoted to a course on bituminous surfaces and bituminous pavements; while during the final period of two weeks will be given a laboratory course, in which those enrolled will test various types of bituminous materials, make analyses of unknown materials, and write specifications covering the use of bituminous materials under varying conditions. Each course will comprise forty lectures or eight laboratory hours, depending upon the character of the course.

During the coming year at Columbia it is expected that another innovation will be introduced, inasmuch as, in connection with the graduate work in highway engineering, there will be founded several research fellowships by various manufacturing companies. The research workers holding these fellowships will investigate problems of particular interest and value to the manufacturing concerns founding the same. It is expected that many problems which interest those engaged in highway work will be thoroughly investigated through this medium. While admirable work has been done along many lines in the research laboratories of our universities, the speaker earnestly hopes that more attention will be given in the next decade than in the past ten years to the multitude of problems in highway engineering which demand the best efforts of investigators for their ultimate solution.

Woolwich Subway.—The new subway under the Thames at Woolwich will be opened to-morrow

MANCHESTER SEWAGE DISPOSAL.

We make the following extracts from the annual report of the Manchester Rivers Department for the year ended March 27th last:—

DAVYHULME WORKS.

Total flow of sewage (fifty-two weeks) 12,382,950,000 gallons. Amount of sludge, sand, &c., removed, 18·3 tons per 1,000,000 gallons.

Cost of sludge disposal, 12s. per 1 000 000 gallons. Of the total volume of sewage 94·1 per cent was treated in the contact beds. The results of this treatment were 74 per cent purification on the oxygen absorbed test, and 76 per cent purification on the albuminoid ammonia test; but these figures apply to the *average* effluent including the unfiltered tank effluent. This is the highest percentage purification of the raw sewage that has been obtained so far at these works, and further improvement is expected as the additional beds now under construction come into operation.

The cost of filtration of the actual volume so treated was 15s. 8·4d. per 1,000,000 gallons. Of this sum 5s. 3·6d. was for maintenance and 10s. 4·8d. for renewals. Calculated upon the total volume of sewage these figures are 14s. 9·4d., 4s. 11·8d. and 9s. 9·6d. respectively per 1,000,000 gallons.

The total revenue cost of the disposal of the sewage at the Davyhulme works (apart from interest and sinking fund) was £1 19s. 7·5d. per 1,000,000 gallons, or 9·8d. per head of population, which compares favourably with the average of 10·1d. for the seven years to March 27, 1912.

WITHINGTON WORKS.

At these works the amount of sludge removed was 9·3 tons from the tanks and 4·4 cwts. from the screens, or a total on the average of about 9·5 tons per 1,000 000 gallons of sewage, while the cost of sludge disposal was 6s. 10·8d. per 1,000,000 gallons of sewage. The total cost of sewage treatment was £1 17s. 2·2d. per 1,000,000 gallons, or 9·7d. per head of population connected to sewers.

MAIN ROAD MAINTENANCE.

SOMERSET COUNTY COUNCIL'S REQUIREMENTS.

The Somerset County Council have agreed to a set of specific requirements with the object of obtaining better results for the money expended upon main road maintenance. Among the conditions recommended for contracts with the rural district councils in future are that the maintenance of main roads shall not be entrusted to any district council that does not employ a properly qualified surveyor. A second provides for notice to be given to district councils failing to carry out the road maintenance to the satisfaction of the County Works Committee, giving grounds of complaint and providing for the County Works Committee to take over the work themselves subject to certain conditions.

Wood Paving in Belgrade.—Belgrade seems always to be hampered in times of political crisis by the processes of Western civilisation (writes Mr. Charles E. Hands, the famous war correspondent). Four years ago, at the time of the crisis caused by Bulgaria's declaration of independence, the Servian capital was in the throes of a sewerage scheme. The first sewage pipes in Servian history were being laid down in the capital, and the narrow streets in the centre of the city were blocked by trenches and heaps of rock and dirt. . . . Now comes another crisis, and the principal streets have been torn up by a paving scheme. Two have been taken in hand—the pavements of the Prince Michael Gulitza and the King Milan Boulevard and the adjoining street in the middle of the town to make way for a wood [illegible]. The result is an unusual picturesque sight is that an afternoon promenade through the fashionable quarter of the city is a painful exercise of picking one's way through muddy excavations. They are doing their best for a makeshift finish to the operations, and the effort is doubtless wise. For the Royal Palace stands on the boulevard where the excavations are deepest, and if the crisis does not end to the popular satisfaction it may be as well to have the streets in condition for quick cavalry work and volley firing.

SOFT WOOD PAVING.

PARIS EXPERIMENTS: EFFECTS OF VARIOUS TREATMENTS.

[Notes from a paper prepared for the Sixth Congress of the International Association for Testing Materials, by Mr. P. Labordere, engineer, Ponts et Chaussees, and Mr. F. Anstett, director of the Municipal Testing Laboratory, Paris.]

Some 2,220,000 square metres, or about 24 per cent of the area, of the Paris roads and streets are paved with wood. All the wood used is resinous, the species including pines and red fir. The average life of these pavements is nine years, but on roads subjected to much traffic they have to be renewed every five or six years. Up till lately the usual treatment for preserving the blocks has been to immerse them in a heavy coal-tar oil, rich in phenols; but recently pressure has been employed in order to secure better penetration. It was found that this impregnation, while reducing porosity, did not increase the strength of the wood. Experiments were therefore made to find out what treatment would add to the mechanical strength of the material, the test adopted being the crushing strength in the direction of the fibres on a specimen 125 mm. long and 75 mm. square (just under 5 in. long by 3 in. square). Three equal specimens were cut from each block. To allow for the effects of moisture, as occurring under service conditions, two of these were, in each case, tested dry, and one after immersion in water for thirty days.

The substances with which the wood specimens were treated included: Pine tar, sodium and potassium carbonates, and sodium silicate. The proportions were varied, and the temperature of application was also varied.

PINE TAR TREATMENT.

The effects of various baths were tried, the temperatures being 60 deg., 80 deg. and 110 deg. Cent. (140 deg., 176 deg. and 230 deg. Fahr.). The first baths were of pure pine tar, and the effect was tried of adding (1) 2 grammes per litre of sodium carbonate, (2) 4 grammes per litre of sodium carbonate, and (3) 2 grammes per litre of sodium silicate. The nature of the bath did not affect the result. The temperature affected the results with the dry specimens, the hottest bath increasing the strength by about 12 per cent; but no such effect was observed in the case of wet specimens.

COAL-TAR OIL TREATMENT.

Coal-tar oil was then tried at temperatures between 112 deg. and 140 deg. Cent. (234 deg. and 284 deg. Fahr.). The treatment at the highest temperatures imparted strengths as great as those resulting from the pine tar treatment; but after the baths at the lower temperatures the strengths were no greater than those of the untreated blocks. Generally, it was found that the results were affected but little by the addition of the salts mentioned, the important factor being the temperature of the bath. The following results were obtained, starting with a strength of 323 kilograms per square centimetre (4,593 lb. per square inch) of the untreated block.

Temperature of bath.		Mean strength.	
Cent.	Fahr.	Kilograms per sq. c.m.	lbs. per sq. in
80°	176°	307	4,702
90°	194°	347	4,934
100°	212°	320	4,806
110°	230°	358	5,091
120°	248°	345	4,906
140°	284°	187	6,925
150°	302°	346	7,338
200°	392°	506	7,192

It was regarded as desirable that a temperature of about 140 deg. Cent. (284 deg. Fahr.) should not be exceeded owing to the ill-effects of the higher temperatures upon the structure of the wood. Tests of blocks heated in a dry-air stove showed an increase in strength due to heating alone, though less than in the case of blocks from the same baulk of timber treated with oil, the temperature in both cases being 200 deg. Cent. (392 deg. Fahr.). It was concluded, however, that heating in dry air is more likely to injure the wood than heating in oil, since the blocks would lose their moisture more rapidly.

An important matter is the relation which the length of time during which the wood is in the bath bears to the strength. It was found that there was a gain in strength up to three hours or three and a-half hours, and it was therefore recommended that the blocks should remain in the bath for about this period.

TESTS WITH SOAKED SPECIMENS.

Tests with soaked specimens—thirty days in water—showed little or no gain in strength. Further, the experimenters concluded that the hot oil treatment would not prevent the wood pavement becoming soaked with water in service. Creosoting under pressure was therefore tried at high temperatures, sometimes before and sometimes after treatment in an oil bath. Blocks which had been kept dry were strengthened by the creosoting, but those which had been soaked were not made stronger than the untreated blocks. Experiments were also made with blocks coated with pitch, but the results were inconclusive. It was thought, however, that there was some advantage gained by keeping the blocks for ten minutes in pitch at a temperature of 110 deg. Cent. (230 deg. Fahr.). This treatment is suggested as suitable in conjunction with surface tarring of the pavement when laid.

ROADS IMPROVEMENT ASSOCIATION.

COUNCIL MEETING.

Mr. H. Percy Boulnois, M.Inst.C.E., occupied the chair at the October meeting of the council of the Roads Improvement Association held on the 17th inst. Correspondence with London County Council was reported concerning the establishment of by-laws to compel slow-going traffic always to keep to the near side of the highway. The London County Council informed the association that it was framing by-laws to deal with this matter under powers conferred upon it by sec. 23 of the Municipal Corporations Act, 1882, and sec. 16 of the Local Government Act, 1888. A resolution strongly supporting the proposal was passed, and ordered to be sent to the county council.

Upon the recommendation of the Office and Finance Committee the association resolved to take new and larger offices at the end of the current year. It was felt that the satisfactory way in which the association's work is progressing will convince motorists, cyclists, and other road users of the large field of usefulness before the association, and that the association will be accorded much more liberal support, and thus enabled to meet its increased expenses.

Important decisions were arrived at in regard to the great west road scheme, and the extension of the association's local activities. Full particulars of these will be issued when details are complete.

Bradford Sewerage Contract.—For the construction of a tunnel through Strangford Hill to connect Frizinghall with the new sewage works at Esholt, the Sewage Committee of the Bradford Corporation last week decided to accept the tender of Messrs. J. Best & Sons, who are the contractors for the Bradford waterworks scheme in the Nidd Valley. The amount of Messrs. Best's tender is £112,312.

London Western Approach Road Scheme.—The Improvements Committee of the London County Council recommend that the Road Board's scheme for a new western approach road to London be not accepted. The Road Board's scheme was for a continuation of West Cromwell-road through Hammersmith and by a new by-pass road to the north of Brentford High-street out on to the Bath-road at Hounslow. The estimated cost of the scheme, including street widenings, was £1,750,000, of which the Road Board offered to contribute £875,000. About £1,000,000 represents the cost of the section of the road which would be in London. A less expensive amended scheme prepared by the committee was submitted to the Road Board, the committee report. This scheme preserved the principle of providing a through western approach road from King-street, Hammersmith, to Cromwell-road, but reduced the estimated cost to London to £600,000. The Road Board have approved the modified scheme and with the consent of the Treasury would pay half the cost. They could not, however, promise grants for other London improvements. The committee, therefore, propose that the offer of the Road Board be declined and that the committee prepare an alternative scheme, which they consider would be of greater value to London traffic as a whole.

Institution of Municipal and County Engineers.

NORTH WALES DISTRICT MEETING AT WREXHAM.

Although not very largely attended, the North Wales District meeting of the Institution of Municipal and County Engineers which took place on Saturday last at Wrexham proved an entirely successful function, a pleasant and instructive time being spent by those who participated in the gathering. The proceedings opened at the free library, where a cordial welcome was extended to the members by his Worship the Mayor (Councillor W. J. Williams). Mr. R. J. Thomas, the president, occupied the chair, and there were present Messrs. J. Price Evans (Wrexham Rural District), E. Evans (Carnarvon County Surveyor), R. Burslam (Congleton), H. Collins (Norwich), G. W. Lacey (Oswestry), T. W. A. Hayward (Battersea), W. Wellburn (Middleton), F. Wilkinson (Prestatyn), J. A. Settle (Heywood), A. W. Panton and A. Asquith (Holyhead), J. England (Wrexham), J. S. Shaw (Wrexham), T. Roberts and J. J. Griffiths (Oswestry), T. Roberts, W. Ll. Williams and R. J. Prydderch (Wrexham).

Mr. J. England, the borough surveyor, said he regretted to announce that he had had a letter from Alderman Samuels, the chairman of the General Purposes Committee, and chairman of the Main Roads Committee of the county council, saying that he was confined to the house with a severe cold, and would not be able to meet and welcome the members of the institution. He regretted it all the more as he had met several of the members in his public capacity.

The Mayor of Wrexham, in his address of welcome, said he wished that the committee could have arranged another period of the year for the visit, because at the present time Nature was in one of her uncertain moods. If they had been there three or four months ago they would have had some idea of the beautiful district in which he lived, and on their visit to the sewage farm would have seen what splendid results could be attained when sewage disposal was placed in the hands of a scientific agriculturist and horticulturist. He trusted their visit to Wrexham would be thoroughly enjoyable.

The President, in acknowledgment of the welcome, said it was the desire of the members of the institution by their visits to different towns not only to benefit themselves, but also to impart to others in conversation and discussion any information they might have on any particular subject that was raised. It was not an institution entirely for self-advancement, although perhaps in more than one sense it was, but they did endeavour to make themselves more efficient servants of the public they had to serve. These visits enabled them to improve their knowledge, for, however admirable a treatise on any subject was, it was only in seeing the actual results of these theories that they could hope to advance in the profession they were following. In a small town the municipal engineer had a larger variety of work to carry out in his working hours than the engineer of a larger town. His experience of Wrexham was not great. He had been there years ago at a musical function, called the Eisteddfod, and took a prize away. This year the same choir under the same conductor also took a prize away. As officials they felt very keenly this mark of the mayor's appreciation, more especially as it showed appreciation of the work of Mr. England. He knew Mr. England had suffered of late from ill-health, he seemed to have recovered completely, and he hoped he would long continue in good health.

Leaving the free library, the members proceeded on a tour of the markets, and afterwards paid a visit to the fire station, the electricity works and the town's depot. They were subsequently the guests of the mayor at luncheon at the Wynnstay Hotel, his Worship presiding.

The health of the Mayor was proposed by the President, who, in the course of his remarks, gave expression to the members' keen appreciation of his Worship's cordial reception of them and his kindly hospitality.

In responding, the Mayor proposed "The Institution of Municipal and County Engineers." One consolation which municipal engineers had was that nothing in the way of discovery or invention could do away with their work; whatever reforms might come about, they would always be wanted. The comfort and health and progress of a municipality depended very largely upon the efficiency of the work of its borough engineer and surveyor. He knew that they were not adequately paid, and from his experience of a corporation he knew that sometimes they were not supported in the way they ought to be by the councils they served. There were members in every council who held parochial views, and belittled the work of their officials. Seeing that so much of the comfort and health of the people depended upon the ability, foresight and tact with which the surveyor and engineer approached his work, it was of the utmost importance that they should not only bring to bear upon their work a determination to do the work which devolved upon them, but that they should have all the information and all the experience which these conferences gave to them. Therefore, corporations should do everything they could to encourage their officials to attend these meetings whenever possible.

The President, in reply, observed that there were between 1,100 and 1,500 members of the institution scattered. They had many difficulties and obstacles to overcome, not the least of these being the difficulty that first cost was generally the main consideration, whereas in the important matter of prolonging human life and preventing human misery cost should not be an unduly prominent factor. They were trying to raise the status of their profession, and he could assure his Worship that the class of young men who sat for their examinations promised well for the future, not only as regarded their own profession, but the people generally. They had also endeavoured to look after the widows and orphans of members who had been called away suddenly. They had been able to assist, and they hoped to assist still more. They had endeavoured recently to widen the scope of their institution by getting district committees formed, and he felt sure in his native country of Wales they would not be behind any other nationality in this work. Concluding, Mr. Thomas said it was surely a question for public bodies to consider whether it was not an excellent expenditure of their funds to encourage officials, particularly the younger ones among them, to attend as many of these meetings as possible by at least defraying their out-of-pocket expenses.

In proposing "The Corporation of Wrexham," Mr. W. Jones (Colwyn Bay), chairman of the North-Western District, remarked that the town council had in Mr. England, their surveyor, one of the best members of the institution. He had known Mr. England for many years, and he could assure them that he was a man who was most anxious to do his duty and to do it thoroughly.

Dr. Edward Jones, chairman of the Sanitary Committee, responding to the toast, said he was glad to think their borough surveyor was held in such esteem by the members of their institution. In the department of which he was chairman, he was brought in contact with Mr. England a good deal, and whatever he took up he put his whole heart and soul into it, and carried out his work efficiently and well. He might say that Mr. Price Evans's work in the rural district was, if anything, more difficult than Mr. England's, for he was working in a wide and scattered district where villages had been dumped down here, there and everywhere. As a professional man speaking to professional men, he could not help regretting that means could not be adopted, either by the Government or by a combination of sanitary authorities, to put the medical officer of health and the municipal engineer and surveyor in a position more or less parallel with that of Government officials, so that they would not be liable to be shot at or humbugged to death in various committees by men who, in a great many cases, did not know what they were talking about. The public health of the community ought to be a State matter entirely free from any local prejudice. Probably the day would come when that would be done, for he saw that the Local Government Board was stiffening its back in many respects, and although a political opponent of the President of the Local Government Board, he thought they would all agree that Mr. John Burns had been an ideal President of that body.

The next two hours were devoted to an inspection of the sewage farm.

The members returned to Wrexham at 4 o'clock considerably later than had been arranged for the discussion of a paper on the municipal works of the town, by Mr. J. England, the borough surveyor, and for the transaction of other business. The proceedings took place at the Wynnstay Hotel, Mr. R. J. Thomas, the president, occupying the chair. At the outset the matter of the formation of a district executive committee was introduced by Mr. Wm. Jones (Colwyn Bay), district chairman, upon whose proposition, seconded by Mr. Evan Evans (Carnarvon), it was agreed that the whole of the members of the district should compose the committee.

The President expressed the hope that the formation of the different committees would conduce to the general prosperity of the institution. The idea was, no doubt, to get more meetings in each district, and he could tell them, more or less unofficially, that the council were hopeful of making arrangements by which in the future it would not be necessary to advise every member of the institution of a forthcoming district meeting a step which would, of course, effect a certain economy. At the same time the arrangements would permit of members being acquainted with and of attending meetings in outside districts should they so desire. He very much hoped the North Wales district secretary would take a leading part in promoting the interests of the institution; evening meetings might possibly be held, and topics of importance discussed to the general advantage. There was another connection in which the council were desirous of obtaining support—namely, the Orphan Fund—which was particularly in need of assistance. It was desirable that every member of the institution should contribute to that fund, irrespective of the amount he might be able to contribute. What was essential was the practical support of all; the help thus given would enable the committee to carry on their work of assisting the widows and orphans of deceased members. He wished the district every possible success and advancement, and felt sure that those belonging to it would do all in their power to promote the interests of the institution.

Letters of apology for non-attendance were reported to have been received from Messrs. E. Hall (Carnarvon), S. Evans (Flintshire), A. D. Greatorex (West Bromwich) and Parry (Barmouth).

The minutes of the last district meeting—held at Colwyn Bay on May 31, 1907 were next read by the hon. district secretary (Mr. J. England) and confirmed, following which the subjoined paper was submitted for consideration.

WREXHAM AND ITS MUNICIPAL WORKS

By J. England,
Borough Engineer.

Wrexham is a market and manufacturing town situated in the north-east corner of Denbighshire, having as its western boundary the famous Offa's Dyke of ancient history. The local historian, Mr. A. N. Palmer, in his book, "The History of the Town of Wrexham, its Houses, Streets, Fields and Old Families," states that the name is derived from Wrocansaetan, or the people round the Wrekin, a well-known group of hills situated in the adjoining county of Salop. The parish church, built previous to the year 1220, is one of the seven wonders of Wales, and is well worth a visit, the tower being a magnificent piece of architecture.

PHYSICAL FEATURES.

The subsoil consists chiefly of drifts composed of gravel and boulders overlying the Permian sandstone. Sand and clay are also found in places. The surface levels vary considerably, the mean being 275·0 above ordnance datum.

GENERAL STATISTICS.

Incorporated 1857; area, 1,305 acres; population, 18,379; number of houses, 3,849; birth rate, 25·8 per 1,000; death rate, 14·3 per 1,000; rateable value, £77,968; rates—poor, 5s. 4d., general district, 3s. 5d.

INDUSTRIES.

The principal industries carried on within the borough are brewing, tanneries, flour mills and leather works; but in close proximity to its boundaries are collieries, steel and terra-cotta works, and it is owing to the large population within a radius of 3 miles of the town—*i.e.*, over 50,000 inhabitants—that Wrexham has grown to be the premier town of North Wales.

ROADS.

There are at present 20¼ miles of public highways, of which 3¾ miles are main roads; there are also 3 miles of unadopted streets. The county council contribute the sum of £848 towards the maintenance of the main roads, and in addition pay the principal and interest, amounting to £135 per annum, on a loan, covering a period of twenty years, for the paving of a length of main road 2½ furlongs in extent. The author experiences considerable trouble in the maintenance of the roads owing to the constant openings made by the various public authorities having statutory powers, and during the last twelve months the length of mains and services laid along the carriageways alone amounts to over 1,300 lin. yds. Arrangements have been made whereby the corporation undertake the final repair of street cuttings at prices which are sufficient to cover all expenses incurred. The streets bearing heavy traffic are chiefly coated with granite, the remainder with a whinstone obtained from a local quarry. Tar painting the roads has proved very successful, crude tar being principally used, the penetration in some instances having been found to be as much as 2 in. The author is of opinion that streets having a gravel subsoil are the best for tarring, and if laid where the subsoil is clay the foundation requires to be well drained. It is found that two coats are required to make the surface waterproof, and considerable economy is effected both in maintenance, scavenging and watering. The cost averages 1d. per yard for the first coat and ¾d. for the second. The author keeps a record of the cost of street repairs, and the average for a 3-in. coating of granite is 1s. 2d. per square yard, and with whinstone 10d. per square yard.

Footpaths.—The main street footpaths are principally paved with York or 2½-in. concrete flags, and in several instances concrete *in situ* and chequered tiles, the two first-named being principally used at the present time. The light-traffic streets have tar-paved footpaths constructed with a 3-in. foundation of tarred destructor clinker and a 1½-in. topping of ¼-in. tarred slag, the average cost being 1s. 4d. per square yard. Trial lengths of granite treated with ferromac, tar macadam (both whinstone and granite) and tar-grouted granite have been laid; but, with the exception of the first named, all have been laid recently.

Street Improvements.—Wrexham, in common with most of the older towns, is suffering from a lack of wide streets, and during the last nine years over £10,000 has been spent in widening and improving the principal traffic streets. The most important improvement of recent years has been the widening of Regent-street, from 32 ft. to 42 ft., for a length of 200 yds., at a cost of £1,500, towards which the Road Board contributed £800.

Private Street Works.—The Act of 1892 has been adopted, and since 1904 the streets have been constructed to the following specification:—

Carriageways.—Foundation, 9 in. of pitchers, hand laid, well rolled, and 6 in. of whinstone macadam (consolidated) of 2-in. gauge, well rolled and blinded with gravel or chippings, York channel blocks, 10 in. by 5 in.

Footways.—York kerbs, 12 in. by 5 in., with tar paving consisting of a 3-in. bed of tarred destructor clinker, and 1½ in. of tarred slag topping.

The average cost for a 36-ft. road, excluding soil and surface-water sewers, is 9s. 6d. per foot of frontage. The work has of late years been carried out by administration.

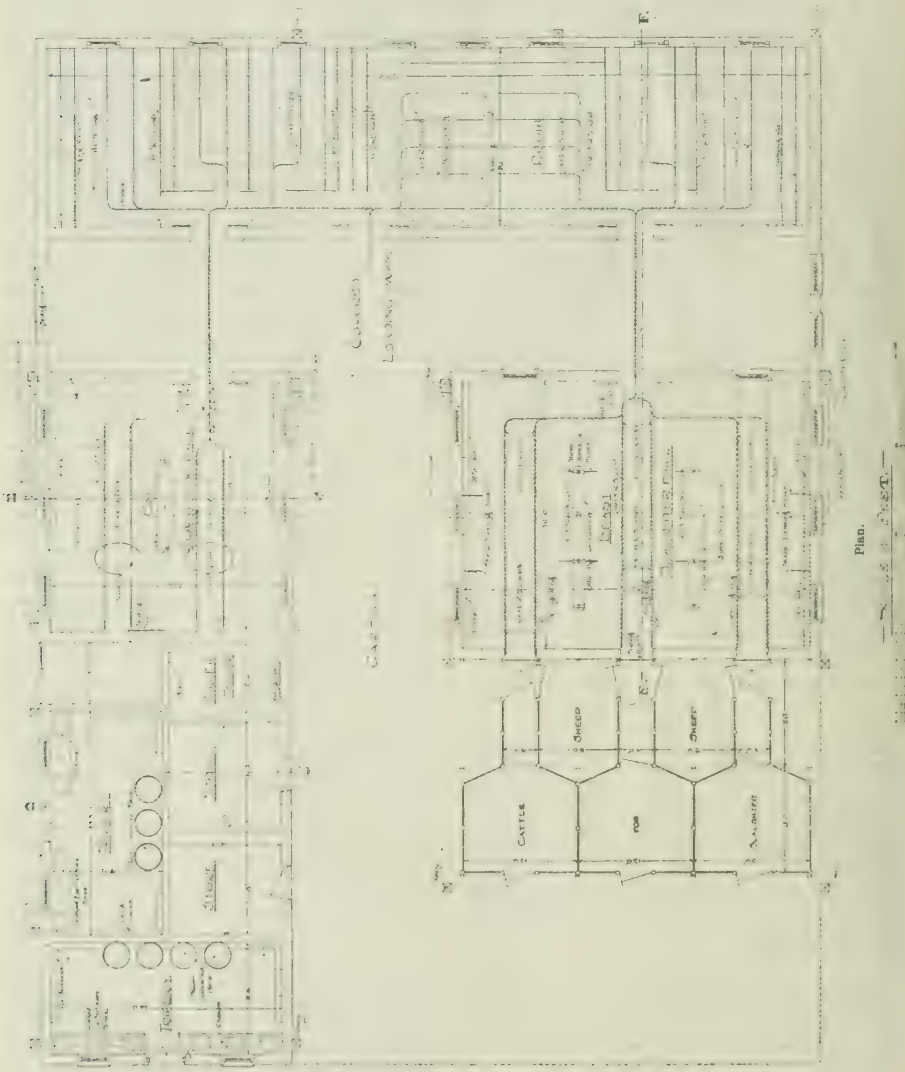
MARKETS AND SMITHFIELD.

The markets were purchased in 1898 at a cost of £46,850, and consist of three separate buildings—*viz.*, butchers', general and vegetable markets—the annual income being about £3,300. The corporation have also purchased, at a cost of £6,200, with a view to extensions, properties known as Queen-square and Yspytty, the areas of these being 900 sq. yds. and 1,440 sq. yds. respectively, the first named being for the enlargement of the vegetable market and the latter for the erection of a wholesale market. A portion of the Yspytty land has been leased for a term of five years to the Glynn Picture Company at a ground rent of £120 per annum. The vegetable market has recently been greatly improved by covering over the large open space in the centre, at a cost of £1,907, and it is intended in the near future to proceed with an extension of this market, along with the provision of a corn exchange, at an estimated cost of £5,000. The Smithfield covers an area of 3¾ acres, and cost, with land for future extensions, £6,300, the whole of the pens, with few exceptions, having concrete *in situ* paving and a large number of the pens are covered with galvanised roofing. The author recom-

mends concrete *in situ* paving for sheep and pig pens, but for cattle it is not suitable owing to its slipperiness.

WILLOW DEPOT.

The Willow depot and the electricity works, refuse destructor and baths comprise spacious and substantially built brewery premises, purchased by the corporation from the late Mr. Peter Walker's Trustees for the sum of £8,000. The situation is admirable, being very central, and the depot portion comprises stabling, cart-sheds, stores, workshops and horse-keeper's house. There are two smaller depots, used



Proposed Corporation Abattoir, Wrexham.

principally for the storage of material. The number of horses employed by the surveyor's department is thirteen, including two light horses suitable for fire brigade use, which are yoked and worked together as far as possible when not required for fire-brigade purposes. The average cost per horse and man per day is 8s. 4½d. The fodder allowed each horse per day is: Clover, 7½ lb.; hay, 10 lb.; oats, 8 lb.; bran, 2 lb.; and the cost per horse per week is 13s. 4d.

BATHS AND GYMNASIUM.

The baths were constructed in an existing building (forming part of the disused brewery already referred to). The plans were prepared by and the work carried out under the supervision of the author's predecessor, and comprise plunge bath, 60 ft. by 42½ ft., with shower baths, dressing boxes, &c. There are four first and five second class slipper baths, and one vapour bath. The manager lives on the premises. The plunge bath is open from April 1st to October 31st, the number of bathers last year being nearly 20,000 in the aggregate. The slipper baths are open the whole of the year, and are well patronised. The water supply for the plunge bath is obtained from a public spring known as the Brynyffynon Well, a line of 4-in. cast-iron pipes being laid therefrom, a distance of 550 yds., along the bed of a small river that passes close to both spring and baths, and flows by gravity into an underground tank at the electricity works, from which it is pumped into an elevated storage tank of 20,000 gallons capacity. The electricity department provide the steam for heating, and do all pumping required for the baths department for the sum of £50 per annum. The plunge bath is emptied twice weekly, the water supply from the well being sufficient to enable this to be done. Land has been purchased for the provision of an additional plunge bath, and sketch designs for same have been prepared by the author, but up to the present nothing further has been done. The gymnasium adjoins the baths, and is fitted up with the necessary appliances, and

North Elevation.

PROPOSED CORPORATION ABATTOIR, WREXHAM.

when first opened was well patronised, but of late little interest is taken in it by the public.

REFUSE REMOVAL AND DISPOSAL.

The refuse collection is carried out by day work at present, but the author has recommended his council to adopt the piece-work system, as he is of opinion that this is the best means whereby the cost of collection can be kept within reasonable limits. The collection is weekly where portable bins are provided, and monthly where ashpits exist, but it is hoped that in a short time the whole of the houses will be provided with bins, the conversion to bins by the property owners being at a rapid rate. The shop refuse is collected daily without extra charge. The wages of the ash-men are 21s. per week, with the leading hand 2s. per week extra. The refuse is destroyed in a four-cell Meldrum destructor, erected in 1901, which adjoins the electricity works, and is in the charge of the electrical engineer. The cost of burning is borne by the Health Committee, who receive £150 per annum from the Electricity Department for the steam generated. Owing to the refuse not having been weighed previous to June this year, the cost for collecting same is uncertain, but averages 3s. 6d. per ton, the amount destroyed being approximately 135 tons per week, and the cost 1s. 4d. per ton. The residue from the destructor averages 33 per cent of the refuse tipped, and of this 10 per cent is hard clinker.

ELECTRICITY SUPPLY DEPARTMENT.

The works were opened in 1901. Originally three 120-kw. sets were installed, with a surface condenser, and two Babcock boilers of a capacity of 200-h.p. each. In 1903 extensions to the generating plant were found necessary, and a 300-kw. set was installed, with the necessary boiler and condenser, the boiler being of a similar type to those already installed. Each of the Babcock boilers were fitted with superheaters. Since 1907 the generating station has been thoroughly reconstructed and brought up to date. At the beginning of 1908 a 60-kw. set was installed, consisting of a Lancashire dynamo and Belliss engine, this for the purpose of doing the street lighting night load, and subsequently to do traction in conjunction with a battery. A superheater was also fitted to the destructor boiler, and a set of economisers has been installed. The engine room has been extended, and one of the original Willans engines has been fitted with automatic expansion gear, and a second dynamo coupled to the end of the shaft. This enables both traction and lighting to be run from one engine. A new switchboard of an unusual type has just been erected; a particular and special feature about this board is that there is no combustible material on the rear of the panels, bare copper being used throughout. The number of consumers at present connected equals 354, and the connected load, exclusive of street lighting, equals approximately 33,200 30-watt lamps. A supply is also given to tramways, which are controlled by the Wrexham and District Electric Tramways Company. For the year ended March, 1912, the current supplied was as follows:—

Private supply lighting	234,664 units.
Power	129,486 ,,
Tramways	165,114 ,,
Public lighting	181,030 ,,

The accompanying schedule sets out the rate of increase and financial progress during the last seven years:—

Year ending	Units sold.	Increase.	Loss.			Profit.		
			£	s.	d.	£	s.	d.
March, 1906	409,974	81,687	957	1	1			
.. 1907	425,235	25,161	190	17	2			
.. 1908	485,886	60,651				11	5	8
.. 1909	536,284	50,398				569	17	1
.. 1910	548,711	12,427		—		342	13	5
.. 1911	646,877	98,166				503	6	8
.. 1912	710,500	63,623		—		375	0	0

The borough electrical engineer is Mr. W. G. Pickvance, A.M.I.E.E., by whose energy and professional skill the undertaking has been placed upon a thoroughly sound and satisfactory profit-earning basis.

PUBLIC LIGHTING.

The street lighting is by both gas and electricity, the total number of lamps being 375, and the total cost £1,906. The whole of the gas lamps are fitted with incandescent burners, and the average cost per lamp with 5-ft. burners, including renewals and cleaning, is £2 1s. 3d. per annum, the lighting hours being 4,345, and gas costing 2s. per 1,000 ft. The electric lighting is by means of 45 high-candle-power metallic filament lamps of 600 watts in the principal streets, each costing £20 per annum, the smaller lamps being fitted with metallic filament lamps, averaging 75-candle power, the cost per lamp being £3 3s. Automatic switches have been fitted to twenty of the gas lamps as an experiment, and up to the present have been found very reliable, and it is hoped to extend this system to the whole of the lamps on the outskirts of the town in the near future.

FIRE BRIGADE.

The fire station adjoins the Guildhall, the appliances consisting of a 350-gallon steamer, manual, hose cart, and two fire escapes, the largest being 56 ft. high, and is of the self-supporting type. The brigade consists of superintendent and twelve men, the superintendent and one man being permanent. The men are paid 1s. 6d. per drill, twenty-six drills per annum, and on Bank Holidays four men are specially retained for the day. The whole of the men's houses are electrically connected. At the rear of the station is the recreation room, with billiard and card tables, which is a means of attracting the firemen to the station in their spare time, thereby increasing the efficiency of the brigade to a considerable extent. The water supply is in the hands of a company, the corporation until recently paying 4s. per annum for each hydrant; but they are now in negotiations with the company for the purchase of these hydrants. The pressure in the mains averages 35 lb. per square inch.

ABATTOIRS.

The public abattoirs are situated at the Holt-road depot, on an area of 2½ acres belonging to the corporation, and consist of eight separate slaughter-houses and lairages. The buildings, having been erected about the year 1864, are not in a condition to fulfil present-day requirements, and the author has been instructed to prepare plans for the erection of abattoirs on the most modern lines, and hopes that the same will be prepared in time for those members of the institution attending the meeting to inspect and criticise.

PUBLIC CONVENIENCES.

Since 1903 the whole of the public conveniences have been reconstructed on modern lines, and, in addition, an underground convenience, comprising six stalls and two water-closets, and three overground conveniences, with a total of twenty stalls, have been added. The returns from the water-closets in the underground convenience is more than sufficient to pay interest and sinking fund on the loan raised for its construction.

PARKS AND OPEN SPACES.

The town is well provided with "lungs," the chief being "The Parc'au," comprising an area of 17½ acres, which is being laid out as a park and recreation ground under the directions of the author to a design prepared by Messrs. Cheale & Co., of London, in a prize competition. Up to the present the entrance gates, railings and lodge have been completed to plans prepared by the author.

The William Jones recreation ground was presented to the town by John Jones, Esq., in memory of his brother, together with £650 to defray the cost of erecting boundary walls, fencing, shelter, and laying out the ground in accordance with plans prepared by the author, the area being 2½ acres. The beast market, purchased for an open space from the Crown in 1898, comprises an area of 1½ acres, and was used until the Smithfield was constructed as the cattle market. The annual pleasure fair is now held thereon, which brings in a revenue of over £200 per annum.

CEMETERY.

The cemetery, established in 1876, originally comprised an area of some 5 acres or so, and two extensions have since been carried out, the last in 1908, when a 12-acre field was purchased to be laid out as required to plans prepared by the author, but up to the present it has only been necessary to enclose about 1 acre of this land. It will be of interest to know that it has not been found necessary to lay down any drainage in connection with the cemetery, the land being gravel throughout.

MAIN SEWERS.

The main sewers were laid about forty years ago on the combined system from plans prepared by the late Sir Robert Rawlinson, the main outfall to Hafodywern being circular, 30 in. in diameter. There are about 21 miles of brick and earthenware sewers in the borough, the whole of which discharge by

gravitation. Owing to the old earthenware sewers being laid with clay joints, and in several instances with half collars only to the pipes, there is a very considerable amount of infiltration of subsoil water. All new streets constructed since 1904 have surface-water sewers in addition to foul-water sewers. The whole of the sewers are flushed monthly by means of a 400-gallon van. There are no privies within the borough, and with the exception of four isolated houses the drainage of every house is connected to the sewers. The system of ventilation is by means of shafts and Webb's sewer lamps, the manholes with few exceptions having closed covers.

SEWAGE DISPOSAL WORKS.

Previous to 1890 the sewage disposal works were situated at Hafodywern, and consisted of three shallow sedimentation tanks about 190 ft. in length, the effluent afterwards passing on to the Hafodywern Farm where it was distributed by broad irrigation. In 1889, owing to the Hafodywern farm being insufficient to deal with the whole of the sewage, the corporation leased for a period of ninety-nine years Five Fords farm, which is situated about 2 miles south-east of the borough, and to which the sewage is conveyed from the Hafodywern tanks by means of a 15-in. sewer. In 1903 the author's predecessor (the late Mr. J. W. M. Smith) prepared plans for the entire reconstruction of the sewage disposal works, and recommended that new sedimentation tanks be constructed at Five Fords farm, and that storm-water filters be constructed at Hafodywern to deal with the excess over three times the dry-weather flow. The works consist of detritus chambers and three sedimentation tanks, each 120 ft. long and 24 ft. wide, and have a total capacity of 300,000 gallons. Previous to entering the tanks the sewage passes through an automatic revolving screen worked by the flow of sewage. After passing through the tanks the sewage flows along underground carriers to various points on the farm for treatment by broad irrigation, chiefly on the ridge-and-furrow system. The farm has an area of 210 acres, of which 180 acres are available for sewage treatment, but 108 acres only are underdrained up to the present. The subsoil for the greater part is loamy sand and gravel. The tanks are constructed throughout of concrete, the aggregate consisting for the major portion of clinker from the refuse destructor, and it is of interest to mention that the works do not show the slightest signs of fracture. The storm-water filters at Hafodywern consist of four beds with a total area of 2,240 super. yds., and provide for the treatment of 1,120,000 gallons per day, the filtering medium being destructor clinker 4 ft. deep. The sewage is chiefly domestic, with a considerable quantity of chemicals from leather works and brewery waste. The dry-weather flow averages 1,145,000 gallons per day, of which it is estimated 425,000 gallons only is domestic sewage, the remainder being trade waste and infiltration water in the proportion of two-thirds and one-third respectively.

Owing to the regrettable death of Mr. Smith on the eve of commencing the construction of the works, the author was appointed engineer with the late Mr. J. T. Eayrs, M.INST.C.E., as consultant.

DISCUSSION OF MR. ENGLAND'S PAPER.

Mr. T. W. A. Hayward (Battersea) communicated the following remarks on the paper: Mr. England is to be congratulated on being able to present such an admirable account of the municipal works of Wrexham. The historical description is an interesting one, and the general statistics are good. There is, however, one question an answer to which would be of interest to the members generally, and that is, How much of the total rate of 8s. 9d. is raised for the payment of principal and interest on loans incurred, and does the poor rate include the police rate and the county rate? Mr. England has troubles, like all of us, through the breaking up of streets by the various authorities having statutory powers. It is now generally agreed that the reinstatement of road surfaces on breaking up is best undertaken by the local authority, and Mr. England is undoubtedly right in suggesting that this course should be adopted in Wrexham. The notes in regard to tar painting are interesting and instructive. They would be more so if Mr. England would kindly state the rate of wages paid to labourers and others. This would further elucidate the cost of horse, cart and man (8s. 4½d. per hour) many of us would like to hire at the same rate. Wrexham should be congratulated on its bold policy as regards street improvements. It is to be noted in regard to refuse collection and disposal that Mr England is recommending the adoption of the piece-work system. It is presumed that this is meant to convey that the men would be paid on the tonnage of refuse collected. Similar arrangements have been made in several boroughs in and around London, and, it is believed, with success. There is no reason why such a system should not work well in Wrexham. It is not my intention to weary members with a lengthy discussion on this interesting paper, but I cannot close without calling attention to one other point, upon which I should like some further information—that is, public lighting. It is stated that there is a total number of 375 lamps, and that the cost of lighting is £1,936, the hours of lighting being 3,345. This appears to be a very high cost for a town of the size of Wrexham, and one cannot help but notice the difference in the cost of lamps where gas is the illuminant as compared with the lamps where electricity is the illuminant. The price for the high candle-power filament lamps is undoubtedly excessive. The automatic switches for gas lamps have been working in Battersea for several years, and have given every satisfaction.

Mr. Wm. Jones (Colwyn Bay), in proposing a vote of thanks to Mr. England, said there were many valuable figures in the paper. He noticed that in Wrexham they experienced the same difficulty as he did at Colwyn Bay through having his roads cut up by various irresponsible authorities and persons. At Wrexham it appeared that arrangements had been made by which the corporation undertook the final repair of street cuttings at prices which were sufficient to cover all expenses incurred. He should like to know whether Mr. England had any standard price which would serve as a guide as to what other towns could charge. He could assure the meeting that this was a great trouble with him. People thought they could do as they liked after a road had been put into order, and he would be extremely glad, therefore, to get the information he had asked for. The cost of street repairs were given by the author as 1s. 2d. per square yard for a 3-in. coating of granite, and 10d. per square yard with whinstone. Although they were situated in the same county, he had been unable to convince the county surveyor that the work could not be done for the 7d. per square yard which he allowed him (the speaker). He (Mr. Jones) was sure it could not be done at the price. As to the statement in the paper that all new streets constructed since 1904 had surface-water sewers in addition to foul-water sewers, he would be glad to know what protection Mr. England took against unauthorised persons making wrong connections. At Colwyn Bay they had come across several such instances. The system of sewer ventilation at Wrexham was by means of shafts and Webb's lamps, the manholes, with few exceptions, having closed covers. Had Mr. England any figures to give them as to the cost of maintaining these lamps? As they knew, their usual custom was to advise their authorities to erect ventilating shafts, but although he had several of these, he still received complaints. What he wished to know was whether the Webb lamps prevented the effusion of foul gases, and whether as a result of their adoption complaints ceased.

Mr. Evan Evans (Carnarvon) seconded the vote of thanks for his clear, concise, and altogether excellent paper. Having lived for some years in that locality, perhaps he would be permitted for a moment to leave the subject of the paper. He wished to say how delighted he was with the success which had attended all that Mr. England had undertaken on behalf of the community which he served. He (the speaker) knew his predecessor in office, Mr. Smith, an excellent official, who did his work well, and he could realise what a difficult task it was to follow such a man. He was all the more glad to find, therefore, that his successor had made such an excellent impression on the town. Turning to the paper, he would like to know the basis of the figures in the paragraph in which it was stated that the county council contributed the sum of £848 towards the maintenance of the main roads, and, in addition, paid the principal and interest, amounting to £135 per annum, on a loan covering a period of twenty years, for the paving of a length of road 2½ furlongs in extent; also what expenditure was repaid in full—if any. Then, as regarded what was not paid in full, what proportion of scavenging and watering, and, now that it was so much in vogue all over the country, what proportion of the tarring was paid back to the county council. The paper stated that streets bearing heavy traffic were chiefly coated with granite, and the remainder

with a whinstone obtained from a local quarry. In connection with that he would like to know whether the granite was obtained from Penmaenmawr or Cleo Hill, and the prices at the station; also, had Mr. England had an opportunity of comparing the granites under equal conditions, and which did he prefer. The price of tarring was very clearly put, except that he should like to have the price of the tar itself. The average cost for a 36-ft. road, excluding soil and surface-water sewers, was given as 9s. 6d. per foot of frontage, but he should like it made clear whether the figure quoted referred to one side of the street or both; was it 9s. 6d. per lineal foot of street, or 9s. 6d. per foot of frontage on one side? In the section of the paper referring to the depot the average cost per horse, cart and man was stated to be 8s. 4½d. per day, but subsequently the cost of fodder was given as 13s. 4d. per week, and there seemed to him to be some disparity between the figures.

Mr. G. W. Lacey (Oswestry) remarked that 9s. 6d. per foot of frontage, considering the construction, did seem a little high for the new street works, and the 6 in. of granite used in the construction of the carriageways also appeared to be somewhat extravagant. The price quoted did not include soil and surface sewers, but did it include the gullies and branches through? With regard to the horses he took it the 13s. 4d. was for horse keep alone. He found it cost him, at the present rates for fodder, from 7s. 6d. to 7s. 8d. to keep a horse, cart and man, including all stable charges and depreciation—which was sometimes not included—veterinary attendance, repairs, and so on. As to refuse removal, it would be interesting to have some indication of the method he would recommend with regard to the piece-work system. It seemed rather difficult to carry out; was it at so much per ton collected? He took it it was all done by the corporation staff. In regard to wages, he should like to know what was paid to the horse drivers, so as to be able to ascertain how the 8s. 4½d. per day was made up.

Mr. Price Evans (Wrexham) observed that great strides had been made in Wrexham and the district, a very different condition of things prevailing twenty or twenty-five years ago as compared with the present. The statistics both as regarded the town and district were now very favourable indeed, and there were not many places that could boast anything very much better. As regards the death rate, for some years the sewerage system of the town was in a very bad state, and he thought they had to thank Colonel Jones for having introduced the broad irrigation system there. Wrexham, of course, was very fortunate in having such a farm and land situated as it was, and so suitable in character. For his own part he was not very much in favour of sewage farming, but to provide works to deal with the sewage of the district would mean a large expenditure. Colonel Jones' scheme, therefore, eased matters very considerably, and provided very satisfactorily for a long time, though, as Wrexham had increased greatly since then, he had no doubt that before long the sewage farm would have to be enlarged. Everything seemed to be satisfactory, and the corporation were fortunate in having a competent man to look after the farm. As regarded the ventilation of sewers, he recalled that a gentleman who was connected with the town, Mr. Isaac Shone, did a very great deal for Wrexham. In the days when town planning was hardly thought about he (the speaker) spent much of his time in preparing plans for Mr. Shone in connection with the construction of certain new roads through the borough, and he had no doubt that several of the roads which had since been formed in the town had been due to Mr. Shone's inception. Mr. Shone, added the speaker, was engaged at the present time in the preparation of a book on the ventilation of sewers, and he (Mr. Price Evans) was looking forward to its appearance with interest.

Mr. H. Collins (Norwich), speaking with regard to the question of street tarring, said it was the custom in Norwich before tarring any extensive road portion to send a circular letter to the different property owners and occupiers informing them of the corporation's intention and requesting them to make any connections within the succeeding three months. This had proved satisfactory, though it did not of course put an end to the trouble entirely. The street repairs were denser than in Wrexham, being 1s. 5d. instead of 1s. 2d. Granite was about 12s. per ton in Norwich. Their private street work was the same as in Wrexham, 9s. 6d. per lineal foot of frontage, inclusive of granite kerb and bituminous surface. The cost of horse keep was practically the same also, being 13s. 2d. instead of 13s. 4d. The cost of cart, horse and man was 13s. 10d. against 13s. 4d., their wages being slightly higher. He was sorry to hear the gymnasium was not very well patronised. They had one in Norwich, and it was probable that they would have to extend it. He had been very interested at the sewage farm. They were very fortunate in getting such good sludge. In Norwich they had considerable difficulty in that respect. There was a large amount of trade and brewery wastes, and their sludge was practically an emulsion of water and fats, the difficulty being to extract the latter. Works were now, however, being put down for treatment on a wet pulverising process, and it was hoped to sell the residue as manure. As regarded the connections to sewers, in Norwich all these were carried out by the corporation. Wrong connections might, of course, be made on the drains, but there was a very rigid examination of all work done.

The President said he had great pleasure in putting the vote of thanks to Mr. England for his admirable paper. Time was short, and he could not say very much, but he should personally like to support the proposition most heartily. It had been a most interesting meeting, and they had had an opportunity of seeing work which had been very well and economically done. The sewage farm seemed to be in admirable condition, and doing its work very well indeed; such a site must, metaphorically speaking, make many engineers' mouths water. At the electric light station great ingenuity had been shown in effecting economies, and considerable benefits should accrue to the ratepayers. The roads were in good condition, and were a great credit to the engineer. The question of excavations in streets was a most difficult matter indeed. It was desirable, as Mr. Collins had said, to inform companies and others concerned of prospective works; at the same time, even when that were done, innumerable excavations were made, and the authorities responsible for the roads should be the ones to restore the surfaces to their own satisfaction. The ratepayers should not be allowed to suffer either from the condition of the roads or through their pockets owing to the excavations of other people.

The vote of thanks was passed.

Mr. England, in returning thanks, said he could assure those present that it had been a great pleasure to him to have the honour of preparing a paper to present to a meeting of the institution. He only regretted that the meeting had not extended over two days, as was originally intended. Unfortunately, he fell ill just when the meeting was due, and it was then found that the surveyor to the rural district council was unable to join him in the gathering. Mr. Jones had asked the cost of cuttings in roads. Previous to his going to Wrexham there was no recognised price for the repair of cuttings, but he made arrangements with the companies for a payment of 1s. 6d. per lineal yard for service pipes, and 2s. 3d. for mains. Should, however, the main require a wider trench than 1 yd., the price was to be arranged with the engineer. He had had many instances in which, after having given three weeks' or a month's notice to companies and just repaired a road, one of them came along and cut up the road. As regarded the sewer connections, the only precaution he took was that every connection was examined either by himself or an assistant, so there was no possibility of wrong connections being made. With reference to the cost of the Webb lamps, the price of gas was about £4 per annum. The lamps had been a splendid thing in stopping complaints as to bad smells. The price of gas in Wrexham was the lowest in Wales, being 2s. per 1,000 cub. ft. The granite he used was Penmaenmawr. He had a certain amount of granite from another quarry near Bala, but for the main streets he used Penmaenmawr. The cost per ton was 9s. at the station. They did not ask the county council to contribute anything towards the cost of tarring. The price of crude tar was 35s. per ton. He had used quantities of refined tar, but had found that the crude tar, a good quality one, was quite suitable for the roads there. The 8s. 4½d. for carting, of course, included everything—the man, veterinary attendance and horse, and the cost of feeding was the cost of fodder only. As regarded the private street works, the cost in the paper was per foot of frontage and not per foot of street. The cost of gullies and connections was included. As to refuse removal, the system he proposed was similar to that of Chiswick. The wages of the ashmen were 22s. per week.

At the close of the discussion the members were entertained to tea by Mr. England, to whom a cordial vote of thanks was passed for his hospitality.

Permissible Limits of Sewage Pollution as Related to New York Harbour.

By GEORGE A. SOPER, President of the Metropolitan Sewerage Commission of New York.

[Mr. Soper's paper, which, we learn from the "Engineering Record" from which we reproduce it—was presented before the American Public Health Association, recently, is the subject of editorial reference in the present issue.]

Starting with the fact that the water of which sewage is chiefly composed must eventually be discharged into some natural body of water, and recognising that it is usually impracticable to remove all the impurities beforehand, the question arises—To what extent must the sewage be purified?

In arriving at an understanding of this subject many general statements can be made, but upon attempting to apply them to any particular case it will often be found that they are lacking in that definiteness and suitability which is necessary in order that they shall have practical value. So much depends upon the uses to which the natural body of water is put after the sewage is discharged into it that hard-and-fast requirements are difficult to lay down. In some cases the most complete purification which it is possible to give will not be too much, while in others it will be permissible to discharge the sewage in practically crude condition. Each situation requires to be considered separately.

An instance in which the need for careful study of the local conditions was clearly recognised and a situation of more than ordinary importance from various standpoints recently arose in connection with the work of the Metropolitan Sewerage Commission of New York, which is a board of engineers created to make plans for the protection of New York Harbour against excessive contamination by sewage. The commission has recently drafted a report in which the permissible limit of pollution for the harbour is fully dealt with and a definite standard of cleanness for the water proposed. In addition to the conclusions of the board, the report contains a number of reports of sanitary experts who were engaged by the commission to express their individual views as to the desirability of establishing a standard of cleanness for the harbour and of the provisions which such a standard should contain. Following is a statement of the qualifications of the experts, the questions which were submitted to them and a brief synopsis of their replies.

THE EXPERTS.

The experts were selected from the professions of engineering, chemistry, biology and sanitary science. Each was given a list of questions to which he was asked to make written reply. The experts were afforded facilities for inspecting the harbour in order to become personally acquainted with the conditions created by the present method of disposing of the sewage, and with the uses to which the harbour waters were put, and were furnished with the printed reports of the commission. There were eight experts; their qualifications were briefly as follows:—

A foreign chemist: An eminent authority on the chemistry of sewage-polluted tidal waters and a contributor to the Fifth Report of the Royal Commission on Sewage Disposal of Great Britain.

An epidemiologist: Noted as an author and authority on the transmission of communicable diseases.

A sanitary engineer: Of wide practical experience in the design, construction and management of sewerage and sewage disposal works.

A civil engineer: Past-president of the American Society of Civil Engineers, and of much experience in sanitary work.

An American chemist: Professor of chemistry in a prominent technical school and author of various books on sanitary subjects.

A hygienist: Professor in a well-known technical school, author, and prominent sanitarian.

A health officer and chief engineer of one of the most progressive State departments of health in America.

A biologist, experienced in sanitary investigations, particularly with reference to the purification of sewage.

THE QUESTIONS.

(1) Do you think it would be desirable and feasible to establish a standard of cleanness for the waters of New York Harbour?

(2) If a standard is established, should it be based solely on chemical analyses, or would a mixed standard which would take into consideration the appearance of the water and perhaps its physical, chemical and bacterial condition be better?

(3) Should a standard of cleanness rest upon the amount of sickness and death which can be shown to be produced by pollution, or should the standard be based on what seems suitable and appropriate on the score of cleanness?

(4) Should the waters be kept pure enough for bathing, and, if so, where?

(5) Should the waters be kept pure enough for oyster culture, and, if so, in what parts of the harbour?

(6) Should effervescence, marked discoloration, decided turbidity, oily, sleek, floating solid sewage materials or deposits of sludge be permitted anywhere in the harbour, and, if so, where and under what circumstances?

(7) Should we establish one standard of cleanness for the whole harbour, or should there be different standards for different parts of the metropolitan district?

(8) If a definite standard of cleanness is desirable, how should that standard be expressed? Please give us a draft of your opinion as to the proper wording.

(9) Will the amount of dissolved oxygen in the waters of the harbour, expressed in a percentage of its saturation value, furnish a reliable index of the cleanness of the water, and, if so, what percentage should be adopted to secure each of the following results?—(*a*) That the waters of the harbour may not become offensive under any weather conditions. (*b*) That the use of public baths, if judiciously located, may not be prejudicial to the health of those using them. (*c*) That shellfish taken from the beds in present use may be eaten without danger to health. If the percentage of dissolved oxygen will not furnish a satisfactory standard, what standard would you suggest, and should it be based upon chemical analysis, or should it take into account chemical, physical and bacterial conditions?

REPLIES TO QUESTIONS.

All the experts considered that provisional standards of cleanness for the harbour should be established. Some favoured one standard; some another. In no case was a standard proposed solely in terms of chemical or biological analysis.

All laid emphasis upon the appearance of the water, and insisted that the standard of cleanness should be so framed as to provide that the water should look clean. All were of opinion that the standard of cleanness should not rest solely upon the effect of the harbour water upon the health of the people who lived in the near-by cities, or passed over the waters in ships, or worked upon docks and piers, or sought recreation in the parks on shores.

So far as sickness was concerned, it was the epidemiologist's opinion that the present condition of the harbour was not a serious menace to health; but he thought this no reason why sewage should be permitted to defile the water. Strong reasons existed for keeping the harbour clean. There was a public demand for clean highways and clean waterways as well. To the occasional visitor to New York it appeared that the limit of permissible pollution of its waterways had been reached. The waters were evidently heavily polluted with sewage.

The American chemist considered that the amount of disease and death directly produced would not be a proper measure of the objectionable nature of the harbour's condition. Conditions which offended the senses, and of the existence of which conditions he saw abundant evidence, should also be taken carefully into account, for such conditions indirectly lead to disease.

The civil engineer pointed out that while many lives probably could be saved and much ill-health alleviated by reducing the pollution, it was still more

important to consider the question of a clean harbour from the standpoint of what was suitable and appropriate on the score of cleanness. It was a case where civilisation demanded a remedy on the score of what was necessary for the comfort, happiness and welfare of the public.

BATHING AND SHELLFISH.

There was a preponderance of opinion among the experts that it would not be practicable to keep the waters of the inner harbour clean enough to make bathing entirely safe, but it was held to be both feasible and desirable to maintain bathing places near the sea and within easy reach of the public in satisfactory condition. Because some bathing was likely to occur in the populous parts of the harbour, in spite of any restrictions which might be made, and because the shores were certain to be crowded with human beings engaged in gainful occupations or seeking the water fronts for relaxation and fresh air, the hygienist and others thought the water along the shores ought to be kept as clean as practicable.

In the opinion of the sanitary engineer it seemed probable that if the open waters of the harbour were kept as clean as the requirements of business, pleasure and recreation demanded, there would be little danger to the public health, provided bathing and the taking of shellfish for food were restricted or prohibited. The foreign chemist did not think there was great danger in bathing, provided analyses showed that the water contained plenty of oxygen, was comparatively free from ammonia, and there was absence of visible sewage matters. The epidemiologist did not consider that there was a great danger of sickness from bathing in polluted water unless the sewage was discharged close to the bathing places. On the other hand, the sanitary engineer found it impossible to avoid the conclusion that considerable sickness was produced by bathing in the polluted water of New York Harbour. All thought it unnecessary that the waters of the inner harbour should be kept pure enough to make bathing perfectly safe, if suitable bathing places, such as Coney Island and Rockaway, could be maintained in satisfactory condition. The hygienist would have such bathing places as Coney Island kept in scrupulously clean condition. The civil engineer did not think it practicable to make bathing in the waters of the inner harbour entirely safe against disease, and regarded this as an unreasonably high standard of cleanness to seek to maintain. The American chemist considered that it would not be possible to keep the water in any part of upper New York Bay clean enough for bathing, and thought that bathing establishments on the water front of Manhattan and Brooklyn were a menace to public health. The very presence of these places, he pointed out, was a guarantee by the city authorities of the safe character of the water. The biologist expressed the opinion that the waters of the inner harbour should be abandoned for bathing and shellfish culture. The waters of the lower bay could, he thought, be kept clean enough for bathing and the cultivation of shellfish, and should be maintained in that condition.

OYSTER BEDS.

All the experts considered it impracticable to keep the waters in the inner part of New York Harbour pure enough for oyster culture, but with care it seemed to some to be possible adequately to protect the oyster grounds near the sea. The value of the oyster industry did not appear to the sanitary engineer to be of sufficient consequence to warrant the construction of the expensive works which would be necessary to ensure to the waters of the inner harbour a sufficient degree of purity to warrant oysters being taken from them. The hygienist did not consider the oyster business to be of sufficient importance to warrant the expenditure of large sums of money to secure any special degree of purity for the water. The danger of pollution from increasing sewerage was so great as to forbid the culture of shellfish in New York Harbour. The civil engineer thought shellfish should be protected against sewage to a degree which might result from sanitary human activities, if this protection could be made genuinely effective. The health officer would not permit oysters to be cultivated anywhere within the metropolitan district except under strict supervision and control, and the biologist thought it might ultimately be necessary to sacrifice all oyster beds within the metropolitan district.

VISIBLE POLLUTION.

All the experts held the opinion that while visible evidences of sewage was practically unavoidable near sewer outfalls, large sewage solids should not be present anywhere in the harbour except, perhaps, to a limited extent from the shipping. A small amount of oily sleek was permissible, but sludge and the escape of gases due to putrefaction should be prevented. The foreign chemist believed that sewage solids, either floating or deposited and gas should certainly not be permitted anywhere except such as come from boats, but that some discoloration and turbidity might be allowed in the vicinity of suitably situated outfalls. The sanitary engineer considered that turbidity and discoloration might be tolerated over relatively small areas in the immediate vicinity of properly located sewer outfalls, and oily sleek be allowed, provided it consisted simply of very thin films of oil in isolated and relatively small areas. The civil engineer would not permit sewage to be visible at the points of sewage outfall or elsewhere, and thought that the sewage should be purified or discharged into deep water under circumstances which would prevent its appearance from the shores, docks and other places where it might prove offensive. The water should not be allowed to become so polluted as to be blackened. Deposits of putrefying sludge should not be permitted to occur along the docks.

In the opinion of the American chemist the presence of oily sleek was not objectionable, since he did not consider it unsightly, and an infinitesimal amount of oily matter might produce it. He considered that it would be impossible to keep the water free from discoloration and turbidity, on account of the natural silt which the Hudson river carried down from the northern part of the state. Floating solid sewage material should not occur. Conditions which were disagreeable or disgusting either to the sight or smell of the average citizen using the waters for rowing, sailing or similar purposes of pleasure and recreation the hygienist thought should not be permitted.

The health officer felt that the visible evidences of sewage were so objectionable, and already existed to such an extent, that immediate steps should be taken to construct a system of main drainage and sewage disposal. This view was also held by the epidemiologist and others. The civil engineer expressed the opinion that no time should be lost in determining upon and beginning this work so that the pollution of the harbour might be reduced rather than increased, a result which he considered inevitable if wise action was not soon begun. The biologist's opinion was that occasional discoloration, turbidity and sleek could scarcely be avoided in the vicinity of a great city, but these conditions should not be permitted to become persistent or of frequent occurrence, otherwise they would constitute what he regarded as a short-sighted and uneconomic waste of one of the city's most precious assets.

DISSOLVED OXYGEN.

So far as the permissible draught upon the oxygen was concerned, there was no unanimity of opinion. All who expressed themselves upon this point considered that a deficiency of 50 per cent indicated serious conditions. The civil engineer's idea was that the sewage should not anywhere reduce the percentage of dissolved oxygen below 50 per cent. In the neighbourhood of permanent or comparatively permanent beds for the cultivation of shellfish, the standard should insure bacterial purity. In the vicinity of bathing-places the water should not only be of a high standard bacterially, but should also be free from floating sewage, should have a large amount of dissolved oxygen, and should be chemically near to the normal condition of pure salt water or water of the normal salinity due to its position. In the neighbourhood of docks and thickly populated shores it might be sufficient to provide a physical standard of purity.

The American chemist was not prepared to suggest a definite amount of oxygen as the least permissible to seek to maintain, although he believed 70 per cent was an unduly severe measure by which to be guided. He considered that the physical appearance of the water, more complete chemical analyses than determinations of dissolved oxygen and bacterial examinations, should be included in the standard of cleanness.

For the more polluted parts of the harbour the biologist suggested that the dissolved oxygen be at no time and at no place allowed to fall below 50 per cent of its saturation value. No effervescence, marked discoloration, decided turbidity, oily sleek, floating solid sewage materials, deposits of sludge, or other conditions offensive to sight and smell should be permitted in any part of the harbour. For the less polluted regions—the outer bay, for example—the standard should be primarily sanitary, and should rest upon bacterial rather than chemical data

The foreign chemist would establish a higher standard of purity than any of the experts mentioned, so far as oxygen was concerned. He would not permit the oxygen to be exhausted below 60 or 70 per cent of saturation at low tide under calm weather conditions and at any point within 200 yds. of a point of sewage discharge, either at the surface or any depth below it. Before discharge the sewage should be freed, as far as possible, of solid matters by means of mechanical subsidence, or, in the case of unfavourably situated outfalls which it would be difficult or impossible to remove, by chemical precipitation. In his opinion, such a requirement would ensure proper protection to the harbour without undue hardship upon the taxpayers. The water beyond the neighbourhood of the sewer outfalls would, in all probability, show no appreciable deficiency in dissolved oxygen, not even when the volume of sewage to be disposed of became largely increased with the increase of population.

OPINION OF THE COMMISSION.

With regard to the degree of cleanness which should be maintained in the harbour waters, the commission has officially recommended the following specific requirements:—

(1) Garbage, offal or solid matter recognisable as of sewage origin shall not be visible in any of the harbour waters.

(2) Marked discoloration or turbidity due to sewage or trade wastes, effervescence, oily sleek, odour or deposits shall not occur except, perhaps, in the immediate vicinity of sewer outfalls, and then only to such an extent and in such places as may be permitted by the authority having jurisdiction over the sanitary condition of the harbour.

(3) The discharge of sewage shall not materially contribute to the formation of deposits injurious to navigation.

(4) Except in the immediate vicinity of docks and piers and sewer outfalls, the dissolved oxygen in the water shall not fall below 3·0 cubic centimetres per litre of water. (Within 60 per cent of sea water and 40 per cent of land water, and at the extreme summer temperature of 80 deg. Fahr., 3.0 cubic centimetres of oxygen per litre corresponds to 58 per cent of saturation.) Near docks and piers there should always be sufficient oxygen in the water to prevent nuisance from odours.

(5) The quality of the water at points suitable for bathing and oyster culture should conform substantially as to bacterial purity to a drinking water standard. It is not practicable to maintain so high a standard in any port of the harbour north of the Narrows or in the Arthur Kill. In the lower bay and elsewhere bathing and the taking of shellfish cannot be prohibited [illegible] outfalls [illegible] of a sewage outfall.

New School at Southend.—Mr. William Gregson, chairman of the Essex Higher Education Committee, on Tuesday laid the memorial stone of a new secondary school for girls at Southend, which is to cost £25,000, and will accommodate 400 students.

Surveyors' Institution.—The opening address of the president of this body, the Hon. Edward Strutt, will be delivered at a meeting which is to be held on November 11th when [illegible] for the best paper [illegible] last session will also be announced. Papers on "The Amendment of Rural Building By-laws," by Mr. W. Woodward, F.R.I.B.A., and "Some Urban Housing Problems," by Mr. M. Price Holmes, will be discussed at a meeting of the institution which will take place on January 27th.

Lawn Tennis Courts at Llanelly.—Mr. J. H. Montgomery, deputy surveyor to the Llanelly Urban District Council, informs *Lawn Tennis* that four courts have been laid down at Parc Howard, three of which were sown with Carter's seed and special manure, in June last, on 6 in. of soil laid over one foot of clinker. A hard court has also been laid and is formed with a bottom layer of 12 in. of clinker. On this was placed 1 in. of old macadam taken from the roads in the district, and well rolled before the top layer of tarred limestone chippings ½-in. gauge was laid on. This layer was about 3 in., rolled down to about 2½ in. thick. The surface was then sprayed with tar and sand, spread over and again rolled. Mr. Montgomery adds that the court plays truly and is fast, and that he does not anticipate any maintenance charges, except an occasional spraying and sanding, for the next fifteen years.

LONDON COUNTY COUNCIL CHIEF ENGINEERSHIP.

NAMES OF SELECTED CANDIDATES.

We are unofficially informed that the following are the selected candidates for the position of chief engineer to the London County Council, rendered vacant by the resignation of Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E.:—

Mr. J. W. Bradley, M.INST.C.E., city engineer of Westminster.

Mr. S. E. Burgess, M.INST.C.E., borough engineer of Middlesbrough.

Mr. G. F. Carter, M.INST.C.E., borough engineer of Croydon.

Mr. W. C. Copperthwaite, M.INST.C.E., bridge engineer to the London County Council.

Mr. G. F. Griffiths, engineer to the Thames Conservancy.

Mr. G. W. Humphreys, M.INST.C.E., deputy engineer to the London County Council.

Mr. Chas. F. Marsh, M.INST.C.E., deputy engineer, Metropolitan Water Board.

Mr. W. H. Prescott, M.INST.C.E., engineer and surveyor to the Tottenham Urban District Council.

Mr. E. Sandeman, M.INST.C.E., chief engineer, Derwent Valley Water Board.

Mr. F. E. Wentworth Sheilds, M.INST.C.E., Docks Department, L. & S.W. Rly.

Mr. J. Walker Smith, M.INST.C.E., chief engineering inspector to the Local Government Board for Scotland.

Mr. W. J. Steele, ASSOC.M.INST.C.E., city engineer, Newcastle-on-Tyne.

Mr. H. E. Stilgoe, M.INST.C.E., city engineer of Birmingham.

Mr. H. T. Wakelam, M.INST.C.E., county engineer of Middlesex.

SOUTHWARK BRIDGE.

REBUILDING TENDER ACCEPTED.

After negotiations proceeding over three years, the Bridge House Estates Committee of the City of London Corporation on Tuesday carried the matter of the Southwark Bridge improvement a definite step forward by accepting the tender of Sir William Arrol & Co., Limited, for the execution of the necessary works. The amount of the successful tender did not transpire, but it is generally understood that the cost of the improvement will be nearly £300,000. All the arrangements are in an advanced state, and everything points to the workmen being engaged on the improvement before Christmas next.

The first operation to be taken in hand will be the construction of a temporary footbridge over the Thames by the side of the present structure, and it is anticipated that something like four years will elapse before the entire scheme is completed. In the contract provision is made for the widening of Southwark Bridge to the width of Queen-street-place, the construction of a straighter approach, and the reduction of the gradient, which is at present very steep, by several feet.

Wooden Water Pipes.—It is announced by the South Australian Official Intelligence Bureau that in order to test the utility of wooden water pipes the Government have placed a contract for the supply of a considerable quantity to be employed in connection with two large water schemes at Millbrook and Mount Crawford respectively. The company who have received the contract propose to erect extensive works at Port Adelaide in order to carry it into execution, and to supply pipes to the value of £40,000 for use on the Umeratumbika water [illegible] which is to serve Broken Hill.

BRIDGE DESIGN.—Engineers who are concerned with the principles of designing ordinary highway bridges of moderate spans will find the work on this subject by Reginald Ryves, Assoc.M.Inst.,C.E., M.S.A., F.R.Met. Soc., a practically helpful treatise on original lines. It is published by the St. Bride's Press, Limited, of 24 Bride-lane Fleet-street, London, E.C., at 2s. net (post-free 2s. 2d.), bound in cloth and well illustrated with Engineering Diagrams

Law Notes.

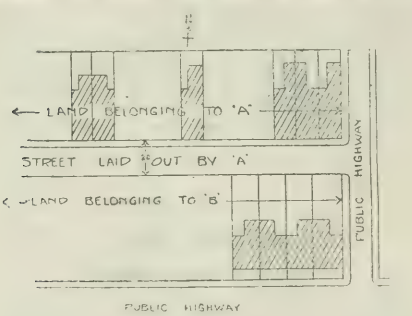
Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction — i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. *The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.*

Private Street Works.—"Eastern" writes: In 1896 a plan was submitted by an owner A of a building estate for laying out a new street. This was approved by the council, and the street was subsequently laid out by A. The plan showed a road 25 ft. in width, with a footpath on the north side only, and building plots only on this side; the land on the south side was the property of another owner B. Several houses have been erected on the north side of this road, also houses on the south side, the latter fronting another road, but abutting on the road in question. My council now desire to make up this



road under the provisions of the Private Street Works Act, 1892, and, on making enquiries as to ownership of the various properties, I am informed that A, when he laid out the road, reserved a strip of land 1 ft. in width along the south side to prevent B from gaining access from his land to this road. There is nothing in the road to define this reserved strip of ground, and the public have been allowed to walk over it. On measuring the width of the road, however, I find that it is 26 ft. wide (the plan approved was for a road 25 ft. in width). Will you kindly give me your opinion on the following points: (1) Does the fact of the public being allowed to walk over the reserved strip of land for a period of sixteen years dedicate this to the road? (2) Who is the frontager to be apportioned under the provisions of the Act for the land on the south side?

(1) If the public have used the strip during this period, openly as of right, without interruption, this would be such strong evidence of dedication as to be practically conclusive, in the absence of any rebutting evidence. (2) Assuming that the strip in fact forms part of the street, the owners of the land and houses on the south side are chargeable.

By-Laws: Picture Theatre.—"Alpha" writes: A plan has been submitted for a proposed picture theatre. It is intended to be built in the main street, coming right up to the street, in the centre of the town, and adjoining some shops on one side, and on the other side to be set back 8 ft. from a proposed new side street. The outside walls are to be constructed as follows: 9-in. brick foundation walls to main walls, 10-in. by 5-in. R.S. stanchions, 10-ft. centres, resting on 2-ft. 6-in. by 2-ft. 6-in. by 2-ft. concrete blocks. In between the stanchions are to be filled in with 4-in. by 3-in. wood framing, covered with Hyrib sheets, finished outside with cement and pebble dash or rough cast, and inside with plaster. No thickness is shown for the wall but most likely it will be 5 in. or 6 in. at the most. The plan was disapproved on the following ground: "That the walls are not constructed of incombustible materials." Our contention is that the 4-in. by 3-in. wood framing covered with Hyrib sheeting and finished plaster is not incombustible within the meaning of the by-laws. (1) Are we right in our contention that the walls are not constructed of incombustible materials, and could we insist on the outside walls being 13½ in. thick, as required for public buildings, and built of brick or stone? (2) The gallery is proposed to be built entirely of wood, including the principals and uprights; it is simply 7-in. by 3-in. wood framing. Have we any jurisdiction over this? Could we insist on the uprights being R.S. stanchions instead of 7-in. by 3-in. battens? The public have to pass the back of this gallery to get into the building, but nothing is proposed to be stored under the gallery.

(1) I think the council's contention is correct. In my opinion a wall partly constructed of wood framing is not constructed of hard and incombustible materials within the meaning of the by-law. Under by-law 20 the council can require the external walls to be 13½ in. thick, and either of bricks or of suitable stone, or other blocks of hard and incombustible substance. (2) There does not appear to be any provision in the by-laws which would enable the council to insist on any particular kind of uprights, but by-law 55 (x) would, presumably, apply to the floor of the gallery (unless it is intended to be used for private purposes). If, however, Part III. of the Public Health Acts Amendment Act, 1890, has been adopted, the council could, under sec. 33 of that Act, insist upon the building being substantially constructed, regard being had to the purposes for which it is intended to be used, and this might justify the suggested requirement as to uprights of the gallery.

By-Laws: Exemption: Height of Rooms.—"C.F.B." writes: "I should like your opinion on the following points: (1) A railway company are about to erect houses for their workmen in this district, and claim they are exempt from sending in plans for approval by the council. Is this so? (2) Plans have been deposited with this council for houses in which the bed-rooms on the first floor are not shown to be the full height of 9 ft. over the whole area. I contend this is against the by-laws (copy forwarded), but the owner claims otherwise. Please give your opinion. (3) The same owner sends in the height of his scullery (one storey only) similar to above, the height to ceiling being only 8 ft. and 7 ft. to eaves, contending that it is not a habitable room. The size is 7 ft. 6 in. by 7 ft., with copper and sink in it. I contend it is a habitable room, and should be 9 ft. high over the whole area. What say you?

[copy of by-laws.]

Height of Rooms.

66. Every person who shall erect a new building shall construct every room in such building which shall be intended to be used for human habitation, in accordance with such of the following regulations as may be applicable to the circumstances of the case, that is to say,—

(1) Every such room which is an attic, or a room wholly or partly in the roof of such building, shall, over at least two-thirds of the area of the floor, be not less than nine feet in height, and shall not in any part be less than five feet in height:

(2) Every such room which is not an attic, or a room wholly or partly in the roof of such building, shall not in any part be less than nine feet in height.

(1) No, unless there is any clause in their special Act which would have the effect of exempting them. Buildings used *for the purposes of the railway* would be exempt under sec. 157 of the Public Health Act, 1875, but this does not apply to houses built for their workmen (see *Scargill and Carmarthenshire Railway Company v. Burnley Local Board*, 13 L.T., 749). (2) If this is an attic (as it would appear to be), it is sufficient if the height is 9 ft. over two-thirds of the floor area. (3) In my opinion this is a room intended to be used for human habitation within the meaning of the by-law.

Highway Repair: Damage to Water Main. "Stop-cock" writes: A county council, in the exercise of their powers as a highway authority, are improving and repairing a section of main road by re-ballasting and surface metalling. In the course of carrying out the work a water main, laid by a private company under statutory powers, is alleged to have been displaced and the joints broken. Are the county council liable for the cost of the repairs to the main if it can be shown that the damage has resulted from the work they are carrying out? Can it not be maintained that the powers possessed by the water company under their statutory powers, &c., do not take away or abridge any of the powers vested in the

highway authority for which such authority was constituted, and that therefore the highway authority could not be held liable for any expenses in addition to that which they would have necessarily incurred in reconstructing and repairing the road if the main had not been laid under it, for instance, as in the case of a tramway (sec. 32, Tramways Act, 1870)? Does not the onus of protecting their main from damage by traffic, or repairs carried out with the aid of a steam roller, rest entirely with the water company?

If the main was at a sufficient depth as not to have been injured by the ordinary mode of repair if the steam-roller had not been used, the council are liable. See *Gas Light and Coke Company* v. *St. Mary Abbots*, (15 Q.B.D., 1).

Connections to New Sewers: Cellar under Street.—"Diz." writes: (1) Some time ago my council approved plans for two houses in parts of their district where there were no sewers, and allowed the drainage from the buildings to be carried to open mill leats. My council are now carrying out a drainage scheme, which will enable these houses to be drained to the new sewers, but to do so it necessitates the relaying of the house drains in the opposite direction. Under these conditions, can the council call upon the owners to connect to the new sewers? (2) With reference to sec. 26 of the Public Health Act, 1875 (Part 2)—(*a*) Does "carriageway" include the footway of a street? (*b*) Can a person who has premises with a cellar under a footway build new premises with a new cellar under a footway without the consent of the council as to the construction of the cellar? (*c*) or erect new premises, on site that has not had a cellar, constructing a cellar under the footway without the consent of the council? (*d*) Would the approval of the plans be the council's consent for the construction of the sewer, or must the owner make separate application for consent?

(1) If the drains are sufficient for effectual drainage the council cannot call upon the owners to provide new ones. But the council can close the old drains and provide new ones at their own expense under sec. 23 of the Public Health Act, 1875. (2) (*a*) No. (*b* and *c*) The consent of the council does not appear to be necessary, except so far as any by-laws may apply. (*d*) I think the approval of plans would be sufficient.

Water Stand Post.—"Disturbed" writes: A borough council some years ago erected a stand post for filling water carts in a public street. Since its erection a house has been built, and the presence of the stand post causes a nuisance and annoyance to the occupants of the ground floor by reason of the noise in the early morning and, indeed, all day. Children play with the cap and fittings and cause further noise and annoyance. The man from his elevated position can see right into the room, &c. (*a*) Under what powers are stand posts erected by metropolitan boroughs? (*b*) Have the Water Board powers over these stand posts, and, if so, what powers? (*c*) If the stand post was legally erected and caused no nuisance at the time, would the altered circumstances—*viz.*, the erection of the dwelling house—make any difference, and what powers have the occupiers to proceed against the local authority if the latter decline to remove the stand post?

(*a*) I cannot find that the metropolitan borough councils have any powers to erect stand-pipes. The control of the water supply of the metropolis was formerly in the hands of eight water companies whose undertakings have now been taken over by the Metropolitan Water Board. It may be that the stand post in question was erected by the council by arrangement with the water company. (*b*) The board would have such powers as were conferred on the respective water companies by their special Acts, and (if incorporated therewith) by the Waterworks Clauses Act, 1847. The only material clause in that Act seems to be sec. 37, which provides that in all pipes to which any fire-plug shall be fixed the undertakers shall provide water for (*inter alia*) street watering. The section does not expressly authorise the erection of stand posts, but I think it would be held to do so by implication. See *Metropolitan Water Board Company* v. *St. Matthew, Bethnal Green* (17 Q.B.D., 475). (*c*) I think the altered circumstances would make a difference, and would entitle the owners or occupiers to an injunction if a sufficiently strong case could be made out; see *Sturges* v. *Bridgman* (11 Ch.D., 852). A nuisance by noise, however, is emphatically a question of degree, regard being had to the character of the neighbourhood.

Cesspool Construction.—"Watertight" writes: By-law No. 89 of those in force within this borough reads thus: "Every person who shall construct a cesspool in connection with a building shall construct such cesspool of good brickwork in cement, and with a backing of at least 9 in. of well-puddled clay around and beneath such brickwork. He shall also cause such cesspool to be arched over, or otherwise properly covered over, and to be provided with adequate means of ventilation." If a cesspool constructed as above is still not watertight, has the local authority power to insist that it shall be made watertight? By the insertion of the portion of the by-law relating to clay puddling, it seems evident that the intention of the by-law is to compel a watertight cesspool.

If the leakage is due to the fact that the work required by the by-law has not been efficiently carried out, the local authority can enforce compliance with the by-law in this respect. In the event of a nuisance occurring, from whatever cause, the authority can proceed under sec. 41 of the Public Health Act, 1875.

Rain-Water Pipes.—"Owner" writes: A rain-water pipe from the roof of a building discharges on to a public footpath, either directly or through a forecourt. In order to prevent the stream of water from the pipe damaging the surface of the footpath, particularly where the latter consists of ashes or asphalt, it is usual to fix in the footpath a cast-iron conduit, provided with cover-plate to convey the water to the street channel. Who is liable to provide this conduit, the owner of the building or the local authority, where the latter is either (1) a rural district council, (2) an urban district council, or (3) a corporation?

There does not appear to be any enactment directly imposing such a liability on either the owner or the local authority. But under sec. 74 of the Towns Improvement Clauses Act, 1847, an urban district council can require the owner or occupier to fix a pipe to carry the water from the roof "in such manner that the water from such house or any portico or projection therefrom shall not fall upon the persons passing along the street or flow over the footpath." This section would apparently enable the council to require the owner to provide a conduit or some other means of preventing the water from flowing over the footpath. Municipal corporations are urban district councils for this purpose. The enactment does not apply to rural districts, but if the owner or occupier in such a district permitted water to flow over the footpath to such an extent as to be a public nuisance he would be liable to be indicted.

New Street.—"Street" writes: Some years ago the owner of an estate submitted a plan for a new street, 12 yds. wide, which was approved by the authority. Only a part of the street was formed, and this part was built upon. The remainder of the estate has changed hands, and the present owner, who is a builder, wishes to develop the land differently, and not continue this street, but to leave it a *cul-de-sac*, as it is at present. Can the authority compel the builder to make this street in accordance with the original plan, which was approved twenty years ago, or will the builder be in order in closing the street at the end of the portion already formed?

If the unformed part of the street has been used by the public as a highway, uninterruptedly, and as of right, for any considerable time, this would be very strong evidence of its having been dedicated as a highway, and in that case the builder could not enclose it. If, however, it has not been so dedicated the authority could not compel the builder to lay it out as a street.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

New Reservoir for South Wales.—The first turf of the Abertillery and District Water Board's new reservoir in the Grwyne Fawr Valley was cut last week. The reservoir will serve a population of 80,000.

Continental Municipal Engineers at Hampton.—On Monday afternoon a large party of members of the Association Generale des Hygienistes et Techniciens Municipaux—a body which consists largely of municipal engineers and medical officers of cities and towns in France, Belgium and Switzerland—paid a visit to Hampton for the purpose of inspecting the works of the Metropolitan Water Board and the district council's sewage disposal works. The party, who were under the care of Mr. Thomas Cole, secretary of the Institution of Municipal and County Engineers, were met at the waterworks by Mr. W. B. Bryan, the chief engineer to the Water Board, Mr. H. B. Stent, resident engineer, and Mr. S. H. Chambers, engineer and surveyor to the district council, and spent nearly an hour in their examination of the undertaking. The visitors next proceeded to the sewage works, inspecting *en route* a section of tarred road. Some time was spent in examining the hydrolytic tank—which, as is well known, is a feature of these works—percolating filters, power-driven distributors, and other details, thanks for the cordial reception extended to the party being expressed before departure by M. Montricher, of Marseilles, speaking on behalf of M. Arthur Metz, vice-president of the association, who was among those present.

TOWN PLANNING: WHOSE WORK?

To the Editor of THE SURVEYOR.

SIR,—In a recent number of your paper you invited opinions from readers on the above question. I should like to give an expression of my ideas on the subject.

Let me say clearly at the outset that it is my opinion that the municipal engineer is best qualified to prepare a town planning scheme. Having said this, I must also give it as my decided opinion that if the engineer is successfully to carry out this work without incurring the censure of the architects and everyone interested in the beauty of our towns, he must cultivate an "architectural sense." By this I do not mean that he must become an architect, with all the training that it involves, nor that he should cover his work with gimcracks evolved by the architectural draughtsman, or be carried away by that folly which attempts to make a water tower look like a Norman keep or a sewage tank to appear as an ornamental lake. What I do mean is that the engineer should study the principles of beauty in design, and apply them to his own particular work.

This sense of beauty—the "architectural sense," as I have called it—once acquired must inevitably influence the engineer's town planning, and remove from him the stigma of ugliness which at present attaches to his works. When planning his roads he will then consider their prospects and vistas; when arranging his areas for residential purposes, his sites for public buildings and parks, he will consider the possibilities of architectural grouping, the dignity essential to public places, and the preservation of natural beauty.

Moreover, this sense of beauty in design will assert itself in his bridges, culverts, embankments, and all other works which essentially belong to his science. That this sense of beauty has been sadly lacking among engineers in the past is all too evident. Can anyone stand on Waterloo Bridge and look westward without feeling that a great profession should be ashamed of producing such a vulgar monstrosity as Hungerford Bridge?

Engineering structures can be made beautiful by a right use of materials, and a sense of line and proportion, without altering their character as such. As an instance of such a one let me cite the new reinforced-concrete bridge at Thorverton, Devon (built in 1910 to the designs of Mr. S. Ingram, county surveyor). The beauty of this is apparent in the graceful curve of the arch surmounted by the line of the roadway, and the careful treatment of detail. Yet it is an engineer's bridge, built with an engineer's materials. Its beauty is a spontaneous one, due to a simple and natural use of materials proper to the structure, and expressive of its purpose. I cannot see why engineers generally cannot study this possibility for beauty in their works.

If the engineer approaches his work in this spirit, the architect will find his work assisted by the sympathetic foresight of the former, and much of the enmity between the two professions will cease. If the engineer cannot or will not acquire this "architectural sense," then let him openly acknowledge his deficiency and make it his duty to collaborate with an architect at every stage of preparing a town plan.—Yours, &c.

F. G. [illegible]

Surveyor's Office,
Town Hall,
Sandown, I.W.
October 18, 1912.

To the Editor of THE SURVEYOR.

SIR,—I am afraid that there are many municipal engineers and architects even claiming that town planning is essentially his work.

Town planning involves many things, a number of which Mr. Wilkes, in his letter, has enumerated; however, it seems to me that Mr. Wilkes has contradicted himself, for in the first part of his letter he says that the planning of a new town is essentially the work of a municipal engineer, and in the latter part he says that the British architect's true function is to do for his town what his prototype has done for Düsseldorf, and to concede to the municipal engineer his true work of town planning construction and maintenance. I take it, therefore, from the latter part of Mr. Wilkes' letter that he agrees that town planning is the work of the architect, but—and I agree—that town planning construction and maintenance is the work of the municipal engineer.

There is a broad distinction of definition between architect and engineer; an architect is a member of a professional art, and an engineer is a member of a science.

The question now is, Does town planning come under the former or the latter? I think there is no doubt that it comes under the former; town planning is essentially a work of art. But when one comes to the constructional part of town planning, then it is the work of science, and this is when the engineer takes his place. Thus the two work together, the architect doing the planning and the engineer the construction.

As regards the most delicate negotiations, and so forth, which Mr. Wilkes refers to, and into which the architect would be plunged, am I to understand that the architect would not be able to carry these negotiations through? Here, again, of course, I admit the municipal engineer in whose district the town planning scheme is can materially help the architect, and I doubt not that all municipal engineers would do so. I think it will, however, be admitted by Mr. Wilkes, and all municipal engineers and architects, that the carrying through of a town planning scheme is not the work of either engineer or architect alone, but of both. By the term architect, I am not taking into consideration the estate agent who terms himself an architect, but whose calling has nothing whatever to do with architecture.—Yours, &c.,

J. BARBER.

North Finchley, N.
October 16, 1912.

To the Editor of THE SURVEYOR.

SIR,—May I correct one error in the letter of Mr. A. J. Price? He says that "garden city and garden suburb schemes are essentially promoted by building speculators."

Inasmuch as the return of capital is limited to 5 per cent, and that the companies which are responsible for the schemes do not themselves build at all, except in the case of co-partnership tenants, where houses are not sold, the description is surely very far removed from the fact. Mr. Price's acquaintance with the garden city movement is apparently of the very faintest, for he says "the main feature is the effort to cheapen road making"! And this in the year of grace 1912.

The observations on the federal capital plan, however, are worthy of note, and I may say that on November 20th Mr. W. R. Davidge, F.S.I., A.R.I.B.A., ASSOC.M.INST.C.E., will give a lecture on the subject here at 5 p.m., illustrated by plans and models. I shall be pleased to send an invitation to any of your readers who may like to see the subject dealt with by one who is both an architect and surveyor.—Yours, &c.,

EWART G. CULPIN,
Secretary, Garden Cities and
Town Planning Association.

books, golf links or schools that are not related to the places in the county which are dealt with in the book. The same applies to that portion of Kent which lies fairly near to London. It is just possible that in looking through the article on the books to read that you may find the author has included books dealing with one or two places not dealt with in a separate descriptive section (*e.g.*, Gravesend). The reason for this is that we had hoped to be able to include several other places, for which at the last moment we were unable to find room, but as these places were mentioned in certain of the preliminary articles we did not deem it advisable to delete them from those articles. The tendency of the book was to run far outside the limits of what we could possibly give for 1s., and I note that you speak of the book as a marvel of cheapness.

There is no doubt that in this the first edition there are probably one or two small errors or omissions, and, of course, we are quite pleased to have these pointed out, so that we may correct them in future issues. Naturally, we also hope to be able to deal with additional places in succeeding issues.—Yours, &c.,

NON-SLIPPERY WHINSTONE.

To the Editor of The Surveyor.

Sir,—Your correspondent "Scotch Whinstone" avers that "he has seen many miles of streets paved with whinstone setts, but has never observed slipperiness in such paving." The exact value of this testimony cannot be estimated in the absence of more definite data; of itself it does not go far to confute my view that whinstone is an undesirable material for paving tramways.

It is easy to understand that evidence of slipperiness in sett paving may exist, but be unobserved by a casual pedestrian; it is the riders and drivers of horses who have cause to notice it, so likewise has the surveyor, who usually gets the blame for it. "Scotch Whinstone's" testimony would probably have been very different had he had official responsibility for the condition of whinstone-paved streets. Possibly his observations may have been made on newly laid whinstone or where it is laid in streets with light traffic. I have myself paved with whinstone many miles of streets where the traffic has been of the "milk cart order" and unlikely to wear any paving slippery in a generation.

But to bring the consideration of this question more closely to my point—*viz.*, the wisdom, or otherwise, of using whinstone for tramway paving—as pointed out in my previous letter, the responsibility upon tramway authorities for maintaining their paving free from slipperiness is much more direct and onerous, under the decision of the House of Lords in the Dublin case, than that of road authorities. As an example of the cost thus entailed, Cardiff spends over £1,000 per annum in gritting its tramway tracks, which are almost wholly paved with hard wood. This evidences the importance of using a paving material not prone to slipperiness.

That it is the general view of road surveyors that whinstone wears slippery is evidenced by the fact that local authorities, both English and Scotch, invariably give this as their reason for declining to approve the use of whinstone setts by companies about to construct tramways in their districts. That a municipal authority (Portsmouth) should use setts of this material was therefore not a little surprising. Possibly the explanation may be that in this instance the committee were not acting under the advice of the borough surveyor, but of the tramway manager; as a rule, such gentlemen are not experts in paving materials.

As your correspondent rightly says, "he must be ignorant indeed who cannot tell Scotch whinstone from Scotch granite." The fact that the two materials are so unlike is the reason of my complaint that traders sometimes apply the latter term to the first-mentioned material; there must be an intent to deceive by this. "Scotch Whinstone" tells us such a practice is unknown north of the Border; doubtless, even tramway managers and town councillors are too much "on the spot" there to be misled by such a misuse of terms.—Yours, &c.,

W. J. Howard-Smith.

Westminster.
October 23, 1912.

THE CROMPTON PAVEMENT.

To the Editor of The Surveyor.

Sir,—To have taken up your valuable space by directly answering Mr. W. J. Howard-Smith's very elementary question as to why a percentage of cement is employed in the manufacture of asphaltic paving mixtures was farthest from my thoughts when I suggested that it seemed a pity that he should make invidious comparisons between asphaltic paving mixtures.

I will refrain from commenting upon Mr. Howard-Smith's retort courteous giving his opinion as to the personal motives which he imagines actuated my criticism of his former letter, but would now humbly beg of him to enlighten the paving world upon what he calls "liquid 'bitumen' (*i.e.*, British)," and so refute the strictures which I made upon his apparent lack of knowledge on this subject.—Yours, &c.,

Cecil Nathan.

3 London Wall Buildings,
London, E.C.
October 18, 1912.

To the Editor of The Surveyor.

Sir,—I have followed the correspondence on this subject with much interest.

Mr. Howard-Smith will know that it is not difficult to ascertain the length of time that any particular expert has been connected with a material such as bitumen, and whether any inferred claims to possess superior knowledge are based on long experience or otherwise. At the same time I do not quite understand what Mr. Howard-Smith means by "bitumen (*i.e.*, British)." If he refers to tar and pitch, then I must say I think he should make this more clear, and not lead us to think that Nature had, perhaps, been keeping abreast of the times by giving us bitumen in this country just at the moment when natural materials are being so much sought after. Seeing, however, that bitumen is not found in commercial quantities in Britain, and as we shall always, unfortunately, be compelled to import natural bitumen, Mr. Howard-Smith must have been referring to tar, pitch or some other artificial material, and using the word bitumen in the same loose way that many others have done.—Yours, &c.,

Natural.

October 21, 1912.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

278. Mechanics.—Give an expression for the tension of the bucket rod or piston rod in a common suction pump. The barrel of the pump is 8 in. diameter, and the stroke of the bucket or piston is 10 in. Find the work done per stroke in ft.-lbs. when the spout is 16 ft. above the surface of the water in the well. (A.M.I.C.E., October, 1901.)

280. Building Construction.—The walls at the base of a high brick tower are 3 ft. 9 in. thick. Describe, with drawing, what footings should be provided, the thickness of concrete, and the distance below the surface. (T. R.)

281. Surveying.—Upon what trigonometrical rule does triangulation depend? Prove that the sides of a triangle are proportional to the sines of the angles opposite to them.

282. Hydraulics.—Explain simply what is meant by the "hydraulic gradient" of a pipe, and how this may be obtained in any given case. ("Pupil.")

REPLIES TO QUESTIONS.

277. Sewage Disposal.—What main principles should be kept in mind in arranging the sewage disposal of the following: (*a*) A village of 800 inhabitants (purely agricultural)? (*b*) A town of 2,000 inhabitants (industrial)? (*c*) An infectious diseases hospital of 100 beds? ("Charger.")

The main principles to be kept in mind in the arrangement of works of sewage disposal are those of economy and efficiency. The works should require a minimum of attention in order that the cost of maintenance may be as low as possible.

(*a*) The question of the removal of sewage comes under two main heads—viz., the conservancy system and the water-carriage system. The first named is now practically obsolete except where houses are very scattered. In a village of this size it is probable that a system of sewers is either already in existence or is contemplated. The cheapest method of disposing of sewage is by running it direct into a stream, but Section 17 of the Public Health Act, 1875, does not permit the use of a sewer for conveying sewage into a watercourse until it is purified to such an extent that it will not deteriorate the quality of the water in that watercourse. The allowing of sewage to flow into a stream is an offence under Section 3 of the Rivers Pollution Prevention Act, 1876. Local Authorities are therefore called upon to purify the sewage before turning it into any stream.

The disposal works should be situated, if possible, in such a position that the sewage may gravitate from the village to them, and so eliminate the necessity and cost of pumping. At the same time the works should be as far removed from houses as is practicable.

The amount of the sewage to be dealt with will depend largely upon whether there is a public water-supply or not, and whether the sewerage is on the separate or combined system. If the water-supply is taken from wells and springs an allowance of 15 gallons per head per day should be ample, but in case of a proper water supply at least twenty gallons per head per day should be allowed. If the sewerage is on the combined system, or a combination of separate and combined, provision will also have to be made for storm water.

The purification of the sewage may be effected by land treatment, chemical precipitation, or by bacteriological or biological methods. If land can be acquired cheaply, suitable as regards nature of soil and position, land treatment may be considered. It must be borne in mind that sewage farms are to be run for efficiency and not solely for profit, and they require a considerable amount of attention to keep them in working order. The suitability of land for sewage treatment varies considerably; thus with a light sandy loam on gravel 15,000 gallons per acre per day of crude sewage may be dealt with, while with stiff clay not more than 1,000 gallons per day can be treated per acre. If the sewage is settled in suitable tanks, or subjected to a preliminary process of purification before being run on to the land, the acreage required will be correspondingly decreased.

Chemical precipitation is not economical, on account of the cost of chemicals and attention required. There is also the sludge problem to be considered.

The disposal in this case would be probably best effected, and with least annual cost, by works on bacteriological lines. The sewage would first be run through detritus chambers with a capacity of 2 per cent to 5 per cent of a day's dry weather flow, then into septic tanks of a combined capacity of eighteen to twenty-four hours' dry weather flow, and then through percolating filters. The capacity of the filters will depend on whether the sewage is classed as strong, average, or weak in strength, according to the recommendations of the Royal Commission on Sewage Disposal. The allowances for weak, average, and strong are respectively 100, 70, and 45 gallons per cubic yard of filtering medium. Provision should be made in the works for removal of the sediment which will form. The effluent would preferably be run on to land, but if this is not practicable it would run into a stream. If there are houses near the works, taking water for any purpose from the stream, the effluent should discharge below the houses.

Local authorities are empowered by the Public Health Acts to borrow money to defray the cost of disposal works, subject to the sanction of the Local Government Board. The sum to be borrowed must not exceed the assessable value of the district for two years. If the sum, together with any outstanding loans exceeds the value for one year the Local Government Board cannot sanction a loan without holding a local inquiry. They will require detailed plans of the works together with an estimate of cost.

(*b*) The general notes given above with regard to pollution of streams and position of works also hold good in this case. The amount of sewage per head of population will probably be higher, however, and an allowance of 25 to 30 gallons per head per day may be necessary. The actual figure will be largely affected by the amount of trade effluents, being an industrial town. Owing to the large area required and the usual high price of land in the vicinity of towns, land treatment will probably be out of the question. The point requiring most consideration here is that regarding the trade effluents.

Under Sections 16 and 17 of the Public Health Act Amendment Act of 1890, liquids issuing from factories, &c., may be discharged into public sewers where such liquids do not interfere with the efficiency of the sewers. The actual method of treatment at the disposal works will be determined by the nature of the predominating trade or trades. Effluents containing an excess of suspended solids, such as from tanneries, coal-washing plants, potteries, aniline stills, dye works, paper mills, &c., can usually be classified by subsidence in suitable tanks or by passing the effluent through screens or mechanical filters. Fermentative and putrefactive effluents, as from breweries, distilleries, tanneries, starch works, wool-scouring works, glue works, &c. can be purified by suitably arranged biological tanks and filters, though liquids that undergo acid fermentation, such as starchy and brewery effluents, are not suited for anaerobic treatment. Colouring matters from dye works, &c., can generally be precipitated by iron or aluminium salts. Effluents containing substances

poisonous to aquatic vegetation and fish life, such as from indiarubber works, sulphur-dye stuffs, and from ammonia stills, should be treated with lime and ferrous sulphate, and settled in precipitation tanks. Some effluents contain oily matters—fat and soap. Free grease and fat can be intercepted by special grease traps. Soap from wool-scouring works may be broken down by acids and then separated and purified. In the case of laundries the soap may be precipitated with lime.

It will depend on the nature and quantities of the trade effluents whether they are purified at the factories or allowed to come into the sewers, in which case the disposal works will be accordingly arranged.

In cases (*a*) and (*b*) allowance should be made in designing the works for increase of population.

(*c*) The most important point to be considered in this case is the possibility of disease-germs finding their way into streams, especially if the hospital be near houses which may take water from these streams. Filtration through land or artificial filters cannot be relied upon to produce, under all circumstances, effluents free from pathogenic organisms. The sewage from an isolated hospital can, however, be efficiently dealt with by a small disposal works on bacteriological lines consisting of septic tanks and percolating filters.

The consumption of water can generally be easily obtained in such institutions so as to arrive at the required size of the works. The number on the staff must, of course, be allowed for in addition to the patients.

The grease, fat, and soap should receive special consideration, as if allowed to get to the disposal works they may cause trouble. The grease and fat should be intercepted in grease-traps, and the soap precipitated with lime at the laundry.

The disposal works should be well away from all buildings and houses, and the effluent should not be discharged into a stream if near cottages, but preferably run on to land. As a precaution it is possible to sterilise the effluent by the use of chlorine in the form of hypochlorites or oxides of chlorine (obtained by electrolysis).—(I. W. S., *Clapham Junction.*)

279. Paving.—What is the best material for paving carriageways of steep gradient? Give reasons. ("Muneng.")

The best material for paving a road having a steep gradient would be granite setts, such as Guernsey or Aberdeen, which do not wear smooth and acquire a polished surface. The shape of the stones should be from 7 in. to 9 in. in depth, and not more than 3 in. to 4 in. in width, and they should be laid in parallel courses across the street

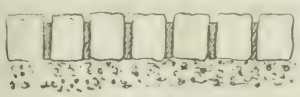

Fig. 1.

in such a manner that the stones in each course break joint with those in the adjoining course.

They should be laid on a bed of 6 in. cement concrete, and the joints in each case should be as small as possible. After the stones have been set they should be well punned, and, if necessary, a thin grouting of sand and lime should be poured over the surface to fill the interstices between the stones.

If the street has a very considerable gradient a course of slate rather more than an inch in thickness, and about an inch less in depth of the stones should be laid between the rows, as shown in

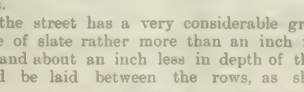

Fig. 2.

Fig. 1. Or a somewhat simpler method may be adopted—namely, placing the stones with a cant on their beds, so forming a series of ledges or steps, as shown in Fig. 2. Either of these methods affords horses a safer foothold than the ordinary way of laying the stones.—(H. B., *Worcester.*)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Belfast T.C. (October 15th. Mr. P. C. Cowan). £17,200 for extensions at Purdysburn Asylum; £10,000 under the Small Dwellings Acquisition Act, 1899; £10,000 for street widenings at North-street and William-street South; and £9,356 for other widenings and flood prevention works; and £63,000 for the purpose of permanent paving of streets.—It was explained that the sum of £17,200 was made up of the cost of the erection of two villas known as villas No. 8 and 9. The cost of those villas was £11,000, and there would be accommodation for fifty patients in each. The cost of sewerage would be £3,000, and the council had acquired only acres of land at the net cost of £2,200, with another £100 as the estimated cost of transfer. With respect to the application for a loan for £10,000 for the Small Dwellings Acquisition Act Councillor John M'Caughey, J.P. (chairman of the Law Committee), was examined in relation to the loans already received under the Act. He instanced the Act had worked most satisfactorily. It raised the principle of self-help, and had proved most beneficial to the thrifty and provident. Referring to the cost which the corporation had had to pay under the arbitrator's award for property for street widening, the inspector pointed out that in one case £6,750, and in the other £5,725, had been paid, and though that was gratifying as showing the value of land in Belfast, it seemed a large sum to pay for less than 40 yds. in North-street for a comparatively small improvement. In regard to the loan for flood prevention works, evidence was offered by Assistant Engineer Mr. H. A. Cutler as to the proposed construction of a storm overflow from the high-level sewer in North Queen-street, down through Frederick-street and Gamble-street, to the river. The alterations in the old sewers in May-street and Lagan-street were estimated to cost £4,260, which, with the sum of £5,091, made up the total at £9,356. The loan of £53,000 for the purpose of permanent paving of the streets in different parts of the city was then explained, and particulars given at length by the city surveyor. In the course of his evidence Mr. Cutler mentioned that he considered that Lithofalt blocks were the most satisfactory and lasting form of asphalt paving.

Berwick T.C. (October 18th. Mr. A. A. G. Malet).—£5,000 for the Tweedmouth drainage scheme.—The Tweed Commissioners opposed on the grounds of pollution to the river, and damage to salmon fishing. It was contended that the additional expense of purification works would be £20,000; and to take the drainage to the sea at Spittal would mean £6,000 additional to the present scheme.

Burgess Hill U.D.C. (October 16th. Mr. P. M. Crosthwaite).—£2,250 for the purpose of works of sewage disposal, including works in the parish of Clayton and in the rural district of Cuckfield.—Mr. A. F. Hardwick, clerk, and Mr. E. Brown, surveyor, presented the scheme for the council. It was stated that the scheme was in two parts, high level and low level. The sewage field was 26 acres in extent. The high-level sewage would go over the whole of the land, and the low-level sewage over about 8 acres. During four months of the year, owing to dry weather and the stiff clay soil, the effluent was not satisfactory. Everything had been done to make the soil workable. Peppermint was grown on the farm. It was proposed to put in sedimentation tanks for each level, with fifteen hours' flow. The capacity of the high-level tank was 31,000 gallons, and the low-level tank 60,000 gallons. The sedimentation tanks would be in addition to the present filter arrangements on the farm.

Doncaster T.C. (October 18th. Major J. Stewart).—£3,800 for the erection of a refuse destructor, and £1,215 for the paving of a part of St. Sepulchregate with granite setts.—The town clerk (Mr. R. A. H. Tovey) explained that, owing to the opening of several collieries in the district, and other industrial developments, the traffic on the road, on which they had the entrance to the Great Northern goods yard, had increased enormously in recent years, and it was found necessary to adopt granite setts. The portion was on the Tinsley main road, and the county council approved the proposal. As to the refuse destructor, the borough surveyor, Mr. F. O. Kirby, said that £300 a year would be saved in cartage alone. The destructor would have a capacity of dealing with 40 tons in eighteen hours, and the capacity could be

doubled when necessary. Major Stewart complimented the officials of the corporation on the way in which the case for the two applications had been placed before him.

Newtownards U.D.C. (October 16th. Mr. P. C. Cowan).—£1 300 for the provision of new gas mains.—It was stated that a considerable portion of the sum asked for was to increase the efficiency of the present gas supply. The present gas mains were too small, and it was intended to adopt the high-pressure system.

Ramsgate T.C. (October 8th. Mr. F. O. Stanford).—£3,206 for the extension of the East Cliff promenade. The borough surveyor, Mr. T. G. Clarke, stated that the cost of scarping the cliff and sinking the front footpath would be £500. Many portions of the cliff were overhanging, and it was estimated that 12,000 yds. of chalk would have to be removed. There were some small caves at the base of the cliff which would have to be filled in. It was estimated that the shelter to be erected on the land would cost £550, but since that estimate was procured there had been a considerable advance in prices.

Sheffield T.C. (October 15th. Mr. Edgar Dudley).—£40 000 for various improvements in the city.—Included in the scheme is the provision of a coroner's court and mortuary, with a central court for the holding of inquests. It is also proposed to purchase 30 acres of land at £210 an acre, and 3½ acres at £350 an acre, to preserve Whiteley Woods from being surrounded and overlooked by houses and buildings and to join up Whiteley Woods and Bingham Park to the property of the city. Other sums are to be expended in various street improvements, including the making of double tram lines where at present single tracks only are laid. Evidence was given by the city engineer, Mr. C. F. Wike, and other officials.

Whitby R.D.C. (October 9th. Major C. E. Norton).—This was an inquiry into the complaint to the Local Government Board made by Mr. Tom Pinkney, shipbroker, Sleights and Sunderland, that the Rural District Council of Whitby had made default in providing the village of Sleights and township with sufficient sewers. Mr. Pinkney read a long letter which he wrote to the Local Government Board in May last, complaining that drainage was in a crude and unsatisfactory state, in some places open and in other places only partially covered, with sewage passing down in semi-open drains. An adverse report on the condition of affairs was made by Dr. Cheetham, county council medical inspector, and by Dr. J. B. Laverick, medical officer of health for the Whitby rural district. Mr. Pinkney dealt with those reports, and said the Whitby Rural District Council had also declined to make any arrangement for the disposal of surface drainage. Many houses had been built with cesspools, but with little or no arrangement for dealing with crude sewage, which went into the becks, where cows drank. He complained that there was no definite system, and the danger of disease was great. Mr. W. Seaton Gray, clerk to the Whitby Rural District Council, maintained that his board had forwarded sewerage schemes for the village to the Sleights Parish Council, who replied that no scheme was necessary, and the Whitby Rural District Council had not therefore forced one on the parish without its consent. Mr. John Popple, land agent and surveyor, said that £50,000 worth of new property had been erected in Sleights during the last twenty-five years. Everyone admitted that something must be done, but the outlying farmers objected to contributing to what would practically be an urban scheme. Witnesses in favour of a sewerage scheme gave evidence, and Dr. J. B. Laverick agreed with Dr. Farrar's (Local Government Board inspector) report, that "the present sewerage system cannot be regarded as satisfactory," and said his council had been considering the matter since 1893, since when he had frequently reported that a scheme was necessary.

APPLICATIONS FOR LOANS.

Anglesey C.C. £500 in connection with the North Wales Counties Training College building scheme.

Barry U.D.C.—£400 for school clinic work.

Brampton R.D.C. £980 for a sewerage scheme.

Darlington T.C.—£8,341 for gas main extensions.

Stoke Newington B.C.—£2,100 for widening Church-street.

Wellington (Salop) U.D.C.—£4,700 for a storm-water drainage scheme.

LOANS SANCTIONED.

Brierfield U.D.C.—£8,215 for the extension of the sewage disposal works.

Carshalton U.D.C.—£757 for road improvement works.

Cheadle U.D.C.—£1,573 for private street improvement works.

Darlington T.C.—£47,550 for the extension of the gasworks.

Frinton U.D.C.—£383 for the purchase of land for a cemetery.

Grimsby T.C.—£1,560 for a new sewer in Wellholme-avenue and £850 for sewer ventilation.

Harrogate T.C.—£1,800 for a site for a school.

Harrow U.D.C.—£5,550 for the enlargement of the municipal buildings.

Hayes U.D.C.—£8,717 for workmen's cottages.

Penybont R.D.C.—£1,420 for private street works.

Portland U.D.C.—£15,000 for the extension of the waterworks.

Swanage U.D.C.—£257 for surface-water drainage.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Building—Ayr £2,700, Ilford £18,000, Newcastle-on-Tyne £36,000; housing and town planning—Llanelly, Moira £16,000; roads and materials—Crompton £3,706; sewerage and sewage disposal—Epsom £6,194, Repton £6,000, Tredegar £24,912, Whittington £7,000, Wigan £21,000, Wrexham £8,400; water, gas and electricity—Llandrindod Wells £4,000.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Anglesey C.C.—The tender of Messrs. R. & J. Williams, of Bangor, at £4,731, has been accepted for the erection of a school at Menai Bridge.

Ardrossan T.C.—A proposal has been made for the construction of a public swimming pond.

Ayr T.C.—Plans have been prepared of a diphtheria block at the Heathfield Hospital, the estimated cost of the work being £2,700.

Basingstoke T.C.—A new fire station is to be erected in Brook-street, at a cost of £700.

Bradford T.C.—The Bolton and Horton tramway car sheds are to be repaired, at an estimated cost of £500.

Campbeltown T.C.—A gift of £1,000 has been received for building an addition to the infectious diseases hospital, the extension to be for the use of consumptive patients.

Clevedon U.D.C.—A committee has been appointed to report upon a scheme for the provision of a pavilion on the sea front, at an estimated cost of £2,800.

Cromer U.D.C.—A sum of £100 is to be spent on the provision of bathing shelters.

Derbyshire C.C.—A scheme has been adopted for the treatment of consumptives in sanatoria in conjunction with county boroughs and urban districts.

Dundee T.C.—Four properties are to be purchased in connection with the central improvement scheme, at a cost of £9,150.

Ilford U.D.C.—The enlargement of the town hall, at an estimated cost of £18,000, is under consideration.

Newcastle-on-Tyne T.C.—The provision of baths for Heaton, at an estimated cost of £8,000, has been agreed to in principle, and a complete scheme of baths for Benwell, Walker and Heaton is to be prepared at an approximate cost of £28,000.

Newton-in-Makerfield U.D.C.—The new isolation hospital at Earlestown, erected from the plans of the surveyor, Mr. Arthur Bowes, has been completed.

Wycombe R.D.C.—The tender of Messrs. C. H. Hunt & Son, at £527, has been accepted for the erection of an administrative block at the isolation hospital.

HOUSING AND TOWN PLANNING.

Ellesmere Port U.D.C.—The Local Government Board have written that they are prepared to give authority for the preparation of a town planning scheme in regard to an area comprising the whole of the urban district of Ellesmere Port and Whitby (with the exceptions of certain lands already built upon) and some 390 acres situate in the rural district of Chester, immediately to the south of the urban district.

Hyde T.C.—With a view of putting the Town Planning Act into operation, the council have instructed the borough surveyor, Mr. J. Diggle, to indicate on an ordnance map what areas are suitable for town planning schemes, either in the borough or in connection with schemes of neighbouring authorities.

Llanelly U.D.C.—It has been decided to erect 100 additional workmen's dwellings.

Moira U.D.C.—A scheme has been approved for the provision of sixty-eight cottages, at an estimated cost of £16,000.

Newcastle-on-Tyne T.C.—An area of 80 acres on the corporation's Walker estate is to be utilised for a housing scheme.

Tilbury U.D.C.—It has been decided to purchase about 7 acres of land, at £150 per acre, for the erection of workmen's dwellings.

Tiverton T.C.—The Streets Committee have under consideration an exhaustive report by the borough surveyor, Mr. J. Siddalls, under the Housing and Town Planning Act on five suggested schemes for providing houses for the working classes.

Wallasey T.C.—A housing scheme is to be carried out, at a cost of £6,280, including the purchase of the necessary land.

Wirral R.D.C.—The council have under consideration schemes for the town planning of the greater part of the area under their control, and on Tuesday last preliminary conferences in respect of two further areas were held.

York T.C.—The Local Government Board have approved the revised proposals of the council with respect to the erection of thirty houses in Almaterrace.

PARKS AND OPEN SPACES.

Ellesmere Port U.D.C.—A committee has been appointed to consider the provision of a bowling green in the district.

Glasgow T.C.—The new park in Springburn, presented to the city by a donor who does not desire his name to be known, will be handed over to the corporation to-morrow. It is understood that the gift represents a sum of £13,000.

Ilkley U.D.C.—The surveyor, Mr. T. H. Smith, has prepared plans for laying out the Holmes estate.

Kingston (Surrey) T.C.—Two additional gravel lawn-tennis courts are to be laid down at Canbury-gardens.

ROADS AND MATERIALS.

Ballymoney R.D.C.—It has been decided to devote the council's share of the grant of £3,000 to be made to the county council by the Road Board almost entirely to giving a tar-macadam coating to part of the trunk road between Ballymoney and Ballymena, north of Newbuildings Bridge.

Crompton U.D.C.—Plans have been approved for the paving of Rochdale-road at an estimated cost of £3,706.

Downpatrick R.D.C.—Proposals have been passed for works to be executed by direct labour in a section of the district. The most important item is a proposal of £1,000 to raise the Ballydugan-road adjacent to Downpatrick, and this has been passed on condition that the Road Board contribute £750.

Edinburgh T.C.—A project for the formation of a new road and the widening of an existing street has been agreed to with the North British Railway Company, which will necessitate the abolition of the Union Canal Basin. The bargain involves a payment of some £25,000 to the company for the acquisition of land.

Kingston (Surrey) T.C.—The tender of Messrs. Griffiths & Co. to relay the outside tramway margin in part of London-road has been accepted at £63 13s., and for similar work in other roads at £118 14s. 8d.

Maldens and Coombe U.D.C.—The surveyor, Mr. R. H. Jeffes, is to present a comprehensive scheme for the widening of about 750 ft. of Kingston-road, so as to lower the level of the roadway on each side of the bridge, and to reduce the gradient to 1 in 48.

Newport (Mon.) T.C.—The widening of the corner of High-street and Bridge-street is under consideration.

Nuneaton T.C.—Property to the value of £4,500 has been purchased for effecting an improvement in Bridge-street.—At the meeting last week a discussion took place in regard to the system of adopting new streets. Alderman Bates contended that the streets ought to be handed over to the council free of charge. There was no other town in the kingdom which had such a system as theirs. He proposed that all new streets from that date be handed over to the council free of charge. The motion was carried *nem. con.*

SEWERAGE AND SEWAGE DISPOSAL.

Brynmawr U.D.C.—The Local Government Board have declined to entertain the council's application for the purchase of property for municipal offices in view of the urgent need of an efficient scheme of sewage disposal.

Cockermouth R.D.C.—The contract for the Great Clifton sewerage scheme, at £1,024 for the laying of pipes, and £735 for the outfall works, has been given to Messrs. Donaghan & Mulcaster, of Egremont.

Epsom U.D.C.—A storm-water drainage scheme, estimated to cost £6,194 is to be carried out.

Kingston (Surrey) T.C.—The tender of Messrs. F. W. Berk & Co., Limited, for supplying about 300 tons of sulphuric acid for the sewage works has been accepted at 33s. per ton.—A new effluent channel for the filter-beds at the works is to be constructed by the corporation workmen, at an estimated cost of £340.

Repton R.D.C.—With respect to the council's application for a loan of £6,000 for sewage disposal works, the Local Government Board have written that they were satisfied that the scheme was necessary, but they thought that some amendments were desirable in the details of the present scheme. The letter also referred to the proposal to create a special drainage area. Such a proposal was contrary to the wishes of the board, excepting in particular cases, and such an area became a separate contributory place for all purposes. The letter has been referred to a committee.

Tredegar U.D.C.—The tender of Messrs. Barnes, Chaplin & Co., of Cardiff, at £24,912, has been accepted for the sewerage scheme.

Whittington U.D.C.—Consideration is being given to a sewage disposal scheme estimated to cost £7,000.

Wigan T.C.—A scheme for the extension of the sewage works, at an estimated cost of £21 000, is under consideration.

Wrexham R.D.C.—Mr. J. Price Evans, engineer and sanitary surveyor, has submitted a scheme dealing with the drainage of Summerhill, Little Mountain, Wheatsheaf, Glanllyn and Bradley. The cost of the work, exclusive of land, estimated at £8,400. The plans have been referred to the Health Committee for consideration.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—It has been decided that the ratepayers should be consulted before any new water scheme for the city is proceeded with. At present expert reports are before the council, in which preference is given to obtaining a new supply of water for the city from the river Dve, rather than dealing with the present supply from the Dee. On the other hand a section of the council believe that the supply should be taken from the river Avon, a private bill for which was thrown out by a Committee of the House of Lords.

Ayr T.C.—After paying £2,621 for interest on loans, and contributing £2,976 to the sinking fund, there was a net surplus of £996 on last year's working of the electricity undertaking.

Cromer U.D.C.—It has been agreed, subject to the consent of the Board of Trade and the Local Government Board to transfer the electric light undertaking to a private company.

Darwen T.C.—A gasworks improvement scheme, estimated to cost £20,000, is under consideration.

Dromore U.D.C.—Steps are to be taken to obtain a provisional order for an electric lighting scheme.

Hampton U.D.C.—A ten-years' contract is to be entered into with the Hampton Court Gas Company. The terms are: (1) The company to provide and fix at their own expense and maintain automatic controllers for lighting and extinguishing each of the street lamps. (2) The company to provide and fix, at an average of 2s. 6d. each lamp, to be paid by the council and estimated at 246 5s., inverted burners to consume 3½ ft. of gas per hour, by-passes, No. 3 mantles and glass protectors and all records to maintain the same during the period of the contract. (3) The price to be paid by the council (together with a comparison of the price paid under the former contract) is as follows: For each single burner consuming 3½ ft. per hour without by-pass, new price per lamp per annum, £2 15s. 3d.; former price, £3 2s. 6d.; saving, 7s. 3d. The present number of burners is 370. (4) In case of any alteration in the price of gas during the period of the contract there shall be automatic rise or fall of 1s. 3d. per lamp per annum for each penny rise or fall in the price of gas charged to private consumers. (5) The company to repair, light and extinguish the lamps as under former contract, but on schedule times (which were all set out in the report for the whole year). The time for lighting is forty-five minutes after sunset, with the exception of April—July, when the period is sixty minutes. The time for extinguishing is sixty minutes before sunrise, with the exception of November—February, when it is thirty minutes. (6) If the council at any time during the continuance of the contract desire to alter the hours during which the lamps shall be alight, the council to be entitled to an adjustment of price at the rate of 2s. 9d. per 1,000 cub. ft. of gas consumed, each burner being calculated to consume 3½ cub. ft. per hour. The new contract will effect a present annual saving of about £140, the initial capital expenditure involved being only £46. Mr. S. H. Chambers, the surveyor to the council, was cordially thanked for the trouble he had taken in connection with it.

Leeds T.C.—The Parliamentary Committee has been requested by the council to seek powers for the acquisition of a site for a new electricity station.

Llandrindod Wells U.D.C.—A scheme for the improvement of the water supply is to be carried out, at a cost of £4,000.

Mayfield R.D.C.—A scheme of water supply for Waterhouses, at a cost of £725 has been adopted.

Pittenweem T.C.—It has been decided to appoint an engineer to formulate a scheme for obtaining an increased water supply.

Rathdown No. 1 R.D.C.—A water supply scheme for Golden Ball, Sandyford and Ballally is to be carried out, at an estimated cost of £2,500.

Selby R.D.C.—An estimate is to be obtained of the cost of carrying a supply of water from the Selby waterworks, at Brayton, through Burn, West Haddlesey, Chapel Haddlesey, Temple Hirst, Hirst Courtney, to Carlton, Camblesforth and Drax.

Shoeburyness U.D.C.—Improvements are to be carried out at the new well at a cost of £2,092.

MISCELLANEOUS.

Birmingham T.C.—The Tramways Committee recommend the acceptance of the tender of Mr. George Law, of Kidderminster, for the construction of the Hagley-road tramway. Parliamentary power is to be sought for the running of trailer cars.

Burley-in-Wharfedale (Yorks) U.D.C.—The council have approved the proposal of the Leeds Corporation to run a service of trackless trolley cars from the tramway terminus at Guiseley, through Menston and Burley, to Ilkley, on the following conditions: (1) Roads to be widened where necessary; (2) rates to be payable on rateable value; (3) that no power be incorporated in the bill to enable the Leeds Corporation to supply light to Burley-in-Wharfedale except through the council; (4) that the Burley council have power to purchase the undertaking so far as it affects their district at the expiration of twenty-one years; (5) that the fares between Guiseley and Burley are not to exceed 2½d., and that special facilities be granted to workmen, and to the public on special occasions.

Edinburgh T.C.—It has been agreed to accept the estimate of Messrs. Merryweather & Sons, Limited, London for the supply of one petrol motor fire engine, fitted with pumps of the plunger type, and the estimate of Halley's Industrial Motors, Limited, Glasgow, for the supply of one motor chassis for fire tenders.

St. Austell R.D.C.—The following appointments have been made: Mr. B. C. Andrews, architect, St. Austell, to prepare plans of all the council's water and sewer services at an inclusive fee of £20; Mr. N. F. Bellamy, surveyor, St. Austell, £3 3s. fee, to prepare a drainage scheme for Roche; Messrs. Jenkin & Son, Liskeard, £5 5s., inclusive fee, to advise the council on a water supply for St. Stephens.

West Hartlepool T.C.—Dr. E. P. Manby, an inspector of the Local Government Board, has prepared a report with respect to the "sanitary circumstances and administration" of West Hartlepool. Referring to the district known as the Old Town—which, it is expected, will be absorbed eventually by the North-Eastern Railway Company for sidings—he says that if the proposed railway extension does not soon become operative the council should deal with this district, say, by an improvement scheme under the Housing Acts, as the unsatisfactory conditions existing at present should not be allowed to persist indefinitely. He urges that the health department of the corporation should be reorganised, there being evidence of a need for systematic inspection in the poorer districts.

PERSONAL.

Mr. J. C. Matthew, assistant surveyor of Exmouth, has had his salary increased by £20 a year.

Mr. R. H. Jenkins, of York, has been appointed surveyor to the Skegness Urban District Council.

Mr. T. Casson Beaumont, surveyor to the Driffield Rural District Council, has had his salary increased.

Mr. C. H. Godfrey, engineer to the Shanghai Municipal Council, has been delegated to represent that body at the International Road Congress in London next year.

Mr. E. B. B. Newton, borough engineer of Paddington, has been authorised to employ a draughtsman at a salary not exceeding £3 3s. a week for a period of six months.

Mr. James C. Stevenson, assistant in the Ulverston surveyor's office, has been appointed surveyor and sanitary inspector to the Barton-on-Humber Urban District Council.

Mr. F. W. Jones, surveyor to the Frome Urban District Council, has been voted £60 addition to his salary during the ensuing six months for extra services in connection with the sewage works extensions.

Mr. Wm. S. Shell, road surveyor and inspector to the Consett Urban District Council for the past fifteen years, and formerly an architect in the town, died somewhat unexpectedly last week at the age of about sixty years.

Mr. A. H. Jameson, M.SC.(Manchester), M.INST.C.E., has been appointed professor of civil engineering at King's College. Since 1909 he has been resident engineer on the Thirlmere aqueduct, and was formerly in the service of the Derwent Valley Water Board.

Mr. R. O. Wynne-Roberts, M.INST.C.E.—whose inquiry on behalf of the Government of the Province of Saskatchewan, Canada, into the possibilities of lignite fields have already been referred to in this column—has just returned from a 6,000-mile journey of investigation. It included Winnipeg, Toronto, Ottawa, Montreal, New York, Washington, Pittsburg, St. Louis, Austin (Texas), Dallas, Kansas City, St. Paul, Minneapolis and Hebron. Apparently the inquiry is not quite a sinecure!

Mr. J. Siddalls, borough surveyor of Tiverton, was last week congratulated by the mayor (Mr. A. T. Gregory) on attaining his official "silver wedding." It was, said the mayor, twenty-five years since Mr. Siddalls became their borough surveyor. The quarter of a century during which he had served them with marked efficiency and fidelity had been a time of progress creditable alike to the council and their officers. Under Mr. Siddalls' *régime* vast improvements had been effected, and the death-rate, which was 20·6 per 1,000, was now only 12·6. In other words, the number of deaths yearly in Tiverton had gone down by 80. The zymotic death-rate was almost *nil*; typhoid fever had practically disappeared. With all these improvements of the borough, the urban sanitary account was £3,449 less than it was twenty-five years ago. Mr. Siddalls thanked the mayor for his remarks and the council for the way in which they had received them.

Mr. Joseph Owen, of the engineers' department, London County Council, has been appointed assistant city engineer of Fort William, Canada, at a salary of about £400 per annum. Mr. Owen, who is, by examination, an associate member of the Institution of Civil Engineers, a member of the Royal Sanitary Institute, and an associate member of the Institution of Municipal and County Engineers, was articled for five years to Mr. T. Aird Murray, consulting engineer, Sheffield, now in practice at Toronto. Subsequently Mr. Owen was, for four years, assistant to the city surveyor of Sheffield, and for two and a-half years to the borough surveyor of Colchester, entering the service of the London County Council six and a-half years ago. At the annual meeting of the Institution of Municipal and County Engineers in 1905 Mr. Owen read a paper which was awarded a premium, and recently he was elected to represent the associate members of Surrey on the Executive Committee of the South-Eastern District of this body. He leaves England on November 7th with the good wishes of his numerous friends.

Mr. John England, borough engineer and surveyor of Wrexham, who read a paper at the meeting of the Institution of Municipal and County Engineers held in that town on Saturday last, was educated at the High School, Oswestry. He was articled to the then borough surveyor and water engineer of the latter town (Mr. R. O. Wynne-Roberts, M.INST.C.E.), and during this period was engaged on the construction of a large impounding reservoir, alterations and additions to markets, and new sewage works. In 1896 he was appointed assistant at Todmorden, where he was principally engaged upon the plans for a new sewage disposal scheme to cost £50 000. In the following year he was appointed chief assistant at Heywood, remaining there until 1902, the principal works upon which he was engaged being extensions to main sewers, the building of electricity works, refuse destructor works, the provision of a new town's yard, fire station, and the construction of tramways, numerous private street works, and street improvements. In 1902 Mr. England was appointed borough engineer and surveyor of Wrexham, and in this capacity has carried out an entirely new scheme of sewage disposal, extensions to markets and Smithfield, the construction of a recreation ground, and numerous extensive street improvements, and is at present engaged in laying out a park and recreation ground of 17½ acres.

FOR OTHER ADVERTISEMENTS

See End of Paper.

NEWMARKET RURAL DISTRICT COUNCIL.

WATER SUPPLY WORKS FOR THE PARISHES OF CHEVELEY AND WOODDITTON.

TO IRONFOUNDERS.

The above Council invite Tenders for the Supply and Delivery at Newmarket Station (G.E.R.) of about 163 tons of 3-inch Cast-Iron Pipes and Specials, and the Erection of Cast-Iron Tank, and all other work in relation thereto.

Plans and Specifications may be seen, and Bill of Quantities and Form of Tender may be obtained, from the Engineers, Messrs. Sands & Walker, Milton Chambers, Milton-street, Nottingham, on payment of £3 3s. (by cheque), which will be returned on receipt of a *bonâ-fide* Tender, not afterwards withdrawn, and the return to the Engineers of all documents lent to the Contractor for the purpose of making up his Tender.

The successful Contractor will be required to enter into a bond, with approved sureties, for the due and proper performance of his contract.

The Council do not bind themselves to accept the lowest or any Tender.

Sealed and endorsed Tenders to be sent to the undersigned on or before 10 a.m. Monday, 25th November, 1912.

S. J. ENNION, Solicitor,
Clerk to the Council.

Newmarket, Cambs.
October 23, 1912.

NEWMARKET RURAL DISTRICT COUNCIL.

WATER SUPPLY WORKS FOR THE PARISHES OF CHEVELEY AND WOODDITTON.

TO CONTRACTORS.

The above Council invite Tenders for the Carting, Excavating for, and Laying of about 5 miles of 3-inch Cast-Iron Pipes, including Fixing of Valves, Hydrants, &c., and the Erection of Brick Water Tower, and all works in relation thereto.

Plans and Specifications may be seen, and copies of Bill of Quantities and Form of Tender obtained, from the Engineers, Messrs. Sands & Walker, Milton Chambers, Milton-street, Nottingham, on payment of £3 3s. (by cheque), which will be returned on receipt of a *bonâ-fide* Tender, not afterwards withdrawn, and the return to the Engineers of all documents lent to the Contractor for the purpose of making up his Tender.

The successful Contractor will be required to enter into a bond, with approved sureties, for the due and proper performance of his contract.

The Council do not bind themselves to accept the lowest or any Tender.

Sealed and endorsed Tenders to be sent to the undersigned on or before 10 a.m. Monday, 25th November, 1912.

S. J. ENNION, Solicitor,
Clerk to the Council.

Newmarket, Cambs.
October 23, 1912.

METROPOLITAN BOROUGH OF WOOLWICH.

SANITARY CONVENIENCES, NORTH WOOLWICH.

The Council of the Metropolitan Borough of Woolwich invite Tenders for the Erection of Sanitary Conveniences for both sexes upon a site situate in the Royal Victoria Gardens, and fronting High-street, North Woolwich.

Persons or firms desirous of tendering may, upon depositing the sum of £1 1s., obtain a copy of the Drawing, Specification and Form of Tender at the office of Mr. J. Rush Dixon, M.INST.C.E., Borough Engineer, Town Hall, Woolwich. The deposit will be returned upon receipt of a *bonâ-fide* Tender and the return of the copies of drawing and specification.

The person or firm whose Tender is accepted will be required to pay Trade Union rates of wages, to observe Trade Union hours of labour, and to enter into a formal contract.

Sealed Tenders, properly filled in, on the official form provided, must be sent to me at the Town Hall, Woolwich, not later than 12 noon on Wednesday, the 13th November, 1912, in envelope endorsed "Tender for Sanitary Conveniences, North Woolwich."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
ARTHUR B. BRYCESON.
Town Clerk.

Town Hall,
Woolwich.
October 24, 1912.

BOROUGH OF RICHMOND (SURREY).

TO BUILDERS.

The Town Council are prepared to receive Tenders for Extensions to the Public Baths, Parkshot, Richmond.

Plans, Specification and Conditions of Contract may be seen, and a copy of the Bill of quantities, &c., obtained, on application to Mr. J. H. Brierley, Borough Surveyor, Town Hall, Richmond, on payment of a deposit of One Guinea, which will be returned on the receipt of a *bonâ-fide* Tender.

Sealed Tenders, properly endorsed, together with the other papers supplied, must be delivered to the undersigned not later than 4 o'clock on Monday, the 11th November, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

HENRY SAGAR.
Town Clerk.

Town Hall,
Richmond, Surrey.
October 23, 1912.

MADRAS CORPORATION, INDIA.

WANTED: ASSISTANT DRAINAGE ENGINEER.

The President, Corporation of Madras, invites applications for the appointment of Drainage Assistant to the Special Engineer, J. W. Madeley, M.A., M.I.C.E., M.AM.SOC.C.E., &c.

The duties will be to assist the Special Engineer in the design, construction and maintenance of works of drainage for the City of Madras.

The salary will be Rs. 500 (£33 6s. 8d.) per mensem, rising by annual increments of Rs 20 per mensem to a maximum of Rs. 700 per mensem. An allowance of Rs.30 (£2) per mensem will be paid to the officer appointed so long as he maintains and uses on the work a first-class motor bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras, the successful candidate will be required to sign a three-years' agreement to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing or by payment of one month's salary.

The officer appointed will be allowed ordinary first-class railway fares and second-class Peninsular & Oriental passage to Madras *viâ* Marseilles and Bombay by P. & O. steamer. A like class return free passage will be granted on the termination of the appointment, subject to the satisfactory service according to the conditions of the agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but not for more than three months at a time.

The applicant must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India must be enclosed with the application, which must reach the undersigned not later than Thursday, November 14th. They will be sent out to Madras, where the final selection will be made by the President of the Corporation.

The President reserves the right of rejection all applications without giving reasons.

The officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of his application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Drainage Assistant."

JAMES MANSERGH & SONS,
Agents to the Corporation of Madras.
5 Victoria-street,
Westminster,
London, S.W.
October 23, 1912.

SINGAPORE, STRAITS SETTLEMENTS.

MUNICIPAL ENGINEER'S DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant, under 32 years of age and of sound constitution, chiefly for their new Sewage Scheme. He must have received a good technical education, a regular training as a Civil Engineer, and including a practical knowledge of Surveying, Levelling and Estimating. He must also have had special experience in designing and constructing sewerage and sewage disposal works and waterworks, and their maintenance. Preference will be given, other things being equal, to applicants who have passed the Examination of the Institution of Civil Engineers—Associate Members—or that of the Institution of Municipal and County Engineers. The engagement will be for three years, and each applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination. A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out.

The salary will be 350 dollars per month, paid monthly in dollars, the currency of the Colony, the value of the dollar being two shillings and fourpence sterling. Such local transport allowance as may from time to time be sanctioned by the Commissioners will be paid. Applications, stating age and place of birth, and giving details of education, training, and experience generally, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, are to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope-street, Glasgow (who will give further particulars if requested), not later than Tuesday, 5th November, 1912.

DRAUGHTSMAN required for Public Works Department, Kedah, Malay States. Salary £350 per annum, with furnished quarters. Free passage three years' agreement. Age about 27. Medical examination. Full particulars on application to Box 1,191, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

THEORY OF ENGINEERING CONSTRUCTION. A reference-book for Civil Engineers and Students. By Ernest H. Essex, A.M.I.C.E. 8¾ in. by 5½ in. 216 pp. Cloth gilt, 5s. Post free, 5s. 3d. Comprising a selection of Notes and Formulæ on the Theory of Construction, arranged in the form of Answers to the Questions set at Examinations for the Election of Associate Members of the Institution of Civil Engineers.

"Students of engineering construction are indebted to Mr. Essex for his book. . . . The book will have its use for students who are preparing for examinations, and to go through it will be found an excellent exercise for all who have to allow contemplation as a business. —*The Architect.*

"The examples chosen refer to problems of general professional interest, and the solutions are well executed and lucidly expressed. As an adjunct to scientific text-books they may often be useful, and it may also be serviceable as a guide to candidates for examination. —*The Builder.*

London: St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C.

WANTED. The following numbers of THE SURVEYOR are required: February 5, April 1 and May 6, 1904; May 24 and October 25, 1907; May 21 and June 25, 1909, also Index to Vol. XXXV. Offers to Box 1,189, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

Institution of Municipal Engineers.

FOURTH ANNUAL GENERAL MEETING IN LONDON.

(Conclusion.)

In continuation of our report of the recent annual general meeting of the Institution of Municipal Engineers we print below the discussions that took place on the subjects treated in the four papers reproduced in last week's issue, commencing with the discussion of Mr. Platt's paper on

THE MODERNISING OF BUILDING BY-LAWS

Mr. F. W. Platt, the author, in a preliminary statement, said that most of them would have seen the circular letter from the Local Government Board. There were three codes of by-laws, two of which were publicly known, but the third, the intermediate code, was not likely to be issued to the public, only on request; the board did not propose to print it in model form. It had been found necessary to meet the requirements of the local authorities between rural and urban districts where the urban end was such as was found in a residential district without manufactures, or the latter were of such a secondary thing that their influence was so slight upon the general district as to be almost negligible. The second code was well worthy of consideration, for it enabled local authorities to have a system of by-laws whereby they could fully control the development of their district on lines found necessary with residential districts. They would note that it was necessary to have quietness in residential districts. The code, if they got it from the Local Government Board, would show how the conditions could readily be furnished. It was that thought that led him to write the paper. The Local Government Board were progressing, for they were prepared to make a departure with regard to buildings of the warehouse class which they had never done before. They were prepared to place the responsibility upon the local authority as to what should be required for the due stability of these buildings. As to a reinforced-concrete building they would give a by-law whereby the local authority would be able to secure due stability without specifying in particular words what that stability was. They said that the council—which meant the official—must be satisfied as to what was due stability. He thought that was an advance. The local authority could demand that the building should be of full stability throughout. The second report of the Royal Institute of British Architects on reinforced concrete would help them best as to what they required from the building as to due stability. Any enclosing walls of a building, apart from wind pressure, did not, as a rule, in large buildings carry a great deal of load. The intermediate piers carried the load and those who were familiar with large warehouses practically knew that they rarely got a building equally loaded throughout. Consequently, it was not necessary to have any uniform system of resistance throughout, but such resistance as would be sufficient to meet the demands of the load of the building in any particular part. The different parts of the building stress were set out in the model code. He put it that such a regulation or by-law was well worthy of consideration because it enabled the local authority to meet demands made from time to time for the trial of new material. If the local authority obtained from the responsible person a full table of loads, what the building was likely to be used for, and that, taken at a minimum, it would be such as would have to be ordinarily resisted, and then a set of calculations given in some recognised and explicit form which was known from experience to be a sound formula for a particular purpose, he thought it would be well for the local authority to allow the board to prescribe a by-law. There was just one other point he should like to call attention to, and that was the suggestions made at the top of page 2, the type of buildings and the purpose for which they would be erected, down to class 7. The purpose of that was simple. Having received from the building owner his whole calculation as to what he expected the building to be used for, it was provided that there should be a guarantee handed down from owner to owner, or a series of tenants or sub-tenants, that precaution should be exercised by the person occupying the building as to what load the floors of the building were capable of resisting. He had had an instance of that lately in the case of a mule (machinery) shed on the top floor of the building, where, owing to the circumstances of trade, it was found necessary to increase the amount of machinery. As a result, so much sagging took place, in spite of extra precautions, that the floor was like the waves of the sea. If there had been some attention given to the matter when the plans were drawn, and it was explicitly stated that the floors were only designed for a certain load, the floors would not have been stressed to such an extent; but the tenant thought the floors would be strong enough for all his purposes. If these conditions were imposed he thought the effect would be beneficial. Might he ask the members of the institution to make themselves thoroughly conversant with every form of modern construction put upon the market? Reinforced concrete, while it was a most excellent material when properly adapted, became most dangerous in the hands of unscrupulous people. Unless, therefore, the surveyor, whether of a large or small district, was thoroughly conversant with every recognised form and with the methods of calculation, he did not stand much chance with the gentleman who came along with building schemes. Many people had written to him asking what they would do in certain circumstances, saying they had no experience. A great deal might be done in such cases by the transfer of such experience as they had, and he thought that if the members, when they saw anything of particular note, communicated with the secretary of the institution much good would be done.

Mr. Horace Cubitt (London) proposed a vote of thanks to the author of the paper. Those of them, he said, who followed the work of the institution in the North would know that Mr. Platt had done very valuable service with regard to the subject he had dealt with, and they were pleased to see him in the South to give them the opportunity of discussing one of his papers. The subject of building by-laws was not an easy one, and he did not think it always received the attention it should. Personally, he (Mr. Cubitt) might look at it from rather a useful standpoint, because at one time it was his duty to supervise, and as he was now in private work it was his duty to obey; so he saw both sides of the shield. There was no doubt that the necessity for modernising the codes had become a very urgent matter. He rather thought that the subject divided itself into two parts: there were by-laws applying to ordinary forms of construction, and by-laws which were not usually expected to apply to these official forms of construction. As regarded the first, he had found a good many cases in which there was room for amendment, and Mr. Platt had mentioned some. Then with respect to setting back the window frames 4½ in. He (Mr. Cubitt) did not think it was a general requirement, and he certainly did not think it was of much value in London. No doubt there were other by-laws which might require modification. There was another thing which applied in London—*viz.*, the by-law for a 14-in. wall if an attic roof was put in and the building made a three-storey building. He had no hesitation in saying that there was no constructional necessity to make a building 14 in. at the bottom if it was taken up three storeys, and he did not think that opinion was a singular one, for he remembered reading of a prominent member of the institution stating the same thing. It would help the progress of cheap and sound building if the schedule of the requirements as to thickness of walls was modified to allow 9-in. walls with three-storey buildings. Then there was the question of construction. Apparently the Local Government Board were willing to allow each authority to act "on its own" in this matter. This might be good or bad policy, but it was not a healthy state of things for the outside person who was to build. Something might be said for different by-laws when there were different circumstances in dealing with the ordinary system of building, but when they came to steel-frame and reinforced-concrete construction it seemed to him the same whether the building was in Cornwall or Caithness there was no reason why the same requirements should not apply in all districts. It would be a very different matter for each local authority when its

own standard requirements were applied to those special buildings. Mr. Platt advised them to take the report of the Royal Institute of British Architects. That was sound advice, but if the Local Government Board framed a model code for ordinary buildings, might it not do so as applicable to special types? A model code was wanted certainly, but it was wanted even more so in the case of special types. He (Mr. Cubitt) went with him to the extent that the warehouse type of building must be specially strong, not by hard and fast rules but as to structure. It was reasonable that the construction should be investigated and approved by the local authority, but as regards Mr. Platt's suggestion that the maximum load on the floor should be stated in written form, he (Mr. Cubitt) thought he could go better than that. In London if they built a steel-frame building the amended Building Act required a notice to be exhibited stating what was the maximum load per square foot that the floor was to be constructed to bear. A similar requirement, he believed, obtained in American cities. Surveyors would appreciate that such a method was sounder than having the particulars given in a written form. This subject was worthy of a good deal of discussion, and seeing that the Local Government Board have thrown it open to publicity by their recent letter, he thought the institution might be inclined to appoint a special committee to consider and report as to whether action should be taken.

Mr. H. C. Adams (London) seconded the vote of thanks. Personally, he said, he had been engaged in building for commercial purposes, and he must say that usually they calculated everything very carefully as regarded the stability of walls, and they found there was not much to complain of as regarded the requirements of the by-laws. The question of the load to be taken on the floors suggested a difficulty. If they specified that the weight to be taken on the floor was not to exceed 1 cwt. per square foot a man wanted to know how this was to be applied—on each single square foot or the big area of the floor as long as the weight did not exceed the gross. It made a great difference as to how the load was to be brought upon the building. A man who wanted to put up a cheap building would make the loads as low as possible, and he could persuade the surveyor to accept his figures. It did not seem to be fair to pass a building of this sort, because the building was, perhaps, let to people for other trades who might put other loads on it, and it might not be safe to have in the district. The difficulty would be to know how to take the load—to distribute it so as not to cause unequal loading. The necessary details for safe loading could not be handed down from tenant to tenant, and therefore the only satisfactory way was to have a figure which experience showed was as low as was safe, or as high as was likely to be required.

The President remarked that there were many points in the paper which were extremely interesting and valuable to municipal engineers. He thought that the institution might take the matter up and appoint a small committee to give it adequate consideration. Municipal surveyors would thus get advantage of the experience of others, and as the committee would sit in London it could communicate with those in authority better than those who were a distance from London.

Mr. Platt, in reply, expressed a hope that the paper might prove of service to municipal engineers. The special code of by-laws would shortly be issued to all authorities, but at present one code was not issued. The notice mentioned by Mr. Cubitt had been tried in Manchester and Salford, but it was generally covered up by packing cases or some other article being placed in front of it. The tenant found that the floor would carry the load or more. He agreed that there should be a minimum load, and that local authorities should advise as to what methods should be adopted in individual cases.

THE LOCAL GOVERNMENT BOARD ON THE INTERCEPTING TRAP.

Mr. H. C. H. Shenton (Westminster) remarked that there were one or two points he would like to [illegible] as supplementary to his paper on the Local Government Board report on the intercepting trap. One was that the report of the Departmental Committee seemed to show that sewer gas was a very different thing from drain gas. He should like to know whether members had found this to be so. It seemed to him that very often sewer gas might be just as bad as drain gas and *vice versa*. The great objection to the intercepting trap was that it was liable to be stopped up, but he did not know much personally of cases in which the trap either was or had been stopped up. He would ask whether, in their experience with drains which had been badly laid, members had found that these also became stopped up, or whether the fact of removing the intercepting trap would have prevented these drains from being stopped up from other causes. Of course, there were many drains which had been badly laid, and he would like to hear the experience of members with respect to that part of the subject. Then there was the question whether intercepting traps were not effective in keeping back rats. If they were not effective it seemed a curious thing that they did not get rats in London houses to the extent they formerly did. The point which seemed to call for most discussion was how they were going to proceed when they came to put the new by-law into operation; when it was decided there were to be no more intercepting traps, what did they intend to do? Would they put in a system of drains without a trap or leave out the subways to the intercepting trap? He asked that question because personally he had not the experience which members of the institution had in municipal matters, and because private engineers might, perhaps, look at the matter from a different point of view.

Mr. Baldwin Latham (London) proposed a vote of thanks to Mr. Shenton for his paper. He had not, he said, read carefully through the Local Government Board report, but in the course of his practice he had put in many thousands of intercepting traps and had never found one to block. An intercepting trap that was laid in the line of the sewer was certain to stop, but one which had an abrupt fall would never stop. There was one of his own, there was the Buchan trap, and there was one brought out by the late Dr. Buchanan; none of those traps failed; but of all the earlier traps, which were merely floating syphons, he had never known one which did not block. As to rats, they were never found in a properly constructed drain. Could a rat stand the quantities of boiling water that were thrown down a drain? Rats were always found with old brick sewers, in old buildings where common mortar had been used, and the drains were all to pieces. He was not going to say that the intercepting trap was necessary for health, because they must remember that a great change had taken place in our ideas with respect to sewer air. It had been shown to be freer from bacteria than the air of the streets, and quite reasonably so. But supposing there was a connection with the house drains or rain-water pipes, which was usually the case, what happened? If there was no intercepting trap the air from the sewer could pass into the house, and if the sewer air was deleterious a nuisance was set up. It used to be said that typhoid was caused by sewer gas. In America they did not find sewer gas mentioned as being the cause of typhoid; the only things mentioned in such a connection were water and flies. He thought they were indebted to Mr. Shenton for bringing this subject before them, and he trusted that when intercepting traps were used they would be of such a kind as had an abrupt fall, for others were not safe.

Mr. H. Percy Boulnois (London) said he seconded the vote of thanks to the author of the paper all the more heartily because his dear friend Mr. Baldwin Latham had proposed it. He had a great deal of sympathy with all that that gentleman had stated. He had been an advocate all his life for the use of the intercepting trap, and he must confess that the report of the Departmental Committee came upon him as somewhat of a bombshell. After careful investigation by a duly appointed committee the members practically came to the conclusion that the intercepting trap was not only useless, but a danger to the health of the inhabitants. They had, doubtless, all read the report, which consisted of a considerable volume of seventy-eight pages, and he could say personally that he had read it carefully. What were the indictments against the intercepting trap? The committee stated that the fresh-air inlet might become an outlet even though it might be provided with a mica trap, and that the outlet was often so placed as to become a positive danger to the inhabitants. The answer to this was that the outlet need not be so placed that it was wrongly constructed if it was so placed, and that if there was a mica trap this acted as a detective, or that there must be something wrong with the drain or trap, and therefore that it served a useful purpose. A still graver indictment was that the intercepting trap was constantly choked, and that as a consequence the drain became choked and the inhab-

tants not being aware of the chokage the soil became saturated and a great evil ensued. It might be urged that the trap became choked by foreign articles, such as dusters, brushes or other things, allowed to get in by carelessness. Careful experiments carried out by Mr. Paton Barber showed that the trap did accumulate a great deal of solid matter passing through the drain, and it was proved conclusively by a number of experiments with all kinds of traps, including the Buchan trap, with cascade action that they all retained a great deal of solid matter, some 79 per cent, and the lowest something like 42 per cent. This might be so; but was it not possible that if there was a greater flush of water it would not occur? He did not know whether Mr. Paton Barber observed whether the solid material in the drain itself was readily moved by the brushes. He (Mr. Boulnois) had carried out experiments with drains laid on small gradients, and he found that a 2-gallon or 3-gallon flush did not remove fæcal matter, and that it was necessary to bring a series of successive flushes to bear in order to remove it. If the drain did not move the solid matter it was not to be wondered at that the trap retained the matter. Another indictment was that the retention of the matter added considerably to the noxious gas given off by the sewer, increased the smell of the sewer, and that if the trap was not there the sewer could be ventilated through the house drain. That would be so, but when they said that the house drain should become the sewer ventilator it was rather a large order, because if no precaution whatever was taken to prevent the gas from the sewer—which might possibly contain the germs of disease from an adjoining house—passing up the drain it might enter the house. He believed that was the principal reason why the trap was first introduced; now the Departmental Committee said it was useless to prevent such a thing occurring. On the question of rats he had a few words to say, for lately the matter arose because rats were accused of spreading [illegible] diseases. An instance had been adduced [illegible] passing through a trap. The fact was that rats would do this when actuated by fear, and animals when actuated by fear would do courageous things. If pressed they dived through the trap. He was certain that a trap would [illegible] rats under normal conditions, and to do away with the trap on old or improperly constructed sewers where there might be rats would be almost certain to encourage these animals. The flush of hot water might kill them, but the flush might not be given at the proper moment. One of the best things in the admirable report of the committee was the investigation of the chemistry and bacteriology of the house drain. They came to the conclusion that the air in the sewer was practically harmless, that it was no worse than the air of the surrounding atmosphere, but that the air of the drain itself might be exceedingly impure and more dangerous than the air of the sewer. That was a most important conclusion to arrive at, and how the difficulty was to be got over he did not know. The reason given for the air of the drain being more full of microbes was the splashing that took place in the drain. How this was to be avoided he did not know, unless the soil pipes were made on a spiral so as to bring the sewage down on a proper gradient without splashing. As Mr. Shenton stated in concluding his remarks, if the trap was to be omitted how were they to proceed in the future? The committee, very properly to his mind, stated that iron drains should be substituted for stoneware drains. That would be one cure. If the whole of the drainage passed through iron pipes with perfectly sealed joints and sinks, there would be no danger or harm in the want of a trap. But if they were to employ stoneware pipes there was always a danger of leaking. Personally, he should like to feel that he had a trap between himself and the sewer, rather than run the risk of admitting sewer air into his house or receiving it from the house of his neighbours. The points raised in the admirable report of the Departmental Committee required the most careful consideration, and he [illegible] municipal surveyor would endeavour to make his own observations by way either of confirming the conclusions or pointing out their disadvantages.

The President said that personally he was very grateful to Mr. Boulnois for his presence and for the excellent demonstration he had given on the report of the Departmental Committee, which would be very valuable to them as officials. It was an excellent thing for them to hear speeches from such able men.

Mr. E. A. Stickland (Windsor) observed that what struck him was that whatever point they went into there was no guarantee that the whole of the house was disconnected from the sewer. The by-laws might insist that this should be done, but unfortunately in the past the by-laws were not directed to altering what was already in existence. If the disconnecting trap was to be fixed, it should not be done in halves or two-thirds. It was, perhaps, a very difficult matter, but it seemed to him they should take the standpoint that every house should or should not have the regulations applied to it. The by-laws stated that the disconnecting trap should be placed as near the sewer as possible, but he knew houses which stood 200 yds. or 300 yds. from the road. In such cases solid matter was bound to get into the drain, for how could they expect the flush from the drain to clear out the trap at such a distance? If they wanted that they must put the traps as near the house as they possibly could. At Eton they had automatic flushing tanks at the top, and this, though expensive, kept the drain clean. But as a matter of fact there was not fair treatment all round, as, while so many houses had disconnecting traps, some had none, and others had ventilators.

Mr. A. J. Martin (London) was reminded of the story of the man whose trousers, having been made too long, were made a bit shorter by his mother and sisters unknown to each other. That seemed to him a good illustration of what was going on in relation to some of the public health work. We taxed the householder over and over again for a number of overlapping precautions which were not only not required, but in some cases actually defeated the object in view. As regarded sewers, we endeavoured to make them self cleansing by providing abundant flushing facilities, and provided ventilators in order to keep the air in the sewers pure. Then we put down an appliance which was expressly designed to keep offensive matter decomposing in the neighbourhood of the house. Now it seemed to him that the arguments used in favour of the trap in the past had largely been based on the conditions which the trap itself had brought about. We put in a trap, we said, because the air in the sewer was apt to become offensive. But why? In a modern system of sewers there was no stagnation, and any decomposition which took place was principally due to the matter held back in the trap. We seemed to assume that the sewer itself was a reservoir of foul, stagnant air. He held that this could only be because we insisted upon a multiplicity of traps which prevented ventilation. It seemed to him that with the trap abolished there was no reason why the air should not be fresh and harmless. The whole system in connection with the ventilation of house drainage was based on a series of assumptions not warranted by fact. A good deal has been made of the argument that it was not fair to allow the householder's drain to be used for the ventilation of the public sewer. That seemed to him to be based upon a false view of the obligation of the citizen. If it was no business of the householder to ventilate the sewer, whose business was it? After all the municipality was only all the householders rolled into one. It was no more hardship to call upon him to ventilate the sewer than it was to take money out of his pocket for this purpose. They must not lose sight of the fact that the sewer air must go somewhere. Bristol was a happy town with no sewer ventilation, but the air must be displaced, and it seemed to him a most unsatisfactory state of things to have large volumes of air displaced if it was not known where these were going to. Then there was the question whether it was better that the air should go out at a few points. Was it not better that it should go off at a large number of points than that it should be concentrated at a few? With respect to the case mentioned by Mr. Shenton of a single house ventilating a long length of sewer, of course, such a state of things should not be allowed. He was going to say that he would not advocate the general doing away with the intercepting trap, but people were too apt to swing from one extreme to the other, and he would therefore remark that it was best to be moderate in their judgment of the house trap. If they did away with it as applied to the modern system of sewers they must retain it on the old sewers. Then with regard to the point raised by Mr. Boulnois and Mr. Baldwin Latham as to drain pipes. If they strictly separated the systems, they would be safe and happy with a trap; but if they were going to admit rain water to the sewers they should consider carefully what was going to happen. If the rain pipes were brought right into the drains, as the soil pipes were brought, there would be a risk of the air being discharged from the neighbourhood of the windows. It must be remembered that the trap and

rain-water gulley was a broken reed in time of long drought. In bringing water into the sewers, the only safe plan was to bring the rain-water pipe into a gutter that should run into a gulley into which the kitchen, bath-house, or continuous source of supply is being constantly discharged.

Mr. F. W. Platt (Salford) observed that there was one aspect of the subject they could not lose sight of, and it was important. When the intercepting trap was introduced in 1877, the science of bacteriology was hardly known. It was introduced because most of the sewers and the drains leading to the sewers were bad. The whole condition of affairs was that the soil round the drain was more or less permeated with sewage matter. This did not exist in modern drainage with watertight pipes, and most of the sewers laid since 1885 were laid with socket watertight joints. The chemists told them that the danger was not in the sewer, but in the drain air. If, then, air came from the sewer, what did it matter? If it was the drain water there was nothing more to say, because the pathogenic germs were not there.

Mr. E. R. Capon (Epsom) was not surprised to hear the remark that rats would dive through a syphon. He had seen them dive through water-closet traps. They did it from fear, no doubt, but if they did it once they would do it again. He favoured the retention of the intercepting trap, and he could not help thinking that it was going to be a very difficult matter to abolish the whole of the traps throughout a district. It would be a big job at the expense of the local authorities, for he did not think they would get private owners to do it, because they would say it would be ventilating the sewers for the whole district.

INFLUENCE OF TOWN PLANNING ON PUBLIC HEALTH.

Mr. A. R. Bleazard (Clitheroe) opened the discussion of Mr. W. Louis Carr's paper on "The Influence of Town Planning upon the Public Health." Everybody would agree, he said, that the influence of town planning on public health was very great, for it was the fact that in all the large towns the death-rate was higher in the densely populated districts than in the more open. He thought it behoved all municipal engineers to be in the front of town planning, because it was undoubtedly part of their business. It seemed as if it must be very expensive to have a dozen houses to the acre instead of forty, which was the number in North Lancashire. People would live near their work; in North-East Lancashire people lived close to the works. What he would like to know was how would Mr. Carr get over the difficulty of people living in one district and the works being in another?

Mr. E. R. Capon remarked that Mr. Carr had a large district to deal with, and he must have had considerable experience in town planning, judging from his carefully prepared paper. Town planning would mean the putting into practice of a happy ideal, but it was very difficult to say when it was going to be carried out. The difficulties to be surmounted in putting the Act into operation were enormous, so enormous, indeed, that many local authorities were prevented from taking the subject up. In his (Mr. Capon's) case the matter had been under consideration for two years, and they were not much "forrarder," but Mr. Carr had met the same difficulties to contend with, and matters were thus simplified. When there were twelve or fourteen owners to deal with, their difficulties might be said to commence. They might get nine owners out of ten into one, but the remaining one might stand out. In that case what was to be done? It seemed to him that the only way out would be for the local authority to buy the land, and that would be costly to the ratepayers. He thought he was sorry to sweep away old property wholesale in order to carry out a town planning scheme. He hoped Mr Carr would show them how they were to get the cheap roads that were spoken about. He was one of those who believed that roads well made were the best and most economical roads. Unless great care was exercised in a new district there might be considerable waste of land in, say, laying out cemeteries, unless an extensive alteration in the Act was made. Mr. Carr stated that the people to benefit from town planning schemes would be the ratepayers. He (Mr. Capon) hoped that gentleman was correct, but he was afraid town planning would be a costly matter to them. He noticed that in the by-laws adopted the proposed height of the living-room was 8 ft. No doubt builders of small property would agree, but he (the speaker) thought it was too low. Small property required a higher living-room, because there were generally so many children. He was glad to find Mr. Carr was so situated that he did not expect any offensive trade. He (Mr. Capon) could not have any such expectation in his own case, but he hoped Mr. Carr's ideal would be fulfilled.

Mr. A. E. Prescott (borough engineer of Eastbourne) said town planning had been before them for a considerable time, and it was almost impossible to look at the technical papers without seeing something about the subject, which was really of very great importance. It had been suggested by previous speakers that town planning would bear heavily upon the ratepayers. He took the view that any improvement in sanitary matters—the health of the individual—instead of an expense would be a cheap thing in the end. He noticed in The Surveyor recently that the Local Government Board inspector had complimented Mr. Carr upon the manner in which he had worked out his scheme. He was pleased to see that, and he only hoped the scheme would come to fruition soon, and that Mr. Carr's efforts would be successful. He extended an invitation to the members to visit Eastbourne in order to see a town laid out as it ought to be. There they had plenty of fresh air, something which was not always appreciated. There were two ground landlords to deal with, both of whom made it their business to work with the corporation, not in getting as many houses as possible per acre, but in laying out the land on a particular line with grass verges. There were 12,000 trees in Eastbourne, and with most of them they had verges. He was bound to admit the verges looked nice, but they were expensive to maintain. It was absolutely impossible to maintain them as they ought to be maintained, for dogs were continually scratching. They might, of course, be protected by a rail or guard, but this increased the cost. As an alternative they might put down gravel verges, which were quite as good, and did not cost so much. Setting out wide roads added to the expense, but after all the chief thing was to have good, wide arterial roads to a central point and main roads diverging from them. With respect to slum property, that was a matter they provided for at Eastbourne under the Town Improvement Act. Where property was insanitary it paid the town to clear it away, and proceed to lay out the town as it ought to be laid out, with good wide streets. Also he considered it was a good thing, with a view to the prevention of overcrowding, to limit the number of houses per acre. We had been too much in the hands of the jerry-builder in the past—too much at the mercy of men who built two houses where there should only be one. Again, in Eastbourne they had been met very liberally by the landowners, which was satisfactory, as it depended very much upon the way these gentlemen looked at this question whether town planning was going to be successful or not.

Mr. E. A. Stickland (borough surveyor of Windsor) thought that every facility should be given for the erection of crematoriums in connection with town planning schemes. This would be preferable to sinking thousands of pounds in cemeteries—preferable so far as the welfare of the present generation was concerned, and also the future generation.

Mr. E. E. Ryder (surveyor to the Bushey Urban District Council) said he would like to know how the difficulty of contour was met before the principal lines of roads were made out in a town planning scheme; also what was the cost per acre; and whether municipal surveyors were able to get satisfaction from the Local Government Board as to what they (the board) wanted before the plans were sent in.

Mr. Horace Cubitt (London) inquired what would be the maximum of the most subsidiary form of road that could be used.

Mr. Horace Boot (Westminster) would like to hear something about the correct position for locating the various municipal works, dust destructor, electricity undertaking, and so on. It behoved surveyors of small districts to get rid of the insanitary method of dealing with refuse in heaps, for there was no doubt that a great deal of disease was spread by this practice. It would also be interesting to know whether Mr. Carr had considered the question of having a combination scheme of working these matters under a single administration. Then there was the question of advertisement hoardings. He was aware there was no Act of Parliament which enabled a municipality to disallow hoardings, but he thought some concerted

action might be taken to insist upon hoardings being less unsightly. It might be suggested, indeed, to a certain famous taxer that he might be able to obtain revenue from hoardings. Then, again, there was the question of food storage. He had recently been called upon to design cold-storage works, and he was not at all sure it should not be the duty of the surveyor to provide for cold storage along with other works. It was well-known that large profits were made out of cold storage.

The President remarked that Mr. Carr was one of the most enthusiastic members of the institution, and he did not know anybody in the country who had taken more interest in town planning than he had. He had written a great deal on the subject, and displayed considerable industry in preparing plans, while he had also attended a large number of public meetings and conferences at which the matter was discussed. In fact, he had gone into the subject with a whole-hearted thoroughness that was greatly to his credit.

Mr. W. Louis Carr, in reply, said he would be delighted to give any information he possessed to municipal engineers at any time in connection with the work in his district, and if any members would like to see his plans he would be pleased to show them. He had received visits from municipal engineers who had told him how pleased they were with his scheme, and a deputation from the Keighley Council had gone thoroughly into the question, and he had been able to satisfy them on nearly all points. As to the question of Mr. Bleazard with respect to the limitation of the number of houses, there must always be differences on that head. They might depend upon it, however, that if they started a town planning scheme they would not be allowed to build forty or forty-five houses to the acre. Personally he did not think any compensation would be payable for scheduling any district. The general opinion was that in the future twenty houses would be about the minimum; but it would certainly be less than forty, and no compensation would be paid. As to how the thing was to be done, they did not really know until they had started with a scheme. They had had a tremendous lot of trouble at Ruislip-Northwood, but they got hold of the chairman of the National Housing Council, and they had gone on better since then. So much depended upon the fact whether the landowners were reasonable, when they were up against the scheme from the beginning it was impossible to go on. At Ruislip-Northwood they had 180 owners to deal with, and 175 leaseholders. They would allow a claim to be made for compensation, but in return they would make a claim for betterment on the owner, and put betterment on the adjoining owners where they got an advantage. There was no doubt there were many ways in which they could improve a town without pulling down old buildings. Then as to roads, there were by-laws which demanded an unreasonable style of construction in the first instance. They considered at Ruislip-Northwood, and he thought they were upheld by the Local Government Board, that the by-laws in the first instance should not be stringent. Landlords objected to the first cost of the roads, and they had nothing in their by-laws as to how they should be made up. He thought this was a great advantage. He did not see why in the case of a 24-ft. road, where there was no heavy traffic, the road should not be taken over in a lighter form when the houses were building, for the owners would possibly make it up in a thorough manner to the satisfaction of the local authority without going to the heavy cost in the first instance. In their scheme they had made agreements for 11 acres of open space, which would not cost a penny to the council. Some of the land was adjoining the station, and was valued at £800 per acre. With regard to the height of the rooms, he might say that in the first instance it was put at 7 ft. 6 in., but they had raised it to 8 ft., with 7 ft. 6 in. subject to proper ventilation near the top of the window. One of the most important points was to get on well with the landowners. If the surveyor could meet them and point out to them the advantages they would derive from a scheme he would make a good start. They did that at Ruislip-Northwood, and he was pleased to say the landowners saw their arguments, so that they made a good start with their scheme. On the south side they had put down main lines of sewers, and the site of the sewage works, and they showed roads along the line of sewers which had been agreed to with the landowners. Those were absolutely the lines which the outfall must take, and the owners laid out their land accordingly. Except for levelling on the south side of the district with regard to roads, nothing had been contoured, and unless the district was extremely hilly he did not think that contour absolutely necessary. The cost of the scheme up to date was £267. What was that with 11 acres of open space obtained, besides the widening of roads that had been agreed to? He might explain that they were supplied with water and electricity from outside, and as to refuse disposal, they had promised to schedule land for that and other purposes. As to advertisement hoardings, they had got most excellent regulations embodied with respect to the sites, this having been brought about chiefly through the instrumentality of the Urban District Councils Association. The minimum width of the roads was 20 ft.

Mr. Platt: You yourself have not been paid.

A Voice: That is to be added later. (Laughter.)

SUPERANNUATION AND SECURITY OF TENURE.

The discussion of Mr. Winter Gray's paper on "Superannuation and Security of Tenure" was opened by

Mr. E. A. Stickland, who proposed a vote of thanks to the author. The energies of the members, he said, with respect to the subjects treated by Mr. Winter Gray were not increasing—certainly there was no furore among them—and it seemed to a large extent as if it was a case of beating the wind.

Mr. C. Chambers Smith (London) remarked that Mr. Winter Gray knew his subject thoroughly, but there was one part of the paper he did not follow. Mr. Winter Gray seemed to have gone a little away from his former views as to security of tenure. He (the speaker) considered it absolutely essential that municipal officers should have security. There was no objection to medical officers, poor-law officials, members of the constabulary and the civil service having security of tenure. The membership of a local authority was temporary, and in consequence of the change in the character of the representatives there was no guarantee of the municipal surveyor's tenure of office; in fact, it became more and more risky. Large councils might offer safety, but small councils were unsafe. It was therefore, in his opinion, essential that municipal officers should ask for security of tenure. The surveyor occupied a position of difficulty because he came more into contact with interested property owners than any other official. The medical officer did not come so much in contact with property owners, yet he received superannuation. The speaker instanced a case in which an appeal against a council's decision was made to the Local Government Board, and they at once intimated that they could not accept the explanation as to why the officer's services should be terminated. That officer still held his appointment, and there were many cases similar to that. He mentioned that as an illustration of the absolute necessity for security of tenure. Superannuation, he considered, could only come in conjunction with the National Association of Local Government Officers, and he thought they should combine with that association in order that the matter should go through a common medium. There was yet another matter that was important to municipal officers—*viz.*, combination for the establishment of a mutual defence fund. It was well known that a number of municipal surveyors had to go through the mill in defending actions after suffering greatly, and there were others who suffered very severely who could not institute legal actions against those who were continually slandering them. If a mutual defence fund was formed for the purpose of giving legal advice and taking up such cases the lot of the municipal surveyor would be infinitely better. Mr. Winter Gray was an expert on this subject, and he (the speaker) hoped he would keep it more and more to the front, and eventually succeed in bringing about both fixity of tenure and superannuation.

The President said that Mr. Winter Gray had undoubtedly taken a great interest in this subject, and he echoed the wish of the last speaker that he would continue to maintain that interest, not only by reading papers, but by agitation, and that sooner or later they might be able to compliment him upon the fact that he had been the main spirit among them to achieve for municipal officers something which would enable them to carry out their duties with a free mind. A municipal surveyor could not do that when he was

continually harassed by certain councillors who seemed to imagine that an official was paid to lie on a couch all day long. They found the same spirit prevailing all over the country, and none of them escaped. There was, however, one saving grace, and that was that in the majority of cases the official was backed up by the majority. He (the speaker) could always get seven-eighths of the town council to back him up. But there remained, of course, in the mind of the officer a feeling of uncertainty, and the public generally looked at the matter against the official with the remark that there was "never smoke without fire." He had known friends pass him in the street because of remarks passed in a committee of the council; and he was grateful to say that the Mayor of Penzance had worked very hard on his behalf, so much so that he felt he could never sufficiently thank that gentleman. The mayor had sacrificed certain friends and a certain amount of quietude in his office for himself (the speaker) as an official when things without foundation were launched out against him, with the result that after getting twenty-three out of twenty-four councillors to back him up he finally got the whole twenty-four. Though he might be tripped up, an honest official would invariably fight, and in the end he would get the majority of the council to support him, and the mud did not stick.

Mr. A. Winter Gray, in reply, remarked that the only way to make mutual defence effective would be to make it part of the subscription to the institution. He had heard something about it hitherto, but so far he had not seen any money put on the table.

EASTERN DISTRICT MEETING AT GODMANCHESTER.

Under very favourable circumstances, and in beautifully fine weather, a meeting of the Institution of Municipal Engineers was held for the first time in the borough of Godmanchester on the 15th inst. The number present was between thirty and forty, and included Messrs. Frank Latham (president of the institution), W. T. Unwin (chairman of the Eastern District), C. F. Mayfield (Godmanchester), G. A. Penwill (Peterborough), A. Paterson (St. Faiths), W. R. Kipling (Swaffham), A. W. Broker (Wimblington), Solden Hipwell (Chatteris), W. R. Bailey (Holbeach), John Bailey (Spalding), G. E. Mathews (South Holland, Spalding), W. A. Norris (Swaffham), P. S. Bennett (Ramsey, hon. secretary Eastern District) and B. Wyand (secretary of the institution). Among the visitors were Messrs. J. P. L. Durrell Stable, J.P. (mayor of Godmanchester), Aubury Markham (deputy-mayor of Godmanchester), F. W. Bird (borough treasurer of Godmanchester), J. T. Dewey (Peterborough), Leonard Cooper (London), G. W. Heathcote (London), F. J. Read (Huntingdonshire), E. Newbury (Huntingdonshire), J. E. Cardell (Huntingdonshire), Wm. Morgan (Ashwell), H. Bowman (Ashwell), H. Sargeant (Beaconsfield), R. Ash (London), Robt. Wade (Doddington) and J. W. Walshaw (Peterborough).

Shortly before mid-day Mr. Charles Mayfield, borough surveyor, met the visitors at Godmanchester Railway Station, and their attention was first directed to a piece of "Roemac" road now in course of construction between the north end of the borough and the Great Eastern Railway level crossing. Later on a call was made at the corporation depot, where Mr. Mayfield explained and pointed out methods of sewer flushing in action worked from the old water flour mill. A visit along the mill bank to the two reinforced concrete bridges, one spanning the flood-gates and the other the largest overfall, was next on the programme, and they proved of much interest, there being something novel and original about their construction.

After luncheon, at which the mayor (Mr. Durrell Stable) presided, some of the ancient charters and documents were viewed, first and foremost being the original of King John's Charter, dated 1213. The mayoral memorial chain was also laid upon the table for inspection.

The Mayor rose, and said he was very glad indeed to have the opportunity of seeing so good an assembly of the profession that he had before him that day on this their first visit to this ancient borough, the date of which went back to a very remote period. He supposed it dated back to before the Roman period. At any rate, the Romans had a camp here, and established themselves, and there had never been any break in the existence of the borough from that period down to the present time. They made road and did all that was necessary. There was a king of such a name as Guthrum or Gurum. Some time after that the charter that they had before them was granted by King John, and he believed that every king from John to James I. granted a charter of some kind to this borough. Having referred to the Fee-farm Rent, and the meeting of King John by agriculturists with plough and teams of horses on the London-road, which caused much pleasure to the King, his Worship proceeded to go into detail of what was known as the "surrender at free bench" in the case of some property in the borough changing hands. The man who bought was not entitled to take the title of his purchase from the man who sold until the wife surrendered her right to the mayor, who handed it over to the proper person. He had acted in that capacity as mayor once or twice. (The deputy-mayor said he had sat three times.) When the time came for the document to be signed, effect was given to it by the wife handing gloves to the mayor. That was one of the old customs that was still retained in the borough. Another custom peculiar to this borough was that when a new sovereign was proclaimed the high sheriff did not attend to make the proclamation, but the mayor for the time being did it on horseback outside the town hall. He was attended by his chaplain, members of the council, and others. Prayers were said, and the proclamation was read by the mayor. The ceremony was repeated on the middle of the stone bridge at the boundary of the two boroughs. The procession then returned to the town hall. He believed there were about three boroughs that had this privilege; at any rate, this borough valued it highly, and would not give it up. They saw the mayor's chain on the table, and he must tell them that it was arranged to erect a panel in that hall containing 600 names of bailiffs and mayors from the year 1604. He explained that in ancient times there were bailiffs instead of mayors. He must tell them that the chain had been worn at the Lord Mayor's banquet several times and much admired. Having alluded to the various charters, he referred to the maintenance of roads, remarking how necessary it was that they should be well maintained now that they had such an increase of motor traffic. He spoke of Mr. F. W. Bird's book of memories of the borough, which he said was most interesting reading, and contained a good deal of the history of the borough. Again, his Worship expressed his pleasure in meeting so many on the present occasion.

Mr. Unwin (district chairman) moved a vote of thanks to the mayor for presiding. He said if there was anything he wished to give expression to that day it was to thank his Worship for his kindness in presiding over their gathering on the present occasion, and also for the lucid explanation he had given of the old customs of the borough. He thought it went to prove how well qualified his Worship was to hold the position he did in the borough. As chairman of the council, or as mayor, he must know something about the particular town or borough in which he lives, and he was sure his Worship had that qualification, and on behalf of all present he begged to thank him most heartily for the kindness he had shown them in presiding at their gathering. (Hear, hear.) He must add how much they all appreciated what their surveyor had shown them that morning, and the many little details he had pointed out to them in the work he had accomplished. The reinforced concrete bridges they had seen spoke well of the ingenuity and inventive powers of the surveyor, and showed that he took good care of their finances, and no doubt caused the rates to be lower than they otherwise would be. He could assure his Worship that they had all been much gratified with what the surveyor had shown them of his own work. He then proceeded to speak of the institution of which he was chairman. He was sure they had a very good and able president in the person of Mr. Latham. It was the first time he had met him, but he knew him to be a man of influence and specially fitted for his position. He had a large work in hand, and he trusted he (Mr. Latham) might be able to carry it to a successful issue. He hoped they might all benefit by their visit to Godmanchester, for they had seen much to interest them, and he thought it went to show how little towns could carry out the work. He considered their surveyor was doing most excellent and exclusive work for them here. He would now ask Mr. Latham (the president of the institution) to second the vote of thanks.

The President said he had much pleasure in

seconding the vote of thanks to the mayor for so ably presiding over their meeting that day. He also desired to thank the ex-mayor for his presence, and Mr. Mayfield (the surveyor) for showing them over the works. The mayor had given them a nice little lecture in detailing many things pertaining to this ancient and honourable borough. In the borough of Penzance, to which he belonged, they had some ancient rights in common with Godmanchester. For instance, the mayor had the right to proclaim a new king, although he did not perform the ceremony on horseback. Originally Penzance possessed a number of gold maces, but the Spaniards in the wars did great damage to the town and stole the maces. They had many charters granted to the borough from time to time which gave them certain privileges. He could assure them that it was of great interest for him to come from one ancient borough to another that day. He must congratulate the town of Godmanchester in having a mayor who had so ably presided over their gathering, and who took an interest in all around him. To be able to trace all those things through generations, and hand them down from one to the other was extremely interesting in connection with a borough of this importance. He spoke in high terms of the work of the surveyor (Mr. Mayfield), and said from what they had seen that morning showed them that he had specialities of his own. He carried out things not in common practice, but gave effect to his own thoughts and designs. He then proceeded to speak upon the institution of which he was president, and said how grateful he was to have something of this kind. There was nothing of more importance to municipal engineers than meeting together and discussing matters relating to the profession. Those who took up observation were the men who made improvements—going on taking things up and materialising them. To rub shoulders with one another gave them an opportunity of developing knowledge. He showed the advantages of belonging to the institution, and the difficulties he experienced in his young days before there was anything of this kind in existence. But they had every opportunity now. They met together in different towns, and there were good fellows among their number who were determined to get on, and the institution did all it could to encourage them and give them knowledge in municipal engineering. He alluded to the library in connection with the institution, and spoke of its usefulness to members, who could obtain books from it on a variety of subjects. The work of the library, he could assure them, was of a highly satisfactory character, and the more it was known the more satisfactorily it would work. There were many important matters connected with the institution, and they had some most honoured men connected with it. Some interesting papers were read at the meeting, and he specially noted one that he heard read last Friday. They wanted in their institution downright sturdy work, and men who put their whole heart in the work and who would do the best for the community. After alluding to the examination question, he said the most common-sense line was to get in the minds of members themselves a firmness in their work, and get them to develop new plans and methods to carry out their work. They must have solid, good, practical work, both untheoretically and theoretically, and experimental work as well. In conclusion, he said they had at present 900 members, and they hoped to see the number up to 1,500.

Mr. S. Hipwell (Chatteris) briefly moved a vote of thanks to Mr. Mayfield for the kindness in showing them what he had that morning. He considered he was a veritable encyclopædia in himself. He had told them things that were both interesting and instructive.

Mr. J. W. Worsnop Peterborough seconded the vote of thanks. He took it as a compliment to be invited to Godmanchester, and it afforded him much pleasure to be there that day. The incorporation of the city of Peterborough was nothing like so old as Godmanchester. He was a member of the municipal borough about thirty-five years ago. There were some old customs that they kept up. For magisterial purposes it was called the Soke of Peterborough, and that it was really a county. One curious feature was that they could try a prisoner for murder. They still kept up the old custom of proclaiming a fair. What Mr. Mayfield had shown them had been of special interest. It was a picturesque little borough despite its flat site and low lying, and possessed the advantages that Godmanchester did.

Mr. Mayfield responded in a short speech. He commenced with the Roman station in 400, and passed on to the medallion representing the Danish fort in 880. He next came to the representation of the old water mill, which was built in 1066, and came to King John's Charter in 1213, and another charter granted by King James in 1604, when the borough was incorporated. He alluded to the order that was made for every owner to place down a causeway of pebbles known as "kidneys," 3 ft. wide in front of his houses, and added that had his friends visited Godmanchester in those days they would not have found the footways very soft to their feet. After some further remarks, he thanked them for the vote of thanks.

The Mayor briefly acknowledged the vote of thanks on behalf of himself and the ex-mayor.

After a further inspection of the documents, the visitors had a walk round the town and viewed, among others, the following items of interest: A road made on the tarviated principle which had sustained a fairly heavy traffic for more than three years without any signs of wear whatever, and another road made of gravel dredged from the river and mixed with tar. This road, which was laid in 1906, is as good as ever, and its cost was only 1s. per square yard.

The party then inspected about twenty new cottages, some of which presented novel and attractive features. The cost of the cottages, all of which have three bed-rooms, was stated to be from £120 to £175 each. Next attention was drawn to some splendid examples of sixteenth century architecture, including one old house with a delightful oriel bay window set in a gable of open timber work with rope-pattern carved oak verges and most ornate chimneys. The last items showed were two rooms built as a back addition to a cottage, on quite novel lines. This work is the last word in cheap construction combined with durability. The walls consist of two bricks on edge, separated by a cavity, and tied every fourth course by lattice-girder fencing wire. The floor and roof each consist of a reinforced slab, 4 in. thick, and the walls are built in cement mortar and painted inside. A special flue ventilates the ground and first floor rooms. The cost was £15 per room, and altogether it represents a system of building which should do much to solve the housing question in the country districts.

Some outbuildings built of a single brick on edge were also shown. These walls, which are built in cement mortar and reinforced with ½-in. steel rods, were built at a cost of 1s. 8d. per yard super., and the row of barns, which measure 22 ft. by 7 ft., were all built for less than a £5 note. One more example of concrete work remained—viz., a concrete wharf, with [illegible] constructed in situ with unskilled labour.

The party then returned to the Horseshoe Temperance Hotel, where tea was provided by Mr. Mayfield, who was congratulated on the success of his efforts to provide a most enjoyable day's outing.

JOINT DISTRICT MEETING.

A joint meeting of the Yorkshire and Northern districts of the institution was held at Harrogate on Saturday last. Among the members present were the following: Messrs. J. H. Halstead (chairman, Yorkshire District), J. W. Moncur (chairman, Northern District), H. G. Firth (hon. district secretary, Yorkshire District), John Robinson (hon. district secretary, Northern District), R. Atkinson (Durham), G. W. Battye (South Crosland), J. Davison (Morpeth), G. Gregson (Durham), C. F. Hodgson (Otley), R. Heath (Emley), J. W. Holbrook (Houghton-le-Spring), J. Howard (Worsley), A. Light (Otley), H. W. Marsden [illegible], J. W. [illegible] (Ripon), G. Symon (Blaydon-on-Tyne), R. E. Wilson (Knaresborough), R. Appleby (Newbiggin-by-Sea), R. Alves (Ripon), W. J. Coulson (Cramlington), T. G. Easdale (Northallerton), J. Firth (Shelley), C. H. Hearder (North Ormesby), B. Hinchliffe (Gomersal), F. Hargreaves (Burley-in-Wharfedale), R. H. Kilburn (Guisborough), J. Nuttall (Hunslet), J. T. Pegge (Durham), L. Simpson (Middleton-in-Teesdale), W. Wilby (Gildersome), W. B. Thomas (Southwick-on-Wear), M. Turnbull (Shildon) and B. Wyand (secretary of the institution). Among the visitors were Messrs. C. E. Rivers (borough engineer of Harrogate), W. J. Thorpe (surveyor of highways, Harrogate), W. Atkinson (chairman, Knaresborough Rural District Council), J. Smith (clerk to Knaresborough Rural District

Council), Councillor Duff (Ormesby), Anderson (Howden). J. Thompson (Easingwold), A. Routledge (Stanley), Hiscock, Gilderdale and Greaves. Several ladies also were present and accompanied the members on the visits, afterwards attending the dinner.

The party met at Harrogate station and drove by motor chars-à-banc to the corporation depot, Wetherby-lane, where the very excellent new tarmacadam mechanical-mixing plant (supplied by Messrs. Ord & Maddison, of Darlington) and the stone-beaking machine were witnessed in operation. The process is mechanical from the entry of the stone into the breaker to its final delivery—broken, graded, tarred and mixed—into the corporation carts.

After a brief interval for refreshments visits were made (to programme time) to the North sewage outfall works, where the new septic tanks and percolating filters, new aërating sprinklers and special apparatus for sludge treatment were viewed; the Royal Baths, with their eighty-six different forms of treatment, many of which were carefully explained; the Iron Gate and Harlow Hill reservoirs, with sand bed and mechanical filters; the corporation stables and town's yard, and the corporation fire brigade station. The whole of the visits had been arranged by the kind permission of the Harrogate Corporation, and Mr. C. E. Rivers, the borough surveyor, accompanied the party, and furnished all necessary explanations.

At the dinner, which was held at the North-Eastern Hotel, Mr. J. W. Moncur presided, and at its conclusion proposed "Success to the Institution," coupled with the name of Mr. Wyand, who "suitably responded" in the two minutes which his departing train allowed him. A vote of thanks to the Harrogate Corporation for their kindness in allowing the members to visit the works as they had that day was heartily carried, Mr. W. J. Thorp replying in the unavoidable absence of Mr. Rivers. Mr. J. T. Pegge, in the course of a few remarks, laid stress upon the flourishing condition of the institution and the well-maintained increase of membership. Meetings such as that they were holding that day were both instructive and beneficial to all concerned. The toast of the visitors was responded to by Messrs. Atkinson and J. Smith, respectively chairman and clerk to the Knaresborough Rural District Council.

A business meeting of the Yorkshire District was held afterwards, with Mr. J. H. Halstead in the chair, when the following resolutions were passed: (1) That, as a temporary arrangement only, the East and West Ridings of Yorkshire join the North-Western District and the North Riding joins the Northern District, and that notice be sent to the members of the three Ridings of meetings held in both the Northern and North-Western Districts. (2) That the council of the institution be requested to hold general or council meetings at Leeds, York and other centres.

Lambeth Bridge Rebuilding.—The London County Council have decided to go to Parliament with the old scheme for rebuilding Lambeth Bridge.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

Local Authorities and Heavy Motor Traffic.—At Richmond on Tuesday it was reported to the Executive Committee appointed by the recent conference of local authorities on the western side of London, with respect to the question of heavy motor traffic, that another conference had been called by the Ilford Council to co-ordinate all the authorities on the eastern side of the Metropolis. The Wood Green Council have set on foot a larger conference still to embrace all England, and have sent letters to every district of over 20,000 inhabitants. The subjects for consideration will be the maintenance of the main trunk roads of the country, to which it is suggested the State should contribute directly the county main roads, and first and second class district roads.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Ltd. Price 10s. 6d.

THE ROAD BOARD.

THE FUNCTIONS OF COLONEL CROMPTON.

The following question appeared on the order paper of the House of Commons on Thursday of last week, addressed by Mr. T. M. Healy to Mr. Lloyd George:—

To ask Mr. Chancellor of the Exchequer whether he can state what salary is paid to Colonel Crompton as consulting engineer to the Road Board, and whether the conditions of his employment allow him to be interested in particular methods of forming road crusts; whether the board have the advice of any salaried engineer other than Colonel Crompton in distributing among local authorities the large sums which they devote to the improvement of road crusts; whether Colonel Crompton is a director of Crompton & Co., Limited, and of the Aron Electricity Meter Company, which have business with local authorities; whether he is aware that on October 5, 1911, Colonel Crompton and a relative jointly applied for a patent for a method of road surfacing, and that on May 22, 1912, Colonel Crompton and another applied for a patent for road rollers; whether he is aware that two companies, called Taroads, Limited, and the Praed Construction Company, Limited, are engaged in exploiting Colonel Crompton's method of road surfacing; whether Colonel Crompton's relative, who was on October 5, 1911, the joint applicant for a patent for this process, is in the employment of these companies or either of them; whether he is aware that on September 6, 1912, Colonel Crompton addressed from the Road Board offices a letter to road surveyors in the employment of local authorities, who are or may be applicants for grants from the board, asking them to visit with him a road reconstructed by Taroads, Limited, on his method, and to remain with him to tea, visiting his laboratory and various means of testing road materials; and whether Colonel Crompton's employment by the Road Board will be continued.

The following reply to Mr. T. M. Healy's question was circulated with the Parliamentary Papers on Friday, the question not having been reached within the ordinary time for answering questions orally at Thursday's sitting:—

The salary paid to Colonel Crompton, as consulting engineer to the Road Board, is £670 per annum, out of which he provides his own office and staff. The conditions of his employment are that he is employed only as consulting engineer, his advice being sought on technical questions within the scope of his knowledge and experience, when considered necessary. He has no general or executive duties. The board have in their employment a fully qualified road engineer, and also have the assistance of an advisory engineering committee, whose constitution and duties are set forth in Appendix No. 10 in the first annual report of the board. Colonel Crompton carries on business as a consulting engineer on his own account, and I understand that in the ordinary course of his business he prepared a specification for surfacing roads with a mixture of asphalt and sand. This specification is neither patented nor proprietary, and Colonel Crompton has no interest in the two companies, Taroads, Limited, and Praed Construction Company, Limited, but he frequently acts as consulting engineer for them. The Kensington Borough Council, without any communication with the Road Board, contracted with Taroads, Limited, for the execution of surfacing work in Addison-road in accordance with Colonel Crompton's specification and, following a common practice of engineers, Colonel Crompton invited a company of expert road surveyors to inspect the work being executed. This was done without any communication with the Road Board. It is true that the invitations were printed on paper with a printed heading "The Road Board," supplied to Colonel Crompton for use in connection with matters referred to him for advice, but Colonel Crompton has explained to the board that this was due to a mistake in his office. The board have no intention of ceasing to avail themselves of Colonel Crompton's services as consulting engineer.

The matter is further referred to in "Minutes of Proceedings."

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

ROAD GRITTING.

COUNTY SURVEYOR ON THE SHOEING OF HORSES.

Ham Urban District Council had before it last Friday the question of the main road through Ham which the Surrey County Council have had repaired with a material leaving a hard glossy surface very dangerous for horses (reports the *Times*). As there had been many accidents, the district council directed a letter to be sent to the Surrey County Council asking that grit or sand should be placed on the road to give the horses foothold. Mr. A. Dryland, the county surveyor, replied: "As nearly all the main roads throughout the county now have tarred surfaces, to spread grit or sand on them, except in the case of frosts, would mean the expenditure of a considerable sum of money. The whole tendency of modern road maintenance is towards surfaces less suitable for horse traffic as at present shod. It seems to me what is now necessary is a method of shoeing which will give a better foothold. Everything else has changed, but the horseshoe has not."

Mr. Barnard said that letter was tantamount to an intimation that they must no longer keep horses, and the council thought the letter was most unsatisfactory. The clerk was directed to write a strong letter, pointing out that there were still many people who kept horses, and they had as much right to consideration as motorists, and requesting that the main road should be so made as to be safe for horse traffic.

At a recent Local Government Board inquiry at Belfast into an application of the corporation for sanction to the carrying out of extensive road works, the inspector, Mr. P. C. Cowan, said that both from the health and cost point of view he was quite certain that asphalt was the best form of street paving if owners of horses could only be got to shoe their horses properly.

INSTITUTION OF MUNICIPAL ENGINEERS.

President, Mr. Frank Latham, M.Inst.C.E., F.S.I., Borough Engineer and Surveyor, Penzance.

NORTH-WESTERN DISTRICT.

It has been decided to hold a social evening at Manchester on Saturday, December 7th. The approximate expense per head will be 4s., and it is desirable that members should give notice, at the earliest possible moment, of their intention to attend. Full programme will be issued later.

"Beamwood," Jas. W. Gleave,
Commassie-street, *Hon. District Secretary.*
Heywood.
October 12, 1912.

Subscriptions, 1912-13.—Members and others are requested to note that annual subscriptions for 1912-13 are now due.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, ALTON.

To-morrow (Saturday) a sessional meeting of the Royal Sanitary Institute will be held in the Assembly Rooms, Alton, at 11.15 a.m., when discussions will take place on "Housing Problems in County Areas"—to be opened by Dr. Robert A. Lyster, county medical officer of health, Southampton, and "Municipal Work in Alton"—to be opened by Mr. G. Bertram Hartfree, F.S.I., surveyor to the urban district council. Among those who are expected to take part in the discussion are Messrs. R. W. Cass, surveyor to the Farnham Urban District Council; C. G. Mason, Assoc.M.Inst.C.E., borough engineer, Guildford; W. J. Taylor, M.Inst.C.E., county surveyor, Southampton; and F. C. Uren, M.Inst.C.E.I., surveyor to the Aldershot Urban District Council.

The chair will be taken by Mr. H. Percy Boulnois, M.Inst.C.E., chairman of the council of the institute.

At a meeting of the Royal Sanitary Institute, to be held at 90 Buckingham Palace-road, S.W., on Tuesday, November 12th, Mr. H. Percy Boulnois, M.Inst.C.E., chairman of council of the institute, will open a discussion on the recently issued report of the Departmental Committee on Intercepting Traps in House Drains.

The chair will be taken at 8 p.m. by Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E., chief engineer to the London Council Council.

EAST HAM.—Accepted for tar-paving playgrounds, for the Education Committee:—

Constable, Hart & Co., Limited, London, E.C. 1s. 7¼d. per super. yard.

FLAMBOROUGH.—For main extension.—Messrs. Elliott & Brown, engineers, Nottingham:—

J. Woodhead, Wakefield	£341
J. Webster, Marton	318
J. Clark, Netherfield	291
J. Pickthall, Leeds	287
J. Sheldrake, Hornsea*	271

HARROGATE.—For the erection of boundary walls to cemetery, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor:—

W. Webster, Harrogate	£725
C. Dawson & Son, Harrogate	605
T. Godfrey, Harrogate	600
A. Hymas, Harrogate	574
Kershaw & Hill, Harrogate	569
G. & C. Winterburn, Harrogate	488
W. R. Birkinshaw, Harrogate	449
C. A. Nettleton, Harrogate*	442

HARROW-ON-THE-HILL.—For the construction of two conveniences, for the urban district council.—Mr. J. P. Bennetts, surveyor:—

P. F. Whyborn, Wealdstone	£276
J. Smith, Harrow	234
Strand Building Company, London	233
A. J. Orchard, Pinner	230
W. Payne, Watford	229
J. Batchelor, Harrow	205
J. Simmons, Harrow*	186

HARROW-ON-THE-HILL.—For making up private streets, for the urban district council.—Mr. J. P. Bennetts, surveyor:—

F. G. Brummell, Willesden	£6,957
A. B. Champness, Harrow	6,736
Wimpey & Co., Hammersmith	6,626
J. Mowlem & Co., London	6,506
A. Wooster, Wealdstone	6,433
N. French & Co., Buckhurst Hill	6,304
Free & Sons, Maidenhead	6,226
T. Adams, Wood Green	6,200
G. P. Trentham, Birmingham	6,096
J. Young, Rugby	6,024
Willis & Powis, Wembley*	5,072

HORSHAM.—For the supply of tar for surface treatment, for the rural district council.—Mr. W. Dungate, surveyor:—

	s. d.
Bristowe & Co. (Tarvia)	19 2
Crow & Sons (distilled tar at per barrel of 40 gallons d/d.)	16 3
Carchpole & Son " "	15 10
Grindley & Co. " "	15 0
Standard Tar Company " "	15 0
Forbes, Abbott & Leonard, Shoreham " "	14 4

LONDON.—For the supply of (1) three electrically-propelled shop trucks, and (2) three wheel-turning lathes for the third section of the central car repair depot, for the county council:—

(1) Three Electrically Propelled Shop Trucks, &c.

Hurst, Nelson & Co., Limited, Motherwell	£975
British Westinghouse Electric and Manufacturing Company, Limited	916
S. H. Heywood & Co., Limited, Reddish	908
Schuler & Co., Limited, London, E.C.	753
Brush Electrical Engineering Company, Limited, Loughborough*	730

The estimate of the chief officer of tramways comparable with the tenders was £570.

(2) Three Wheel-turning Lathes.

	Lathes fitted with hand screw gear for the headstock rams.	Lathes fitted with power gear for operating the headstock rams.
Pollock & MacNab, Limited, Manchester	£2,650	£2,720
Tangyes, Limited, Birmingham	2,573	2,589
Buck & Hickman, Limited, Whitechapel-road, E.*	2,115	2,531

Estimate of the chief officer of tramways, £2,950.

LONDON.—For the supply of a pair of chairs for one of the filth screens at the southern outfall, for the county council:—

J. Wright & Co., Tipton	£271
Gibbons Brothers, Limited, Dudley	141
Leech, Goodall & Co., Leeds*	128
Walton & Clough, Bradford	112
T. Larmuth & Co., Limited, Salford	65

The last two firms quoted for chains not in accordance with the council's requirements.

LONDON.—For the provision of electrical discharges for use in the tramways sub-stations, for the county council:—

Ferranti, Limited, Hollinwood	£2,903
The General Electric Company, Limited, Birmingham	2,860
Snagnoletti, Limited, London, W.	2,785
The British Westinghouse Electrical and Manufacturing Company, Limited, Manchester	2,734
Johnson & Phillips, Limited, Charlton*	2,040

Estimate of the chief officer of tramways, £2,200.

SOUTHEND-ON-SEA.—For the erection of pumping station and destructor buildings, inclined roadway, two cottages, and other works at the sewage disposal works, for the corporation:—

Dennis Peerless & Co., Eastbourne	£16,649
A. N. Coles, Plymouth	15,586
Chessum & Son, London, E.C.	15,321
G. Brown, Grays	15,[illegible]
J. Greenwood, Limited, London	14,890
J. C. Flaxman, Southend-on-Sea	14,700
C. Gray, Acton Park	14,611
W. E. Davey, Southend-on-Sea	14,077
S. E. Moss, Southend-on-Sea	13,755
Young & Son, Norwich	13,736
R. & E. Evans, Plymouth	13,712
G. Coxhead, Leytonstone	13,423
Davey & Armitage, Southend-on-Sea	13,333
E. & B. H. Davey, Southend-on-Sea*	13,195

WEMBLEY.—For the work of street improvement, for the urban district council.—Mr. C. R. W. Chapman, engineer and surveyor:—

	Without refuge.	With refuge.
W. Johnson & Co., Limited, Wandsworth Common	£361	£396
A. Wooster, Wealdstone	275	300
O. T. Gibbons, Leytonstone	205	225
F. Tribe, Alperton	196	220
Willis & Powis, Wembley	179	202
F. G. Brummell, Willesden	169	187
F. G. Brummell (alternative tender for Victoria Indurated Paving)	162	180

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER.

28.—Junior Institution of Engineers. Week-end Visit to Sheffield.

26.—Royal Sanitary Institute: Meeting at Alton; Discussions on "Housing Problems in County Areas" and "Municipal Work in Alton." Town Hall, 11.15 a.m.

NOVEMBER.

4.—Royal Institute of British Architects: Mr. Reginald Blomfield, A.R.A., delivers his presidential address. 8.30 p.m.

12.—Royal Sanitary Institute: Discussion on Report of Departmental Committee on Intercepting Traps in House Drains, 90, Buckingham Palace-road, S.W. 8 p.m.

14.—Concrete Institute: Mr. E. P. Wells delivers his presidential address. 7.30 p.m.

28.—Concrete Institute: Mr. John M. Theobald, F.S.I., on "Bills of Quantities for Reinforced Concrete Work." 7.30 p.m.

DECEMBER.

12.—Concrete Institute: Messrs. R. Wheeler and Lawrence Gadd, F.S.I., on "The Effects on Concrete of Acids, Oils and Fats." 7.30 p.m.

APPOINTMENTS OPEN.

COALVILLE URBAN DISTRICT COUNCIL.

TEMPORARY ASSISTANT SANITARY INSPECTOR.

The above Council invite applications for a Temporary Assistant to the Sanitary Inspector. Preference will be given to the holder of a Certificate of the Royal Sanitary Institute, and be subject to one month's notice on either side. Salary £2 7s. per week. Applications, accompanied by not less than two recent testimonials, to be forwarded to me not later than Monday, the 4th day of November, 1912.

THOS. E. JESSON,
Clerk.

Council Chamber,
Coalville.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. NOVEMBER 1, 1912. No. 1,085.

Minutes of Proceedings.

Horse-shoes and the Road Crust.

We have sufficient faith in road surveyors to believe that they will be able to meet the difficulties that arise from the fact that the kind of road surface which is found to be suitable for motor traffic is not always satisfactory with respect to the foothold provided for horses. As regards, for instance, the slipperiness of tarred roads in drizzling autumn weather or in the early winter, it is being found that if the actual film of tar is kept as thin as possible, and if the second application of tar is limited to what is absolutely necessary in places where the tarry part of the crust near the surface has actually worn away, the period of greasy slipperiness will not last long, the tarred road beginning to exhibit the appearance of a dark-coloured ordinary broken-stone crust some time in the autumn, the actual date depending upon climatic and traffic conditions. Greasy slipperiness is especially inconvenient to cyclists, and generally a slippery state of the road is by no means regarded with favour by motorists. It may be suggested that some of the experiments recently made with road crusts of unusual kinds point to the unsuitableness of crusts which, though the surface wear is small and the surface usually hard, have not, on the whole, longer lives than crusts which wear down more steadily and with less tendency to become bumpy on the small scale. This small-scale bumpiness may be tolerated by luxuriously sprung motor cars, but it is a condition very unfavourable to the comfort of the users of other vehicles, especially cycles, and under heavy traffic it results in the crust being severely punished and its foundations severely tried. While we believe, however, that on the whole surveyors are alive to the difficulties imposed by the necessity for accommodating traffic of widely different kinds, and able to meet these difficulties, it is inevitable that some cases will occur in which provision for one kind of traffic or the trial of a new kind of crust inflicts some hardship upon one class or another of road users. As reported in last week's issue, such a case seems to have occurred at Ham, Surrey, and the representations made in the matter to Mr. A. Dryland, the county surveyor, led to his remarking that "the whole tendency of modern road maintenance is towards surfaces less suitable for horse traffic as at present shod," and the suggestion that some better method of shoeing might be found. This raises a large question, with which we hope to deal in our next issue, the matter being one of great moment to a very large number of owners of horses, and one which demands the serious attention of road surveyors.

For the moment we content ourselves with pointing out the three main facts which dominate the subject. First, the nature of the shoes which are worn by horses is in a great measure decided by conditions which are not necessarily average conditions, but may be those of a relatively small mileage of the roads on which the horses have to travel. If surveyors could guarantee that some of the most trying road surfaces should be permanently improved in this respect, one obstacle to the improvement of horse-shoes might be removed. Secondly, some of the worst effects of horse-shoes are those which are felt when the shoes are studded or sharpened in order to enable the horse to obtain a foothold on roads which are slippery in frosty weather. This points to the need for careful attention being given to such conditions, and to the means which can be taken to reduce the frequency with which they occur. Thirdly, it is quite useless to expect the owners of horses to evolve improved shoes unless they have some idea of what the ordinary road surfaces will be like for a good many years ahead. The kind of shoe that can be used depends, for one thing, upon the kind of horse employed, and while horse breeders are quite capable of keeping the state of the roads in mind, it must be remembered that the working life of a horse is a long one, and that changes in shoeing which depend even to a small extent upon the breed of horse employed must necessarily be made slowly. When horses work in a small area in which one kind of pavement predominates, the case is quite different, and of several ways of shoeing at present employed one may give better results than others. In the course of a recent inquiry at Belfast, Mr. P. C. Cowan, chief engineering inspector of the Local Government Board of Ireland, suggested that the farriers of Belfast might effect improvements in their present methods of shoeing horses for work in that city; and as regards our present point it does not matter whether he alluded to bad shoeing or to a method inferior to others in ordinary use—inferior, that is, in view of the conditions in Belfast. Looking at the matter as a whole, it is very important that the fact should be grasped that it is not one for generalisation based upon experience in a limited area. The different climates of the British Isles vary in few respects more than they do in regard to the slipperiness of roads.

Rapid Methods of Construction.

The importance of taking into account the facilities which are ready to the hand of the modern engineer ought not to be overlooked. The many mechanical appliances useful to the constructional engineer which have been invented or improved upon since the application of electrical power became possible alone provide the contractor with a host of labour-saving appliances. By means of these the rate of progress of work of various kinds may be increased enormously, while the work itself is better done and carried out at a much lower rate of cost. With the increase

of such facilities the power of the engineer who possesses the knowledge, genius, courage and judgment required becomes almost infinitely greater, and the possession or lack of these qualities will form the distinction between the true engineer and the man of lower grade. The one will be a true leader of men, and the other will be a machine doing the work he is set to do, useful enough in his sphere, but in no way ranking with the man who is able to apply all the many and various forces and powers which are the heritage of the modern engineer. Hence it behoves the municipal engineer not to overlook the many facilities which now exist. We in this country are slow to trouble our heads about new methods, but it is daily becoming more evident that those who will not learn will be rapidly superseded by those who take a wider view of their responsibilities.

In the descriptions of works which are from time to time given in these pages there is abundant evidence of the satisfactory application of new methods. The construction of the Hemlocks dam given elsewhere in the present issue is a further illustration. Here we read of light motor trucks covering 70 miles of road a day, conveying cement and other materials to the works. The transportation of mixed concrete along an overhead cableway at the rate of 1,800 ft. a minute is mentioned, and we see that by the use of larger skips, ample power and plant, this work is being done very rapidly and effectively. Such methods go far to eliminate many risks which face the contractor on ordinary work; similarly rapidity of construction must enable the engineer to give the work more personal and perfect supervision. Without doubt there are many excellent appliances hitherto almost unheard of in this country which might be adopted most advantageously, even on comparatively small work. Further, it is desirable that municipal authorities should consider the desirability—one might better say the necessity—of possessing such equipment.

* * *

The Municipal Waterworks Association.

The representative character of the attendance at the first annual meeting of the recently formed Municipal Waterworks Association affords ample evidence, if such were needed, that the new society is destined to fill an important place in the ranks of professional bodies. In his presidential address on Saturday last Mr. Barnard pointed out that, although the various authorities have their own peculiar difficulties to face, there are many matters of common interest, the full discussion of which must result in mutual benefit. He divided the future work of the Association into four main parts—*viz.*, administration, public health, finance and physical. Under the first heading comes the vital question of central control, which has for some time been advocated in these columns. Mr. Barnard put the matter very aptly when he said that if any large city or town applies to Parliament for powers to appropriate an area or a source, there seems to be no machinery by which the claims of other localities or authorities can be considered except as to the extent to which those localities and authorities can incur the cost of putting their claims before Parliament. Admirable as this procedure may be in its application to individual cases, it nevertheless fails to deal with many important aspects in relation to the country at large, and as the years roll on and the undeveloped sources of supply become fewer and fewer, it may, perchance, be found that a more general consideration of the subject would have been in the public interest. Under the heading of Public Health comes the important question of purity and adequacy of supply; while it is evident that questions of finance are of the greatest consequence as affecting the cheapness of a commodity which is a necessity of life. In discussing physical questions, the president referred to the possibility of using sea water for non-domestic purposes, and said that, sooner or later, if the population of this country continues to increase, that question would become one of practical politics. It may be that that day is nearer than some of us anticipate, and the question may, perhaps, be usefully borne in mind in connection with our consideration of the needs of the country as a whole with regard to water supply. The new Association is certainly a very healthy infant, and we are convinced that it will perform a very valuable public work in aiding the solution of problems which affect all classes of the community alike.

* * *

Percolating Filters.

An interesting feature of the recently issued annual report for 1911 of the chief engineer of Baltimore, U.S.A., is the account of the experimental work which was carried out in connection with the preparation of the scheme of sewage disposal for dealing with the whole of the sewage of that city. In particular, the results of the investigations with regard to the most efficient grade and depth of material for the percolating filters are well set out, and will be valuable for reference to all workers in the same field. These results agree with the generally adopted practice in this country. It was found that the finer the grade of the material used the greater was the degree of purification obtained, but the liability to clog was also greater. On the other hand, although the coarser material did not become clogged, the degree of purification was not sufficient. It was obviously a case of finding the happy medium, and after a number of experiments with material of grades varying between ½ in. to 4 in., and 4 in. to 6 in., it was decided to adopt stones broken to pass through a 2½-in. circular opening, and be retained upon a screen with 1-in. circular openings. It was found that this grade would give the required degree of purification without undue clogging. With regard to the most suitable depth of material, it was found by careful experiments that the amount of purification per foot of depth decreases as the bed increases in depth, with the exception of nitrification, which seems to vary almost directly as the depth of the bed. On the other hand, there was a considerable increase of purification between the depths of 6 ft. and 9 ft., but relatively very little increase between the depths of 9 ft. and 12 ft. The desirable depth was thus considered to be 9 ft. in the case of Baltimore, and this result was acted upon in designing the large complete scheme of sewage disposal. In these experiments the various depths of material received a uniform volume of sewage, and thus no information is available as to the relative volumes which can be efficiently purified in each case. It would be very desirable to have equally accurate figures on this point, as the question of cost would be affected considerably if it were found, for example, that the *volume* which could be efficiently purified by a filter 9 ft. deep was less than one and a-half times that which could be dealt with by a filter 6 ft. deep, with the same degree of efficiency.

* * *

The London County Council Engineership.

In our issue of the 25th ult. we were able to give the list of candidates selected for the important post of chief engineer to the London County Council, in succession to Sir Maurice Fitzmaurice. Since then a further selection was made, the "elect" being reduced, we understand, to six, and of these Mr. H. T. Wakelam, the county surveyor of Middlesex, had the prescience to withdraw from a contest which was never perfectly open and fair. On the 28th ult. it was decided unanimously to recommend to the council from the short "leet" the election of Mr. G. W. Humphreys, the deputy engi-

neer to the county council, and on Tuesday next he will, we have no doubt, be duly appointed. We have not, of course, a word to say against the fitness for the post of the successful candidate. On the contrary, we have always upheld the principle of promotion, and it is right and proper that an official should in due course receive the reward of good service by stepping upward into the first vacancy he is qualified to fill. But we do protest, as we have for years past, against the pernicious practice of advertising a vacancy when there is already the "man on the spot"—the holder of office temporarily or permanently, or a "local candidate"—waiting to step into the vacant post. Why, in the name of common decency and consideration, cannot the appointing body decide first whether they have in their field of view an individual qualified for appointment; and if there be no such person, then (but not otherwise) raise the hopes of others, put them to trouble and expense, and more or less prejudicially affect their relations with the authorities they serve? Advertising such foredestined appointments is not even a sop to the ratepayers, who see through the thin device, and rightly look upon it as a futile waste of time and money. It is, of course, too late for our latest protest to be effective in the instance of the London County Council appointment, but we are not without hope that it may be borne in mind by other authorities when they have to make appointments.

* * *

Municipal Engineers in Canada.

It may be some small consolation to municipal engineers in this country to know that, however severe their official worries may be, and however insecure their tenure of office is, neither the worries nor the insecurity are comparable with what are met with by Canadian engineers. We gather from the *Canadian Engineer* just to hand that Mr. George Wright, city engineer of London (Ontario), has handed in his resignation as the result of statements and criticisms made by the mayor and members of the city council with respect to the construction of certain footpaths. Mr. Wright is one of a rapidly increasing list of ex-city engineers of London, the most recent of those who accepted the position, only to leave it at an early opportunity, being Mr. Graydon and Mr. A. H. Van Cleve; while, as proving that not in London alone is the life of the officer made miserable and his position untenable, the recent trouble in Calgary is quoted, as well as the fact that an investigation is now pending in Ottawa into the city engineer's department. The *Canadian Engineer* suggests that the predominance of politics in the town councils is at the root of the mischief, and demands the introduction of what is known as the "commission form of municipal government." Whatever the cause of the evil may be, there seems to be no doubt about the facts, and these will tend to press upon municipal engineers on this side the conviction that to transfer themselves from the Mother Country to Canada in the hope of bettering their conditions of life will be tantamount to jumping from the frying-pan into the fire.

* * *

Rural Housing.

The question of the provision of adequate housing accommodation in rural areas is now generally recognised as being at least as urgent as the corresponding urban problem. At the last meeting of the Royal Sanitary Institute some of these aspects of the housing question which are more prominent in rural districts were considered, the subject being introduced in an instructive paper by Dr. Robert A. Lyster, the county medical officer for Hampshire. While not agreeing with much that has been said and written in regard to the supreme importance of good housing conditions for securing the health of a community, Dr. Lyster expressed the opinion that housing is a factor which has a profound influence upon the mental and moral development of the individual. He proceeded to propound the question, What are reasonable essentials to demand in considering any particular house? In answering this it must be remembered that the reasonableness of requirements of this kind is determined by considerations affecting the economic position of the owner as well as the comfort and convenience of the tenant. We agree, however, that in all cases adequate windows and ventilation, absence of dampness, healthy surroundings and a good water supply are desiderata. Dr. Lyster concluded by facing some of the difficulties which beset the path of a conscientious local authority in their endeavours to enforce their requirements. The paper, extracts from which will be found in another column, will amply repay perusal.

* * *

Municipal Work in Alton.

At the meeting just referred to, a report of which appears on another page, a paper on "Municipal Work in Alton" was read by Mr. G. Bertram Hartfree, F.S.I., the surveyor to the district council. The district, which is urban in character, has been developed in the face of many difficulties, particularly with regard to the entry of subsoil water into the sewers. Thus in 1874, while the estimated dry-weather flow was 100,000 gallons, ten times that amount arrived at the works. This state of affairs has been considerably improved, and Alton is now possessed of an excellent sewerage system with modern disposal works, together with a good water supply. Some anxiety has been felt, however, as to the adequacy of the latter, and during the hot summer of 1911 continual observations were made. Owing to the development of building sites on the hills further improvement at the works is under consideration. Among the many matters dealt with in Mr. Hartfree's very interesting paper were those of revision of by-laws and disposal of refuse. Alton now uses the series known as the Intermediate Model By-laws, which contain a special clause for permitting the erection of galvanised-iron dwellings in the rural parts of the urban district. As regards refuse disposal, the system in use at Farnham has been adopted, the refuse being mixed with sewage sludge. The resulting mixture is readily saleable as manure. Some extracts from Mr. Hartfree's paper will be found elsewhere in this issue.

* *

Accommodation Subways.

The construction of accommodation subways for sewers, gas and water mains, electric ducts, and so forth is a question which is frequently discussed, and we believe there is comparatively general agreement that the adoption of such a system would result in great public convenience and considerable annual saving in the cost of street openings. The matter was raised in a recent issue of our contemporary *Scientific American*, from which we ventured to quote in our last issue. It was there stated that the city engineer of New York objected to any placing of pipes in an open gallery, no matter how well designed, on the ground that the character of municipal employees had so deteriorated that it was unsafe to place the maintenance in their hands of pipes in a common gallery. So far as our experience goes, these observations are not applicable to the British municipal employee. Nevertheless, in this country the practical adoption of the subway save in exceptional cases, is unfortunately barred by considerations of finance. If the governing authorities of our cities only had unlimited funds at their disposal, what could they not do in this and other directions? Certainly municipal engineers are ready to design and carry out such works whenever they come within the sphere of practical politics.

C*

Road Materials in Some European Countries.

By A. MESNAGER, Paris.

[From a report submitted to the Sixth Congress, New York, of the International Association for Testing Materials.]

We are indebted to *Engineering and Contracting* for the lengthy abstract from which the following notes are taken. Mr. Mesnager's report includes statements received from several European countries; but, while the subject seems to be primarily the actual testing of road materials, the individual statements include descriptions of the materials used, specifications as regards material and as regards form and size, and procedure with respect to contracts, as well as descriptions of laboratory tests. It seems that the stage at which the most careful precautions are taken to ensure the use of good materials varies in different countries. If, for instance, the stone used comes from quarries which produce uniformly good material, regular laboratory tests are not necessary as far as those materials are concerned. In other cases the national temperament doubtless has an influence upon the relative importance of, for instance, specification and actual tests. No general analysis or comparisons of the statements included will be made here, the object of these notes being to collect a few leading facts, and to place them before the reader in a form convenient for reference.

MATERIALS IN USE.

Natural Stones: Setts.—Porphyry and sandstone setts are used in Belgium, granite and basalt cubes in Budapesth for heavy traffic, and stones such as trachyte and andesite for lighter traffic. Trachyte is also used in this town for the paving of footways. In the Netherlands the following stones are used for setts: Porphyry from the Quenast and Lessines quarries, basalt from quarries between Lintz and Obercassel, lava from quarries at five places, and melaphyre. Sandstone is also used from quarries along the river Ourthe, and from several other places.

Natural Stones: Road Metal.—Stones mentioned as being in use in Austria for road metal or setts include granite, diorite, porphyry and basalt. Other stones mentioned are sandstone, granwacke and conglomerates. In Belgium hard road metal is got from the Quenast and Lessines quarries (porphyry), sandstone being also used to some extent. In Denmark road metal is obtained from old setts, but considerable quantities of stone are got from Sweden and Bornholm. In Budapesth trachyte and pyroxene-andesite are used for road metal. In the Netherlands basalt, granite, porphyry and quartz are used for road metal, and the fact that in some cases the contractor is allowed to supply either porphyry or basalt shows that these two materials give about equally good results. Broken flints and hard gravels are also used.

Asphalt.—Both rammed and poured asphalt are mentioned as being used in the Netherlands and in Germany. Asphalt is also referred to as in use in Belgium, Denmark and Christiania.

Artificial Products.—Artificial flagstones are made in Germany and Denmark, cast slag blocks in Germany and in the Netherlands. Various kinds of bricks are made in the Netherlands, including "clinker" bricks and blue bricks. "Clinker" brick is also used in Copenhagen.

POINTS FROM SPECIFICATIONS.

Stone Setts.—In Budapesth the setts are cubes of 18 cm. ($7\frac{1}{16}$ in.), and blocks 18 cm. by 18 cm. by 13 cm. to 14 cm. ($7\frac{1}{16}$ in. by $7\frac{1}{16}$ in. by $5\frac{1}{8}$ in. to $5\frac{1}{2}$ in.). Bonding setts, about $\frac{3}{4}$ in. and $\frac{1}{8}$ in. shorter, are allowed, but must not exceed 5 per cent in any delivery. The joints of first-class sett paving must not exceed 12 mm. (or about $\frac{1}{2}$ in.) in width. Second-class setts are allowed up to 10 per cent of the deliveries, the maximum joint allowed being just over $\frac{3}{4}$ in. (20 cm.). The trachyte footway setts are 26 cm. by 26 cm. by 15 cm. (10¼ in. by 10¼ in. by 5⅞ in.). In Norway small setts are specified by the number which fills a square metre of area. In the case of setts 8 cm. ($3\frac{1}{8}$ in.) high a divergence of 5mm. (about $\frac{7}{16}$ in.) is allowed, greater or less. In the Netherlands the following are approximately the sizes of porphyry setts: $7\frac{1}{2}$ in. by $6\frac{1}{2}$ in. by 7 in., $6\frac{1}{2}$ in. by $5\frac{1}{2}$ in. by $6\frac{1}{2}$ in., $5\frac{1}{2}$ in. by $5\frac{1}{2}$ in. by $5\frac{1}{2}$ in., $5\frac{1}{2}$ in. by 4 in. by $4\frac{1}{2}$ in. 4 in. by $3\frac{1}{2}$ in. by 4 in. For sandstone and granwacke setts usual dimensions are, approximately, top $5\frac{1}{2}$ in. by $7\frac{1}{2}$ in., base $4\frac{1}{2}$ in. by $7\frac{1}{2}$ in., height $4\frac{1}{2}$ in. to $5\frac{1}{2}$ in., and top 4 in. by $6\frac{1}{2}$ in., base $3\frac{1}{2}$ in. by $5\frac{1}{2}$ in., height $5\frac{1}{2}$ in. As regards quality the specification follows the ordinary lines, but it may be noted that sandstone setts must be free from veins; those of basalt must give a clear resonant note when struck; melaphyre setts must have no stratification.

Road Metal.—In the Netherlands coarse porphyry road metal must pass through a 5-cm. ring, and be retained by a 2-cm. ring, say 2 in. and $\frac{3}{4}$ in.; for small porphyry road metal the sizes are 4 cm. and 2 cm., say $1\frac{5}{8}$ in. and $\frac{3}{4}$ in.; for coarse basalt the sizes are 5 cm. and 3 cm. (2 in. and $1\frac{3}{16}$ in.); and for small basalt 3 cm. and 2 cm. ($1\frac{3}{16}$ and $\frac{3}{4}$ in.). Five per cent, or in some cases 3 per cent, may be larger or smaller. The colour of the basalt must be pale, almost blue, and free from white spots.

Asphalt.—An asphalt binder used in Germany is specified as containing 55 per cent of Trinidad Lake asphalt, 36 per cent of ground rock asphalt, 5 per cent of petroleum residuum, and 4 per cent of vaseline oil. The lake asphalt must contain between 50 per cent and 60 per cent of material soluble in carbon disulphide. The melting point should be 93 deg. Cent. (199·4 deg. Fahr.). In the Netherlands rammed asphalt must be made from native rock asphalt, and must contain 10 per cent to 14 per cent of bituminous substances. It must not lose more than 2 per cent when heated for six hours at a temperature of 225 deg. Cent. (437 deg. Fahr.).

Other Materials.—In Norway Portland cement for use in road work must make a mortar, 1 to 3, which will have a tensile strength of 227 lb. per square inch, after setting one day in air and twenty-seven days under water, and a crushing strength of 2,275 lb. per square inch. In the Netherlands paving bricks must have a strength of from 4,764 lb. to 7,110 lb. per square inch, the higher figure being frequently demanded, this being the minimum for warped bricks. The bricks must not absorb more than 10 per cent by volume of water. This is regarded as too high, and a lower figure is sometimes required. "Iron" bricks, it may be noted, must not have a fracture exhibiting mottled colours, but must be blue throughout.

METHODS OF TESTING.

In Germany considerable importance is attached to freezing tests. The strength of the material is tested after soaking in water, and similarly soaked blocks are tested for crushing strength after being frozen and thawed twenty-five times. The loss of weight due to the freezings and thawings is found, and the specimens are inspected with magnifying glasses. The temperature of freezing is 10 deg. to 15 deg. below zero Cent., 14 deg. to 5 deg. Fahr. The specimens are thawed with a definite quantity of distilled water at 15 deg. to 20 deg. Cent., 59 deg. to 68 deg. Fahr. Generally the importance of testing road materials under service conditions is recognised in Germany, but the more rapid artificial tests are also valued. Attrition tests are carried out by the French method in revolving cylinders.

Stone setts are tested for crushing strength, absorption of water, loss by freezings, loss by grinding (with a disc), loss under the sand blast, and resistance to impact. Road metal is tested in the Deval machine, by impact, by blows with a pick, and by suddenly applied loading, the last tests being made on the material when dry, when wet, and after repeated freezings. Similar tests are made in Austria, where the freezing test is regarded as of much importance. In Belgium and in Denmark most of the stone used is consistent in character, and little testing is done beyond examination by the working staff. In Frederiksberg, Denmark, the English Road Board Specifications for road tar have been adopted. In Budapesth a system of service tests has been adopted, the behaviour of trial strips of road being carefully recorded, with measurements of wear. A notable feature is the provision of a standard strip of proved material, laid alongside the strip of paving which is under test. In the Netherlands flagstones made of basalt or Quenast chippings and cement are tested for breaking strength on a span of about 30 in. These flags are also tested by an abrading machine for absorption of water, and by impact.

Housing Problems in County Areas.*

By ROBERT A LYSTER, M.D., B.Sc., D.P.H., County Medical Officer, Hampshire.

Before discussing actual problems and difficulties connected with housing, I wish to refer in a very few words to the place that housing should occupy in any campaign for improving the public health. A close study of the annual reports of many medical officers of health would give the average reader the impression that bad housing conditions were responsible for nearly all the ills that human flesh is heir to. Such annual reports usually contain tables of statistics which are alleged to prove the direct relationship between housing conditions and disease and death. The compilation of such tables must represent a vast amount of labour, but in practically every case they are entirely unreliable and fallacious. . . .

Nothing could be more unscientific than a mere compilation of mortalities or case incidences arranged according to housing conditions, and the classification of families according to housing conditions. Of course, it is inevitable that in the worst-housed families there will be the greatest mortality, but such mortality is not necessarily due to housing at all. My own opinion is that this is one of the less important factors in the production of a high infant mortality or in the causation of consumption. People who live in undesirable and apparently unhealthy habitations are usually forced there by circumstances owing to lack of means to pay for better accommodation. . . . I believe that most people with actual practical experience in the matter will agree that environment is largely the product of the man, and that the undesirable houses or slums in towns are largely occupied by the mentally and physically unfit, who have drifted into such surroundings from all ranks of society and will wherever they may live, will inevitably tend to exist among degrading and unhealthy surroundings.

In my opinion the modern requirements as regards housing cannot be regarded as belonging to the essentials for a healthy existence, such as food, for instance; and we shall only be endangering our cause by making ill-founded claims of this kind. Housing belongs to those other factors which have a profound influence upon the mental and moral development of the individual, and it is on this ground that we should take our stand when we demand a general improvement in housing conditions. On the other hand, all medical officers of health are constantly having brought to their notice houses which, from the most elementary point of view, need attention before they can be considered possible as human habitations, and it is the problems connected with such houses that I propose to refer to briefly.

Reasonable Essentials.

The first question that arises is "What are reasonable essentials to demand in considering any particular house?" In reply to this question I make the following list of requirements:—

(1) *Windows.*—These should be of sufficient area to render the rooms reasonably light, and should be made to open so as to be of value as ventilators.

(2) *Ventilation.*—A room with a fireplace, and a window of satisfactory size that will open so as to make an opening of at least half its area, can usually be ventilated satisfactorily if the occupier really desires ventilation.

(3) *Dampness.*—The roof must be watertight, and the walls should be provided with dampcourses, and outside protection as well in some cases. No soil should be in contact with the walls above the level of the ground floor.

(4) *Cleanliness.*—This is a responsibility shared by the occupier and the owner. The owner should be expected to keep the walls and floors sound, and the facilities for dealing with excreta and house wastes of such a character as to represent the best methods available for the district in which the house is situated. The occupier should be expected to maintain the house in a state of cleanliness.

(5) *Surroundings.*—Houses must not be so shut in as to render it impossible for them to be lighted and ventilated satisfactorily. Such circumstances are rarely met with in practice. In the majority of instances the available means of ventilation are rarely or never used.

(6) *Water Supply.*—A suitable water supply must be available within reasonable distance.

Assuming that a district council undertakes any serious inspection, there is little difficulty in finding houses and tenants that are unsatisfactory, and then the troubles begin. Some of the difficulties are as follows:—

(1) *The Owners.*—The average owner is willing to carry out reasonable repairs if approached with tact and consideration. There are two classes of owner, however, that give great difficulty. These are (1) the poor owner, who depends entirely upon the small rents of a few cottages, and (2) the wealthy owner, who declines to do anything and is quite willing for the houses to be condemned. The poor owner is very common in this county, and cases are constantly met where it seems cruel and oppressive to take vigorous action. Quite often the owner lives in one of the cottages in question, and is in many cases sharing the disadvantages of poverty with his tenants. A case was recently reported to me where the closure of three cottages resulted in the admission of the three families and the owner of the cottages into the workhouse. Wealthy owners often declare their intention of doing nothing, and say that they have no objection to the houses being condemned. The best plan of dealing with these houses is to proceed under the nuisance clauses of the Public Health Acts, and so compel the owners to deal with the defects.

(2) *The Tenants.*—Quite commonly the tenants in the unsatisfactory houses are such as to make one hesitate about the necessity, or even the desirability, of improving their surroundings. Experience tells us that when their present house is improved, or if they move into a better house, they will continue to live in the same filthy condition. On the other hand, one constantly meets clean, healthy families living in the most unsatisfactory houses.

(3) *The Supply of Houses.*—Most closing of houses makes matters worse instead of better, as a rule, because there are no other houses available. The families ejected either have to leave the district or go to the workhouse, or find accommodation in houses already more than full. Everyone with experience knows that the scarcity of houses is the real reason for the steady depopulation of rural areas.

Some Suggestions.

The above constitute the immediate difficulties that may be met, and I suggest that ways of meeting them are as follows:—

(1) The poor owner is not in a position to improve the property, but it is obviously desirable to improve rather than condemn the houses, not only because other dwellings are not available, but also because the elevation of the average class of people who live in these houses can only be a gradual and slow process. Housing authorities should have the power to purchase such property at a fair price, and to repair the same. Such powers are far more likely to be utilised than the present powers of provision of new houses, because such investments are much more likely to be remunerative. The property of the wealthy but obstinate owner should be dealt with as I have advised above, by using the powers under the Public Health Acts rather than the Housing Acts.

(2) *The Tenants.*—Efforts should be made in every district to improve the filthy, careless and destructive tenant who is so common in cottage property. There is no doubt that sanitary authorities have been very lax in this respect, and have devoted much attention to the owners, while they have overlooked the fact that the tenant is really not fit for better surroundings. Notices on occupiers are rarely or never served in many sanitary districts. My own experience as a local medical officer of health has convinced me that owners of property are much more reasonable and far more willing to effect improvements if they know that every effort is being made to make the dirty and destructive tenant realise his responsibilities.

(3) *The Supply of Houses.*—The supply of houses is deficient in nearly every district for the following reasons: (*a*) The stringency of the local by-laws. By-laws ought to be more elastic, so as to allow something to be built that will be between the permanent and perfect structures that are the aim of the modern

* Extracts from a paper read on Saturday last at a Provincial Sessional meeting of the Royal Sanitary Institute at Alton.

by-laws and the tumbledown and insanitary structures that people are compelled to inhabit for lack of anything better. The man who has saved a little money and has a site that would be quite satisfactory for his purpose, while neither his means nor his accommodations will allow him to build a residence that will serve for his great-grandson. Such men rarely have any ambition to build for posterity, and they should not be forced to do so. Builders also are prevented from supplying the need for more houses. The price of land and the modern by-laws combine to prevent the possibility of obtaining any return on this form of commercial enterprise.

Of course, the district council has power to build cottages, but they are not likely to do so, because the cost of such schemes is usually out of all proportion to the small rateable value of a rural or small urban area. The result is that their natural anxiety to keep down the local rates overcomes their inclination to relieve the urgent need for additional houses. Unfortunately, when the district council decides to do nothing the matter, in practice, ends there. It is true that under the Housing and Town Planning Act, 1909, the county council has power to act if the district council fail to do their duty, but it is unreasonable to expect any county council to declare war in this fashion with one of its constituent areas unless things have become so bad as to become a public scandal. There is no doubt in my mind that matters would be improved by giving the county council concurrent powers, and by making them directly responsible for dealing with housing conditions all over their area. It is no use to expect a county council to become involved in local quarrels with district councils over matters for which it has been given no definite or direct legal responsibility, but as soon as the responsibility became theirs every county council would act. An expenditure that is a heavy burden on a parish or a district council becomes a light and hardly noticeable charge when spread over a county area. If, in addition to giving county councils definite responsibilities concerning housing, it was arranged for subsidies to be forthcoming from Imperial funds, I have little doubt that some very substantial improvements in housing would soon be apparent.

At the same time it must be remembered that considerable care will be necessary in order to prevent such public provision being used for lowering wages in rural areas.. In fact, it is the opinion of many experts that the provision of cheap, rate-aided cottages is simply putting back the time when the agricultural labourer will receive sufficient wages to pay a reasonable rent, and that local doles and Parliamentary grants, however disguised, are mere temporary palliatives.

TOWN PLANNING AT HALE.

COMPETITION AWARDS.

The Town Planning Committee of the Hale (Cheshire) Urban District Council, with their adviser, Mr. Percy D. Lodge, F.R.I.B.A., of 3 Ridgefield, Manchester, at a meeting held last week, made the awards in connection with the above competition.

The first premium of £50 was awarded to Mr. R. Dunn, of Messrs. J. Cheal & Sons, Limited, Lowfield Nurseries, Crawley, Sussex, and the second premium of £25 to Messrs. Robert Bennett, A.R.I.B.A., and Wilson Bidwell, architects, Letchworth (Garden City), Herts. The design coming next in order of merit was that of Mr. John C. Thompson, of the Earle Estate Office, Manchester, and 12 Dunham-road, Altrincham.

The committee present, which consisted of a majority of the council, were unanimous in their decision.

The plans of the two successful competitors will be used as the basis for the scheme proposing which the council intend to make application to the Local Government Board for permission to prepare, the first step in which will be the acquisition of the area to be included in the scheme. This question will come up at the next meeting of the committee, which is to be held at an early date.

Institution of Civil Engineers.—The first ordinary meeting of the present session will be held at the Institution of Mechanical Engineers, Storey's-gate, S.W., on Tuesday next, when Mr. R. Elliott Cooper, the president, will deliver his annual address, and medals awarded by the council will be presented. The chair will be taken at 7 p.m.

DISPOSAL OF SEWAGE SLUDGE.

OLDHAM CORPORATION'S NEW PLANT.

At the sewage works of the Oldham Corporation, on Saturday, the new plant constructed under the direction of Dr. J. Grossmann for the disposal of sewage sludge was formally opened. The process for which the new works have been designed is one for the conversion of what have formerly been the waste products of sewage into marketable commodities—fertiliser and grease. Dr. Grossman, who is its inventor and patentee, has (the *Manchester Guardian* states) been working for the last five or six years under the Oldham Corporation as engineer to the Health Committee. The process has been thoroughly tested on an experimental scale, and the new plant, which is sufficiently extensive to deal with all the sewage of the borough, has been installed as the result of the preliminary experiments. The question of the disposal of the sludge from its sewage works has been in recent years of considerable difficulty to the Oldham Health Committee, and it is estimated that the new process will mean a saving in working costs to the corporation of about £1,000 a year. In addition to this, Dr. Grossmann has undertaken to take out of their hands the products of his process.

At the formal opening of the new works Dr. Grossmann, who gave a short account of the arrangement under which the corporation had adopted his process, said that with the old methods they had great difficulty and expense in disposing of the sludge at all. The first great advantage of the new system was that the sludge was disposed of, all the difficulties were removed, and the Health Committee would find itself £1,000 a year in pocket. He himself took the products of the process from the corporation and paid for them. But the advantage did not stop there. It was a question of public health, and it was generally agreed that wherever sludge was carried infection might be carried too; to put it on to the land, in fact, was to go against all the laws of hygiene. He had been working on the process now for some fourteen years, during six of which his time had been given to the town of Oldham. He had succeeded in disposing of all the grease with which they could supply him for several years to come, and for the fertiliser, which would need enriching before it became marketable, he had found purchasers up to the end of March.

By Dr. Grossmann's process about 1,000,000 tons of valuable manure capable of recovery, and at present running to waste, could, it is pointed out, be produced in this country, and 50,000 tons of phosphates, 50,000 tons of potash salts, and nitrogen equal to 100,000 tons of sulphate of ammonia taken back to the land. These constituents have an intrinsic value of about £2,500,000, and would be available for manuring at least 3,000,000 acres of land. The manure produced by Dr. Grossmann's process is a brown, odourless, perfectly sterilised powder, and the results obtained with it on farms in Cheshire and elsewhere have been good.

The plant at Oldham is capable of dealing with all the sludge produced from the whole population of Oldham. The settled sludge is pumped into special draining tanks, in which it is reduced to a slimy consistency. From these tanks it is moved by mechanical means into a receptable below, from which it is taken by bucket elevators to the top of the building into a storage tank. From this storage tank it is distributed into six hoppers, each of which is connected with a drying machine, which it automatically feeds. These drying machines, which are bricked in and heated by coal, contain an internal arrangement, driven by gearing and pulleys, by means of which the sludge is automatically moved from the inlet to the outlet, and the movement is adjusted in such a manner that by the time the sludge arrives at the outlet it is completely dried. Each drier has placed underneath it a distillation retort. In this it is automatically mixed with a little acid and moved along towards the outlet of the machine, from which the finished manure is automatically discharged. The building in which the plant is housed is 120 ft. by 45 ft., and 30 ft. high.

Lower Thames Valley District Surveyors' Association.—A meeting of this body, the president of which is Mr. H. F. Cowles, Assoc.M.Inst.C.E., will be held at the Town Hall, Twickenham, to-morrow (Saturday), at 6.30 p.m. It is hoped that members will note the change and endeavour to be present.

The Municipal Waterworks Association.

NEW INSTITUTION'S FIRST ANNUAL MEETING.

Founded with the object of safeguarding the interests in common of waterworks, and facilitating the acquisition of experimental, statistical and scientific knowledge relating to the construction, control and management of municipal water undertakings, the Municipal Waterworks Association held its first annual meeting on Saturday last in London. Membership of the new body is for the present confined to representatives of municipal water authorities serving communities of not fewer than 40,000 persons, but we believe it is not unlikely that before long this rule will be relaxed with a view to permitting representatives of areas with smaller populations being enrolled as members of the institution, the first president of which is Mr. E. B. Barnard, chairman of the Metropolitan Water Board.

At last Saturday's meeting, which took place at the offices of the Metropolitan Water Board, members were present from towns and districts supplying over 16,000,000 out of the total of 23,000,000 consumers within municipal areas, the attendance being as follows: Accrington—Mr. C. Harrison (manager); Ashton-under-Lyne—Mr. Alderman Fentem, Mr. Alderman Hall, and Mr. Fred Dixon, ASSOC.M.INST.C.E.; Barnsley—Mr. J. H. Taylor, M.INST.C.E.; Bolton—Mr. Jas. Hollywood, Mr. W. T. Braithwaite, Mr. R. Hamilton (secretary), and Mr. F. W. McCullough, M.INST.C.E.; Birmingham—Mr. Alderman Bewlay, Mr. E. A. Lees (manager), Mr. F. W. Macaulay, M.INST.C.E., and Mr. W. Gray, ASSOC.M.INST.C.E.; Bolton—Mr. Councillor Rimmer, Mr. Alderman Parkinson, and Mr. L. Mitchell, ASSOC.M.INST.C.E.; Bradford—Mr. Alderman Milner, Mr. Alderman Gadie, and Mr. Jas. Watson, M.INST.C.E.; Brighton—Mr. Jas. Johnston, M.INST.C.E.; Coventry—Mr. Alderman Drinkwater and Mr. J. E. Swindlehurst, M.INST.C.E.; Croydon—Mr. G. F. Carter, M.INST.C.E.; Derby—Chairman, Deputy-Chairman, and Mr. John Ward, M.INST.C.E.; District of the Lancashire Mid-[illegible]—Mr. J. M. M[illegible]; Doncaster—Mr. Councillor Halmshaw, Mr. Alderman Spencer, and Mr. F. O. Kirby, ASSOC.M.INST.C.E.; Dundee—Lord Provost Urquhart, Deputy-Chairman, and Mr. George Baxter, M.INST.C.E.; Dunfermline—Mr. D. Mackenzie; Edinburgh District—Deputy-Chairman, Mr. Wm. A. Tait, M.INST.C.E., and Mr. W. C. Reid; Falkirk—Mr. C. Mac[illegible], F.[illegible] District—Mr. Alderman Bickerstaffe, Deputy-Chairman, Mr. John Cook, ASSOC.M.INST.C.E., and Mr. G. Arthur (secretary); Glasgow—Mr. Bailie Campbell, Mr. Bailie Maclure, and Mr. J. R. Sutherland, M.INST.C.E.; Greenock—Mr. Thos. Mitchell, Mr. J. W. Bailey, and Mr. D. Macalister, M.INST.C.E.; Heywood—Mr. J. Diggle, ASSOC.M.INST.C.E., and Mr. S. Diggle, ASSOC.M.INST.C.E.; Hull—Mr. C. B. Newton, M.INST.C.E.; Keighley—Chairman, Deputy-Chairman, and Mr. M. K. Barnett, M.INST.C.E. Lancaster—Mr. [illegible] Huntington and another Member, and Mr. A. G. Bradshaw, [illegible]; Leeds—Mr. Alderman [illegible], Mr. Alderman Willey, and Mr. C. G. Henzell, M.INST.C.E.; Lincoln—Chairman, Deputy-Chairman, and Mr. N. M. K. Barnett, M.INST.C.E. Liverpool—Lieut.-Colonel R. S. Porter, Mr. W. P. Wethered, and Mr. Joseph Parry, M.INST.C.E.; Metropolitan Water Board—Mr. E. B. Barnard, Mr. John Sheehan, Mr. W. B. Bryan, M.INST.C.E., Mr. A. B. Pilling (clerk of the board), Mr. W. Moon (solicitor to the board), Mr. A. Newton (accountant to the board), Mr. W. J. G. Norris (deputy-clerk), and Mr. J. Restler, M.INST.C.E.; Northampton—Chairman, Deputy-Chairman, and Mr. F. Tomlinson (engineer and manager); Nottingham—Mr. Councillor A. R. Atkey and Mr. F. W. Davies (engineer); Plymouth—Mr. F. Howarth, M.INST.C.E.; Pontypridd—Mr. E. W. Terrey, A.M.I.MECH.E., and Mr. F. J. Alban (accountant); Reading—Chairman, Deputy-Chairman, and Mr. L. C. Walker, A.M.I.MECH.E.; Rotherham—Chairman, Deputy-Chairman, and Mr. E. B. Martin, ASSOC.M.INST.C.E.; Salford—Chairman, Deputy-Chairman, and Mr. L. H. A. Gaunt, ASSOC.M.INST.C.E.; Sheffield—Chairman, Deputy-Chairman, and Mr. W. Terrey (manager); Tynemouth—J. W. McKerrow, ASSOC.M.INST.C.E.

In the course of the proceedings Mr. E. B. BARNARD delivered the following

PRESIDENTIAL ADDRESS.

This is an age of associations, an age when men are engaged in different branches of public work find themselves together with one great aim in view—the advancement of the public interest. It is, perhaps, a singular thing that until the formation of this association no attempt had been made to organise and bring together the representatives of the great municipal water undertakings, for it might be difficult indeed to find a more fertile field of work, and I venture to entertain the confident belief that great advantage to the community at large will result from our bringing to bear upon the problems and anxieties that beset us the concentrated experience and wisdom of those who for many years have been so actively engaged in providing for the people of this country one of the prime necessities of life. The man in the street is but too apt to take for granted the provision of a proper water supply; but the fact remains that the very life of the community depends upon such a supply, and no one knows better than we who are present to-day how huge is the work which has to be performed in order to safeguard and protect that most vital public service.

It may be thought that each particular community is quite able to look after its own interests, and to deal, without the assistance of any outside persons, with the problems which confront it. It may be that London has its particular problems, and that the questions which confront Glasgow are not those with which Birmingham or Sheffield have to deal; nevertheless, there are many things which, while of first-rate importance to each individual undertaking, can be, indeed must be, considered from the broader aspect of the whole country.

[illegible] the committee rooms of Parliament afford ample opportunity for the discussion of matters of this kind. But that, I feel, [illegible] and [illegible] treatment of the case, for while each one of us will acknowledge and deeply appreciate the great care and attention which the Committees of Parliament give to our requests, and the marked ability which invariably characterises their deliberations, the fact remains that there is a vast amount of work which ought to be undertaken before we enter the Parliamentary arena, so that public opinion in connection with water supply may be assisted and guided on lines which have been proved [illegible]. Those who have had many dealings with the State departments appreciate to the full how welcome to them are the practical views and opinions of those who, equipped with ripe experience and knowledge, are best able to judge of the various questions which arise from time to time, and I cannot conceive anything but cordial welcome to an association such as our own which will provide machinery for the consideration of the great questions connected with the public water supply of this country.

The work of our association lies in the future, and time will only permit of my indicating in the broadest outline the questions which I hope will be dealt with in due season. That work, perhaps, will naturally divide itself under four main headings—namely, (1) administration, (2) public health, (3) finance, (4) [illegible].

ADMINISTRATION.

Under the heading of administrative problems perhaps one stands out with special prominence—that of the constitution of watershed conservancy authorities; for I suppose that no problem is greater than that of apportioning the natural water supplies of the country between the various communities. Hitherto there seems to have been little policy but one of "first come first served." If any large city or town applies to Parliament for powers to appropriate an area or a source, there seems to be no machinery by which the claims of other localities or authorities can be considered except to the extent to which those localities and authorities can incur the cost of putting their claims before Parliament. Admirable as this procedure may be in its application to individual cases, it nevertheless fails to deal with many important aspects in relation to the country at large, and as the years roll on and the untouched sources of supply become fewer and fewer, it may, perchance, be found that a more general consideration of the subject would have been in the public interest. The matter has already been brought forward by the Royal Commission on Sewage Disposal, who, in their Fifth Report, [illegible]

whose duties should comprise the protection of water supplied from pollution, the collection of information as to water supplies available in various parts of the country, and as to the need of water in different areas. Whatever may be said as to the establishment of a new department or authority to deal with this matter, I think the various problems thus foreshadowed would derive the greatest assistance if they could be discussed in an association such as we have now formed.

PUBLIC HEALTH.

The next department of work to which I have referred is that relating to public health, under which I deal with the question of the purity of our supplies. I suppose every member in this room will admit that the primary aim of any authority responsible for a water undertaking should be the provision of a supply whose purity is beyond reproach. Here, again, difficulties of infinite variety confront the different undertakings throughout the country; the problems of an authority supplying a river-derived water are not those which have to be dealt with by one whose supply is derived from natural or artificial lakes, and the cares and responsibilities of those who draw their water from wells sunk deep in the chalk are very different from those of undertakings which depend upon peaty uplands. Nevertheless, it does seem to me that a body of men familiar with the difficulties of individual localities would, by a joint discussion of the whole question of the quality of water supplied, perform a work of incalculable benefit to the community at large.

FINANCE.

The third heading—namely, that of finance—would bring us to a matter upon which we shall, no doubt, have widely divergent views. But here again I think the opportunity of comparing the systems in force in different parts of the country will be of the greatest possible interest and practical importance, and I look forward with a good deal of gratification to the opportunity which I think this association will afford of enabling one to compare the systems of charge adopted in different parts of the country, and of studying the various aspects of the relationship of the water consumer to the ratepayer, of the domestic consumer to the trader, and other problems of a like character.

Under this heading, too, will arise questions which to me are of peculiar interest—namely, those relating to assessment and rating. It is suggested that a question of great practical importance is arising in connection with the assessment of compensation reservoirs. This, perhaps, is only one of many rating problems which confront us, and I hope that during the year we shall have an opportunity of discussing these matters in some detail.

PHYSICAL QUESTIONS.

The last heading to which I have referred relates to what I call "physical" questions. Under this heading I include problems relating to the construction of works of all kinds, and the great responsibility of securing a first-class supply from the point of view of "quantity." In this matter, as in others, we all have our peculiar difficulties. Nevertheless, I think this is a subject on which we might give one another valuable assistance, and ideas in discussing, for instance, such things as the normal consumption per head of population supplied, in describing experiments with apparatus invented from time to time, in dealing with problems of underground water, in recording statistics of rainfall, and in the other innumerable questions which will arise in this connection. It may be even that some of you will desire to look so far ahead as to discuss the possibility of using sea water for non-domestic purposes. I suppose that, sooner or later, if the population of this country continues to increase, that question will become one of practical politics. It may be that that day is nearer than some of us anticipate, and the question may, perhaps, be usefully borne in mind in connection with our consideration of the needs of the country as a whole with regard to water-supply.

It is impossible in the time at our disposal this morning to proceed to the discussion of the various matters to which I have briefly alluded, and perhaps this is not the time at which it could be usefully undertaken. None the less, I hope we shall have an early opportunity of discussing some, at all events, of these problems, and perhaps this morning the most useful work we can undertake is to consider how to provide opportunities for their full and adequate discussion.

CONCLUSION.

In conclusion I can only say this—that I appreciate to the full the vital importance of the work upon which we are entering, and it is therefore with a sense of deep responsibility that I undertake the office of first president of the association. I regard my election to that office in no personal sense, and I believe that you have done me the honour of electing me in my capacity of chairman of the Metropolitan Water Board. I am therefore speaking on behalf of the largest water authority in the country, probably in the world, when I say that the Metropolitan Water Board appreciates the honour which has been done to it by the water authorities throughout the country, and will always be glad to render any assistance in its power to other municipal authorities in their efforts to provide the water consumers for which they are responsible with an adequate supply of pure and wholesome water.

ELECTION OF VICE-PRESIDENT AND OFFICERS.

Mr. James Watson, the engineer of the Bradford Waterworks, afterwards proposed, and Mr. Alderman Pickersgill, of the Leeds Waterworks Committee, seconded, that Mr. Bailie Archibald Campbell, J.P., chairman of the Glasgow Water Committee, should be elected to the office of vice-president. This motion was carried unanimously.

The following appointments were then made:—

Joint Honorary Secretaries: Mr. C. G. Henzell, M.INST.C.E., engineer of the Leeds Waterworks, and Mr. William Terrey, manager of the Sheffield Waterworks.

Honorary Treasurer: Mr. E. Antony Lees, manager of the Birmingham Waterworks.

Honorary Solicitor: Mr. Walter Moon, the solicitor of the Metropolitan Water Board.

Honorary Auditors: Mr. R. Hamilton, of Belfast, and Mr. C. Arthur, of the Fylde Water Board.

EXECUTIVE COMMITTEE.

As the result of ballot the following gentlemen were elected as members of the Executive Committee: Sir William Slater Brown, Lord Provost of Edinburgh; Messrs. A. R. Atkey, chairman of Nottingham Corporation Waterworks; J. Cook, ASSOC.M.INST.C.E., engineer to the Fylde Water Board; J. Hollywood, chairman of Belfast and District Waterworks; Joseph Parry, M.INST.C.E., waterworks engineer, Liverpool; A. B. Pilling, clerk of the Metropolitan Water Board; W. Rimmer, chairman of Bolton Corporation Waterworks; J. R. Sutherland, M.INST.C.E., waterworks engineer, Glasgow; William Terrey, waterworks manager, Sheffield; L. C. Walker, A.M.I.MECH.E., waterworks engineer, Reading; James Watson, M.INST.C.E., waterworks engineer, Bradford; and the Chairman of the Birmingham Water Committee.

Millars' Timber and Trading Company, Limited.—We understand that the order has been placed with this company for the sleepers for relaying the whole of the line of the Central London Railway in their well-known fire-resisting hardwood "Jarrah."

Shorland's Patent Manchester Stoves.—The Spittlesea Hospital, Luton, is being supplied with Shorland's warm air ventilating patent Manchester stoves with descending smoke flues and patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

Business Announcement.—We are informed that the Canadian Mineral Rubber Company, Limited, of 32 Victoria-street, Westminster, have secured the services of Mr. C. O. Seymour, who is well known to a large number of county, municipal and other surveyors. Mr. Seymour has acted for the past two and a-half years with much success in the management of the Roadoleum branch of the Anglo-American Oil Company. This latter company, we understand, have given up the active marketing of Roadoleum; and as Mr. Seymour is nothing if not active and enthusiastic in bituminous road work, we congratulate him, and in no less degree his present principals, on what must be a satisfactory connection on both sides. Mr. Seymour asks us to state that he will now bring before his friends the merits of "Camarco" for road purposes. This is a bitumen without a trace of coal tar or pitch, nor is it a petroleum residue. The basic material of this high-class asphalt is gilsonite, the purest form of bitumen known, and it is claimed that this natural base gives to "Camarco" more elasticity, adhesiveness and tensile strength than any competitive materials, while it also possesses the imperishability and resistance to extreme weather conditions so necessary for a road binder.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

At a meeting of the council of the Institution of Municipal and County Engineers, held at the offices of the institution on Saturday last, there were present Messrs. R. J. Thomas (president, in the chair), T. W. A. Hayward, J. S. Pickering, J. S. Brodie, J. W. Cockrill, A. D. Greatorex, N. Scorgie, W. Stubbs, W. N. Blair, J. Patten Barber, J. A. Brodie, J. L. Redfern, W. H. Prescott, H. T. Wakelam, O. E. Winter, C. F. Wike, E. B. Martin, Chas. Brownridge, W. Harpur, A. E. Collins, Thos. Cole (secretary) and H. A. Giles (assistant secretary).

New Offices Committee.—Mr. Carter was elected chairman. The committee further considered the acquirement of suitable headquarters.

Roads Committee.—Mr. J. Scott, president of Scottish Road Surveyors' Association, and Mr. J. Willmot, county surveyor, Warwickshire, were co-opted members of the committee.

A letter of thanks from the council of the International Roads Congress was received for the donation of 100 guineas towards the technical expenses of the congress. It was resolved that the whole council of the institution be appointed delegates to the congress.

On the recommendation of the Standardisation Committee the council approved the principle of specifying as the basis of a street lighting contract "illumination" instead of "candle power," as suggested by the Joint Committee of the Institution of Electrical Engineers, Institution of Gas Engineers, Institution of Municipal and County Engineers and the Illuminating Engineering Society. Subject to amendment in details the draft scheme prepared by the Joint Committee was approved.

The secretary having reported that the first edition of the "Standard Specification for Concrete Flags" had been exhausted, and that a number of orders could not be executed, the council, on the recommendation of the committee, gave instructions for the preparation of a second edition.

On the recommendation of the committee the council agreed to certain amendments proposed by the Sectional Committee of the Engineering Standards Committee on Vitrified Ware Pipes.

Election of Members.—Messrs. E. E. Rich, engineer and surveyor to the Bushey Urban District Council: W. H. McLean, municipal engineer, Khartoum City: J. Mathison, engineer and surveyor to the Langport (Somerset) Rural District Council; G. Palmer, assistant county surveyor, Cornwall County Council; and F. Stanghe, surveyor to the West Sterling Rural District Council.

Election of Associate Members: Messrs. G. Dyke, engineering assistant, Walsall Corporation, and S. C. Lloyd, assistant county surveyor, West Sussex.

Election of Students.—Messrs. H. E. Bradley, surveying assistant, Worcestershire County Council, and E. Bleakley, pupil to F. E. Jones, Tyldesley.

Transfer to Member: Mr. D. Cattanach, burgh surveyor, sanitary inspector and master of works for Tobermory (affiliated member).

The General Purposes Committee reported in reference as to arbitration clause, as proposed by the Builders' Federation, the Builders' Merchants' Alliance and the Bituminous Paving Manufacturers' Association.

The council learned with much regret of the deaths of Messrs. J. Smith, W. J. Press and F. W. Richardson, and letters of condolence were ordered to proceed.

On the recommendation of the Constitution Committee, Mr. Hayward was elected a member of the committee.

The secretary was instructed to forward a cheque for the balance of sitting moneys received for the Will am Jones Fund, and the account was accordingly closed.

Mr. W. H. Prescott was elected honorary secretary and treasurer to the Mansel Davies Fund, and a sub-committee was appointed to prepare a scheme for the working of the fund.

It was resolved that the offices of the institution be placed at the disposal of the District Committees for meeting purposes by arrangement with the secretary.

On the recommendation of the Town Planning Committee, the question of printing and circulating to the members of the institution a report by Mr. J. S. Brodie as to advertisement hoardings was referred to the Finance Committee. Mr. Hayward was appointed a member of the committee.

The council resolved that a Town Planning Conference be held at the next annual meeting, and that steps be taken with a view to obtaining the sanction of the Local Government Board for the payment of expenses of delegates attending. The council resolved that a competition open to all members, associate members and students of the institution for the laying out of a seaside pleasure resort be held in connection with the conference. The rules governing the competition were ordered to be drawn up and circulated.

On the recommendation of the Tramways Committee, the council resolved that Mr. Wakelam be asked to submit a report of the committee as to corrugation of tramway rails in the shape of a paper, and that the paper be submitted to and discussed at a meeting of the institution to be held in the Metropolitan District on Friday, December 6th, at 8 p.m.

The report of the Finance Committee recommending the payment of various accounts was received, and cheques were ordered to be drawn.

Testamurs were granted to the following candidates who passed the examination of the institution in October last: Messrs. G. Rigby, G. Stanley, G. Smith, R. H. Davies, J. R. Hill, F. J. Harris, W. B. Acton, B. Archer, T. S. Soorma, F. H. Holden, H. E. Griffiths, P. E. Harvey, E. Pilling, E. Wickenden, G. R. Folland, F. W. Dean and H. Anderson.

The attention of the council having been drawn to the appointment as surveyor to a district council of a gentleman having no engineering qualifications, a letter was ordered to be sent to the district council and a copy to be sent to the Local Government Board.

Messrs. A. D. Greatorex and N. Scorgie were reappointed delegates from this institution to the N.A.L.G.O.

The secretary reported intervention on behalf of a member whose competence to hold his position as surveyor to an important urban district council had been attacked without justification, and the council learnt with satisfaction that such intervention had led to the charge being defeated.

The secretary reported the satisfactory completion of the arrangements made jointly by Mr. Bryan, chief engineer to the Metropolitan Water Board, and the institution, for the visit of the Association Générale des Hygiénistes et Techniciens Municipaux. The visitors expressed themselves as delighted with the programme of visits to works arranged for them, and the council learnt with pleasure that during their visit Mr. Cole was elected an honorary member of the association.

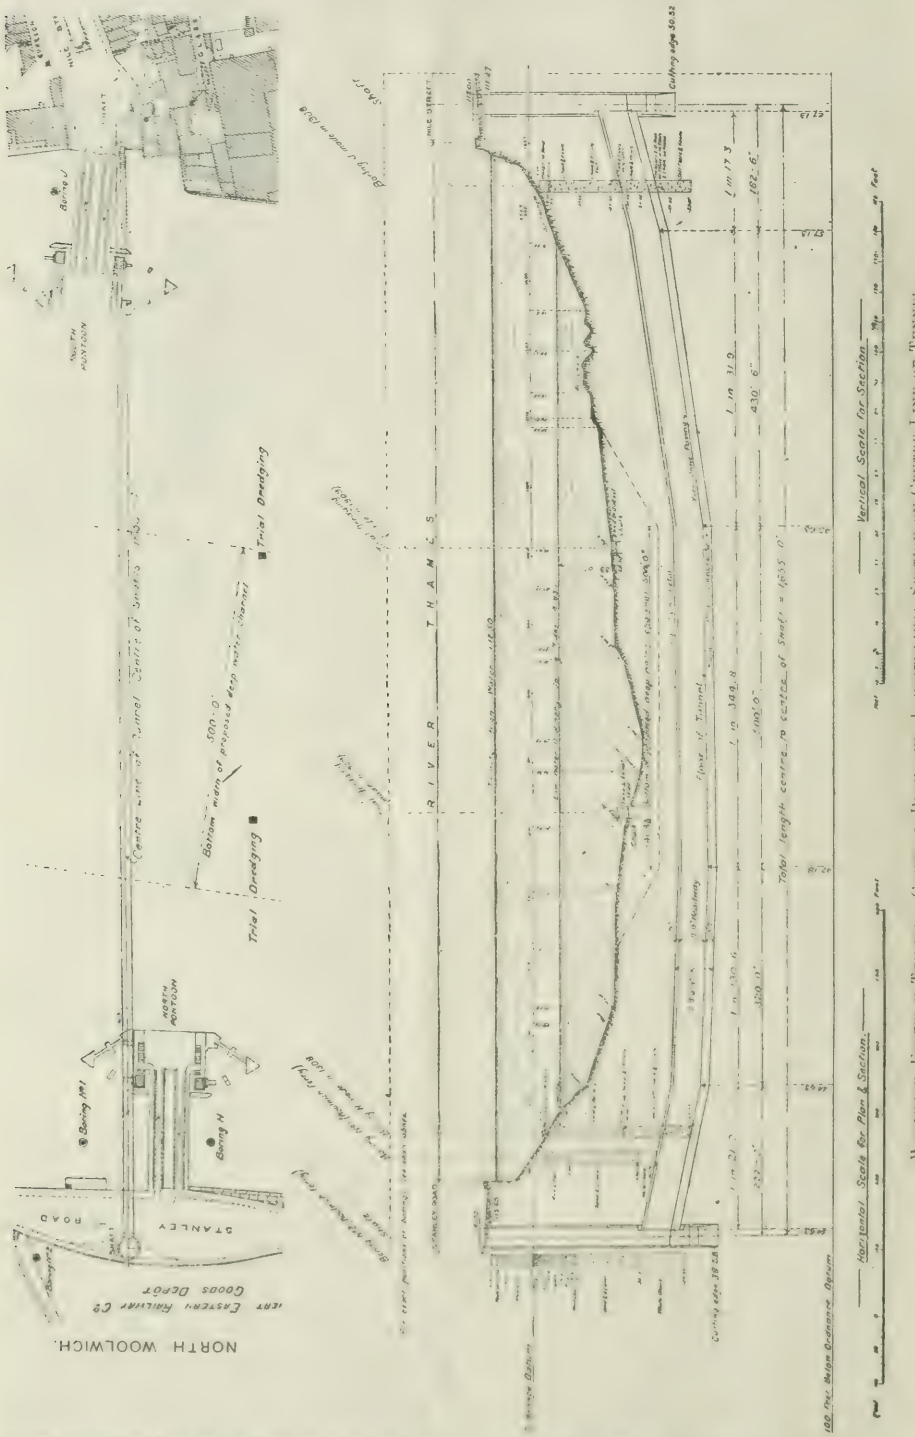
Leiston (Suffolk) Water Supply.—For many years past the Urban District Council of Leiston-cum-Sizewell, Suffolk, has been dependent for its water supply on a well belonging to a local engineering company, but recently steps were taken to obtain an independent supply. On the advice of Mr. Chas. H. Warren, of Woodbridge, a trial well was sunk on a site a short distance from the railway station, and water was found from 18 ft. to 20 ft. from the surface, the final depth of the boring being 40 ft. A fourteen-days' continuous test gave an average supply of 6,333 gallons an hour, and the water on being submitted to analysis was found to be of good quality. The cost of the preliminary work has been £500, and it is expected that a further £800 will be spent in providing permanent pumping machinery.

Road Tarring in Uxbridge.—Reporting specially to the council on the use of tar on the highways, the surveyor to the Uxbridge Urban District Council, Mr. J. W. Harrison, writes: "In the method used by me crude cold tar is hand-painted on the road by means of rubber squeegees, and only about 3½ sq. yds. can be done with 1 gallon of tar, whereas if the tar were put on hot, from 5 sq. yds. to 7 sq. yds. can be done with 1 gallon. This, of course, is a great saving in the cost of tar, but against this must be put the cost of tar-boilers (and more than one would be required to expedite the work), also the fuel, so that for the first year or two the cost would probably be more than with cold tar. As the cost of tar is increasing each year, and has gone up to us from 1¼d. to 2½d. since we started, and as we may get some help from the county council or the Road Board if we comply with certain conditions, I do not advise you to do this work departmentally after the next year, and only for the next year, as you have already contracted for the tar, and if let to contract it should be let a long time ahead, so as to make it a condition that it was all done by the end of May, weather permitting."

WOOLWICH FOOTWAY TUNNEL OPENED.

DESCRIPTION OF THE WORK.

On Saturday last Lord Cheylesmore, chairman of the London County Council, opened the new footway



Woolwich Footway Tunnel. General Plan and Longitudinal Section on Centre Line of Tunnel.

communication across the river Thames for the eastern districts of London was initiated in 1889, when a ferry was established at the point where the new tunnel has been constructed, three vessels being employed on the service. Two causes, however, militated against the continuous working of the ferry—fog and,

...which has been constructed by that authority to connect North and South Woolwich.

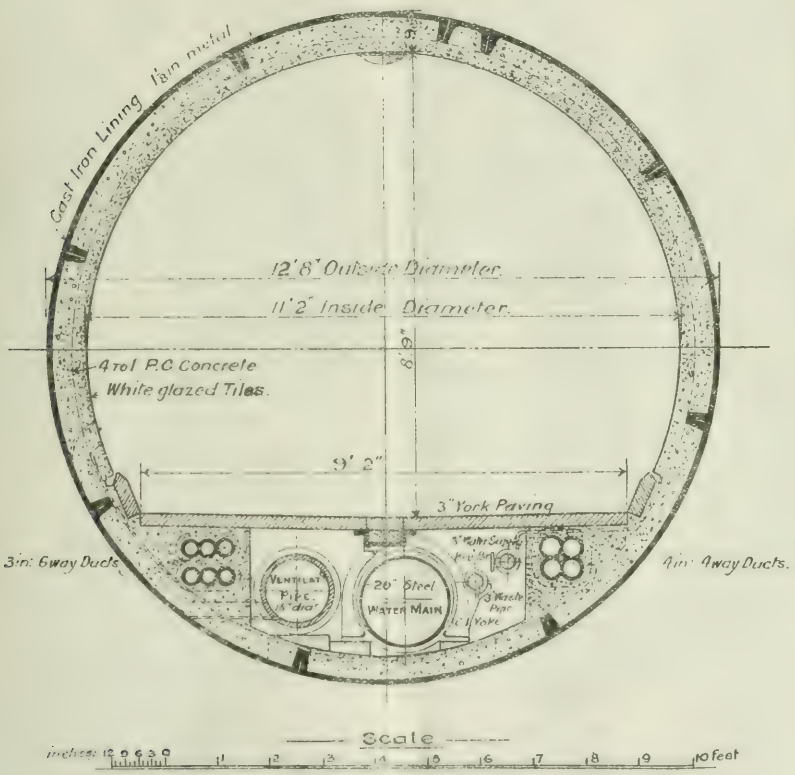
The first successful attempt to provide free means of

in exceptionally severe winters, ice. For instance, during the eight years 1900–1907 the ferry was suspended, owing to fogs, for no fewer than 833 hours, or

an average of 104 hours a year. In 1907 it was suspended for as many as 187 hours. In 1895, owing to floating ice, the ferry was suspended on a part of every day from February 7th to 23rd—on one day for more than fourteen hours. The stoppages, especially those from fog, usually occurred during the early morning, when workpeople had to cross the river to their work and serious hardship was thus inflicted on a large number of persons. In view, however, of the heavy cost of constructing and maintaining the ferry, the council did not feel justified for some time in incurring further expenditure on cross-river communications at Woolwich, but turned its attention to similar works of even greater urgency and importance in other parts of London. The chief of these, the cost of which amounted to about £2,000,000, were the reconstruction of Vauxhall Bridge and the construction of Rotherhithe Tunnel. The former was completed in 1906 and the latter in 1908, and in November of the latter year the council felt that it was in a position to submit to Parliament a scheme for the construction of a tunnel for foot passengers between North and South Woolwich. It was pointed out that, if such a tunnel were constructed, it would no longer be necessary to provide a practically continuous service of ferry boats, and the council accordingly decided to obtain, and were subsequently granted, Parliamentary authority for the reduction of the ferry service. Tenders were invited, and the lowest, that of Messrs. Walter Scott and Middleton, Limited, amounting to £78,860, was accepted in December, 1909.

In accordance with sec. 21 of the Tunnel Act, plans of the works, designed so as to allow of dredging the river to a depth of 30 ft. below low water, were submitted to the Port of London Authority for its approval. The authority admitted that the plans were in order and that such a depth would probably be found adequate for some years to come. They pressed the council, however, to modify the plans so as to allow of the river being dredged over the tunnel to a depth of 40 ft. The Tunnel Act authorised the council to deviate to an extent not exceeding 10 ft. from the levels shown on the deposited plan, and, as a deviation of 5 ft. was made when the plans were prepared, the council could not, without special Parliamentary authority, deviate to the full extent suggested by the authority. The contractors required an additional payment of £1,500 if the tunnel were lowered 3 ft., £4,500 for a lowering by 5 ft., and £10,000 for a lowering by 10 ft. The council, while anxious to meet the views of the authority, was not prepared to cause the delay and to incur the considerable extra expense which the adoption of the authority's proposals in their entirety would have entailed. It agreed, however, to lower the tunnel by 3 ft., thus enabling the river at this point to be dredged to a depth of 33 ft. The authority expressed themselves as satisfied with this concession.

The scheme adopted by the council did not include the provision of lifts, although the works were so arranged that, if necessary, lifts could be added at a future date. While the works were in progress the Woolwich Borough Council strongly urged that the absence of lifts would be a serious inconvenience to persons using the tunnel. The council finally concurred in this view, and agreed to follow the course adopted at the Greenwich footway tunnel, and to provide lift accommodation at both ends of the tunnel. The additional cost of this amounted to £5,000. The work was entrusted to the contractors, who were allowed to sub-let it to the Easton Lift Company, Limited.



Woolwich Footway Tunnel. Cross-section, Looking North.

The tunnel was designed by, and the work executed under the supervision of, the council's chief engineer, Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., who has supplied the following description of the undertaking:—

In design this work closely resembles the Greenwich Tunnel, constructed by the council and opened to the public in 1902. It consists of a cast-iron tube

of 12 ft. 8 in. outside diameter, connecting two vertical shafts of 25 ft. inside diameter and about 60 ft. deep. The length between the shafts is 1,635 ft., or nearly ¼ mile. The thickness of the river bed between the top of the tunnel and the river is about 10 ft. at the deepest place.

The shafts consist of steel caissons formed of two skins of steel plating, the annular space between them being filled with concrete. Both shafts were sunk by excavating inside them under compressed air. They are lined with brickwork, and in each there is a spiral steel staircase giving access to the tunnel from the street above. In the well of each staircase there is an electric lift capable of carrying forty passengers. The electric motors, gearing, switchboards, &c., are installed upon an upper floor in the brick buildings which have been erected above each shaft. Electric current for power and lighting is supplied from the mains of the Woolwich Borough Council.

The tunnel was constructed by the shield method under compressed air. The ground passed through was almost entirely chalk with numerous fissures which were in free communication with the river. The air pressure required to keep the working face dry varied from 18 lb. to 28 lb. per square inch, according to the state of the tide and other conditions. A fair day's progress in tunnelling was 8 ft. 6 in.

The cast-iron rings composing the lining are 1 ft. 8 in. long and each ring is made up of nine plates. The thickness of the metal is 1⅛ in., and about 2,000 tons were required in all. After the tunnel was completed from shaft to shaft it was lined throughout with concrete, upon which white-glazed tiles are fixed. The footway is paved with York stone flags, and underneath are water pipes and electric cables for the tunnel service, and also a steel water main 20 in. in diameter, and high-tension electric power cables which have been laid by the Metropolitan Water Board and the Woolwich Borough Council respectively.

The construction of the north shaft was begun on May 1st, and it was sunk to its final level in September, 1910. Actual tunnelling was started on December 1st, 1910, and finished in October, 1911. The resident engineer was Mr. E. H. Tabor.

TESTS OF PAVING MATERIALS IN PARIS.

The Paris municipal laboratory for the testing of paving materials has recently been improved by the alteration of some of the old apparatus and the installation of new machines.

Shaping Machine.—In order to shape the specimens for testing with perfectly flat and parallel faces a polishing machine with a carborundum tool is used, capable of being run at a speed of 1,400 revolutions per minute.

Impact Tests.—For tests of paving-sett materials a tup weighing 6 kilogs. and dropped from a height of 1 metre is used, the apparatus permitting of a range of drop between 5 cm. and 1 metre (2 in. and 39 in., say). The specimen is contained within a box which is bolted to the anvil, and it is held in the middle of the box by four springs, one on each side. The specimen stands 1 cm. above the box, and the blow is transmitted through a round-topped steel cap with a flat base.

Attrition Tests.—The blocks are tested by means of a cast-iron drum 60 cm. in diameter, turning on a horizontal axis. The blocks are placed in pivoted boxes sliding in vertical guides. The first part of the tests consists in imparting the curvature of the drum to the side of the block. Sand (crushed sandstone) and water are delivered by funnels in front of each specimen. The specimens are spaced apart by gaps of their own width, and after every 1,000 revolutions the drum is shifted exactly this distance on its axis to prevent the formation of grooves in the shell of the drum.

Tendency to take a Polish.—At present there is no apparatus for testing the tendency of the stone to be rubbed smooth, but owing to the importance of this matter in the case of materials used for paving streets, it is now under investigation with a view to the devising of suitable apparatus.

Fire at Tytherington Quarry.—A fire occurred in the Tytherington Main Quarry on the evening of the 24th ult., a gas plant and engine-house being destroyed. The damage done is estimated at £500, but the Tytherington Stone Company state that the fire will not seriously affect the working of the quarry, and that business will be carried on as usual.

BIRMINGHAM TOWN PLANNING SCHEME.

LOCAL GOVERNMENT BOARD INQUIRY.

Major C. E. Norton and Mr. Thomas Adams, on behalf of the Local Government Board, last week presided at an inquiry into an application by the Birmingham City Council for approval of their town planning scheme for East Birmingham, the preparation of which was sanctioned in March, 1911. It was explained by the town clerk, Mr. E. V. Riley, that the area to which the scheme applied embraced 1,443 acres, and that in the middle it was an excluded portion, almost entirely built up, measuring 98½ acres. Situated on the east side of Birmingham, the district was in part of four wards and in two Parliamentary divisions, and was drained in the northern part by the river Tame, and in the Southern part by the river Cole. The one distinguishing feature of the district was that, while there were plenty of means of communication from almost any part of the centre of Birmingham, there was no communication from north to south of the district itself, for the railway line formed an almost impossible barrier, except at two places. The scheme submitted, however, provided for the remedying of this defect by the construction of several new roads, and for up-to-date and proper means of communication from east to west. Those roads numbered twenty-one. Provision was also made for the limitation of the number of houses to the acre. The area was divided into zones, and the building density on these parts was fixed at eighteen, fifteen or twelve houses to the acre, with a stipulation that not more than twenty houses should be erected on any one acre. The area adjoined a manufacturing and industrial district, and the council had thought it desirable to set apart certain spaces for factory sites, while other spaces had been set apart for allotments. It was also the intention of the council to provide works for the improvement of the river Cole and the relief of flooding.

The city surveyor, Mr. H. E. Stilgoe, M.INST.C.E., gave details of the proposed new roads, and was cross-examined by Mr. H. H. Joy on behalf of a number of property owners who are affected by the scheme. With respect to the proposed limitation of the number of houses per acre, Mr. Stilgoe said he was not aware that another large city entering upon a town planning scheme were prepared to allow twenty-four houses to the acre. Whatever might have been decided on elsewhere, he added, he was certain that twenty-four houses to the acre in this case would not be in the best interest of the district.

ROAD BOARD GRANTS.

CORPORATION'S CIRCULAR TO LOCAL AUTHORITIES.

At a meeting of the Thames Valley Councils' Association held on Wednesday of last week a letter from the clerk to the Reigate Corporation on the above subject was read. It appeared that representations had been made to the Surrey County Council as to the manner in which the Road Board had treated local authorities as to grants, and the reply was that the Highways and Bridges Committee, before taking any action, thought it would be advisable for Reigate to circularise the local authorities to ascertain how many were aggrieved at the Road Board's action. The Reigate Corporation were of opinion that the Road Board were not carrying out the intentions of Parliament, as when the Road Board was constituted it was clearly laid down that a large portion of the grants made to it should be appropriated for road surface improvements, road widenings, objectionable corners, and so forth. It was manifest that these conditions were not being complied with, and not a little dissatisfaction had arisen owing to the manner in which applications were met by the Road Board. The association's views were therefore asked upon this important question.

It was stated by a delegate from Barnes that his authority thought the contributions given by the Surrey County Council were totally inadequate, and it was decided that the association should reply to Reigate in similar terms.

Institution of Electrical Engineers.—The opening meeting of this body is fixed for Thursday, November 14th, at 8 p.m., when the president, Mr. W. Duddell, F.R.S., will deliver his inaugural address.

Royal Sanitary Institute.

PROVINCIAL SESSIONAL MEETING AT ALTON.

A largely attended provincial sessional meeting of the Royal Sanitary Institute was held on Saturday morning last at Alton, Hants. The subject of housing problems in county areas was introduced in a paper submitted by Dr. Robert A. Lyster, medical officer of health, county of Southampton. A paper dealing with the municipal work of the district was afterwards presented by the surveyor to the urban council, Mr. G. Bertram Hartfree, F.S.I., M.S.E., and, together with the first-named contribution, will be found elsewhere in this issue. Those attending the meeting included, in addition to Mr. H. Percy Boulnois, chairman of the council of the institute, who presided, Mr. A. J. Martin, president of the Institute of Sanitary Engineers, Dr. Samuel Rideal, Mr. W. V. Anderson, city surveyor of Winchester, Mr. R. W. Cass, surveyor to the Farnham Urban District Council, Mr. F. R. Phipps, borough surveyor of Basingstoke, Mr. C. G. Mason, borough engineer of Guildford, Mr. J. A. Manning, divisional surveyor to the Hampshire County Council, and Mr. F. C. Uren, surveyor to the Aldershot Urban District Council.

A cordial welcome to the town was given by Mr. Gerald Hall, chairman of the urban district council.

Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute, in thanking the district council for giving facilities for the meeting, observed that these gatherings did an enormous amount of good wherever they were held. Papers on sanitary questions were discussed and brought home to the people of the different localities the need for sanitation. Legislation would, of course, go a long way towards helping sanitation, but unless some attempt were made to educate people legislative measures would remain comparatively ineffective. It was impossible to make a people religious by legislation, or to make them even temperate by legislation; it was the education of the masses of the people that brought about the necessary reforms, and the Royal Sanitary Institute was spreading knowledge all over the country, and evoking that interest in the subject that was necessary to progress.

DISCUSSION OF PAPERS.

It was agreed that the discussions on the two papers should be taken together, and the debate was opened by Dr. J. F. Briscoe (Alton), who remarked that the town was to be congratulated on having such an energetic and practical man as Mr. Hartfree fulfilling the duties of surveyor. The probable appointment of a Minister of Public Health in the near future was commented upon by the speaker, who, in the course of further remarks, put forward the suggestion that local authorities might be well advised in dealing with housing matters to insist on the minimum requirements in county areas.

Mr. C. G. Mason, borough engineer of Guildford, spoke of the lead which his town had taken in the housing problem in Surrey. He agreed entirely as to the desirability of ample garden space in cottages. His corporation had recently carried out two schemes, one in 1906 and the other during the present year [see THE SURVEYOR, May 3, 1912, and 22nd]. They might say that these were paying concerns. In all country towns the question of the demolition of cottages arose frequently. Property owners naturally retained cottages when they were long past occupation, and his council experienced great difficulty before they could put the Housing Act into operation in the town. But, as he had said, they had carried out these two schemes, and he was pleased to say they were giving general satisfaction. The cottages were never empty, and the yearly balance-sheets enabled the council to see that no loss was incurred. The cheapest of the dwellings were let at a rent of 5s. 6d. per week, inclusive of rates, though, of course, a cottage which they were able to provide at that figure was only fit for a young married couple. The aspect, however, was very pleasant, and there had been thirty applicants for the last cottages which they had erected. The selection of a site was an all-important matter, and one could not do better than choose one in which the roads ran east and west, so that there was plenty of sunlight on both the front and rear of the dwellings. In connection with the last scheme he was not in any way fettered by the engagement of an independent architect to prepare plans for one-half of the cottages put up, the result being that the dwellings were not all of a single design but of differing designs, which, fortunately, harmonised.

Dr. Francis E. Fremantle (London) followed with a reference to the misleading character of vital statistics, which were brought forward to show the need for rehousing in different localities. Nothing could be gained by exaggeration. Even the most carefully prepared statistics, particularly some of the Local Government Board with regard to back-to-back houses, were absolutely useless. They might talk as much as they pleased about back-to-back houses, and assert that people in them died more quickly than those in other types of houses, but they could not say that they started with the proper population to begin with, and the Local Government Board did not point out the essential difference. It was the poor and less intelligent people who would inevitably inhabit the least desirable houses. They might erect better houses in place of these, but they would not be solving the problem unless they were able to house the people who were displaced without increasing the burden on the tenants, because additional rental only meant reduced food supply and clothing. What was the natural life history of a house? An ordinary house was put up at an economic rental. It gradually became old and rapidly declined in price. A new house must inevitably have a great deal of extra value attached to it simply because it was new, but when they were trying to supply houses to the very poorest people they could not expect them to pay the extra amount which was due simply to the newness of the structure. From a sanitary point of view they must admit that an old house, say fifteen or twenty years old, could be made every bit as good as a new house. That was the basis of the position dealt with briefly by Dr. Lyster at the end of his paper on the proposal for a State grant. There were many objections against a State grant. One was that the Housing Act of 1909 had not been in operation sufficiently long for its full effect to be known. It would increase in usefulness, but they were acquainted with it sufficiently to know that it would not solve the problem entirely. The second objection was that it would lessen the responsibility of district councils, but that was an objection for which the time had gone by. Then it was contended that it was unfair to the tenants of other houses. He quite agreed, however, that the grant should be given only to the extent which represented the extra expense of a new house compared with an older one which the Act had provided. On the point that it was inadvisable to finance an industry, he would only point out that the grant would come out of the whole wealth of the nation, and that it was in the national interest that all interests should contribute fairly to a national charge. The question was of such urgency at the present time that the most careful consideration should be given to it, and attention given to the advisability of dealing with the problem in rural areas by applying for a State grant which could be properly distributed by the Local Government Board, with the assistance of county and district councils.

Mr. F. C. Uren, surveyor to the Aldershot Urban District Council, suggested that it would have been easier to appreciate the value of the sewage works at Alton if Mr. Hartfree had given in his statement as to the population they served. There was no information either with regard to the dry or wet weather flow, with the result that one was unable to ascertain whether the arrangements complied with recognised practice and were in accordance with the standards of the Local Government Board. He would like to know whether the filters with earth walls which were described in the paper were used as streaming filters only or as contact beds; if the latter, how were they filled with such porous material as earth, and why did Mr. Hartfree depart from the very general practice of using clinker? Mr. Hartfree admitted that clinker was the best, and surely the best was always the cheapest in the end. He presumed there had been no complaints with regard to the removal of house refuse, but to mix it with sewage sludge, as was done, seemed to him to be only aggravating the nuisance from it without enhancing its manurial value. Mr. Uren added that a little further information in regard to the sinking of the [illegible] and the method of using [illegible]

have been interesting for comparative purposes. Concluding, the speaker said that the council deserved to be congratulated upon the success of its water undertaking. The low rates charged reflected credit alike upon the council's policy and the management and energy of the surveyor. Altogether Mr. Hartfree deserved the warmest thanks of the meeting for his interesting and well-prepared paper. He (Mr. Uren) knew Alton before Mr. Hartfree took up his present position there, and he had visited it many times since, and, handicapped as Mr. Hartfree had undoubtedly been in the matter of funds, his work and paper gave evidence of zeal and ability which were quite exemplary. The analysis of costs in connection with his road works should considerably enhance the value of the Transactions of the institute.

Mr. W. V. Anderson, city surveyor of Winchester, observed that much of the difficulty experienced in the past in connection with the provision of cottages for the working classes was due to the great stringency of the by-laws, and they were all pleased to see the new set of model by-laws of the Local Government Board, which would give them a great deal of latitude in that connection. He was in total agreement with the "reasonable essentials" of Dr. Lyster, and if they made their specifications agree with those headings he did not think they would go far wrong. Mr. Anderson added that he disagreed with Mr. Uren on the point as to the mixture of house refuse and sludge.

Mr. R. W. Cass, surveyor to the Farnham Urban District Council, said he maintained that this matter of housing was every bit as important as any other section of the public service, and the matter of cost should be a secondary consideration altogether as compared with the health and comfort of the people.

Dr. Bevan (Alton) expressed the view that a great deal of the ill-health among people was attributable to the bad foundations of houses on made soil which was full of organic impurities. He was in favour of compromise in the carrying out of the law on the subject, and considered it would be helpful, not only to the people themselves, but to the sanitation of a town, if the local authority could assist poor owners of property to carry out necessary repairs to houses.

Mr. F. Ayles (Stockbridge) said that, after an extended study of means for effecting economies in cottage building, he had come to the conclusion that until the various materials were standardised nothing could be done. He had purchased 50 acres of land near Romsey, and he proposed to build on that a number of houses for letting at a rent of 5s. per week each, with an additional 9d. for rates. The houses would accommodate six or eight persons. Others would be a trifle more costly, and would be let to people who occupied houses which were not good enough for them, and who were in surroundings that were not to their taste. If he could provide houses at that rent public authorities ought to be able to do it also, because they were in a position to get money cheaper than he could; but if private bodies were going to get a State grant it would not be fair to the private builder.

Mr. C. Phillips (Hursley) said he was in favour of less stringent by-laws, adding that he knew of wooden structures built on brick foundations which were in every way healthy. In his opinion every house ought to have at least three bed-rooms.

Mr. A. J. Martin (Westminster) commented upon the excellent arrangement and interest of Mr. Hartfree's paper. It might be a fact that there were many undesirable features in the public works of Alton, but he was sure that would not have been the case had Mr. Hartfree started with a clean slate. Like many other surveyors, however, he had had to contend with great difficulties, and he (the speaker) could find nothing in the paper which went to show that either the council or their surveyor had not done the best in the circumstances. Proceeding to deal with Dr. Lyster's paper, Mr. Martin agreed that there was no earthly use in putting up the best kind of houses for the purpose they had in view and expecting them to remain sanitary. It seemed to him a most perverse and wrong-headed proceeding all round to attempt to deal with the problem by putting down the houses to begin with. Dr. Lyster had suggested that the local authorities should be more liberal in their by-laws, but many authorities would hesitate to do that, and many owners would not like to be deprived of their property. Where property was not fit for habitation, and the owner could not put it into proper repair, the local authority might undertake the necessary work and collect the rent until the amount paid for repairs was refunded.

Mr. T. Paterson (Farnham) agreed that the whole thing was a matter of the education of the individual, and that unless something of that kind was attempted the slums would remain.

The Chairman (Mr. H. Percy Boulnois), in closing the discussion, said the question of housing was, of course, an extremely difficult one. The point was this: If a local authority were to find houses for the people—State-aided houses, that was to say—where were they to draw the line? Why should Smith live in a State-aided house and pay a rent which did not pay the local authority, while Brown lived in a house on which the owner had to charge a remunerative rent? They must consider the ratepayers, who were not all wealthy. He perfectly agreed that the working man experienced difficulty in finding a house suited to his means. When he was city engineer of Liverpool he endeavoured to build working-class dwellings on the basis of 1s. per room per week, and to bring in 4½ per cent on the outlay, the land costing 12s. 6d. per square yard. In the construction of those houses he exercised the greatest economy in the matter of materials. There was no plaster on the walls, the floors were of concrete made out of clinker, and old tramway rails were used as girders, while the panes of glass in the windows were so small that if broken they would cost only 3½d. each to replace. The plumbing, however, was thoroughly well done, and separate water-closets—so important in the interests of cleanliness—were provided for each tenant. He was sorry to say he did not quite succeed in getting down to the basis of 1s. per room per week, but he did the work for 1s. 3d., and brought in the 4½ per cent he had aimed at. He tried and, as he had since found, succeeded in providing for the lowest class of people, and it was his opinion that that was what local authorities should try to accomplish, leaving the better class to private individuals to find houses for them.

Dr. Lyster and Mr. Hartfree replied shortly to the points raised by the various speakers. The latter, replying to Mr. Uren, stated that the population of Alton was 5,000, and that the dry-weather flow of sewage was 180,000 gallons per day. In the Bagshot sands, as at Aldershot and Frimley, it would be impossible to make bacteria beds with earth walls, but in that district it was different. They were able to make perfectly watertight walls, and he considered it was well worth the saving effected. On the question of the use of clinker, in a district like theirs they had to cut their coat according to their cloth. They would have liked to use clinker, but the cost prohibited it. In regard to the question as to house refuse, on the face of it it would appear that the nuisance from that material would be intensified by the addition of sludge, but their experience in the matter had been otherwise. Calcium chloride and Akonia were employed as dust palliatives.

The members of the institute were afterwards the guests of the urban district council at luncheon, the hospitality being appropriately acknowledged by Mr. H. Percy Boulnois, the chairman of the council of the institute in proposing the toast of the local authority.

FOUR BOOKS FOR MUNICIPAL ENGINEERS. **There is a field for enterprising local authorities to lead the way by providing municipal crematoria. Mr Albert C. Freeman's book—"Crematoria in Great Britain and Abroad," with 70 illustrative plans and designs, price 5s (post-free 5s. 4d.)—is the standard work on the subject. Mr. Freeman is also the author of "The Planning of Poor-Law Buildings and Mortuaries," price 7s. 6d. (post-free 7s. 10d.), a companion work in which the illustrations are again a valuable feature. "Roofs and Floors of New Buildings: their Structure and Stability," by Ernest H. Essex, Assoc.M.Inst.C.E., price 2s. 6d. (post-free 2s. 8d.), embodies in a most concise manner the calculations necessary for the strengths of timbers in floors and roofs. "The Housing of the Labouring Classes and Back-to-Back Houses," by H. Percy Boulnois, M.Inst.C.E., price 1s. (post-free 1s. 1d.), contains 41 diagrams, and comprises, says "The Architect," "valuable information on one of the most embarrassing of social problems." The above four works are all published by the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.**

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for October is awarded to

MR. FRANK NICHOLSON,
County Surveyor's Office,
Dornoch,

whose solution has been the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

276. Roof Design. It is [illegible] necessary, in designing the steel trusses [illegible] to adopt some system of wind bracing. Explain in detail how the [illegible] sectional area of the wind ties is determined. (H. F. W. *Tottenham.*)

281. Surveying. Upon what [illegible] does triangulation depend? Prove that the sides of a triangle are proportional to the sines of the angles opposite to them.

282. Hydraulics. Explain simply what is meant by the "hydraulic gradient" in a pipe, and how this may be obtained in any given case. ("Pupil.")

283. Strength of Materials.—What is meant by the following terms:—Modulus of elasticity, limit of elasticity, permanent set, plastic elongation, ultimate resistance, and resilience of a bar? (Inquirer.)

284. Wood Paving.—What are the comparative advantages and disadvantages of soft and hard wood for wood paving? ("Suburban.")

REPLIES TO QUESTIONS.

278. Mechanics.—Give an expression for the tension of the bucket rod in a piston-rod in a common suction pump. The barrel of the pump is 8 in. diameter, and the stroke of the bucket or piston is 10 in. Find the work done per stroke in ft.-lb. when the spout is 16 ft. above the surface of the water in the well. (A.M.I.C.E., October, 1901.)

(*a*) Let A = area of bucket in square feet
S = length of stroke in feet
H = height from water surface in well to delivery spout, in feet.
F = force in lb. required to raise bucket on the up-stroke
= 62·3 lb. = weight of 1 cub. ft. of water

Neglecting friction and weight of bucket and rod we have: Weight of water raised by one up-stroke
= volume swept out by bucket × 62·3
= 62·3 × A × S

Work done during up-stroke = 62·3 × A × S × H ft.-lb., because the weight (A × S) of water moved is raised through a height (H) equal to the total head.

Or work done = force × distance = F × S ft.-lb.
F × S = 62·3 × A × S × H
∴ F = 62·3 × A × H lb.

i.e., F lb., the tension in the rod, is equal to the weight of a column of water of cross-section equal to that of the bucket, and height equal to the total head. The actual tension in practice will be greater than F lb. by the weight of bucket and rod, and the resistance due to friction.

(*b*) As above:—

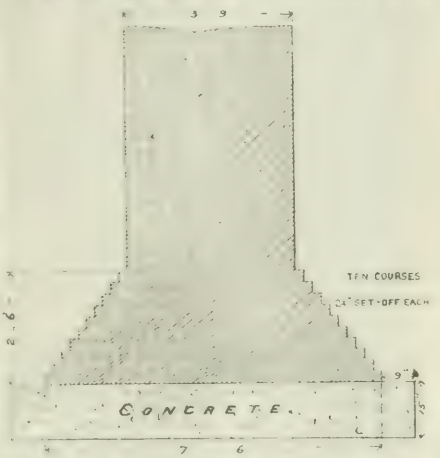
Work done = $62{\cdot}3 \cdot A \cdot S \cdot H$ ft.-lb.
$= 62{\cdot}3 \cdot \frac{\pi}{4} \cdot \left(\frac{8}{12}\right)^2 \times \frac{10}{12} \times 16$ ft.-lb.
$= 62{\cdot}3 \times {\cdot}7854 \times \frac{64}{144} \times \frac{10}{12} \times 16$ ft.-lb.
= 290 ft.-lb. = Answer.

(H. V. O., *West Bromwich.*)

280. Building Construction.—The walls at the base of a high brick tower are 3 ft. 9 in. thick. Describe, with drawing, what footings should be provided, the thickness of concrete, and the distance below the surface. (T. R.)

The number of courses should be equal to the number of half-bricks in the wall, and should be laid in regular set-offs of 2¼-in. projection on each side; the base of the footings should be twice the width of the base of the wall. As many brackets as necessary should be laid in the footings, so as to form a good tie between the back and front of the wall, and to render less likely a disturbance in the case of the soil moving.

The [illegible] should not be less than 9 in. in depth, and should project at least 6 in. on each side. (J. O. N., *Pontefract.*)



[M. E. N., Dublin, points out in his reply that a good practical rule for obtaining the depth of the concrete is to draw a line at an angle of 60° with the horizontal from the outer edge of the footings, when the intersection of this line with the edge of the concrete will give the required depth.—Ed.]

NOTES.

A [illegible] to Question 273 (Cast-Iron Stanchion) in the issue of October 4, 1912:—

In the Rankine formula as given the constant a is [illegible] for the expression $\frac{f}{\pi^2 E}$ (E being Young's modulus for the material), considering a strut with both ends free.

Using the value of f given [illegible] 80,000 lb. and assuming E as 6,000 tons per square inch, this gives a value of

$$a = \frac{80{,}000}{9{\cdot}87 \times 6{,}000 \times 2{,}240} = \frac{1}{1{,}650} \text{ approx.}$$

If both ends are perfectly fixed, the constant is $\frac{a}{4}$ *i.e.*, $\frac{1}{6{,}400}$, and if one end is fixed and the other free the constant may be taken as $\frac{a}{2}$ *i.e.*, $\frac{1}{3{,}200}$. The ends of the strut are obviously not free, but it cannot be assumed that they are perfectly fixed, so that an assumed value of the constant $= \frac{1}{3{,}200}$ is reasonable, any error being on the safe side.

The value of the moment of inertia, and consequently the radius of gyration, as worked out, is the maximum for the section, whereas the minimum should be used.

The minimum moment of inertia of the suggested section is 50·8, and the corresponding radius of gyration is 1·63 in. Using these values with the constants given,

$$P = \frac{8{,}000 \cdot 19}{1 + \frac{1}{3{,}200} \times \left(\frac{144}{1{\cdot}63}\right)} = 142{,}000 \text{ lb.}$$

and with the factor of safety of 5·55

the safe load $= \frac{442{,}000}{5{\cdot}55}$ lb. = 35·5 tons.

A similar section, 7·5 in. × 7·5 in. × 1·3 in., area 25·9 sq. in., and minimum radius of gyration 1·89 in., would carry a safe load of 59 tons, calculated in the above manner. (H. E. I., *Hastings.*)

Correspondence.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesie."
GEO. HERBERT, *"The Temple."*

MIXING CEMENT WITH "BITUMEN."

To the Editor of THE SURVEYOR.

SIR,—My faith in Mr. Nathan's claim to be regarded as an expert in bitumen gets rather a shock by his confession that he does not know what is meant by "liquid 'bitumen' (*i.e.*, British)." To me, whose knowledge, on Mr. Nathan's view, is not equal to "the veriest tyro in bitumen manufacture," its meaning is "quite an elementary question;" in fact, the term has been commonplace throughout my experience of some forty years past as an engineer employing such materials.

As this gentleman now confesses that, though quite able to do so, he had no intention—indeed, "it was farthest from his thoughts"—to throw any light upon the practical point embodied in my query as to the safety of mixing cement and "bitumen" his concern being, he says, for your space (surely a matter for your solicitude rather than his)—one may be pardoned for wondering why he took up your space at all by entering into this correspondence. If it was merely to apply to my comparisons of pavings the term "invidious," an objectionable imputation for which he has no justification, he might, I hope, have been more worthily employed. Would he regard it as justifiable for such an obnoxious term to be applied to his own comparisons on p. 506 of your issue of October 11th?

As my comparison was made from the standpoint of purely technical interest, while his is from the point of view of a trader concerned in exploiting a rival mode of paving, there might be the more ground for attributing motives. The old adage about those who live in glass houses should not be forgotten.

When penning my first remarks (THE SURVEYOR, October 4th, p. 462) I little thought that the first object-lesson illustrative of one of the points my query was designed to elucidate would come from one who is engaged in bitumen manufacture: his remarks may therefore be fairly judged from a strictly technical and practical standpoint.

Now, my queries were:—

(*a*) "The exact composition of the bitumen?" (used in one of the systems of paving).

(*b*) "Was it a good thing to mix 'bitumen' and cement?" To which I added, "I prefer it (the cement) uncontaminated by any tarry mixture" (in one of the systems of paving then under consideration forty to sixty volumes of cement were mixed with five volumes of liquefied tar).

Mr. Nathan now renders my (*b*) query thus: "Why a percentage of cement is employed in the manufacture of asphaltic paving mixtures?" This misquotation of words is either due to carelessness, intention, or a belief that the meaning is synonymous; assuming the latter to be the case, we have the significant fact, to which special attention is called—that even an expert and manufacturer terms a mixture of "bitumen" and cement an asphaltic paving mixture. He even goes further, for the same term is applied to the mixture of tar (only) and cement before referred to (this word being on p. 577, "comparison between asphaltic paving mixtures").

It was the indiscriminate and unscientific use of these several terms, for which, I believe, we have the Americans mainly to thank, and the consequent confusion that arises—as the remarks of your correspondent "Natural" appositely show that led to my query on.

It is to be hoped that the Road Materials Standardisation Committee will include within the scope of its duties the proper classification and definition of [illegible]. A complete glossary on the subject is badly wanted.

With regard to my query (*b*), it will, I have been observed, that "bitumen" was written in inverted commas, intended thereby to convey that the article [illegible] "British bitumen" was meant. Having some experience with Pratford's wood mixed with this material, and not myself recognising the utility of this process, I thought it was time to raise the question in the hope of eliciting the views of some of your readers. Unfortunately, the correspondence has so far not been very informing on the point. Perhaps some of your readers will come forward and make it [illegible].—Yours, &c.,

W. J. HOWARD-SMITH.

October 29, 1912.

NON-SLIPPERY WHINSTONE.

To the Editor of THE SURVEYOR.

SIR,—Mr. Howard-Smith observes that the exact value of my testimony with regard to the slipperiness of whinstone cannot be estimated in the absence of more definite data, and presumably this will equally apply to his own remarks.

Contrary to Mr. Howard-Smith's supposition, I have had official responsibility for the condition of whinstone-paved streets over a long period of years, and in streets subjected to heavy as well as light traffic. Local authorities in Scotland at least, when they have declined to approve of the use of whinstone setts when proposed to be used by companies about to construct tramways in their districts, have done so, not on account of the slipperiness of the whinstone, but because it has not the lasting qualities of granite. From repeated trials over long periods I am quite satisfied that the best Scottish granite has twice the life of the best whinstone. The fact that Mr. Howard-Smith has not discovered a non-slippery whinstone is no proof that such does not exist, as there are many quarries which produce such stones.

It is absurd to give an opinion on whinstone setts without knowing the particular quarry from which they are produced. Large quantities of Scotch whinstone are yearly sent to England, and it is quite apparent that the buyers do not have much knowledge of the qualities of the respective quarries, as they accept setts from quarries which would not be approved of locally as being of best quality.

It would undoubtedly be of advantage to surveyors who are purchasing material from a district with which they have no personal acquaintance first to ascertain the opinion of a fellow-surveyor in the district, as they would thereby obtain the best class of stone, which is sold at practically the same price as the inferior ones.—Yours, &c.,

"SCOTCH WHINSTONE."

October 28, 1912.

TOWN PLANNING: WHOSE WORK?

To the Editor of THE SURVEYOR.

SIR,—The contention of the secretary to the Garden City and Town Planning Association that because the shareholders in the garden city companies are limited to 5 per cent interest on their investments, and as many of the companies do not build houses, they cannot be said to be building speculators, is one that I cannot accept.

At a time when corporations can practically get all the money they require at 3½ per cent, and the speculative builder can borrow at 4 per cent, the 5 per cent obtained by the shareholders shows clearly that the companies are of a speculative character.

The promotion of garden city schemes under the alluring disguise of philanthropy and housing reform does not make them non-speculative transactions, though the fact that investors are always attracted by high-sounding titles of a moral or social character may make them a greater commercial success, and therefore somewhat less speculative.

As the value of the property of one of the companies mentioned by Mr. Culpin as being a building company, the Co-partnership Tenants, Limited, which builds for and buys from its tenants, had property at the end of 1909 valued at £56,560, I fail to see why he should, or how he can, object to the term "building speculation" being applied to the shareholders in such companies.

Mr. Culpin's cheap sneer at my "acquaintance" with the garden city movement does not disturb me unduly. I have been a fairly regular and industrious student of garden city and town planning literature for several years, have visited a number of garden cities, and have had the advantage of listening to Mr. Raymond Unwin, Mr. Thompson, and other leaders of this movement; and the outstanding feature of the discussions and literature is the statement that if you are to get a less number of houses to the acre you must reduce the cost of your road making.

When the reduction of the cost of road making is obtained by reducing the width of the road and lowering the quality of the materials for road making below the standard accepted by any self-respecting road authority, I cannot say that I feel called upon

The Surveyor
And Municipal and County Engineer.

[We quite [illegible] Ed. SURVEYOR.]

SEWAGE DISTRIBUTION AT ILKESTON.

To the Editor of THE SURVEYOR.

SIR,—In your issue of October 18th we note a letter from Mr. E. Witton Booth stating that considerable interest was taken in the Ilkeston sewage distributors, and that municipal engineers would be interested also to see the results of these distributors after several years' working. These distributors are generally known as the Hanley distributors. The first of these distributors were specially designed and constructed by the principal of our firm for Messrs. Wilcox & Rookes, the engineers to the Hanley sewage scheme. The method of coupling these distributors by a haulage rope so contrived that one distributing arm balances another against the effect of wind pressure was for the first time brought into operation in 1905 on these distributors. Distributors covering nine acres have been in operation during the last five or six years at Hanley, and these have proved so successful that a number of other towns have also adopted them, Ilkeston being the most recent installation. In every case the perfect time intervals and evenness of dosing have produced what may be said to be a most perfect effluent. Engineers from all parts of the world have visited Hanley to see these distributors and the opinion they have invariably expressed has been in the highest terms of praise. Certainly in efficiency of operation and control during the best or the stormiest weather, also for evenness of the distribution, and their great range of dealing with large or small volumes of sewage, there is no other sewage distributor on the market that will bear comparison with the Hanley sewage distributors. The power-driven rectangular distributor will be without doubt more extensively used as its merits become more widely known to the municipal engineers.—Yours, &c.,

HARTLEY, CAUSTON & RICHMOND, LIMITED.
(J. W. Hartley, Managing Director.)

Regent Engineering Works,
Stoke-on-Trent.
October 22, 1912.

TWO APPOINTMENTS.

To the Editor of THE SURVEYOR.

SIR,—May I draw the attention of your readers to the two following advertisements which appeared in THE SURVEYOR of September 27th?—*viz.*:—

"Chief Engineer and County Surveyor." London County Council. £2,000 per annum.

"Deputy City Engineer." Manchester. £500 per annum.

In the issue of the 25th inst. you publish the short list of selected candidates for the first-named appointment, and, strange to say, two of the gentlemen selected for the honour are not eligible, according to the terms of the advertisement, to compete for the latter appointment, which offers only one-fourth of the salary of the first-named. Comment is useless, as [illegible] must be kept there.—Yours, &c.,

A.M.I.C.E.

October 26, 1912.

[We publish our correspondent's letter, but with the note that the conditions of the Manchester appointment are under reconsideration.—Ed. THE SURVEYOR.]

ROAD CRITTING.

To the Editor of THE SURVEYOR.

SIR,—It would be interesting to have the remarks of surveyors on this subject.

My experience is that so long as asphalt or tar dressed roads are clean there is no slipping; the dirt brought from the water-bound roads causes slipping and skidding on the better pavements. I find that the horses I use myself slip more on pitched crossings than on any other form of pavement.

It is true that horses are not so liable to slip on macadam as on the better form of road surface, as their shoes are driven through the mud and dirt on the surface of such macadam, but as this mud can support pneumatic tyres, such tyres skid more readily on macadam, especially on limestone macadam, than on the better forms of road surfaces.—Yours, &c.,

C. H. COOPER, M.INST.C.E.,
Borough Engineer.

Wimbledon.
October 26, 1912.

Meldrum Brothers, Limited.—We are informed that the works and assets of this firm at Timperley, together with the goodwill, have been transferred to a new company, formed for the purpose, which will continue the business under the style of Meldrums, Limited, of which company Mr. John W. Meldrum, who has been manager during the liquidation, will be the managing director.

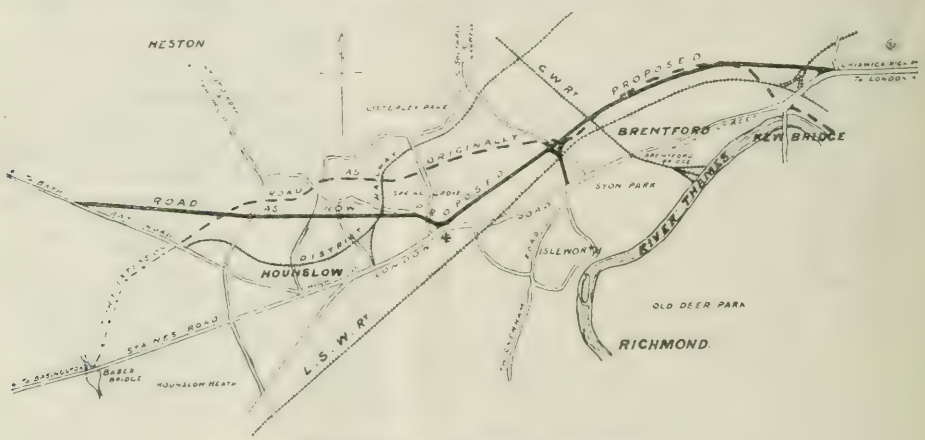
THE LONDON WESTERN APPROACH ROAD SCHEME.

An improved scheme has been evolved for the Brentford section of the Road Board's Great West Road proposal, and it is hoped that this will settle the chief difference now existing between the various authorities interested in a broad western exit from London. The improved scheme, the principle of which was approved by the Council of the Roads Improvement Association at its last meeting, provides that the new road when approaching Brentford shall not swerve upwards at the Brentford Waterworks to pass in a north-westerly direction to the Bath-road near Hounslow Barracks Station, with a possible extension across country to the Staines-road at Bedfont, but shall start at Chiswick High-road at the foot of Gunnersbury-lane, near St. James' Church. It will then pass straight across the railway lines, avoiding the tangle of tramway sidings at Kew Bridge, and then run parallel with the London and South-Western Railway until a junction is made with the existing road at Pears' Fountain. From this point the new road will go due west across country until the Bath-road is reached in the neighbourhood of "The Traveller's Friend" at Hounslow.

A consideration of the local circumstances and objections will, the Roads Improvement Association contend, quickly show the outstanding advantages of the revised proposal. The new scheme is really a development of principle of the Road Board's proposal. In addition to the advantages mentioned, it is pointed out that when the new road is constructed very little difficulty will occur when repairs are in progress, as traffic can be diverted to either the old or the new sections temporarily. The angles at which the roads will join are claimed to be almost perfect.

Only three local authorities will be concerned in the scheme—the Brentford Urban District Council, the Heston and Isleworth Urban District Council and the Middlesex County Council. The Heston and Isleworth Urban District Council, whose chairman was mainly responsible for the creation of the revised scheme, has agreed to the new proposal, and the Road Board have also approved it. It now remains for the principle to be adopted by the Middlesex County Council and the Brentford Urban District Council.

The cost of the scheme is estimated at about £250,000, a relatively small figure when the cost of the whole Road Board proposal—£1,750,000—is borne in mind.



New Western Road: Proposed Deviation.

(Junction of proposed road with main road through Hounslow and Brentford.)

"Tarco." We learn that Messrs. R. S. Carr & Co., Limited, of Liverpool, the patentees and proprietors of "Tarco," the well known road-surface compound, will in future deal themselves with all business connected with the manufacture and sale of this article for use in the United Kingdom, as well as the export trade, and are asked to state that all enquiries should be addressed to their head office at Liverpool. The arrangements with their licensees for the United Kingdom have just expired.

CONTINENTAL MUNICIPAL ENGINEERS' VISIT.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS' WELCOME.

Over fifty members of the Association Générale des Hygiénistes et des Techniciens Municipaux paid a visit to England last week. On the morning of the 21st inst. the party assembled at the St. Ermin's Hotel, Westminster, where Mr. Thomas Cole, secretary of the Institution of Municipal and County Engineers, addressing the party in French, offered them a very hearty welcome to London on behalf of the institution. Mr. Cole explained that the programme that had been prepared for them for the three days of their visit would enable them to see examples of waterworks, sewage disposal works, electricity and gas works, and a garden city. The party, including ladies, then drove to the Mansion House where they were presented to the Lord Mayor and Lady Mayoress by Mr. W. B. Bryan, the chief engineer of the Metropolitan Water Board, who referred to the great work in which the members of the association were engaged in the improvement of sanitation and the amelioration of the conditions of life in the cities and towns of France, Belgium and other countries. A visit was then paid to the Guildhall. Later in the day, as we have already reported, an inspection was made of the pumping machinery and the roof-gardens at Hampton, under the guidance of Mr. Bryan. The party then proceeded to the sewage works, where they were greatly interested in the processes there adopted. Mr. S. H. Chambers, engineer to the Hampton Urban District Council, acted as guide. The members were hospitably received by the chairman of the district council at the Manor House.

On the following day visits were paid to the Letchworth Garden City, and to the sewage disposal works at Saltley, Birmingham, which were described and explained by Mr. J. D. Watson, engineer to the Drainage Board. The party were afterwards entertained to luncheon by the board.

The next day's programme included an inspection of the electricity works of the London County Council at Greenwich, Mr. Fell, the tramways engineer, being present to receive the visitors. At the gasworks at East Greenwich the South Metropolitan Gas Company entertained the party to luncheon. In the absence of the chairman, Mr. Bywater presided, and welcomed the party. The works were inspected with the greatest interest, and were described by Mr. Bywater, engineer to the company, and his assistants.

At a reception held in the course of the week, Mr. Cole, the secretary of the Institution of Municipal and County Engineers, was elected an hon. member of the association.

Bridlington Waterworks Extension.—The Mayor of Bridlington last week formally opened extensions at the new waterworks, which have been carried out at a cost of £12,500 and which have provided a water supply that is likely to be ample for many years. The waterworks are run at a large profit to the town.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Belfast R.D.C. (October 18th. Mr. P. C. Cowan).—£800 for the Glengormley and Whitehouse sewerage system. The money, it was stated, was required for the provision of a caretaker's house at the sewage works, for fencing, making a road, and extending the sewerage.

Cardiff T.C. (October 22nd. Mr. H. R. Hooper).—£63 713 for waterworks (including the purchase of land), wood paving, and the provision of a live-stock market. With respect to the proposed expenditure of £36,533 on repaving with wood blocks, the city engineer, Mr. W. Harpur, stated that it was intended to relay certain streets with Jarrah wood. The old paving had given a fifteen years' life, and they had it for a ten years' loan. As to the purchase of land for waterworks purposes, it was admitted that the price to be paid was high, but that, having regard to the value of the adjoining land, the council could not do better.

Chester-le-Street R.D.C. (October 15th. Mr. A. A. G. Malet).—£1,385 for a water supply for Great and Little Lumley.—It was stated that the colliery industry had developed very greatly; plans for nearly 600 houses in Little Lumley had been approved, and over 150 were already built. The proposal included the construction of a reservoir, and it would be possible to collect sufficient water during the night time in the reservoir to supply the whole of the new houses, also the existing houses, and give both parishes a good supply.

Doncaster T.C. (October 18th. Major J. Stewart).—£1,215 for laying granite setts, and £3,802 for the provision of a destructor. It is proposed to lay the granite setts in St. Sepulchre-gate. With respect to the destructor, it was stated that the proposal is to erect one of the Horsfall type, for which the tender of Messrs. Holloway Brothers, of London, has been accepted. Before agreeing to the tender the sub-committee visited several works in other towns. The maximum period of repayment was asked for with respect to each loan. The inspector complimented the borough surveyor, Mr. F. O. Kirby, on the care with which the scheme had been prepared.

Driffield R.D.C. (October 11th. Major C. E. Norton). £550 for the Nafferton waterworks scheme, which was opened in May last. The first loan was for £3,600. Mr. C. E. Fairbank, of York, for the council, explained that since the scheme was commenced the price of material and labour had gone up. This and other things caused a difference in cash over and above his estimate of £269. The extension of the services to outlying farms caused additional outlay. There was no opposition.

Hertfordshire C.C. (October 8th. Mr. A. G. Drury). £665 in respect of the erection of a new bridge over the River Stort Navigation at South Mill. It was stated that the proposed bridge would have a waterway of 25 ft., and a headway of 7 ft. 6 in., and that it was proposed to give a roadway (including a footpath of 5 ft. on the west side) of 25 ft.

Horwich U.D.C. (October 17th. Mr. F. H. Tulloch). £4,000 for a sanitary conversion scheme. The surveyor, Mr. T. Green, stated that the scheme provided for the conversion of 978 privy and 430 pail closets, making a total of 1,408 conversions, this being a complete abolition of all privy and pail closets in the district.

Hyde T.C. (October 23rd. Mr. M. K. Knott).—£6,000 for an extension of the baths.—It is proposed to build the extension on land adjoining the present baths, to provide a larger plunge bath for boys and men, and to use the present men's plunge bath for girls and women.

Ilkeston T.C. (October 16th. Mr. Edgar Dudley).—£2,667 for the improvement of Burns-street and Heanor-road, and £569 for the purchase of Car-close depot.—The town clerk gave the usual details of population, assessable value, and so forth, and mentioned that the total indebtedness of the town was £229 000. The proposed improvement and widening of Heanor-road and Burns-street were explained, land having been given by the Duke of Rutland for the widening of the first-named road on certain conditions.

Keighley T.C. (October 17th. Major J. Stewart).—£7,500 for the extension of the public baths in Albert-street, and £7,900 for Devonshire Park extension, and improvements at Lund Park, Victoria Park, Hainworth Wood-road Recreation Ground and the Lynum-street Recreation Ground.—It was stated that the proposed new bath would be 100 ft. by 30 ft., and that the area would be about three times that of the present first-class swimming bath. The tenders which had been provisionally accepted, subject to the approval of the Local Government Board, amounted to £7,246. The work to be done in connection with the improvements in the parks includes the construction of boundary walls, street works, laying out an old English garden, conservatory and shelter, at a cost of £3,233, in Devonshire Park, providing a bowling green and macadamising roads, at a cost of £687, in Lund Park; making the boundary walls, improving Bradford-road, and providing an aviary, for £2,165, in Victoria Park; carrying out works, chiefly in making boundary walls, at the Hainworth-road Recreation Ground, at a cost of £826, and at Lynum-street for £389.

Kirbymoorside R.D.C. (October 10th. Major C. E. Norton).—£6,049, £815 and £736 for works of water supply for the townships of Farndale Low Quarter, Bransdale East Side, and Farndale West Side.—The clerk, Mr. R. Jennings, stated that the council had found it necessary to extend their works at Kirby so as to get an additional supply of water for Kirby, and to extend the works to Kirby Mills and Keldholme and several outlying farms. Certain springs were awarded to the parishes, and these would yield an abundant supply.

Lees (Lancs) U.D.C. (October 10th. Mr. Courtenay Clifton).—£480 for the purpose of widening Stamford-street, leading to the Market-place and Thomas-street. —It was stated that during the last thirty or forty years various improvements had been carried out, and the present proposal was one part and parcel of the general intention of the council to improve the well-being of the village and the comfort of the inhabitants. It was requested that the period for repayment of the loan should be sixty years, but the inspector doubted very much whether such a term would be granted.

Maesteg U.D.C. (October 22nd. Mr. W. H. Collin). £2,100 for the purchase of the town hall freehold, and £3,410 for alterations and extensions to the existing town hall and market.—There was no opposition to the application.

Maldens and Coombe U.D.C. (October 18th. Mr. Edgar Dudley).—£3,600 for the purchase, for an open space, of land adjacent to Wimbledon Common and situated partly in the council's district and partly in the borough of Wimbledon.—Mr. J. W. Johnson, clerk to the council, appeared in support of the application, and Mr. Leslie Vigers, the well-known surveyor, and Mr. R. H. Jeffes, surveyor to the council, were among those who took part in the proceedings.

Plympton R.D.C. (October 22nd. Mr. W. O. E. Meade-King). £806 for works of water supply to the village of Crabtree and Longbridge, Egg Buckland. The council also applied for sanction to the purchase of water mains belonging to the corporation of Plymouth.—It was stated that the present supply of water to the two hamlets was unsatisfactory, depending, as it did, upon wells which were dirty and springs which failed in the summer. The hamlets were in the area of Plymouth's water supply, and three houses were already supplied from the Plymouth mains, and an agreement was projected—subject to the sanction of the Local Government Board—under which the rural council would take a supply for the whole of the villages in bulk from the Plymouth mains at 6d. per 1,000 gallons, and purchase the mains, communication pipes and fittings which were already in the ground. When the estimates were made in February it was thought that £750 would cover the cost, but in consequence of the increase in the price of iron pipes from £6 to £7 12s. per ton, it was necessary to increase the proposed loan to £802.

Twickenham U.D.C. (October 29th. Mr. W. O. E. Meade-King).—£1,850 for the purchase of Long Croft and Briar Cottage, Mereway-road, and White House, Colne-road, for purposes of allotments, depot and stables, bathing accommodation, school site and street improvements; and £675 for the construction of an embankment along the river side at Radnor Island.—Mr. F. W. Pearce, surveyor to the council, submitted evidence in support of the opening statements of the

clerk, Mr. H. Jason Saunders, and explained the second part of the application.

Wallsend T.C. (October 17th. Mr. A. A. G. Malet).—£750 for the provision of an underground convenience in Sycamore-street, and adjoining High-street, and £4,000 for the provision of a wharf adjoining Stephenson-street, Willington Quay, and for the purchase of a hopper barge for sending refuse out to sea.—With regard to the second application it was stated that it was proposed to lease, for sixty-six years, 6,106 sq. yds. of land from the Northern Corporation.

Wincanton R.D.C. (September 26th. Mr. F. O. Stanford).—£525 for the purchase of water rights at Penselwood, in connection with the extended water supply for the parish of Wincanton.—Mr. E. N. Martin, clerk, stated that the District and Parish Councils of Wincanton had agreed to purchase from Lord Ilchester certain rights at Penselwood for the sum of £500 for the extension of the Wincanton water supply, these having recently come into the market by the disposal of his lordship's estate at Redlynch Park. The additional sum of £25 was for legal expenses and other contingencies. There were at present two reservoirs at Penselwood, whence the whole of the Wincanton water supply was obtained. The loans for the previous water undertaking had been paid off, and with the additional storage from the recently acquired springs at Penselwood it was estimated there would be a daily supply of 64,000 gallons, or 30 gallons per day per head of the population, which was considered to be very satisfactory for the requirements of the town.

Wokingham T.C. (September 20th. Mr. M. K. North).—£2,500 for sewerage and surface-water drainage.—The town clerk, Mr. James May, stated that the application arose partly in consequence of a notice from the Thames Conservancy requiring the discontinuance of the alleged pollution of the Emm brook by effluent from Union Sewage Farm. In consequence of building operations in Oxford-road, an extension of the sewerage system was necessary, and as this increased flow to Union Farm would enlarge the difficulty of satisfying the Thames Conservancy, it was decided to discontinue that farm and divert the sewage, by means of ejectors, to Bucks Copse, where there was adequate means of dealing with the flow. It was stated that owing to building operations in Oxford-road a part of the extension of the sewer had already been carried out, at a cost of £62. The borough engineer, Mr. C. W. Marks, explained the scheme in detail. There was no opposition.

Woolwich B.C. (October 1st. Mr. A. A. G. Malet).—£1,050 for the provision of an underground convenience for women in Beresford-square, Woolwich, and £350 in respect of a sanitary convenience for both sexes in the Royal Victoria Gardens, North Woolwich.—Detailed plans were submitted by the borough engineer, Mr. J. Rush Dixon, who stated that the Beresford-square convenience would consist of six water-closets and a lavatory. With reference to the North Woolwich structure, it was stated that the East Ham Town Council had agreed to contribute one-third of the cost of construction and one-third of the cost of maintenance. The estimated cost was £500, and the £350 loan applied for represented the Woolwich Borough Council's proportion of the cost.

APPLICATIONS FOR LOANS.

Ashton-under-Lyne T.C. £365 for a [illegible] at a public school.

Bognor U.D.C.—£11,000 for extending the sewage outfall.

Congleton T.C.—£1,125 for two Lancashire boilers and [illegible] to Forge [illegible].

Easington R.D.C. £[illegible] [illegible] hospital.

Epsom R.D.C.—£1,000 for the purchase of land for the Cobham outfall works.

Erith U.D.C. £1,100 [illegible].

Freebridge R.D.C. £500 for workmen's [illegible].

Cillingham T.C.—£2,500 for the provision of pleasure [illegible] and street works.

Heage (Derbyshire) U.D.C. £900 [illegible].

Hinckley U.D.C. £3,320 for eight [illegible].

Larne U.D.C. £5,000 for the [illegible] new street.

Leicester T.C.—£118,916 for a sewage disposal and other schemes.

Mexborough U.D.C.—£7,370 for the enlargement of the sewage disposal works.

Moira R.D.C.—£16,400 for sixty-eight labourers' cottages.

Tilbury U.D.C.—£600 for street lighting purposes.

Tiverton T.C.—Supplemental loan of £1,950 for council school and caretaker's house.

LOANS SANCTIONED.

Bridlington T.C.—£4,700 for workmen's dwellings.

Dundalk U.D.C.—£12,000 for a housing scheme.

Edmonton U.D.C.—£6,775 for private street works.

New Forest R.D.C.—£800 for a road improvement scheme.

St. Helens (Isle of Wight) U.D.C.—£1,848 for a sewerage scheme.

Chorley R.D.C.—£367 for water supply schemes.

Southend T.C.—£4,892 for making up several roads and £3,542 for a new administrative block at the sanatorium.

Surrey C.C.—£1,050 for the purchase of a playground at Egham.

Swanwick U.D.C.—£1,400 for the purchase of land for road improvements.

Correction.—In our last week's report of Mr. H. Percy Boulnois' remarks in the discussion on the subject of the intercepting trap at the recent annual meeting of the Institution of Municipal Engineers, the word "flushes" appeared as "brushes" in one instance, the name of Mr. Patten Barber, whose experiments were commented upon by the speaker, being also misspelt.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Bath £10,000, East Riding £10,674, Paddington £20,000, Plymouth; housing and town planning—Spalding £5,176; roads and materials—Blackpool £48,000, Warrington £2,762; sewerage and sewage disposal—Brampton, Eccles £56,554, Leicester, Nantwich £12,500, Windsor £73,688; water, gas and electricity—Merthyr.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Bradford T.C.—Authority is to be sought in a Parliamentary Bill to give optional powers to the council to establish a superannuation fund for corporation officers and servants.

BUILDINGS.

Bangor (co. Down) U.D.C.—New baths and public conveniences are to be provided at an estimated cost of £3,000.

Bath T.C. The Education Committee propose to build a secondary school at an estimated cost of £10,000.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has received instructions to prepare estimates for a large public bath to be erected at Llandaff Fields.

Carlton U.D.C.—The tender of Mr. G. T. Tegerdine, at £799, has been accepted for pulling down five houses and erecting four new dwellings for firemen.

Deptford B.C.—For the erection of the central public library in Lewisham High-road the tender of Mr. H. L. Holloway, of Deptford, has been accepted. The various items were: Bath stone and deal joinery, £10,482; Portland stone and hardwood joinery, £1,528; sundries, £408.

Darwen T.C. It has been decided to build a fire station in Charles-street.

Dorset C.C.—The tender of Messrs. Jesty & Baker, of Portland, at £3,949, has been accepted for a new school at Portland Underhill.

East Riding C.C.—With regard to the reconstruction of Hull Bridge, near Beverley, the Road Board have increased their grant to £4,000. The estimated cost of the work is £10,674.

Festiniog U.D.C.—The Council Assembly Rooms are being ventilated by means of Shorland's patent exhaust roof ventilators and patent hygienic inlet ventilating panels, supplied by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

Glasgow T.C.—With a view to effecting improvements at the Cross, it has been referred to a committee to consider the purchase of certain properties at the corner of the Trongate and High-street.

Keighley T.C.—A new school for 440 children, built at a cost of £5,548, was formally opened on Saturday last.

Matlock U.D.C.—A scheme for the erection of a pavilion in the park, at an estimated cost of £4,000, has been approved.

Paddington B.C. A sum of £20,000 has been provisionally agreed upon for the provision of public baths.

Plymouth T.C.—The Parks Committee have decided to recommend the council to purchase the West Hoe estate for the sum provisionally agreed upon—viz., £8,000. It is proposed by the committee to utilise the property—probably the quarry site—for the erection of swimming baths and the provision of winter gardens and a pavilion, but the details connected with such a scheme must be a matter for future consideration.

Roxburgh C.C.—The Jedbury District Committee are promoting a scheme for the reconstruction of three bridges on the Jedwater road, at an estimated cost of £3,300.

Warrington T.C.—The borough surveyor, Mr. T. Longdin, has received instructions to prepare plans for extensions to the police station.

Wood Green U.D.C.—The Local Government Board have returned an application by the council for a loan of £3,100 for the purchase [illegible] fire station. The site was only one-fifth of an acre in extent, and was partly occupied by five small houses. The cost would have been at the rate of £15,000 an acre.

HOUSING AND TOWN PLANNING.

Boston R.D.C.—Plans of labourers' double cottages at Benington have been prepared and forwarded to the Local Government Board.

Billericay R.D.C.—Six workmen's cottages are to be erected at Ramsden Bellhouse, at a cost of £990.

Bradford T.C.—A town planning scheme for the centre of the city is to be proceeded with. It is proposed to acquire the whole of the land and buildings fronting and within the following area: Commencing at the Market-street junction with Bridge-street, along Bridge-street to Hall Ings, along Hall Ings, Peel-place and Leeds-road to Well-street and Forster-square, along Market-street back to Bridge-street.

Spalding U.D.C.—A scheme has been adopted for the erection of thirty-six houses for the working classes, and the tender, at £5,176, of Mr. E. Clarke, of Melton Mowbray, has been accepted for carrying out the work.

Swaffham R.D.C. [illegible] to provide six labourers' cottages in the parish of Pickenham.

Twickenham U.D.C.—The council have approved the draft of a proposed agreement with regard to the land situate in the urban district of Ham, originally included in the Twickenham town planning scheme.

Wirral R.D.C.—Application is to be made for sanction to a town planning scheme.

REFUSE COLLECTION AND DISPOSAL.

Taunton T.C. A dust cart has been purchased from Messrs. G[illegible] & Son for £28.

ROADS AND MATERIALS.

Aberdeen C.C. A claim [illegible] with respect to the alleged damage by tar was supplied by a letter received by the Aberdeen District Committee making a claim for 10s. for damage to potatoes by fumes from a tar boiler in connection with road operations at Culter. The council instructed the clerk to forward the claim to the Century Insurance Company, and to intimate that in their opinion it should be repudiated.

Abergele U.D.C.—Improvements are to be carried out at the promenade, at an estimated cost of £1,500.

Blackpool T.C.— The borough engineer, Mr. J. S. Brodie, has prepared a scheme for the further extension of the Promenade, at an estimated cost of £48,000.

Castlereagh R.D.C.—The weekly pay of road surfacemen has been increased from 15s. to 16s.

Croydon R.D.C.—The tender of the Improved Wood Pavement Company, Limited, [illegible] accepted for works of wood paving.

Croydon R.D.C.—The tender of Mr. E. Iles, senr., of Croydon, at £2,945, has been accepted for making up three roads.

Deptford B.C.—It has been agreed to carry out road repairs, at an estimated cost of £914.

Donegal C.C.—The county surveyor, Mr. James H. Steadman, reported that with the chairman of the council he had had an interview with the Road Board, with the result that the board agreed to make a grant to County Donegal of £10,000, on condition that the county raised a ½d. rate, which was to be devoted to the improvements of existing maintenance contracts. The £10,000 grant was to be applied to the resurfacing of leading roads to be approved by the board; the specification of same and the execution of the work to be [illegible] The Road Board had further agreed to lend the county a sum of £5,000, free of interest, repayable within five years, to facilitate the improvement of leading roads with the same reservations *re* specifications and executions of work as were provided for under the £10,000 grant. The county surveyor and the chairman of the council have been formally thanked by the council for their services in the matter.

Edinburgh T.C.—The Streets Committee have adopted a proposal for the widening of a Musselburgh main road, at an estimated cost of £3,000.

Evesham R.D.C. The surveyor, Mr. J. Smith, has prepared schemes for repairing the road from Blackminster to Bretforton, and these have been forwarded to the county council for their observations.

Harrow U.D.C.—The tenders of Messrs. Willis & Powis, of Wembley, at £5,672 has been accepted for making up several roads.

Heston and Isleworth U.D.C.—It has been decided to repave the main road through Hounslow with wood blocks, and the remainder of the road to Brentford with an artificial granite paving.

Hitchin R.D.C. The tender of Messrs. S. Redhouse & Sons, of Stotfold, at £1,066 has been accepted for a scheme of road improvement.

Kanturk (co. Cork) R.D.C. A new road is to be made form Charleville to Dromcollogher at a cost of £300.

Knaresborough U.D.C.—The surveyor, Mr. R. E. Wilson, has been instructed to report on the cost of the upkeep and reconstruction of the High-street, which connects the York-road with the Leeds and Harrogate road, and afterwards to apply to the county council for a grant.

Louth T.C.—Upgate is to be widened, at an estimated cost of £3,385, and the council have asked the county council for a contribution towards the project.

Okehampton R.D.C.—A suggestion has been adopted that the county surveyor be invited to hold periodical consultations with the district council on the subject of the maintenance of main roads generally.

Southport T.C.—The plan of the borough surveyor, Mr. R. P. Hirst, has been approved for the paving of Nevill-street, the laying out the centre of the street opposite the Victoria Hotel as a small garden, and the placing of the Queen Victoria monument therein. The paving work is to be done by the Limmer Asphalte Paving Company from Lord-street to the Promenade, with Lithofalt blocks, 1½in. thick, at 6s. 9d. per square yard, and with block 1¼ in. thick at 7s. 6d. per square yard.

Warrington T.C.—Paving works are to be carried out at a cost of £2,762.

SEWERAGE AND SEWAGE DISPOSAL.

Brampton R.D.C. The council have now approved and accepted the scheme of sewerage and sewage disposal for Castle Carrock prepared by the engineers, Messrs. Taylor & Wallin (Mr. Harry W. Taylor, ASSOC.M.INST.C.E.), of Newcastle-upon-Tyne and Birmingham. The sewage will gravitate to the outfall, and be disposed of in modern bacterial works. Application for the necessary loan is to be made at once to the Local Government Board.

Eccles T.C.—Plans of a main sewerage scheme, estimated to cost £56,554 are under consideration.

Hunsworth (Yorks) U.D.C. A new scheme of sewage disposal has been prepared by Mr. N. A. Johnson for dealing with the whole of the sewage of the district. The estimated cost is £2,500, including a fee of £125 for the engineer.

Leicester T.C.—A scheme has been adopted to deal with the sewage in times of storm, including an increase of plant at the Abbey pumping station. The scheme is the outcome of a report prepared by the borough surveyor, Mr. E. G. Mawbey.

Linlithgow T.C. It has been decided to carry out improvements at the sewage disposal works.

Nantwich R.D.C.—A sewerage scheme costing £12,500 is being considered by the council.

Windsor R.D.C.—Amended plans for Sunninghill and Sunningdale sewerage have been submitted to the council. The estimated cost is £73,688, to be apportioned between the two parishes. The original estimate was £55,000, but additional requirements in connection with the scheme have been made since last year, and this accounts for the £18,000 difference. The scheme has been submitted to the Local Government Board.

WATER, GAS, AND ELECTRICITY.

Banbridge (co. Down) U.D.C.—Application is to be made to the Board of Works for a provisional order authorising the supply of electricity by the council within the urban district.

Bolton T.C.—The Finance Committee have passed a recommendation that application be made to the Local Government Board for sanction to borrow £130,000 for purposes in connection with the proposed new generating station at Back-o'-th'-Bank.

Cardigan T.C.—Proposals are being considered for the extension of the waterworks, at an estimated cost of £2,000.

Heage (Derbyshire) U.D.C.—Plans of a water supply scheme have been prepared by Messrs. Hunter & Woodhouse, of Belper, and they have been submitted to the Local Government Board. The estimated cost, with connections, is about £600.

Merthyr T.C.—The plans and specifications in connection with the new waterworks at Pontsticyll have been approved. The engineers are Sir Alexander Binnie, Mr. W. Binnie, and Mr. T. F. Harvey.

Leicester T.C.—It has been decided to seek for powers to extend the area of supply of electricity.

St. Thomas R.D.C. In connection with the Topsham water supply the council have decided to make application for leave to borrow £500 for experimental boring.

Withernsea U.D.C.—The council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, ASSOC.M.INST.C.), Newcastle-upon-Tyne and Birmingham, to report as to whether a local source can be used for supplying the urban district. Hitherto it has been considered that a satisfactory supply could only be obtained from Hull, a distance of about 20 miles, which would involve very considerable expense. The engineers are now investigating this matter, and expect to report to the council very shortly.

MISCELLANEOUS.

Tilbury U.D.C.—The surveyor, Mr. S. A. Hill-Willis, has been instructed that only British manufactured goods are to be purchased when ordering materials, and that those tendering must pay the trade union rate of wages.

Twickenham U.D.C.—The tender of the Ham River Grit Company has been accepted for a barge-load of sand at 5s. 6d. per yard delivered.

PERSONAL.

Mr. D. Edwards, borough surveyor of Taunton, has had his salary increased by £25 per annum.

Mr. R. A. Shelton has been appointed surveyor and sanitary inspector to the Wilton Rural District Council.

Mr. D. D. Macleay, of Inverness, has been appointed burgh surveyor of Nairn, in succession to Mr. D. Munro.

Mr. J. S. Senior, surveyor to the Swanage Urban District Council, has tendered his resignation to that authority.

Mr. T. Gardner, surveyor to the Newmarket Rural District Council, has had his salary increased by £50 per annum.

Mr. W. S. Shell, surveyor to the Consett (Durham) Urban District Council, has died, we regret to state, at the age of sixty.

Mr. H. Blewitt, of Southwell, has been appointed district surveyor to the Mutford and Lothingland Rural District Council.

Mr. F. A. Adlard, assistant surveyor of Warwick, has been appointed assistant waterworks engineer to the Madras Municipality.

Mr. A. S. Whipp of Milnrow, has been appointed assistant to Mr. O. P. Abbott, surveyor to the Hindley (Lancs) Urban District Council.

Mr. Arthur J. Abbott, F.A.S.I., A.R.S.I., building surveyor and sanitary inspector to the East Barnet Valley Urban District Council, has been granted a motor cycle allowance of £25 per annum.

Mr. H. A. Cutler, city surveyor of Belfast, and Mr. Henry Seaver, architect, have been appointed joint assessors in connection with the proposed competitions for dwellings to be erected under the housing scheme.

Mr. R. W. Jones, surveyor for the western division of Carmarthenshire, has been voted £150 (including £44 out-of-pocket expenses) for services rendered in the Eastern Division while the office of surveyor was vacant.

SOME RECENT PUBLICATIONS.*

The Law and Practice of Rating. By Walter C. Ryde. Price £1 17s. 6d. London: Butterworth & Co., and Shaw & Sons.

This is the third edition of Mr. Ryde's masterly work on rating, a subject that is full of complexities and pitfalls to the layman. The contents have been thoroughly revised, and summaries prepared of all new cases, while due attention is paid to the more recent developments of the law. This latter feature is all the more necessary and important owing to the fact that upon questions of practice several far-reaching decisions have been given. These include the rating of railways and the rating of buildings containing machinery, both vexed questions in the strictest sense of that phrase. While seeking to set out in the body of the work what the law is, Mr. Hyde, in his preface, states quite candidly what he considers the law ought to be, and among the desiderata he enforces are the urgent need for codification, an amendment of the process of appeal from quarter sessions, and (as regards the Metropolis) a right of appeal against a provisional list. In addition to the appendices of statutes and of statutory orders which appeared in the second edition, the present revised edition contains an appendix showing the authorities who appoint the assessment committees in London. The work is, indeed, as complete in all respects as it is possible to make it, and it is provided with that valuable adjunct an excellently arranged index.

Estimating. Part I. By T. D. L. Piper. Price 3s. 6d. nett. Portsmouth: The Ubique Press, Limited.

This work consists substantially of a reprint of a series of articles which originally appeared in the *Southern Builder and Engineer*. These have, however, been thoroughly revised, and much new matter has been added. Full analyses showing how prices are arrived at are given wherever possible and the book has been prepared in a concise and simple style specially adapted to the requirements of students. Thus it commences with a preliminary chapter and one dealing with squaring and cubing. Subsequent chapters are concerned with labour, shoring and scaffolding, pulling down, excavating, drainage, concrete, brickwork, arches, damp-courses and steel. A study of Mr. Piper's book will go far to enable the student to qualify himself as an estimator, while the fully fledged builder's clerk will also find much useful information.

Where to Live Round London. (Northern Side.) Edited by Prescott Row and Arthur Henry Anderson. Price 1s. nett. London: The Homeland Association, Limited.

We have already commended most favourably this useful little work of reference, and the appearance of the edition before us, the fourth, justifies our high opinion of it. It has been revised to date and fresh sections added to it and it now includes a new feature, five pages of summary of the principal statistics of the more important places dealt with in the book. We again congratulate the editors and publishers on an excellent idea happily carried into practice.

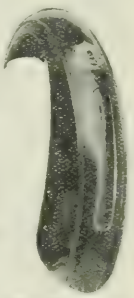
London County Council. In pursuance of their good work of indicating by memorial tablets the houses in London of historical interest the London County Council have just issued Part xxxviii. of their series of descriptive penny pamphlets (London: P. S. King & Son). This particular brochure gives notes of the associations of W. M. Thackeray with 36 Onslow-square, South Kensington, and of Charles James Fox with 9 Arlington-street, S.W.

Lectures on Illuminating Engineering. The first of a special series of lectures on illuminating engineering at the Polytechnic (Regent-street, W.) took place on Friday last. In this introductory lecture Mr. W. C. Clinton, of University College, gave a brief account of the fundamental laws of light and colour, and showed some interesting experiments illustrating the appearance of coloured objects illuminated by the arc lamp, the mercury-vapour lamp and the Neon tube. The next two lectures of the course, to-day and next Friday, will deal with electric lighting, and will be illustrated by lantern slides and exhibits of the latest types of lamps.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

A GENEROUS PROPOSAL.

If all members of the Institution of Municipal and County Engineers showed as great a practical interest in the Orphan Fund as that displayed by Mr. Walter Maughan, the sum at the disposal of the committee would soon be more adequate to meet the demands made upon it. Mr. Maughan has achieved no little distinction as an inventor, and among his patents is a mudguard for motor cyclists known as the Mon-Aero mudguard. The advantages of this device are many, and have been testified to by some of the leading exponents of motor cycling. Although the matter is not one which affects our readers professionally, we feel sure that there are many in the ranks of municipal engineers who are motor cyclists, and we are led to draw attention to the matter by reason of Mr. Maughan's generous offer to give 2s. 6d. to the Orphan Fund in respect of each guard (price 12s. 6d.) sold to or through a municipal engineer. The guards are to be obtained from the Coventry Auto-Aero Company, Limited, Priory-street, Coventry.



The Mon-Aero Mudguard.

The Esholt Sewage Tunnel.—At the meeting last week of the Bradford Corporation Alderman Johnson moved the adoption of the Sewage Committee minutes, with the exception that the tender of Messrs. Pethick & Dix (£113,975) be substituted for that of Messrs. Best & Sons, Limited (£112,312). He explained that there were twenty-three tenders, the amounts ranging up to £200,000. He had been advised by the town clerk that an item of £5,598 which had been omitted from Messrs. Best's tender must be included. The committee's minutes were approved.

Surveyors' Institution Examinations.—The Surveyors' Institution Students' Preliminary Examination will be held on January 15th and 16th next. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Staffordshire, Durham, Cumberland, Westmorland, Northumberland and North Wales at Manchester. Candidates from other counties in England and Wales will be examined in London, Irish candidates in Dublin, and Scottish candidates in Glasgow. The list of entries closed on September 30th. Examinations qualifying for the class of Professional Associate and Fellow will commence on March 31st next. English candidates for the professional examinations will be examined in London, Irish candidates in Dublin, and Scottish candidates in Glasgow. The list of entries closed on September 30th. The preliminary examinations are held once in three years. The next examination will be held on June 10th, 11th and 12th next.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CLACTON URBAN DISTRICT COUNCIL.
SURVEYOR'S DEPARTMENT

The above Council invite applications for the appointment of Junior Assistant in the Surveyor's Department.

The applicant should be a fair draughtsman, able to take levels and make surveys.

Wages One Guinea per week.

Applications, stating age, qualifications, &c., accompanied by copies of three recent testimonials, to be delivered, under sealed cover, endorsed "Junior Assistant," at my office not later than Monday, November 11th, 1912.

GEO. T. LEWIS,
Clerk to the Council.

Town Hall Buildings,
Clacton-on-Sea.
October 30, 1912.

WANTED at once, an Assistant Surveyor in Town Surveyor's Office; neat Draughtsman, used to inspection of buildings, drainage under the by-laws, levelling, surveying, office routine; commencing salary Thirty Shillings per week.—Box 1,196, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

THE CONSTRUCTION OF THE HEMLOCKS DAM AT BRIDGEPORT, CONNECTICUT.

The *Engineering Record* of New York contains a description of the construction of a dam at Bridgeport, Connecticut, in the building of which supplies are being hauled seven miles by motor trucks and the concrete is being delivered by a cableway. The satisfactory progress of the work proves the advantages which may be secured by the use of improved methods.

The dam is 96ft. high above the lowest part in its foundation and will retain about 4,500,000 gallons of water. The body of the structure is formed of cyclopean masonry, that is to say, concrete in which large blocks of stone which weigh sometimes as much as 6 or 8 tons each are embedded. As the site of the work is seven miles from the city of Bridgeport, the transportation of plant and material to and from the work is a matter of considerable importance, and it was necessary at the outset to consider what was the most economical and rapid means of transport available. It appeared probable that motor trucks would be better than horse traction, and accordingly two 5-ton motor trucks were used. These carry cement, coal for the power plant, or other materials, and experience has proved that each truck will make 5 trips a day, carrying 100 bags of cement on each journey and covering about 70 miles in the day. Also by using a trailer with the trucks a large number of masts and booms 65ft. in length for derricks have been transported to the site.

In constructing the dam, two stationary towers, each 75ft. high, set on concrete foundations on the hillsides at each end of the work, were erected. These were securely guyed with cables fastened to anchorages, and a cableway was stretched between the towers along the course of the dam. This cableway has a span of 1,325ft., and the velocity of travel along it is 1,800ft. per minute. Along this cableway run 2-yard or 4-yard buckets or skips filled with material, which is thus carried very rapidly to the point required. A number of stiff-legged derricks have been erected along one side of the dam, and these are used to remove the excavated earth and rock to the side of the trench and also to deliver to the exact points required the concrete or stone delivered by the cableway. These derricks have 65ft. booms and are spaced 100ft. apart. About 500,000 cubic yards of masonry are to be placed in this manner. The concrete is mixed mechanically and is discharged into 2-yard buckets, which are then run along a trestle to the centre of the dam. These are then picked up by the cableway, which delivers them quickly to the place where the work is going on.

At first concrete was dumped from the cableway direct, but it was soon found that the sudden removal of weight from the bucket caused it to jump upwards, producing oscillations which occasioned considerable delay and danger to the workmen. The buckets are therefore first lowered on to the dam from the cableway, and are then picked up by the nearest derrick and emptied where needed. Four-yard skips are used for delivering the smaller sized blocks of stone, while the very large blocks are lifted and placed by the derricks. The concrete is laid in sections 60 ft. long and 4 ft. to 5 ft. high. There are transverse joints at intervals of 8 ft. across the dam, each section being jointed to the next by a groove and projection 12 in. deep by 18 in. wide. No joints extend through the dam. The use of large-sized buckets and skips has proved to be very satisfactory. The work is being done by day labour, and the methods adopted appear to produce very rapid and economical work and to assist the soundness of construction.

The Wrexham Meeting. Mr. John Edward [illegible], borough engineer and surveyor of Wrexham, writes, in reply to Mr. T. W. A. Hayward's comments [illegible] at the meeting of the North Wales District held [illegible] Institution of Municipal and County Engineers in that town, that the rate of 8s. 9d. includes 2s. 2d. for the repayment of principal and interest on loans and poor rate, including police and county rates. The rate of wages paid to labourers is 24s. per week. Mr. England at the same time corrects certain errors which occurred in his paper. Private street works cost, he states, should read 7s. 6d. per foot of frontage, and the size of the plunge bath should be 60ft. by 24½ ft.

MOTOR TRAFFIC AND HIGHWAY MAINTENANCE.

LIABILITY OF OMNIBUS COMPANIES: COUNSEL'S OPINION.

At a meeting of the Hornsey Town Council on Monday the Parliamentary Committee reported having had before them the opinion of counsel on the question of liability of the London General Omnibus Company in respect of the omnibus traffic along roads in the borough during the past six months, and particularly along three roads at Muswell-hill since the middle of July.

Counsel, in his opinion, stated: "I think there is a justification for the suggestion that in the case before me the motor-omnibus traffic over such a road as Fortis-green is extraordinary traffic within the meaning of the statute, and that the omnibus company may be made liable in respect of it, partly because it is of the character and description which is quite new through a road like Fortis-green, and partly because it is exceptional in the frequency of the journeys over the road."

The committee recommended that the company should be notified of the extraordinary expense which is about to be incurred by the council in repairing the roads in question on account of the extraordinary traffic thereon, and that they should be asked to make a contribution towards such expenses, and be informed that in the case of their not doing so they would be held liable for the expense.

The report was adopted, and a tender of over £3,000 was accepted for the repair of the three roads in question. It was further resolved that counsel's opinion should be communicated to certain selected authorities in the metropolitan police area, including the county council, and that inquiry should be made whether, in the event of the Hornsey Council taking the matter into court, they would be willing to make a contribution towards the cost. Finchley Urban District Council have already agreed to do so. It was decided to take a census of the traffic as regards the character and number on certain streets in the borough.

— — —

The Metropolitan Boroughs Standing Joint Committee on Monday passed resolutions asking the Government to provide in next year's Budget for the handing over of the proceeds of the petrol tax to the local highway authorities; declaring that the Home Secretary should be given power to define motor-omnibus routes; and advocating legislation to require traction engines to be fitted with resilient tyres.

At the last meeting of the Executive Council of the Urban District Councils' Association the proposal of the Wood Green Council to convene a national conference of road authorities to discuss the question of the increasing burden thrown upon the ratepayers and the absence of proper powers to regulate this traffic was unanimously approved. The proposal has already received considerable support from a large number of road authorities, including some important county councils, county borough councils, and town and urban district councils, who have appointed delegates.

DEATH OF MR. F. W. RICHARDSON.

It is with much regret that we have to announce the death, which occurred on Wednesday of last week, at Sidmouth, Devonshire, of Mr. Frederic William Richardson, formerly surveyor of Aston Manor.

Mr. Richardson, who was only thirty-four years of age, was a brother of Mr. Harry Richardson, the hon. secretary of the Midland district of the Institution of Municipal and County Engineers, and served his articles with the latter at Aston, where he afterwards became assistant surveyor under Mr. Jack, whom he eventually succeeded. When Aston was absorbed by the city, Mr. Richardson was offered a post under the Birmingham Corporation, but, declining this offer, he accepted his pension in compensation of loss of office, and, going to London, set up in private practice. Here his health failed, and he was ordered to live in the South. The insidious disease from which he was suffering developed rapidly, and he died, as stated, at Sidmouth, where he had taken up his abode. His marriage a few weeks ago will be fresh in the minds of our readers, and the deepest sympathy will be extended to his widow in her bereavement.

The funeral took place on Monday last at Handsworth Old Church.

Municipal Work in Alton.*

By G. BERTRAM HARTFREE, F.S.I., Surveyor to the Urban District Council.

The area of the urban district of Alton is 3,945 acres, which includes the town, with surrounding land under development for building purposes; Beech area, principally bungalow residences; and agricultural land. The rateable value is £30,768, and the total rates for the present year, including water, amount to 6s. 6d. in the £. The geological formation is chalk: the three varieties (upper containing flints, middle without flints, and lower or chalk marl) occur in turn, covered to varying thicknesses on the hills by clay and in the valleys by gravel. . . .

SEWERAGE.

The earliest sewers were constructed in 1861, and consisted of stoneware socketed pipes, jointed with clay on the underside and left open at top. The best-known patent pipes, the special point of which was the facilities they afforded for inspection in case of stoppage, were used. The patent referred to movable caps placed over the junction of two pipes. No manholes were provided; but relying on subsoil water for sewer flushing was soon discovered to be without any advantage, and led to considerable difficulties. Under the advice of the late Mr. Lawson in 1865 close-jointed pipes were laid, iron being used in the valley; manholes were provided at all necessary points, the original sewer remaining in position as a spring-water drain. Further extensions were made in 1890, under the direction of the late Mr. Mansergh, M.INST.C.E.

Since 1905 short extensions have been made as building development required, and in August last an extension of 2,000 yds. was completed by direct labour. This consisted of 900 yds. of 9-in. and 220 yds. of 6-in. stoneware pipes, 600 yds. of 9-in. cast-iron pipes, and, for the purpose of improving the gradient of the new sewers, a length of 330 yds., formerly with a fall of 1 in 178, was relaid to a less gradient to allow a uniform inclination of 1 in 385 to 900 yds. of the new sewers, the remainder of which were laid at inclinations varying from 1 in 180 to 1 in 280. Lead wool was used for jointing the iron pipes, and proved invaluable, as many of the joints were made under water; all were tested internally to a pressure of 3½ lb. to the square inch before being covered over.

The work being close to the river Wey, rendering brick construction difficult, rock concrete manholes provided with iron spigots and sockets were used. Upon being lowered into position the connections were made sound with lead wool, and the ogee-shaped joints to each section of manhole ensured obtaining sound work. Those stoneware pipes laid to the 1 in 385 gradient were provided with bitumen joints to obtain a true invert. With the greater part of the stoneware construction much more water was met than was anticipated; in consequence, to minimise the risk of future inflow of water, in addition to tested cement joints, they were covered by a band of clay and encased in concrete, with the exception of 200 yds. laid with grouted composite joints; the latter section proved the most economical. Unfortunately the estimated cost (£1,500) was exceeded by £164, caused by the abnormal quantity of water met with and lack of experience on the part of the workmen, only three of whom had previously been engaged on similar work. It has been customary in the past to arrange that all work should, as far as possible, be carried out departmentally in the winter to reduce unemployment, and on smaller works this has been satisfactory from all points of view.

From earliest days great trouble has been experienced from the entry of spring and surface water in the sewers. In 1874, while the estimated dry-weather flow was 100,000 gallons, ten times that amount arrived at the works. This has been reduced considerably by laying iron sewers and separate surface-water drains. On the hilly districts deep stoneware gullies were provided in place of brick catchpits, and turning chambers were substituted by silt-arresting chambers; these were constructed as large catchpits, with bases 2 ft. or 3 ft. below outlet pipes, with brickwork brought to ground surface and covered by ventilating manhole covers. The quantity of silt arrested, and its absence in the pipes, has warranted the continuance of this practice. During the past year concrete built around wood drums has been used in chamber and gully construction, and while being stronger, it has been cheaper than brick or stoneware work.

SEWAGE DISPOSAL.

The sewage disposal works constructed in 1861 consisted of a small precipitation tank and filter made of wrought-iron framework filled with layers of flints and charcoal. With a view to improving the works, from 1874 to 1887 experiments were made with the following processes of purification: A B C, phosphate process, black-ash waste and lime, lime precipitation, and porous carbon. A scheme for lime precipitation was submitted to the Local Government Board in 1887, but was not approved, a final land treatment not being included. Three years after schemes for broad irrigation and intermittent downward filtration were contemplated, but opposition on the part of owners of adjoining lands prevented their execution, and subsequently experiments were made with herring brine, ferrozone and polarite filters. In 1890 an offer was accepted from a company who agreed to construct all buildings, appliances and filters, and purify the town sewage for the sum of £280 per annum, subject to the board purchasing the plant at a price previously agreed upon at the end of three years, in the event of a satisfactory effluent being continued. These works, constructed in 1891, included carboniser-house in which house refuse was burned for purposes of obtaining carbon; precipitation tanks and filters. The contract was terminated owing to complaint of smells and other difficulties. Endeavours were made to obtain suitable ground for land treatment outside the district, but, owing to strenuous opposition on the part of adjoining landowners, without success; as temporary measures, the Amines system of precipitation by brine and lime and aluminoferric treatment were tried.

Subsequently, upon the advice of Mr. R. F. Grantham, M.INST.C.E., a scheme for chemical precipitation with final land treatment was proposed; the precipitation was abandoned in favour of Mr. Dibdin's bacteria beds which had recently been installed at Sutton, and this met with the approval of the Local Government Board. The works included an egg-shaped tank sewer, 3 ft. by 2 ft., capable of holding 40,000 gallons, screening chamber and pump well, an engine-house (containing engine pump-room, workshop and store. Hornsby-Ackroyd oil engines, and three-throw pumps by Messrs. Waller, were provided in duplicate. From the pumping station the sewage is raised to the disposal works at the foot of Neatham Down.

Originally the screened sewage was discharged direct on the primary (coarse) beds, where after contact it flowed on the second (fine) series, the effluent passing on to land laid out in terraces; these were not underdrained, but, notwithstanding, absorbed the effluent for several years. Some eight or nine years ago the beds choked, and both series were refilled with coarse material; a small detritus tank was constructed at the same time. In 1906 two anaërobic tanks, together holding one-third of a day's flow, were constructed; the land has since been underdrained, and additional bacteria beds are in course of construction.

The size of tanks was limited, owing to the large proportion of brewery waste rendering longer contact inadvisable. Strictest economy had to be practised in their construction, and the chalk soil was excavated to its angle of repose, and lined with 9-in. brickwork, with 18-in. piers, 8 ft. apart, at the back. Land drains consist of field pipes butted, but with cement-jointed pipes at the end of each section taken above ground as air inlets. Inspection chambers are provided to each of fourteen sections of land, so that effluents can easily be examined. Gallenkamp's testing apparatus is used for this purpose.

The new beds for bacteria treatment are being constructed with earth walls; as filtering media, any hard, clean material that can be obtained is used. Eight beds, each capable of holding 12,000 gallons, have been commenced, four of which are now in use; two are filled with broken glass, one with clinker, and the fourth with flint. Although not giving as good results as clinker, the glass performs useful work, and results warrant further extension on the same lines,

* Extracts from a paper read on Saturday last at a Provincial Sessional meeting of the Royal Sanitary Institute at Alton.

as the cost of brick-built beds of similar size (£86 each) prevents their use, and purchased filtering media would average an additional £50. The present area of land, including buildings, beds and roads, is 14½ acres, but acquisition of more land is contemplated.

HOSPITAL ACCOMMODATION.

Previous to 1907, a building situate in the town was used as an isolation hospital. The present buildings are erected on a hill overlooking the Caker stream, with excellent views to the south-east, and include a large pavilion, containing two six-bed wards, water-closet, bath-rooms, and nurses' sitting and bed rooms, with kitchen and laundry block, with caretaker's room adjoining; a small pavilion, 40 ft. distant, contains one two-bed and a four-bed ward, with bath and nurses' room; a small discharge cabin, containing disrobing, bath and dressing rooms; there is also a mortuary on the site, which, fortunately, has been used but once. The buildings are constructed of timber framing, covered with galvanised iron outside and lined with matchboard inside; on the face of this uralite has been fixed, the joints of which are covered with strips of the same material finished to give a panelled appearance.

Drainage is to an anaërobic tank, the liquid from which discharges upon filters: No. 1 (open), containing 1-in. granite, and No. 2 (covered by perforated tiles) is filled with ¾-in. flint; the effluent is conveyed away in closely jointed pipes until the outcrop of the middle chalk formation is passed, and discharges on agricultural land with a marl subsoil. Water supply is from the council's waterworks; owing to the altitude of the hospital site a miniature high-level service had to be provided.

The total cost of land, buildings, sewage disposal, water supply and fencing was £1,340. An agreement was entered into with the Alton Rural District Council last year, by which the hospital is now controlled by a joint board, and by a further agreement made in August last the board has taken over the leasehold lands and buildings in the occupation of the rural district council situate at Medstead, to be retained as an emergency hospital.

REFUSE DISPOSAL.

House refuse is collected from town dwellings twice weekly; formerly it was deposited on hop lands, but the supply exceeding demand, complaints of accumulations were received, and some five years back the provision of a one-cell destructor was considered; but as utilising the power for sewage pumping required steam in place of the oil engines in use, and refuse cremation near the water reservoir appeared undesirable, the destructor scheme was abandoned in favour of the system in use at Farnham, and the refuse is mixed with sewage sludge, finding ready sale as manure.

WATER SUPPLY.

Provision of a public water supply received attention in 1871, four years after the works were constructed on Windmill Hill, under the direction of Messrs. Gotto and Beesley. These consist of an engine-house, containing engine-room, boiler-room and coal bunker, a dwelling-house for attendant, and a reservoir constructed with brick, arched and covered, having a capacity of 100,000 gallons. The well was sunk to a depth of 135 ft.; owing to the supply failing to meet increased demands, it was lowered a few feet in 1880, and the advisability of driving headings was considered, but ultimately boring operations were instituted to a depth of 480 ft., reaching the green-sand formation, since when no shortage of water has been experienced. Continual observations were made during the hot summer of 1911, and throughout the supply was in excess of the demand.

Considerable extensions and improvements have been made recently to the mains, and, owing to the development of building sites on the hills, further improvement at the works is under consideration. The draft scheme provides for increased storage, substituting gas or oil engines for those in use, preferably one of each to provide against shortage of any particular fuel, also a high-level supply, the principal power for which probably will be a wind motor capable of raising 50,000 gallons in twenty-four hours 50 ft.

The water charges are low, a special rate of 2s. each for cottages, while larger dwellings pay a rate of 3d in the £, no extras are made in respect to baths or additional water-closets. Trade and garden supplies are metered at a charge of 6d. per 1,000 gallons.

ROADS.

The mileage of roads in the district is 37. 7 of which are main roads. The local materials suitable for road metalling are picked flints and gravel; Guernsey granite was imported in 1903, and the use of hard material has since extended. Clee Hill basalt, Rowley rag, Moel-y-Gest and Scotch basalt have since been used on the level lengths, and Mountsorrel and Hartshill granites on the hillsides.

Dust palliatives were introduced in 1906, and the results warranted further use until 1909, when surface tarring was commenced. This work has been extended yearly, including machine and hand treatment with local tar, distilled tar, and Tarvia. The costs varied from ½d. to 1¾d. per yard super., according to the material and finish; the lowest price being for local tar covered with road dust, and the highest for Tarvia covered with limestone chippings. Recently lengths have been laid with tarviated granite on the Gladwell system, Rocmac sub-binder, and the following materials coated with tar previous to spreading: Slag, Clee Hill basalt, Mendip limestone, Bargate stone and flints.

All the foregoing trials have clearly demonstrated that water-binding methods are obsolete, and present-day traffic can only be combated by some form of tar or bituminous binder. Various materials consolidated to a full thickness of 3 in., allowing 1 ton to cover 6½ yds., have cost per yard: Gravel, 8½d.; flint, 1s.; Bargate rock (a Hampshire calcareous sandstone similar to Kentish rag), 1s. 6d.; Mendip granite, 1s. 7d.; Rowley rag, 2s. 6d.; Mountsorrel granite, 2s. 7½d.; Hartshill granite, 2s. 7½d.; Clee Hill basalt, 2s. 8d.; tarred Mendip stone, 2s. 8½d.; tarred slag, 3s.; Clee Hill basalt on Rocmac binder, 3s. 1½d., on Tarvia binder, 3s. 1½d., and the same material tarred to Road Board specification, 3s. 5½d.

The principal roads are scavenged twice daily, and others according to requirements. Private streets are repaired under the provisions of the Private Street Works Act. The costs, including kerbing, channelling and surface drainage, have ranged from 2s. 4d. to 5s. per foot frontage.

The formation of narrow roads and *culs-de-sac* in the past has drawn attention to the necessity of remedying as far as possible and in future preventing this evil, and a draft town planning scheme is in hand, showing suggested improvements to existing roads and lines of proposed thoroughfares. While local development does not warrant at the present time an application for Government confirmation, the plans will be taken as a general guide in case of alteration, additional building or other similar matters, with a view to obtaining a general conformity of new roads and widening to those existent at small expense to the rates.

MISCELLANEOUS.

Until September, 1907, the by-laws with respect to new buildings in force were those made under the provisions of the Public Health Act, 1848. Those now in use are the series known as the Intermediate Model By-laws, and contain a special clause for permitting the erection of galvanised-iron dwellings in the rural parts of the urban district.

In the public health department periodical house-to-house inspections have been made for many years. In addition to the ordinary registers, a separate record is kept of the type of closets, gullies, and water fittings at the various dwellings. The provision of flushing cisterns to water closets was enforced in 1908; since some 900 additional tanks have been provided. All new drains are subjected to a hydraulic or compressed air test, and wherever possible, in addition, a clearway test is applied to the interior of pipes to prove the existence or otherwise of obstructive joints. Whenever occasion arises, existing drainage is tested with smoke, chemicals, coloured water, or normal air pressure.

The question of provision of sufficient light and ventilation to existing cottages receives special attention. In cases of dampness, roof repairs, rendering walls with cement, and insertion of horizontal damp-proof courses are insisted on as the particular case may require. All the other matters in this department are of the usual routine character.

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

A SUGGESTED NEW FORM OF ARBITRATION CLAUSE.

(By a Legal Contributor.)

There can be no doubt that certain recent decisions of the Courts have very seriously impaired the validity of the arbitration clause in that class of contract with which surveyors are most concerned. It is not too much to say that half the arbitrations which take place in relation to works agreements in this country are conducted by surveyors. They are eminently fitted for the work both by training and experience, and we have never yet heard of a surveyor "nominated by the president of the institution" having been rejected by one party to a dispute on the ground of alleged bias or incompetence. Nevertheless, it cannot be ignored that where a surveyor (who is in the employment of one party to a dispute) is called upon to sit as arbitrator objections may be taken to his so acting. These objections, which are most often taken when the surveyor is in the permanent employment of one of the parties, have been upheld by the Court of Appeal. In the result the arbitration clause in many contracts—particularly those contracts to which a local authority is a party—is sometimes rendered practically valueless to the parties.

It is proposed to summarise the cases which have led to this very awkward state of affairs, and then to consider various suggestions which have been made to obviate the difficulty.

It has long been settled law that the mere fact that a proposed arbitrator is in the permanent employment of one party to a contract does not disqualify him. But the cases go even further than this. They show that even where a man may possibly be biassed or has expressly declared himself on a matter he is not necessarily disqualified. In *Jackson* v. *Barry Railway Company* (1893, 1 Ch., 238) objection was taken to an engineer of a railway company acting in the capacity of arbitrator, because in a preliminary correspondence he had expressed a view adverse to the interests of the contractor. This fact did not induce the Court of Appeal to say that he was unfit to act. Lord Justice Bowen said: "To an adjudication in such a peculiar reference the engineer cannot be expected nor was it intended that he should come with a mind free from the human weakness of a preconceived opinion. The perfectly open judgment, the absence of all previously formed or pronounced views—which in an ordinary arbitrator are natural and to be looked for—neither party to the contract proposed to exact from the arbitrator of their choice. They knew well that he possibly or probably must be committed to the prior view of his own, and that he might not be impartial in the ordinary sense of the word. What they relied on was his professional honour, his practice, his intelligence, and the contractor certainly had a right to demand that whatever views the engineer might have formed he would be ready to listen to argument, and at the last moment to determine as fairly as he could, after all had been said and heard."

That was the law in 1893, and it states a principle which is said to be now accepted by the Courts. In a later case (*Ives* v. *Willans*, 1894, 2 Ch., 478) it appears to have been held that if there is no probability that the arbitrator, being in the employment of one party, will be biassed in favour of one party, the arbitration must proceed. In that case the Lord Justice said: "No doubt in a sense the engineer will be the judge of his own conduct, and no doubt that is a position which *primâ facie* raises some surprise in a judicial mind; but that is the contract of the parties. They have contracted that the servant of one of the parties to the contract shall be the arbitrator, and it appears to me that they have contracted that he shall be the arbitrator in cases which must necessarily involve the correctness of his own opinion, the competency of his own advice and opinion as engineer, and the regularity of his own proceedings. . . ."

Thus, in 1894 it was said, impliedly if not expressly, that in order to set aside a reference something more than a probability of bias must be shown. Let us summarise the cases in which, within the last two or three years, this onus has been discharged.

A reference will be set aside—(*a*) if there is an unseemly personal dispute raising a vindictive feeling between the surveyor and the contractor, and he has expressed an opinion so strongly as to amount to a prejudgment (*Nuttall* v. *Manchester Corporation*, 1893, 8 T.L.R., 515); (*b*) if the dispute be such that it cannot be properly determined without the cross-examination of the surveyor (*Freeman* v. *Chester Rural District Council*, 1911, 1 K.B., 783); (*c*) if the dispute be as to the existence and terms of an agreement made between the surveyor (acting for the building owner) and the contractor (*Aird* v. *Bristol Corporation*, 1912, 28 T.L.R., 278); (*d*) if the question is whether the surveyor did or did not act unreasonably—*e.g.*, by making alterations and amendments in drawings, by delaying the delivery of drawings and materials, and by rejecting suitable material (*Blackwell* v. *Derby Corporation*, 1909, 75 J.P., 129); (*e*) if, although acting honestly, the surveyor has lost his independence by conferring with and accepting advice from one party to the contract (*Roberts* v. *Hickman*, 2 H.B.C., 10).

This summary of recent decisions may appear—at least to the layman—to involve a serious departure from the principle enunciated in *Jackson* v. *Barry Railway Company* (*supra*). However that may be, it is clear that the arbitration clause in many existing contracts may cease to have any value.

Before considering the various methods by which the difficulty may be overcome, it is well to review the motives of those who insert an arbitration clause in a contract. They desire to avoid litigation, to have questions decided finally, promptly and at a minimum cost, and to secure the services of a man who has an intimate knowledge of technical matters, and who will be less trammelled by the forms of law than a judge or a legal arbitrator. In naming as arbitrator the man who has drawn the specifications, prepared the plans, and supervised the execution of the works, the parties clearly contemplate that when he undertakes the burden of a reference he will be possessed of a knowledge of the subject matter which an independent arbitrator could only acquire after much preliminary labour, or by hearing the evidence of numerous witnesses. For these reasons it is considered that (apart from the question of bias) the appointment of the surveyor is the most satisfactory and economical for all concerned.

So far as contracts now in existence are concerned, they must be governed, in the absence of a fresh agreement, by the principle laid down in the cases above quoted. But what course can be adopted in order to avoid the difficulty in future contracts? The following courses are open: (1) Omit all reference to arbitration; (2) name an independent arbitrator in the contract; (3) name two arbitrators in the contract and allow them to appoint an umpire; (4) submit to the arbitration of a person named by the president of the Institution of Civil Engineers or of Surveyors' Institution; (5) name a single arbitrator who may be the surveyor of one of the parties, and then provide, by a special clause, that if the court shall be of opinion that he is disqualified from acting, the dispute shall be decided by an independent person nominated by the president as above.

With reference to these suggestions it is obvious that all of them (except, in a certain event, the last) have the defect that they involve the decision of questions arising under the contract by a person who is wholly unfamiliar with the subject matter. This, as has already been shown, involves delay and additional expense. The last proposal, however, appears to be well calculated to obviate any difficulty. It may be said that it practically reduces the parties to the position they would have been in if their agreement contained no arbitration cause at all; but this is not so. Where a dispute arises between the builder and a building owner, and there is no arbitration clause, a writ is issued. If the dispute is likely to be long and technical it is sent by the judge to an official or special referee, who is an officer of the Court. It cannot be decided by arbitration. On the other hand, assuming the parties are bound by a clause similar to that adumbrated in paragraph (5) (*supra*), they secure the reference of disputes to the surveyor in a proper case. In any event they secure arbitration and avoid litigation. Whether the validity of such a clause would be affirmed by the Courts is an open question, although the present writer sees no objection to it. It does not tend to oust the jurisdiction of the Courts any more than an ordinary arbitration clause. It merely makes a decision by the named arbitrator, or, alternatively, by the arbitrator appointed in the manner agreed to by the parties, a condition precedent to the settlement of disputes by the ordinary legal tribunals of the land.

Competition Award.—Mr. Ernest Fetch, London, has been awarded the premium for his design for new public offices at Goole.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

SOUTH-EASTERN DISTRICT EXECUTIVE COMMITTEE MEETING.

A meeting of the Executive Committee of the South-Eastern District was held at the offices of the institution, 11 Victoria-street, Westminster, S.W., on Saturday last, those present being Messrs. A. Dryland (chairman), H. W. Bowen, J. H. Brierley, W. H. Grieves, F. Harris, H. W. Longdin, C. G. Mason, P. H. Palmer, A. E. Prescott, J. L. Redfern, and Mr. T. Cole (secretary of the institution). The hon. secretary (Mr. Frank Roberts) was unavoidably prevented from attending.

It was decided to hold an afternoon meeting of the members of the South-Eastern District in order to visit the Sidcup-road trial lengths on the afternoon of Wednesday, January 8th, if it could be conveniently arranged, the inspection to be followed by a dinner in London, at 6.30 p.m. The tickets for the dinner will be 5s. per head, exclusive of wines, and any members of the institution outside the South-Eastern District will be welcome if they will previously notify the secretary of their desire to attend. The musical part of the dinner arrangements has been left in the hands of Mr. Frank Harris and Mr. W. Hedley Grieves, who will be glad of offers of assistance from members.

Various matters of interest were discussed by the committee, and it is hoped to arrange for a meeting at one of the coast towns in the district in May next, and probably at another in September.

The committee are meeting again early in December to fill two vacancies among the representatives of the junior members, and to make further arrangements for the proposed meetings.

The committee are anxious to make the institution useful, particularly to the younger members, and will welcome suggestions to that end.

The council of the Institution of Municipal and County Engineers are offering premiums to members, associate members and students of the institution amounting to twenty-eight guineas for the best plans for laying out a seaside pleasure resort.

The drawings are to be delivered prior to the annual meeting in July next at a date to be fixed hereafter. Further particulars will be issued shortly.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance

NORTH-WESTERN DISTRICT.

It has been decided to hold a social evening at Manchester on Saturday, December 7th. The approximate expense per head will be 4s., and it is desirable that members should give notice, at the earliest possible moment, of their intention to attend. Full programme will be issued later.

"Brantwood," Jas. W. Gleave,
Coomassie-street, *Hon. District Secretary.*
Heywood.
October 12, 1912.

Subscriptions, 1912-13. Members and others are requested to note that annual subscriptions for 1912-13 are now due.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

ROYAL SANITARY INSTITUTE.

LONDON MEETING.

At a meeting of the Royal Sanitary Institute, to be held at 90 Buckingham Palace-road, S.W., on Tuesday, November 12th, Mr. H. Percy Boulnois, M.Inst.C.E., chairman of council of the institute, will open a discussion on the recently issued report of the Departmental Committee on Intercepting Traps in House Drains.

The chair will be taken at 8 p.m. by Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E., chief engineer to the London Council Council.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1369 Holborn), subject to later confirmation by letter.*

ASSISTANT SANITARY INSPECTOR.—November 4th.—Coalville Urban District Council. £2 5s. per week.—Mr. T. E. Jesson, clerk.

CLERK OF WORKS.—November 4th.—Tipton Education Committee. £2 2s. per week.—Mr. E. Richards, secretary, Education Offices, Tipton.

INSPECTOR OF NUISANCES.—November 4th.—Whitby Urban District Council. £100 per annum.—Mr. W. S. Gray, clerk.

BUILDING INSPECTOR.—November 5th.—Corporation of Leeds. £120 per annum.—Mr. W. T. Lancashire, city engineer and building surveyor. Applications to be endorsed "Building Surveyor."

INSPECTOR OF NUISANCES.—November 5th.—Sheerness Urban District Council. £120—£150 per annum.—Mr. V. H. Stallon, clerk.

CLERK OF WORKS.—November 5th.—Bray Urban District Council. £2 5s. per week.—Mr. P. MacDonnell, clerk.

SURVEYING ASSISTANT.—November 5th. Corporation of Manchester. £3 3s. per week.—Mr. Thomas Hudson, town clerk.

INSPECTOR OF NUISANCES.—November 7th.—North Walsham Urban District Council. £120 per annum.—Mr. H. W. T. Empson, clerk.

ROAD FOREMAN.—November 11th.—Maidstone Rural District Council. £1 1s. a week.—Mr. R. Hoar, clerk.

TWO TEMPORARY ASSISTANTS.—November 11th.—Corporation of Swansea. £10 16s. 8d. per month.—The Town Clerk.

CLERK OF WORKS.—November 11th.—Lichfield Rural District Council. £3 13s. 6d. per week.—Mr. R. Green, 37 Waterloo-street, Birmingham. Applications to be endorsed "Clerk of Works."

CLERK OF WORKS.—November 12th. Stalybridge and Dukinfield Joint Sewerage Board. £3 3s. per week.—Mr. W. Moss, clerk, Market-place, Ashton-under-Lyne.

INSPECTOR OF NUISANCES.—November 12th. Southborough Urban District Council. £104 per annum.—Mr. Philip Hanmer, clerk.

MUNICIPAL ENGINEER.—November 21st.—Municipal Board of Cawnpore. 800—1,000 rupees per mensem.—Mr. C. E. Goument, C.S.I., M.Inst.C.E., c/o Messrs. Thos. Cook & Son, Ludgate-circus, London.

ARCHITECTURAL DRAUGHTSMAN.—Public Works Department, Kedah, Malay States. £350 per annum and free quarters.—Box No. 1,194, The Surveyor office.

ASSISTANT DRAINAGE ENGINEER. Corporation of Madras. Rs. 500—700 per mensem, and motor bicycle allowance. Age not to exceed thirty-five.—James Mansergh & Sons, agents to the corporation, 5 Victoria-street, Westminster. Envelopes to be endorsed "Drainage Assistant."

ENGINEER'S ASSISTANT. Municipal Commissioners of Singapore. $350 per month. Age under thirty-two.—Mr. C. C. Lindsay, M.Inst.C.E., 180 Hope-street, Glasgow.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but these responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1369 Holborn), subject to later confirmation by letter.*

RHYL.—November 18th.—Plans, specifications and estimates for strengthening Rhyl pier, for the urban district council.—Mr. A. Rowlands, clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

DURSLEY.—Competitive designs for thirty cottages, for the rural district council.—Mr. J. Collett, clerk to the Parochial Committee, Dursley.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but these responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1369 Holborn), subject to later confirmation by letter.*

Buildings.

BEDFORDSHIRE.—November 2nd—14th.—For the erection of a school, for the county council. Mr. W. W. Marks, clerk, Shire Hall, Bedford.

MAIDENHEAD.—November 2nd.—For additions to the electricity station, for the corporation.—Mr. H. E. Davies, town clerk.

LINDSEY (Lincs).—November 4th—21st.—For the erection of a public school, for the county council.—Mr. S. Maudson Grant, secretary, 286 High-street, Lincoln.

TREFECHAN.—November 4th.—For the erection of workmen's dwellings, for the corporation. Mr. R. Jones, borough surveyor, Smithfield-road, Aberystwyth.

BATH.—November 4th.—For constructional work in Orange-grove, for the corporation.—City Surveyor.

SLOUGH.—November 6th.—For the erection of buildings at the pumping station, for the urban district council.—Mr. G. H. Charsley, clerk.

HADHAM.—November 6th.—For the erection of six cottages, for the rural district council.—Mr. A. G. Gwynn, clerk.

DUNDEE.—November 6th.—For reinforced-concrete piling and foundation work, for the corporation.—Mr. H. Richardson, manager of the electricity department.

SHEFFIELD.—November 7th.—For alterations and extensions to a school, for the Education Committee.—City Architect.

WANSTEAD.—November 7th.—For the erection of a fire brigade station, for the urban district council.—Mr. C. H. Brassey, surveyor.

WEST RIDING.—November 8th.—For the erection of a new school and additions to a school, for the Education Committee.—Education Architect, County Hall, Wakefield.

CORNWALL.—November 9th.—For additions and alterations at a school, for the Education Committee.—Mr. F. R. Pascoe, secretary, Education Department, County Hall, Truro.

GLAMORGAN.—November 9th.—For the erection of two detached cottages and four pairs of semi-detached cottages, and the construction of accommodation road, for the county council.—Mr. T. Mansel Franklin, clerk, County Hall, Cardiff.

MARGATE.—November 11th.—For repairs to the water tower, for the corporation.—Mr. Edward Brooke, town clerk.

BIRMINGHAM.—November 11th.—For the erection of stabling, for the corporation.—Mr. William Holt, superintendent and engineer, Refuse Disposal Department.

CAMBRIDGE.—November 11th.—For the erection of cottages, for the corporation.—Mr. J. E. L. Whitehead, town clerk.

PETERHEAD.—November 11th.—For the construction of a storage reservoir, for the corporation.—Messrs. Walker & Duncan, engineers, 3 Golden-square, Aberdeen.

RICHMOND (Surrey).—November 11th.—For extensions to the public baths, for the corporation.—Mr. Henry Sagar, town clerk.

CLEETHORPES.—November 11th.—For the erection of a bandstand, for the urban district council.—Mr. C. H. Waithman, engineer and surveyor.

YORK.—November 12th.—For the erection of thirty cottages, for the corporation.—Mr. F. W. Spurr, city engineer.

STOCKPORT.—November 12th.—For the erection of a shelter, bowl house and tennis pavilion, for the corporation.—Mr. J. Atkinson, borough surveyor.

WOOLWICH.—November 13th.—For the erection of sanitary conveniences in Royal Victoria Gardens, for the borough council.—Mr. Arthur B. Bryceson, town clerk.

RUGBY.—November 14th.—For the erection of a discharge block at hospital, for the Joint Hospital Board. Mr. T. W. Willard, architect, Market-place, Rugby.

EASTBOURNE.—November 14th.—For the construction of a coal bunker retaining wall, for the corporation.—Borough Electrical Engineer.

BIRMINGHAM.—November 18th.—For the erection of a school, for the Education Committee.—Mr. J. Arthur Palmer, secretary, Council House.

PORTSMOUTH.—November 19th.—For the erection of stores, for the corporation.—Borough Engineer.

HACKNEY.—November 21st.—For the erection of a branch library, for the borough council.—Mr. W. A. Williams, town clerk.

BEBINGTON.—November 21st.—For the erection of a school, for the Administrative Sub-Committee.—Mr. J. Harding, clerk, Library Cottage, Bebington, near Birkenhead.

NORWICH.—November 22nd.—For the erection of a shelter at the cemetery, for the corporation.—Mr. A. E. Collins, city engineer.

Iron and Steel.

MALDON.—November 4th.—For laying 370 yds. of 6-in. water main, for the corporation.—Mr. F. H. Bright, town clerk.

EALING.—November 5th.—For the supply of iron fencing, for the corporation.—Mr. Geo. E. Brydges, town clerk.

SWANSEA.—November 5th.—For the extension of water mains, for the rural district council.—Mr. Edward Harris, clerk.

CARLISLE.—November 8th.—For laying water main, for the rural district council.—Mr. F. Barker, waterworks manager, 7 Victoria-place, Carlisle.

KEIGHLEY.—November 9th.—For laying line of water pipes and other works, for the corporation.—Mr. W. Bagshaw, town clerk.

MANCHESTER.—November 9th.—For the erection of a 96-tube fuel economiser, for the corporation.—Mr. Thomas Hudson, town clerk.

EGREMONT.—November 18th.—For the supply of materials for and construction of water supply, for the urban district council.—Mr. John Nelson, clerk.

NEWMARKET.—November 25th.—For carting, excavating for and laying 5 miles of 3-in. cast-iron pipes, including fixing valves and hydrants, and erection of brick water tower, for the rural district council.—Mr. S. J. Ennion, solicitor.

NEWMARKET.—November 25th.—Supply of 163 tons of 3-in. cast-iron pipes and specials, the erection of cast-iron tank and other works, for the rural district council.—Mr. S. J. Ennion, solicitor.

KNOTTINGLEY.—(No date.)—For the supply of 10-in. and 6-in. cast-iron rising main and specials, for the urban district council.—Mr. W. Swaine, clerk.

COCKERMOUTH.—(No date.)—For scraping 16 miles of water mains and fixing hatch boxes, valves, covers, pipes and other fittings, for the rural district council.—Mr. J. H. Musgrave, clerk.

Roads.

HAMPTON WICK.—November 2nd.—For the supply of 200 yds. of broken granite, for the urban district council.—Mr. H. Fawssett, clerk.

ENNISKILLEN.—November 4th.—For the supply of road metal, for the urban district council.—Mr. A. W. G. Ritchie, town clerk.

MONK BRETTON.—November 4th.—For the execution of private street works, for the urban district council.—Mr. James Gibson, clerk.

WALTHAM.—November 4th.—For laying wood-block paving, for the urban district council.—Mr. W. C. Holloway, engineer and surveyor.

GELLIGAER.—November 4th.—For constructional road work, for the urban district council.—Mr. Frank T. James, clerk, Council Offices, Hengoed, *viâ* Cardiff.

WEALDSTONE.—November 5th.—For the supply of granite chippings, for the urban district council.—Mr. H. Walker, surveyor.

TOTTENHAM.—November 5th.—For making up South-grove, for the urban district council.—Mr. Edward Crowne, clerk.

EALING.—November 5th.—For making up Haslemere-avenue and York-road, for the corporation.—Mr. Geo. E. Brydges, town clerk.

BARKING.—November 6th.—For carrying out private street works, for the urban district council.—Mr. C. F. Dawson, surveyor.

CLACTON.—November 6th.—For the supply of flints and granite, for the urban district council.—Mr. D. J. Bowe, surveyor.

HAILSHAM.—November 6th.—For work of road widening, for the rural district council. The Chairman.

WANSTEAD.—November 7th.—For making up certain streets, for the urban district council.—Mr. Bruce Blewitt, clerk.

MIDDLETON.—November 8th.—For private street works, for the corporation.—Mr. W. Welburn, borough surveyor.

HASTINGS.—November 9th.—For the supply of 1,200 yds. of best unbroken blue stone, for the rural district council.—Mr. A. R. Inskipp, clerk, 11 Wellington-square, Hastings.

WILLINGTON.—November 9th.—For work of making up, for the urban district council.—Mr. J. H. Gardner, clerk.

WALSALL.—November 9th.—For making up Charles-street, for the corporation.—Mr. J. R. Cooper, town clerk.

NORTHUMBERLAND.—November 9th.—For supplying, breaking and carting stones, for the county council.—County Surveyor, Moot Hall, Newcastle-upon-Tyne.

SKIPTON.—November 11th.—For work of making up, for the urban district council.—Mr. Richard Wilson, clerk.

WANDSWORTH.—November 11th.—For making up and paving part of Southerolt-road, for the borough council.—Mr. D. A. Nicholl, town clerk.

BEDLINGTONSHIRE.—November 11th.—For work of making up, for the urban district council.—Mr. Charles D. Forster, joint clerk, 24 Grainger-street West, Newcastle-upon-Tyne.

MANCHESTER.—November 11th.—For making up certain thoroughfares, for the corporation.—Mr. Thomas Hudson, clerk.

BIRMINGHAM.—November 11th.—For the supply of stores, for the Water Department.—Mr. E. Antony Lees, secretary, 44 Broad-street.

SALTASH.—November 12th.—For making up certain streets, for the urban district council.—Borough Surveyor.

PENYBONT.—November 12th.—For making up nine streets, for the rural district council.—Mr. R. Harmer Cox, clerk, Union Offices, Bridgend.

LONDON.—November 12th.—For the supply of Jarrah and creosoted deal paving blocks, for the county council.—Sir Laurence Gomme, clerk.

EDMONTON.—November 12th.—For making up certain private streets, for the urban district council.—Mr. W. Francis Payne, clerk.

RAWTENSTALL.—November 13th.—For work of paving and sewering, for the corporation.—Mr. J. Johnson, borough surveyor.

BARNSTAPLE.—November 14th.—For the hire of steam roller, for the corporation.—Mr. E. Y. Saunders, borough surveyor.

METHLEY.—November 16th.—For works of flagging and kerbing, for the urban district council.—Mr. T. Thompson, surveyor.

EAST SUSSEX.—November 22nd.—For the supply of materials, cartage and team labour, for the county council.—Mr. F. J. Wood, county surveyor.

Sanitary.

EAST PRESTON.—November 4th.—For laying a stoneware drain, for the rural district council.—Mr. C. W. Leney, surveyor.

WHITLEY.—November 4th.—For the construction of a sewer, for the urban district council.—Mr. Augustus Whitehorn, clerk, 60 Saville-street, North Shields.

FELTHAM.—November 5th.—For the construction of a stoneware sewer, storm-water drain and manholes, for the urban district council.—Mr. G. Stevens, clerk.

HAVANT.—November 6th.—For laying concrete tubes and manholes, for the rural district council.—Mr. W. L. Hibberd, surveyor.

HOO.—November 6th.—For work of scavenging, for the rural district council.—Mr. R. P. Smyth, clerk.

COCKERMOUTH.—November 9th.—For works of sewerage, for the rural district council.—Mr. J. H. Musgrave, clerk.

TADCASTER.—November 9th.—For the construction of manholes, for the rural district council.—Mr. G. A. Bromet, clerk.

THORNE.—November 12th.—For the removal of town refuse, for the rural district council.—Mr. Harold Plewes, surveyor.

HALIFAX.—November 16th.—For the construction of earthenware pipe sewers, for the corporation.—Mr. J. Lord, borough engineer.

BELFAST.—November 19th.—For the construction of an outlet sewer, for the corporation.—Mr. R. Meyer, town clerk.

LEWES.—November 19th.—For the construction of sewage disposal works, including screen chambers buildings, settlement and storm tanks, tidal storage tanks, and sludge drying beds, for the corporation.—Mr. Montague S. Blaker, town clerk.

LEWES.—November 19th.—For the construction of the low-level pumping station and contingent works, for the corporation.—Mr. Montague S. Blaker, town clerk.

GLOUCESTER.—November 26th.—For the construction of a main outfall sewer, for the corporation.—Town Clerk.

ARDSLEY.—(No date.)—For the construction of small sewerage works, for the urban district council.—Mr. C. McNaughton, clerk.

Stores.

WOKING.—November 16th.—For the supply of oil, sludge press cloth, gulley frames and gratings, brooms, shovels, mud scrapers, pickshafts, fagging hooks, pennant kerb, tar paving, dust skips, coke, coal, lamp standards and lanterns, Izal disinfecting fluid, Izal empty pint tins, Izal soft soap, Izal sulphur candles, Sanitas No. 2. hard soap, gummed rolls for disinfecting, disinfecting powder, lime and oats, for the urban district council.—Mr. Robert Mossop, clerk.

Miscellaneous.

NEW SOUTH WALES.—November 4th.—For the supply of 180,000 casks of Portland cement, for the Government of New South Wales, Australia.—Agent-General for New South Wales, 123 and 125 Cannon-street, London, E.C.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

BIDEFORD.—For the supply of broken and unbroken granite and chippings, for the corporation:—

Baker & Son, Bideford.—Broken granite, 8s. 11d. per ton; unbroken, 7s. 1d. per ton; chippings, 6s. 6d. per ton.

BIRKENHEAD.—Accepted for the construction of a gallery in the swimming bath, for the corporation.—Mr. J. Fearnley, town clerk:—

T. Spencer, Liverpool, £111.

BIRKENHEAD.—Accepted for private street works in Powell-street, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor:—

W. Bramwell, Birkenhead, £300.

BRAINTREE.—For the supply of 500 tons of 1½-in. granite, 100 tons of 3-in. slag, and hire of steam roller for about 80 days, for the rural district council.—Mr. C. V. Bright, surveyor of highways:—

Granite.—Ellis & Everard, Bardon Hill—250 tons, average price per ton, 13s. 3d.; C. Abell, Limited, Hartshill—250 tons, average price per ton, 12s. 5d.

Slag.—Lavender & Bateman, Sutton Bridge—100 tons, 10s. per ton.

Hire of Steam Roller for about 80 days—Pamphin Brothers, Cambridge—21s. per day inclusive.

CARLTON.—For the erection of four cottages, for the urban district council.—Mr. J. C. Haller, surveyor:—

J. A. Betts, Nottingham	£935
J. Powell & Son, Nottingham	896
W. Maule & Co., Nottingham	850
T. H. Harper, Nottingham	840
J. Quinn, Nottingham	830
J. Lewin, Nottingham	828
J. & G. Rouison, Nottingham	810
W. D. Tuck, Nottingham	800
G. T. Tyerdine, Nottingham*	799

CHICHESTER.—For the supply of granite, for the corporation:—

Rowe & Mitchell.—Guernsey granite at 12s. 8d. per ton.

CHINGFORD.—For making-up work, for the urban district council.—Mr. J. T. Griffin, surveyor:—

T. Adams, Wood Green, N.	£1,219
W. & C. French, Buckhurst Hill*	1,215

COCKERMOUTH.—For widening a roadway, for the rural district council:—

W. Weightman, Keswick, £79

HAYES.—For the construction of percolating filters, sludge beds, and humus tank, and alterations at existing works, for the urban district council.—Mr. D. C. Fidler, engineer, Grange-road, Hayes:—

Langley & Johnson, Slough	£1,905
H. M. Blaker, Leatherhead	1,264
G. Rayner, Wallington	1,223
A. Winch, Harlington*	1,134

Surveyor's estimate, £1,210.

HUNSLET.—For making-up work, for the rural district council:—

D. Speight & Son, Leeds	£150
H. C. Pullar, Halifax	138
G. L. Briggs & Son, Leeds	128
J. Robinson, Wakefield*	120

LEISTON-CUM-SIZEWELL.—Accepted for the construction of grit chamber and septic tank, with manhole, for the urban district council.—Mr. J. Baldry, surveyor:—

G. Partridge, Leiston, £130.

MAIDSTONE.—For the supply of disinfectants, for the corporation:

F. J. Oliver, Maidstone, £226.

STOCKPORT.—For taking down one of the bays of the covered market and other work, for the corporation.—Mr. J. Atkinson, borough surveyor:—

H. Bardsley, Stockport, £187.

WANDSWORTH.—For repairing parts of two roads in Southfields for the urban district council.—Mr. P. Dodd, borough engineer:—

Wimbledon-park-road.—H. Woodham & Sons, £255 and 15 per cent above schedule prices for extras or omissions.

Viewfield-road.—H. Woodham & Sons, £227 and 15 per cent above schedule prices for extras or omissions.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

NOVEMBER.

2.—Lower Thames Valley District Surveyors' Association: Meeting at Town Hall, Twickenham. 6.30 p.m.

4.—Royal Institute of British Architects: Mr. Reginald Blomfield, R.A., delivers his presidential address. 8.30 p.m.

8.—Institution of Civil Engineers: Mr. R. Elliott-Cooper, President, delivers his inaugural address: presentation of medals: Institution of Mechanical Engineers, Storey's Gate, S.W. 8 p.m.

11.—Surveyors' Institution: First Ordinary General Meeting of the Session: The Hon. Edward Gerald Strutt delivers his opening address: Presentation of Gold Medal. 8 p.m.

12.—Royal Sanitary Institute: Discussion on Report of Departmental Committee on Intercepting Traps in House Drains, 90, Buckingham Palace-road, S.W. 8 p.m.

14.—Concrete Institute: Mr. E. P. Wells delivers his presidential address. 7.30 p.m.

28.—Concrete Institute: Mr. John M. Theobold, F.S.I., on "Bills of Quantities for Reinforced Concrete Work." 7.30 p.m.

DECEMBER.

12.—Concrete Institute: Messrs. R. Cathcart and Laurence Gadd, F.S.I., on "The Effects on Concrete of Acids, Oils and Fats." 7.30 p.m.

APPOINTMENTS OPEN.

GOVERNMENT OF KEDAH.

MALAY STATES.

ARCHITECTURAL DRAUGHTSMAN.

1. Applications are invited for the appointment of Chief Draughtsman, Public Works Department, Kedah, Malay States.

2. Candidates should be under 30 years of age, unmarried, and expert draughtsmen, experienced in the Design and Construction of Public Buildings, able to prepare Plans, Working Drawings, Details and Specifications, and to control generally the work of the State Engineer's Drawing Office.

3. Evidence of training and experience in Architects' Offices must be given.

4. Engagement for three years, with salary at the rate of $250 per mensem (£350 per annum; the dollar equivalent is 2s. 4d.), and free furnished quarters; free second-class passage out and home again on satisfactory termination of agreement; half salary from date of embarkation, and full salary from date of arrival in Kedah.

5. In the case of the successful candidate a Medical Examination will be necessary.

6. Application by letter (no special form required), giving particulars of experience, accompanied by copies of recent testimonials, should be sent to Box 1,194, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C., not later than November 7th.

7. The selected candidate will be required to leave for Kedah as soon as possible.

MADRAS CORPORATION, INDIA.

WANTED: ASSISTANT DRAINAGE ENGINEER.

The President, Corporation of Madras, invites applications for the appointment of Drainage Assistant to the Special Engineer, J. W. Madeley, M.A., M.I.C.E., M.AM.SOC.C.E., &c.

The duties will be to assist the Special Engineer in the design, construction and maintenance of works of drainage for the City of Madras.

The salary will be Rs. 500 (£33 6s. 8d.) per mensem, rising by annual increments of Rs. 20 per mensem to a maximum of Rs. 700 per mensem. An allowance of Rs. 30 (£2) per mensem will be paid to the officer appointed so long as he maintains and uses on the work a first-class motor bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras, the successful candidate will be required to sign a three-years' agreement to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing or by payment of one month's salary.

The officer appointed will be allowed ordinary first-class railway fares and second-class steamship passage to Madras, *viâ* Marseilles and Bombay, by P. & O. steamer. A like class return free passage will be granted on the termination of the appointment, subject to the satisfactory service according to the conditions of the agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but not for more than three months at a time.

The applicant must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India must be enclosed with the application, which must reach the undersigned not later than Thursday, November 14th. They will be sent out to Madras, where the final selection will be made by the President of the Corporation.

The President reserves the right of rejection all applications without giving reasons.

The officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of his application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Drainage Assistant."

JAMES MANSERGH & SONS,
Agents to the Corporation of Madras.

5 Victoria-street,
Westminster,
London, S.W.
October 23, 1912.

CITY OF LEEDS.

CITY ENGINEER AND BUILDING SURVEYOR'S DEPARTMENT.

Applications are invited for the position of Building Inspector. Candidate must be thoroughly conversant with all branches of the Building Trade, must hold the certificate of the Royal Sanitary Institute, and must not be more than forty years of age. Salary £120 per annum.

Applications (endorsed "Building Inspector"), together with copies of three recent testimonials, to be sent to the undersigned not later than Tuesday, November 5th, 1912.

Forms of application and lists of duties may be obtained at the office of the City Engineer and Building Surveyor.

W. T. LANCASHIRE,
City Engineer and Building Surveyor.

Municipal Buildings,
Leeds.

LICHFIELD RURAL DISTRICT COUNCIL.

STREETLY SEWERAGE AND SEWAGE PURIFICATION WORKS.

CLERK OF WORKS.

Applications are invited for the appointment of Clerk of Works in connection with the above works, at a salary of £3 13s. 6d. per week. The person appointed will be required to devote the whole of his time to the duties of the office, to work under the instructions of the Council's Engineer, and to commence in December.

It is necessary that applicants should be accurate in the use of the dumpy level and the theodolite, and in the setting out and measuring up of works.

Applications, in the candidate's own handwriting, stating age, qualifications and experience of similar work (including sewers in tunnel), together with copies of not more than four recent testimonials, and endorsed "Clerk of Works," must be sent to Mr. Robert Green, M.INST.C.E., 37 Waterloo-street, Birmingham, not later than Monday, the 11th November, 1912. Probable duration of engagement fifteen months.

Canvassing Members of the Council will be considered a disqualification.

THOMAS MOSELEY,
Clerk to the Rural District Council.

Lichfield.
October 25, 1912.

SINGAPORE, STRAITS SETTLEMENTS.
MUNICIPAL ENGINEER'S DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant, under 32 years of age and of sound constitution, chiefly for their new Sewage Scheme. He must have received a good technical education, a regular training as a Civil Engineer, and including a practical knowledge of Surveying, Levelling and Estimating. He must also have had special experience in designing and constructing sewerage and sewage disposal works and waterworks, and their maintenance. Preference will be given, other things being equal, to applicants who have passed the Examination of the Institution of Civil Engineers—Associate Members—or that of the Institution of Municipal and County Engineers. The engagement will be for three years, and each applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination. A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out.

The salary will be 350 dollars per month, paid monthly in dollars, the currency of the Colony, the value of the dollar being two shillings and fourpence sterling. Such local transport allowance as may from time to time be sanctioned by the Commissioners will be paid. Applications, stating age and place of birth, and giving details of education, training, and experience generally, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, are to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope-street, Glasgow (who will give further particulars if requested), not later than Tuesday, 5th November, 1912.

COUNTY BOROUGH OF SWANSEA.

The Corporation require Two Temporary Assistants in the Borough Surveyor's Office for Private Street Works for a period of 12 months.

Candidates must have a thorough knowledge of the Private Street Works Acts. Salary £10 16s. 8d. per month.

Applications, stating age and qualifications, together with three recent testimonials, to be sent to Mr. George Bell, Borough Surveyor, not later than Monday, the 11th November next.

Guildhall, Swansea.
October, 1912.

SURVEYOR (South of England) has vacancy for Pupil; important sewerage works.—Box 1,180, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

APPOINTMENTS WANTED.

ASPHALTE.—Gentleman, 39, wide experience in all branches of trade, is open to manage or represent good firm; moderate salary.—Box 1,190, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

SURVEYOR'S ASSISTANT, disengaged; 5 years' experience building, land, chain and theodolite surveys, levels; good draughtsman; certificates for Building Construction.—Kemp, 18 Bristol-gardens, Maida Hill, W.

PUBLICATIONS FOR SALE.

COPIES of THE SURVEYOR, unbound, 1901, 1907—8, 9, 10 and 11 complete, and 1902, 3, 4 and 6, with only fifteen numbers missing, to dispose of for reasonable offer. Offers to Box 1,195, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

TENDERS WANTED.

EAST SUSSEX COUNTY COUNCIL.

MAIN ROADS.

TENDERS FOR ROAD MATERIALS, CARTAGE AND TEAM LABOUR.

The Roads and Bridges Committee invite Tenders for the Supply of Materials, Cartage and Team Labour for the Maintenance of the Main Roads in the West, South, Central and East Districts of the County, for the year ending 31st March, 1914—*viz.*:—

1. Stone, Granite and other approved Material delivered in cargoes to the Council's Wharf in Newhaven Harbour.
2. Flints, Stone, Granite and other approved Material delivered to various Railway Stations and Wharves.
3. Flints, Local Stone and other approved Material delivered on the Sides of the Main Roads.
4. The Cartage of Materials from Railway Stations and Wharves to the Sides of the Main Roads.
5. General Team Labour.

Further particulars, Conditions of Contract and Forms of Tender can be obtained on and after 8th November on application to the undersigned.

Tenders to be delivered at the County Surveyor's Office, County Hall, Lewes, on or before Friday, 22nd day of November, 1912.

The lowest or any Tender will not necessarily be accepted.

F. J. WOOD, ASSOC.M.INST.C.E.,
County Surveyor.

County Hall, Lewes.
October 26, 1912.

COCKERMOUTH RURAL DISTRICT COUNCIL.

To let by Tender, the Scraping of about Sixteen Miles of Water Mains (three inches to nine inches in diameter). Also the Providing and fixing of all hatch-boxes, valves, covers, pipes and other Fittings necessary.

Forms of Tender and all other information may be obtained on application to Mr. J. B. Wilson, A.M.I.C.E., Water Engineer, Grecian Villa, Cockermouth.

The lowest or any Tender will not necessarily be accepted.

(By order)
J. H. MUSGRAVE,
Clerk.

Grecian Villa,
Cockermouth.

And Municipal and County Engineer.

Vol. XLII. NOVEMBER 8, 1912. No. 1,086.

Minutes of Proceedings.

Concrete and Moisture.

Concrete as usually made is not waterproof, except in the limited sense that it does not allow water to ooze through it quickly. A concrete wall, with water under pressure behind it, will allow water to pass through it at a rate which depends upon its thickness and upon the water pressure. This rate is probably increased somewhat if the face of the wall be at a temperature considerably below that of the water or wet earth behind it, but not below freezing point. The apparent percolation depends upon the state of the atmosphere and the temperature of the face of the wall. If the water is oozing through slowly on a dry day, it may be so quickly evaporated by warmth and wind that the appearance of the wall is hardly altered by it. A rate of percolation which produces a dark appearance on a dry day will on a damp day produce beads of moisture, or the face of the wall may be streaming with wet. It is important in such cases to distinguish between the rate of percolation and the rate of deposition from the atmosphere, more especially in climates like that of the British Isles. The rate at which water will come through a wall or floor in any ordinary case is very small compared with the rate at which warm, damp air will deposit water upon the surface of cold concrete. It will be remembered that not many years ago a recently built sewer in Dublin was supposed to be leaking badly (reverse leaking), but the consulting engineer called in to settle the point found that most of the flow along the sewer was due to the condensation of moisture from the air upon its cold walls. Such an error is far from uncommon, and it is especially important to guard against it in the case of concrete, because the high specific heat per unit volume of the material and its high coefficient of heat conductivity, compared with some common building materials, leads to very rapid deposition of moisture when the temperature rises quickly and the air is damp. Compared with stone, the ease with which it can be finished smooth frequently leads to concrete being left without a protecting coat of plaster when a stone wall, such as those used for Welsh houses, would be well plastered on the inside. For the walls of dwelling-houses and buildings for the storage of goods easily injured by damp, it is, indeed, of very great importance that if the walls are of thick masonry which will "hold the cold," they shall be effectively protected from the deposition of moisture, at any considerable speed, by an internal coating of a light material with a low heat capacity and a low heat conductivity, such as that valuable material common plaster. The more dense the material of the wall itself, and the higher its heat capacity and conductivity, the thicker should be the coat of plaster.

It is no safeguard to make the walls hollow, for, although in a few cases this may keep the inner part at a higher temperature than it would otherwise have when it is cold outside, it does not guard against changes in the temperature of the inside of the house, and the part of the wall which is next to the covering rapidly draws from the surface the heat set free by the condensation of each drop of moisture, keeping the surface cool enough to go on condensing moisture from the air for a considerable time. It is probably the case, too, that an empty space left behind the wall covering is, besides an inconvenience, less effective as a non-conductor of heat than is a coat of porous material. It is clear, then, that a good brick wall, well plastered, offers advantages that must not be lightly thrown aside, although in some parts of these islands it is found necessary at times to coat the southern and western walls of dwelling-houses with paint, or to dress them with boiled linseed oil, in order to prevent the wet from coming through during long spells of driving rain. Again, in a continental climate a relatively thin wall of concrete may be much less effective in keeping out the cold of winter or in keeping a closed house cool during the hot hours of a tropical day than is a thick wall of cheap brick and mud. Where the seasons are consistent in character, however, dry, cold or wet as the case may be, the changes that tend to make vapour condensers of houses will be absent; and the objections to the use of concrete are still less in equable oceanic climates where houses are seldom shut up against cold or required to perform the service of equalising the temperature of the day and night. The matter is mainly one of the frequency of weather changes as far as the deposition of moisture is concerned, and depends, further, upon the rapidity with which changes of temperature occur and the extent to which the higher temperatures are accompanied by humidity of the air. What makes the condenser effect so important in this country is the fact that the cold of winter is often broken into by wet cyclonic disturbances of high temperature, the walls and roofs of houses, as well as the furniture and fittings, being often much colder than the air when such a change takes place.

Space does not permit of any reference here to those structural considerations which make concrete and ferro-concrete such valuable materials in their proper place, and when used in a suitable manner, but it must not be assumed that those advantages have been overlooked.

* * *

Waterproof Concrete.

We pass on to a consideration of the means that may be taken to make concrete waterproof, so that it may be used for the walls and floors of dwellings where water has to be kept out, may provide a suitable material for the building of tanks and aqueducts, and may prevent the rusting of the steel in reinforced concrete work immersed

in water. For some of these purposes, or, rather, in some cases, ordinary concrete will provide the degree of watertightness that is required, while for moderate pressures, at any rate, ordinary concrete, or concrete which is otherwise ordinary, can be made waterproof without the addition of any material beyond the usual ingredients. Such concrete must, however, be mixed in suitable proportions, and made in the proper manner. The exact proportions will depend upon the ratios of voids to solid in the different materials used, but with materials that do not vary much a given proportioning may cover a large number of cases. At the engineering conference of the Institution of Civil Engineers held in 1907 Mr. J. W. Sandeman said: "I make it an invariable rule for all sea work to have absolutely watertight concrete, which will stand perfectly, by making it of one part cement to two of sand and three of aggregates, and no doubt if concrete piles are made of that proportion they will be impervious to water." As regards the method of mixing, the directions given by the engineer vary according to the nature of the materials used, but we believe that the concrete is nearly always, after all the materials have been added, beaten to a jelly. There is no mistaking the feel of the mass under light blows when it has reached the proper condition, and if it appeared dry up to that moment it is probably all right, another sign being the appearance of frothy moisture on the surface. Without attempting to compare the efficiency of proportioning and method with the results obtained by the addition of waterproofing substances, attention may be drawn to the chief of these. Water gets through concrete because it is not quite solid, but contains minute pores. By the addition of a suitable fine material in the mixing, these pores may be filled, or, rather, the spaces will be occupied by solid matter. Such a material may, possibly, be one which will join in the process of crystallisation, but it seems more reasonable to aim merely at the filling of the pores by some inert material, which will not disturb the ordinary routine of setting. This part is played, it may be assumed, by clay, wax or heavy oil, when any of these substances is used with the object of making the concrete waterproof, though alum, which is also used, possibly acts in a different way. It is claimed for waxy materials that they provide repellent surfaces in such capillary spaces as may exist, and this factor may be worth considering, though it is more important as regards the treatment of existing concrete.

The properties of mortar and concrete made with heavy oil, in proportions up to 10 per cent by weight of the cement, are briefly described in another part of the present issue, the information being derived from a valuable report issued by the United States Office of Public Roads. The experiments seem to have been very successful, and fully to have established the particular oil used as a material which may be employed in order to make concrete waterproof. The addition of the oil considerably reduces the strength of the concrete, and its grip upon plain reinforcing bars, but in many cases the reduction of strength is not an important matter. In other cases, however, it points to the need for considering the possible advantage of employing a bituminous material in a layer by itself, especially where the concrete is likely to crack. The addition of a small proportion of clay to concrete has for some time been employed as a means of making it waterproof, and has been found to reduce the strength very little, or even to increase it. Alum, on the other hand, reduces the strength, possibly because it enters into inconvenient competition with the other materials in the matter of crystallisation. In conclusion, it may be pointed out that the extent to which waterproofness may be obtained by the use of mortars other than Portland cement mortars is often overlooked.

Concrete Foundations for Roads and Streets.

The excellent results which, in roads of some classes, follow the use of Portland cement concrete as a material for the sub-crust or foundation of the road-crust proper have from time to time within recent years led to the Portland cement concrete foundation being put forward as a type which ought to be adopted, if not on country roads generally, at least on the main highways. The argument from the particular to the general is often one which is beset with pitfalls, and this case is no exception to the general rule. Probably the ideal situation for a Portland cement foundation is a residential road or street in which all pipes and cables are under the footways, so that the carriageway itself is not subjected to those disturbances which so greatly militate against the value of the services performed by the concrete foundation. Other favourable factors are that in these streets heavy vehicles usually proceed at a slow speed, and the very heaviest axle-loads are seldom carried on them. In noting the success of a tar macadam upper crust in conjunction with the concrete foundation, it must be borne in mind that a large proportion of residential roads are, to some extent at least, shaded by trees and do not suffer the worst effects of hot sunshine and severe frost. As regards the use of concrete foundations for busy streets, it must be noticed that it has already been found economically desirable in many cases to make the concrete nine inches thick, or 50 per cent. thicker than has usually been regarded as sufficient up to the present. The significance of this fact must not be lost when we consider the extension of this method of making the foundation to main roads in the country; on which roads the actual crust-temperatures reached are higher in summer and lower in winter, taking unfavourable places, than is the case as a rule in city streets.

There are quite a number of other considerations which have so far prevented county surveyors from adopting the concrete foundation to any considerable extent, but the subject is one into which we are not able at the moment to enter for lack of the space which it is desirable to give to the subject if it is to be discussed at all. We have been led to these remarks by a careful perusal of the communication, to be found on another page of this issue, in which a reference is made to the paper read last May before the Institution of Municipal and County Engineers by Mr. J. W. Liversedge, Assoc.M.Inst.C.E., engineer and surveyor to the Leigh-on-Sea Urban District Council. The article certainly provides evidence that the problem of street foundation is being grappled with energetically at Leigh-on-Sea, and we may even go a little further—as far in fact as to admit that there are numerous places where concrete foundations might be provided with advantage for country roads, if the cost could be met. It is quite another matter, however, to contemplate the provision of concrete foundations, as an economy, over the main roads of the country generally. We should be interested to learn that any county surveyor is prepared to provide his roads generally with concrete foundations as a matter of economy in road maintenance, and assuming the matter of first cost to present no difficulty.

* * *

The Training of Sanitary Engineers.

The day of the "rule of thumb" engineer is now happily past, and his place has been taken by a body of highly trained professional men who are able to bring to bear on their work all the advantages which accrue from systematic study of their business from both the practical and the theoretical sides. There is still considerable difference of opinion, however, as to what is precisely the best educational training for an engineer—and particularly for one who is destined to become what is rather vaguely termed a "sanitary engineer." The

latter expression is a very comprehensive one, and is made to include a great variety of meanings. This has been very clearly pointed out by Mr. George C. Whipple, the Professor of Sanitary Engineering in Harvard University. The problems which the sanitary engineer is called upon to face are so varied that an exceptionally broad education is necessary to fit him for his duties. Thus he needs a certain acquaintance with sanitary science and the work of the sanitary specialist, and he must also be familiar with much which comes within the special sphere of the medical officer of health. Only in this way can he hope to co-ordinate his own work—which is primarily of a constructive or engineering character—with that of others who are engaged in the same warfare against disease as himself. The work of the sanitary engineer and the health officer in this connection is primarily of a preventive character, and involves the use of mathematics for statistical purposes, engineering to secure cleanliness, chemistry to detect adulteration, bacteriology to prevent infection, law to secure the remedy of nuisances, and education to instruct the people in hygiene and healthful living. In the great campaign against disease specialists are needed, but they should remember that, although they have to know everything about something, they must also know something about everything in the whole range of sanitary knowledge.

* * *

"The Surveyor" Special Issues.

The first issue of The Surveyor is dated January 21st, 1892. The number of the current issue indicates that since then over one thousand and eighty weeks have passed, and it is a matter for grateful thanks that over the long intervening period of time indicated it has been possible to produce The Surveyor with at least unfailing regularity, and with, it is believed, a never-relaxing care for the character of its literary contents. In January of next year it will "come of age," and we propose to mark the occasion by making the issue for the 17th of that month a special one, a prominent feature of it being comparisons of the practice in the chief branches of municipal engineering then and now—twenty-one years ago and to-day. It should be an interesting record of advance in every direction. The issue of January 10th will include the half-yearly index, in this case for Vol. XLII.; and the usual Annual Special Issue, with its forecast of works projected for 1913 and its reviews of the main fields of municipal engineering during 1912, will be published on January 31st. As usual, the claims of The Surveyor Municipal-Engineering Exhibition at Olympia, to be held next year from April 12th to April 26th, will necessitate two or three big numbers; and further special issues will be devoted to the International Road Congress and Exhibition of June next, which will be as fully reported as is practicable in view of the voluminous considerations that will arise out of it. It is to be noted that annual subscribers to The Surveyor will receive, without additional charge, all these contemplated special issues.

* * *

Traders and the Road Congress and Exhibition.

With regard to the above-mentioned International Road Congress and Exhibition we hope soon to be in a position to give interesting details as to the progress of the elaborate arrangements which are being made to ensure its success; but at the moment we only permit ourselves a preliminary assurance that these arrangements promise to be as comprehensive and satisfactory as forethought and patriotism can make them. One of the influential committees which have the matter in hand is the "Traders' Committee," of which the president is the Right Hon. Lord St. Davids; and the vice-presidents Lord Cowdray, Sir R. A. Hadfield, Sir Alfred Hickman, and Sir Herbert Praed, the last-named taking an active part in the proceedings as chairman of the committee. It is obvious that any benefits the "traders" may justifiably hope to reap from the publicity of the exhibition will be attained by their expenditure in that direction; we have therefore used the word "patriotism" because we understand that they have already contributed donations to the Congress Fund on a most generous scale, and with the sole idea of providing for beyond-sea visitors a programme worthy of the nation's resources and hospitality. We would add that the joint hon. secretaries of the committee are Mr. Herbert Beadle, of the Road Maintenance Company, Limited, Gravesend, and Mr. H. L. Wettern, of the London Granite Company, Limited, 16 Water-lane, Great Tower-street, E.C.

The R.I.B.A. Registration and Education.

In another column will be found a report of the very practical address which was delivered by Mr. Reginald Blomfield, A.R.A., on the occasion of his inauguration as president of the Royal Institute of British Architects. Having reviewed the present position of the institute and the architectural profession, Mr. Blomfield had something to say about the important question of registration. In this connection he made it clear that the object of registration is not to create a monopoly regardless of the professional competence of those who are enrolled. On the contrary, the primary reason for the adoption of a system of registration is to put a stop to incompetence, and to establish and maintain a reasonable level of accomplishment, and to see that that level is reached by those who undertake the very responsible work of an architect. If registration is to be confined strictly to those who are professionally competent, it is evident that the question of education assumes a fresh importance, and the new president directed attention to the educational work which the institute has accomplished during the past few years through its Board of Architectural Education. The syllabus of training for students has been thoroughly revised, and the examinations of the institute are an effective and intelligent test of capacity. The principle of registration certainly commends itself, and we hope that Mr. Blomfield's aspirations may be realised in due time.

The Institution of Civil Engineers.

Among the many presidential addresses which are delivered in the course of a year before the various professional societies there are few which command a wider audience than that of the president of the Institution of Civil Engineers. Mr. Robert Elliott-Cooper, the new president of that body, in the course of his address on Tuesday evening dealt with a variety of topics, including the improvement of the conditions under which young men are enabled to obtain their first practical experience of professional work. There is always a certain danger that a young man in his "improver" stage may be kept too closely over the drawing-board. The importance of good draughtsmanship cannot, of course, be exaggerated, but it must not be forgotten that a young man needs more than this. He must avail himself of every opportunity of seeing and doing practical work, and these opportunities ought to be given as freely as possible by his employer. Mr. Elliott-Cooper also called attention to the work of the Civil Engineers' Appointments Boards, which has proved of mutual value to employers and assistants. In a reference to the new premises which are in course of erection, the president expressed the hope that the work would be completed in time to ensure that the official opening would take place during the coming summer.

The Design and Construction of Masonry Dams.*

By H. J. F. GOURLEY, B.ENG., STUD.INST.C.E.

The selection of site is an important question, and one which calls for the most careful investigation. Its solution may mean all the difference between failure and success, and in any case will largely affect the total cost of the work. An examination of many dams indicates that the cost of the work below ground is usually a very substantial, if not the major, portion of the ultimate cost. Therefore when this question is under consideration every effort should be made not only to secure a suitable site, but the best site within the area of possible deviation. Briefly, the main requirements of the dam site are that there shall be rock strong enough to bear the stresses transmitted from the dam, and so compact and free from fissures as to be relatively watertight at a reasonable depth below the surface, and, of course, an ample supply of stone for facing blocks, displacers and concrete in the neighbourhood. It sometimes happens that rock is reached of sufficient strength, but not of a watertight character; in this case a heel or tongue trench is usually carried down until an impermeable bed is reached.

Where there is difficulty in getting watertight ends to the trench, or where there are pervious beds in the trench which outcrop in the reservoir, wing trenches filled with concrete may be used. These trenches, which may be 5 ft. or 6 ft. wide, tie into the ends of the main trench, and run up valley until the pervious outcrop is reached. Should the outcrop take place on one or both sides of the valley above the bottom, but below top-water level, the pervious bed may be cut off in a similar manner. Sometimes a heading is driven into the hillside in the line of the main trench until watertight material is encountered, or to such a distance as will give the water so far to travel as to prevent serious percolation. In some instances the outcrop may be covered with a layer of cement concrete or of clay puddle protected by pitching.

In this country no engineer would dream of founding a masonry dam on superficial deposits, though this had been done in the United States. Even with an earthen embankment there is grave risk of leakage through pockets of gravel or porous material which may sooner or later undermine the bank. The harder rocks also have their failings. Weathering, faulting, folding and surface movements generally render them pervious and insecure. The opening up of the rock caused by weathering decreases with the depth, and the depth at which sound rock may be found varies considerably in different materials. Faults, primarily caused by crustal movements, may give trouble if the material filling the fracture is of a porous nature. This would be the case if the rock on either side of the fault were very hard. If, on the other hand, the country rock is shaley, the fault rock might be entirely watertight. Much depends also on the position of the fault relative to the dam trench. The effect of folding, which may be due to widespread crustal movements or to relative motion between alternating beds of shale and rock, is again to open up the rocks. The opening up may gradually die out in a small distance from the surface, or it may extend to a considerable depth.

For efficient location it is essential that the valley should be geologically surveyed for some distance, depending on the inclination of the strata, above and below the tentative site of the dam. The results should be plotted on a map, from which it will usually be possible to form a general idea of the arrangement of the bed, and their character, the presence of large faults or other dislocations within the area may also be detected. Before the

FINAL POSITION OF THE DAM

can be settled more detailed information is necessary, and this is best obtained by sinking trial shafts, not less than 8 ft. square, which, in the superficial deposits, should be well timbered from the top. The positions of the shafts are fixed after a careful consideration of the information already obtained, and should be such as will yield most information and clear up any points which would otherwise remain in doubt. It is well to carry one or two of the shafts down to and for some distance into the watertight rock.

Possibly there may be an occasional case in which trial shafts or borings are considered unnecessary, but as most valleys are covered with some alluvial or glacial deposit, or have suffered more or less serious crustal disturbance, something beyond mere surface examination is required. Boreholes are sometimes used, but do not give much idea of the actual state of the various beds passed through, and trial shafts, which make it possible to study a comparatively large exposure in detail, are preferable. If boring is carried out cores should always be obtained. Referring to the diamond drill exploration of the strata made when locating the New Croton Dam, it was said that "in a general way the rock was found to be more broken up and traversed by seams, fissures and soft streaks than might have been expected from the general surface conditions and from the boreholes themselves." From the information now available, the best site for the dam and the necessity or otherwise for heel and wing trenches can be decided upon, and a reliable estimate made of the probable ultimate cost.

DESIGN OF DAM.

In Messrs. Pearson & Atcherley's Memoir, published in 1904, it was urged that engineers, by treating horizontal sections as the critical sections, entirely overlooked the fact that serious tensile stresses existed on vertical planes near the tail of the dam. Messrs. Wilson & Gore's experiments on indiarubber models, however, indicated that the middle third rule for horizontal sections, which implied the trapezium law of distribution of stress, could be safely used in design; that there is a rather considerable amount of tension in the vicinity of the upstream toe, which may be reduced by making the upstream face vertical, or by a general increase in the dimensions of the dam, and that the rather high stresses found at the downstream toe may be reduced by rounding off the re-entrant angle there. The two conditions usually observed in practical design are (*a*) that the maximum compressive stress found on planes perpendicular to the downstream face should not exceed 10 tons to 14 tons per square foot, and (*b*) that the line of resultant thrust, reservoir full or empty, should never fall outside the middle third of horizontal sections. The second condition ensures the absence of tension, due to loading, throughout the dam, except near the base, and in general implies that there is no excessive shear stress.

Before commencing the actual design, the flood-water level must be settled. The extent of the drainage area and its character being known, a figure based upon experience and ranging from 1,000 cub. ft. per second per 1,000 acres for a few hundred acres to 250 per 1,000 acres for 15,000 acres, is assumed for the maximum rate of flood discharge. Frequently the dam itself is made to act as the spillway, either for its whole length or part of it, but occasionally the floods may be discharged down a by-wash channel quite independent of the dam. In any case, the height of the flow-over can be estimated. This height varies in practice from 3 ft. to 5 ft.

Following the design given in "Waterworks Engineering," * if

p = specific gravity of material of dam (assumed uniform);
w = weight of a cubic foot of water in tons;
s = maximum compressive stress allowed in tons per square foot;
h = depth of any plane below flood level in feet;
b = breadth at same level;

we have the following relations—

$$b = \frac{1}{\sqrt{\rho}} h, \text{ which holds until } h = \frac{s}{w(p+1)} = h_1$$

Below this level the point at which the resultant (reservoir full) cuts the base must be brought gradu-

* Tudsbery and Brightmore. Third Edition. Page 213.

ally nearer the mid-point of the section as the depth increases, so as to keep the maximum stress within the limit s; the limiting height is that at which the maximum stress equals s. A formula, giving the widths below h_1, is $= b_1 - \sqrt{\frac{w h^3}{s}\left(1 + \frac{w^2 h^2}{4 W^2}\right)}$, in which W, the weight of the dam above the horizontal plane at depth h, is arrived at by approximation.

If $\rho = 2{\cdot}25$, then the base of the elementary triangle will be $\frac{2}{3}$ of the height. For $s = 12$ tons, h_1 works out at 130 ft.

The section obtained by calculation should always be checked by graphic statics.

If any further modifications of the section are considered necessary they will always increase the dimensions of the dam. By making the upstream face vertical the line of pressure, reservoir empty, will fall a little outside the middle third in the lower parts of the dam, owing to the extra thickness added at the top for wave resistance, and possibly for carrying a road over the dam; and for the full reservoir the resultant will cut the base a little nearer the centre, the increased compression at the inner toe helping to neutralise the tension previously referred to.

Messrs. Wilson & Gore's experiments (slide) show that from the upstream toe downwards through the base of the model the plane across which there is tension approaches the vertical and the tension vanishes.* In the actual dam the tension might cause a separation between the upstream face and the rock, though if the tail of the dam abuts on fairly sound rock downstream this is not a serious matter. In many masonry dams, and in practically all constructed in England, the downstream face finishes in a smooth curve so as to reduce the erosive action of the overflowing water on the rock below the dam, and this incidentally reduces the stresses at the toe. As a further precaution against erosion a pool is sometimes formed by a subsidiary dam placed a short distance from the toe.

CRACKS.

There is hardly a straight masonry dam free from cracks; usually these are widest at the top and sometimes extend in more or less vertical lines almost to the base. It is not known whether in massive dams these cracks extend far from the face, though in one or two cases it seems as if this has occurred. That they are partly due to variations of temperature is beyond doubt. It has been stated that in this country the temperature of that portion of the dam within 10 ft. of the face varies from 70 deg. Fahr. to 40 deg. Fahr., and the corresponding longitudinal compressive and tensile stresses exceed 20 tons per square foot.† It is not surprising, therefore, that cracks from this cause do appear. The fact that much of the building takes place during the fine and warm weather and little throughout the winter aggravates the trouble. Some of the failures in this respect have also been attributed to shear stress caused by unequal settlement in rather narrow steep-sided valleys. It is considered by some that such cracks may be prevented, or rather so distributed as to be hardly noticeable, by the use of steel reinforcement, but this method has been employed in but a few cases, and with indifferent success. Certain low dams have been constructed with vertical asphalt joints at intervals in their length, and these appear to have prevented serious cracks, though the idea has not been carried into practice in high dams.

What appears to be the true solution of the problem is to curve the dam in plan. By so doing the longitudinal compression induced by arch action will close up any cracks formed by contraction. The principle can be applied in most cases, and has such advantages that, although widely adopted in the past, it will probably be more extensively used in the future. Among the exceptions may be noted cases where (1) the dam is very long, (2) the curvature would throw the dam on to unsound material, and (3) where the hillsides are not strong enough, though by increasing the area receiving the thrust the pressure may be reduced to suit almost any material. In a curved dam the stresses on what might be termed the gravity section are reduced as the moment of inertia of the various horizontal sections about their axis of figure in plan is increased. This reduction is usually treated as a rather indefinite increase in the factor of safety, and not as a reason for reducing the section.

Leakage under a dam may, in the absence of adequate drainage of the foundation, lead to such an uplift on its base as would reduce its stability to a dangerously low value, especially where the rocks are shaley and level bedded. If this should occur in a straight dam the structure or parts of it might be swept downstream before the water in the reservoir could be drawn off, whereas no such thing could happen with a curved dam unless the material of the dam absolutely crushed or the solid hillside yielded.

It is very desirable to prevent water from entering the dam. In this country and in America reliance is generally placed on carefully caulked face joints, while on the Continent one finds that the upstream face is rendered with asphalt or trass cement mortar. This rendering is usually protected from weathering by a screen wall leaning against the battered face. In addition, vertical drains, connected with horizontal longitudinal tunnels, are sometimes formed at intervals near the vertical face. Further modification in the section will probably be required to take account of the character of the foundation rock and the proportion which the length of maximum section bears to the total length of the dam.

SETTING OUT AND CONSTRUCTION.

It will be assumed that a straight dam is to be constructed. The setting out of a curved dam is not quite so simple, but presents no particular difficulty. One of the first things to be done is to construct two observatories, one on each side of the valley, at 100 ft. or 150 ft. above the top of the dam. These observatories will be of brick or concrete, about 15 sq. in. or 18 sq. in., standing on a good foundation, on top of which are iron plates in which a good "centre dot" has been made so as to be in the vertical plane containing the "centre line" of the dam, and having three lead spots to receive the three screws of the upper plate of the theodolite. The "centre line" may be the line of the crest or any other convenient parallel line. On the valley faces of the observatories black arrows with finely drawn-out points are painted on a white ground, so that the points are in the previously mentioned vertical plane. It is sometimes thought that greater accuracy is obtained by wide vertical black lines instead of the arrows. Supplementary stations, distant multiples of 20 ft. away from the principal stations, are a convenience; they may be defined by a nail in a stout peg behind which a plumb ranging rod has been erected, the whole being surrounded by a fence to prevent disturbance by sheep. An arbitrary point, usually not on the dam itself, is then chosen as the zero from which distances are measured along the centre line of the dam. For convenience of setting out and periodical measurement, cross-sections are taken every 20 ft. or 25 ft.

If the dam is situated some distance from a railway station, as is generally the case, some means of transport to the works must be provided. Traction haulage may meet the case. Frequently, however, a railway and sidings is considered necessary, and its construction is put in hand as soon as the dam has been decided upon. At the same time the temporary works are started, and the various mechanical arrangements installed. These would include accommodation for the workmen, cement storing and aërating sheds, stone-breaking and grading machines, domestic water supply, a small reservoir for a high-pressure water supply, masons' sheds, wagon roads, and, frequently, if sufficient head room can be obtained, one, or preferably two, overhead cableways capable of lifting about 6 tons, together with locomotives and other cranes. The main function of the cableways is to remove the excavated material from the trenches, and later to carry the concrete in tip skips from the mixers placed on the hillside near the end of the dam, or from some point in the valley bottom to which the skips are brought in wagons. They are particularly useful when the various cranes, travelling or otherwise, scattered about the dam are to be moved.

The widths of the main trench at various cross-sections being taken from the plans, the limits of the excavation can be defined, and this portion of the work put in hand. Perhaps it should be stated that the maximum width of the trench at any point is the width of the dam section corresponding to the top of the rock at the point. Below this level the sides of the excavation are vertical, or as nearly so as is possible without timbering. A timber trough capable of discharging the maximum flood is constructed across the main trench some distance from the stream, and at such a level as will give a sufficient fall in a channel to be cut from the trench to a point at which the stream may be conveniently

* Water Supply. "Encyclopædia Britannica": 11th Edition.
† E. Sandeman. Presidential Address, Association of Water Engineers, 1911.

diverted. This course is followed when it is desired to proceed with the excavation under the existing stream bed as soon as possible. In other cases the river is not diverted until a tunnel, left to convey it through the dam, is ready.

As the main trench is completed the heel trench is put in hand. The usual width is 5 ft. or 6 ft., and it is carried down some little distance into watertight rock. For convenience of working it is generally kept a little distance back from the upper toe of the dam, and to minimise movement of the rocks on which the dam will ultimately rest, particular care is taken with the timbering. While the main trench may be carried 40 ft. or 50 ft. below the ground, the heel trench may have 50 ft. or 60 ft. greater depth. It is generally possible, and always advisable to fill up the heel trench with 4 or 5 to 1 concrete, free from displacers, as soon as it is bottomed. Prior to putting in the concrete the rock surface is well cleaned by a pressure water jet and wire brushes, any small cracks being grouted up and plastered with cement mortar or coated with grout.

Sump holes are sunk and pumps divided, so that the trench may at all times be kept fairly dry during the excavation and refilling. Any springs encountered as the concreting proceeds, and which would interfere with the proper setting of the concrete, are led into pipes which are carried up with the concrete; when the water ceases to rise, the pipes are filled with grout under pressure or simply sealed with a screwed plug. Great care is taken, both here and elsewhere, that all old concrete is picked over, washed and plastered before resuming the concreting, and that no through joints, vertical or horizontal, are left.

When the heel trench has been completed, and before a start is made with the dam proper, a system of 6-in. stoneware

DRAINS

is arranged to afford ample opportunity of escape for any water which may exert upward pressure on the base of the dam behind the heel trench. These drains lead to larger vertical pipes placed at intervals along the toe of the dam, and with their outlets at such a level as will ensure a free discharge at all times, or they may be led into the drainage culvert of the dam.

After all loose rock has been removed, and with the rock bed rough, jagged, and inclining downwards towards the upstream face, a bed of mortar is spread over the foundation, and a layer of concrete about 2 ft. thick spread over this forms the first course of the dam. Above this the concrete may contain displacers or plums. These stones, which must be of sound, hard rock, are of large size, running up to 1 or 2 tons, and prior to being dropped on a good bed of concrete they are well washed, scrubbed with wire brushes, and coated while damp with cement grout. They are so placed in the work that no air cavities can exist beneath them, and adjacent blocks are seldom less than some 6 in. apart. The bed of concrete into which the plum is beaten with wooden mawls is always of such a thickness that there is no risk of the block "riding" upon a lower one. The displacers are rarely surrounded by concrete in one day, and, projecting as they do up and from the work 1 ft. or 2 ft., form excellent keys and serve to break joints. As additional safeguards, vertical V-shaped grooves, some 9 in. deep, are sometimes made at vertical joints, and longitudinal grooves about the same depth and 18 in. wide on any flat surfaces.

As the ground surface is reached an arched opening is formed to convey the water through the dam. Two methods of dealing with it will be described. The top, sides and bottom of this tunnel have large toothings or indents formed at intervals throughout its length, and the exposed surfaces are well picked over. When the tunnel is complete, the river is diverted to flow through it. As the superstructure is nearing completion, and at a dry season when possible, a cofferdam or earthen bank is formed about the entrance to the tunnel, and forthwith the closing up of the masonry facing at both ends of the tunnel is commenced. Concreting then proceeds, working inwards from either end, and using 4 to 1 concrete and plenty of mortar between the old and the new work. In the dam a vertical shaft 3 ft. in diameter has been formed rising from the crown of the tunnel to a longitudinal tunnel connecting the valve towers. It is through this shaft that the concrete is passed, and this in its turn is made up with concrete. A wrought-iron pipe with screwed joints is embedded in the concrete with its lower end near to the up-stream [illegible] and its upper end [illegible] with a grouting pan worked in the longitudinal tunnel. When the concrete has had time to set, grout is forced down the pipe with a view to filling up any interstices left by the concretor.

In the second method not only are grooves left in the sides of the tunnel, but a reduction in size is also made towards its lower end by three or four offsets. Through the cofferdam the scouring-out pipe (or pipes) is laid, and is continued through to the other end of the tunnel. The water is allowed to flow through this pipe until the tunnel has been filled in. To provide against floods the upstream face is at once built up and made practically watertight. The remainder of the concreting is then completed. The arrangements made for grouting in this case take the form of a pipe leading through the dam to the top of the arch from a convenient point on its downstream side. When it is considered that all crevices not previously filled by the concrete are sealed, the pipe is left full of grout and plugged. While the

PROPORTIONS OF THE CONCRETE

—5 or 6 to 1—vary but little in this country, the practice with regard to the quantity of water used in mixing it varies considerably. Some prefer such mixtures as will show the least trace of water on the surface after vigorous ramming; others use an almost sloppy mixture. Dry concrete is the more costly, though if the ramming is uniform throughout this concrete will be more compact and therefore less pervious. On the other hand, a wetter concrete is more easily handled, less dependent on the workmen for its uniformity, and, considered in bulk, very little, if at all, inferior to the more expensive mixing. It has been suggested that by using "dry" concrete shrinkage cracks may be avoided. This appears to be reasonable, though there hardly seems to be enough evidence to warrant a definite conclusion.

The proportions of sand and stone to cement are arrived at by experiment, and are such as will give a mixture of maximum density. Once the proportion of sand and stone is fixed, it should be strictly maintained, the two materials being gauged separately for each banker. One sometimes finds that stone and sand are allowed to be tipped, probably in the correct proportion, to form one large heap on the stage. From this heap a quantity equal to the total bulk of sand and stone is gauged with the necessary cement, with the result that there is considerable variation in the proportions of sand and stone in the bankers. As regards the

FACING OF THE DAM,

it is a general rule that the blocks should be massive and the face impervious to water. Courses of squared rubble, varying between 18 in. and 30 in. in depth, and not less than 18 in. wide, with headers not less than 3 ft. to 4 ft. long, and occupying at least 25 per cent of the face area, represents average practice. The length of the stretchers ranges from 3 ft. to 8 ft., and their average weight would be about 2 tons. Though in most cases the beds and joints of all facing stones are left fairly rough, but true, in some instances V or other grooves have been added. The top and bottom beds are parallel, and always perpendicular to the face of the dam; curved faces necessitate slight variations in the thickness of the bed joints.

It is an advantage to get as high an average specific gravity as possible in the dam, and since the stone used has, in general, a higher specific gravity than the concrete, the greater the percentage of stone within the limits mentioned, the better. The ratio of the weights of stone and concrete in dams ranges from 30 and 70 to 45 and 55.

The face stones on the downstream face are set in 2 to 1 cement mortar, both bed and vertical joints being ¼ in. to ¾ in. thick. Some little time after the facing has been backed up with concrete the joints are raked out to a depth of 3 in. and caulked with almost dry 1 to 1 cement mortar. On the upstream face the caulking is done with neat cement, and the setting in 1 to 1 mortar. In this case there is no particular restriction as to displacers, except that the distance between them and the face stones should somewhat exceed 6 in. In other cases no caulking of face joints has been done, but then no displacers have been allowed within 10 ft. of the water face, and the 3 to 1 concrete backing has been made of stone broken to pass a 14-in ring instead of the more usual 2-in. ring.

For handling the stones and other materials travelling cranes, capable of lifting 5 tons at a radius of 25 ft., may be employed. Piers of concrete are raised, to 15 ft. or 20 ft. above the work at some point, and 300 ft. to 400 ft. apart. On these are placed girder beds,

upon which rest longitudinal girders carrying sleepers and rails. The sides of the piers are deeply indented and well picked over, so as to provide the requisite key for the concrete which will eventually surround them. As the work is levelled up at this point fresh piers are constructed at some distance away. Another set of girders and rails is then fixed in position, and the crane is raised on to its new track.

Derrick cranes having 50-ft. or 60-ft. jibs may be used. They may be supported on wood or steel towers placed quite clear of the dam or resting on the downstream face, or temporary piers may be raised from the existing work to carry girders or baulks on which are longitudinal rails. The ends of the sills of the crane rest on trucks running on the one set of rails, while the king post rests on another truck running on the other parallel rails.

The crest of the dam is faced or formed of radiating ashlar blocks, often set in 1 to 1 cement mortar, and the coping stones have joggled joints. If a road crosses the dam, it is generally carried on arches springing from piers rising from the crest, and as this work is always visible some attempt is made to give it a pleasing appearance.

Space will not permit of a description of the outlet works, though we may remark that, whereas in many earthen embankments it is inadvisable to make a culvert through the bank, in a masonry dam this is the usual procedure.

A POINT TO BE WATCHED

during construction is that at its various sections the dam is true to the drawings. For both straight and curved faces straight profiles 10 ft. or 12 ft. long, made of floor boards, meet the case. These are supported by iron brackets fixed into the bed joints, or into holes drilled for the purpose in the facing-stones, and are placed a definite distance measured horizontally out from the dam in every case. The brackets are so made as to permit of a movement of several inches to and from the wall. For a straight face the arrangement is exact, but a curve becomes a series of chords, the difference between the arc and its chord is inappreciable, particularly when it is remembered that the work is quarry-faced and the pitching lines are not too well defined.

The dam is drawn out to a large scale, and a table is compiled giving the distance of the two faces from the centre line for various levels at vertical intervals of 5 ft. or 6 ft., allowing, of course, for the constant projection, say 12 in., of the profile outside the work. From these distances the batter of the faces lying between pairs of levels is worked out and tabulated. Batter plum rules are made to correspond with the tabulated batters. It is now a comparatively simple matter to fix a profile at any particular point. A theodolite can be set up at the most convenient of the hillside stations and, taking the usual steps to ensure accuracy, a mark can be made on the dam which will be so many feet back from the centre line. From the facing already completed and using the batter plum rule, the profile is set at approximately its true position. After ascertaining the level at which the next widths have been tabulated this level can be marked on the profile, and the distance of the profile from the mark on the dam should agree with the tabulated figure. If it does not, the profile is moved slightly, the level is marked on afresh, and the distance again checked.

Address Wanted. A firm of engineers require the address of the Watkins Heat Recorder Company. Please address "H. N." c/o THE EDITOR.

Housing in Ireland.—The Lord-Lieutenant of Ireland lately received a deputation composed of gentlemen representing thirty-five towns in Ireland, whose object was to ask him to use his influence with the Government in order that the facilities obtained by rural councils for providing suitable dwellings for the working classes should also be extended to urban councils.

Paving Tramways with Nidged Setts.—The Glasgow Corporation Streets Committee, having adopted as a principle the employment of nidged setts—*i.e.*, setts with a finely dressed surfaces in paving the principal thoroughfares in that city, largely with a view to minimising noise, have represented to the Tramways Committee the desirability of paving the tramway tracks with a similar class of sett. The Tramways Committee have requested the general manager to prepare a report upon the subject.

MUNICIPAL WORK AT GODALMING.

REPORT OF BOROUGH SURVEYOR AND WATER ENGINEER.

Statistics in regard to the borough of Godalming, which appear in the last-issued report of Mr. J. H. Norris, the surveyor and water engineer, show that the population of that town—which has an area of 812 acres—has increased since the year 1892 from 8,117 to 8,847. The death-rate stands at the very low figure of 10·96 per 1,000, as compared with a birth-rate of 17·52 per 1,000.

In regard to sewerage the report mentions that there are leakages of sub-soil water at several points, and that the question of stopping these must be considered in the near future, as they seriously swell the quantity of sewage to be lifted at the outfall works. A similar remark applies to much roof and surface water which finds admission to the sewers.

Some difficulty exists in eliminating the colour of certain trade wastes discharged into the sewers, and there appears evidence of inadequate sedimentation in some of the liquors. These matters are being inquired into.

The indicated quantity of sewage pumped during the year was 248,832,000 gallons, but this must be diminished by deductions for slip in pumps, amounting, perhaps, to 10 per cent. It also includes trade wastes, leaks, storm water and flushing water; but after allowing for all these factors the flow must be considered a very large one for the population connected.

Building activity in the borough has again slackened, and it is noteworthy that the erection of fourteen new dwelling houses, for which plans were submitted during the year, involved the demolition of eight old ones.

The number of loads of dust removed from houses within the borough during the year was 1,844 against 1,716 loads for the previous year. Mr. Norris states that the work continues to be very well organised and efficiently carried out by a foreman and a staff of five men.

Dealing with highway matters, the borough surveyor mentions that the town is now feeling the benefit of tarring operations on roads with light traffic. It has been found that the tar coating lasts throughout the year, and that little wear of the road surfaces has occurred during recent seasons.

No change has been made in the organisation of the scavenging work, which is arranged on the basis of each man responsible for a particular district. Experiments were conducted to prove whether a change of system would be advantageous, when it appeared that with horses and carts and sweepers, working in gangs, the work could be done much more expeditiously, though perhaps not more economically.

The total quantity of water pumped to the town's reservoirs, as indicated by the pumps, was 194,422,631 gallons, or an average of 632,665 gallons per diem; 15,500,000 gallons of the total was lifted from new works at Ockford.

The estimated population supplied is 14,500, and the quantity per head is therefore 36½ gallons. This figure, however, must be diminished by the quantities used for trade purposes, gardens, street watering, sewer flushing, and by an allowance for main leakages and slips in pumps. These will probably amount to at least 120,000 gallons per day, making the daily consumption per head 29 gallons for domestic purposes.

Stoke-on-Trent New Municipal Buildings.—New municipal buildings at Stoke-on-Trent were formally opened last week. The mayor (Alderman F. Green, J.P.), in the course of the proceedings, expressed deep gratitude to the officials who had helped with the scheme, adding, "I specially desire to mention the name of the borough surveyor, Mr. A. Burton. The architects have done their duty, and have done it well, But in Mr. Burton we have had a man we could trust, whose whole life has been one devoted to his duty and to his employers. I give utterance to this expression because I can, with the committee, say without hesitation that we are deeply indebted to him." The whole of the buildings, decoration and fittings, including electric light fittings, have been designed and detailed by the joint architects, Messrs. James A. Bowden, of 6 Duke-street, Adelphi, Strand, and Thomas Wallis, of Queen Anne's Chambers, Westminster. The contractors for the building were Messrs. Wilcock & Co., of Wolverhampton.

INSTITUTION OF CIVIL ENGINEERS.

PRESIDENTIAL ADDRESS.

In his presidential address to the members of the Institution of Civil Engineers on Tuesday evening, Mr. Robert Elliott-Cooper said the improvement of the conditions under which young men were enabled to obtain their first practical experience of professional work—during the early years of which they must necessarily be more or less in the position of learners—was one of the most important questions that the institution has ever had before it. It could avail little to lay down standards of knowledge suited to form the basis of engineering training, and to devote the most careful attention to the means of testing the possession of such knowledge, unless at the same time the needs of those who had proved their fitness in this respect were recognised and provided for in the matter of opportunities of obtaining practical training. In the past quarter of a century the facilities for acquiring a knowledge of engineering science had been vastly extended and improved, and it might be said generally that the technical institutions fully recognised the desirability of sending out young men fitted to enter engineers' offices and works, and able to render some useful service in return for the opportunities they sought of obtaining a working knowledge of the profession.

It was for engineers—members of the institution—to realise more widely the desirability of extending a helping hand to young men at this stage; for it was clear that the future of the profession must depend very much upon the extent to which the engineers of the present day were disposed to take active interest in the question of the training of their successors, to facilitate the acquisition of practical training, and also to insist upon complete qualifications on the part of those engaged by them as assistants. He pleaded in favour of all possible facilities being afforded by masters to their pupils and younger assistants for participation in the visits to engineering works which were regularly arranged for by the institution. Such inspections were of advantage to those who made them, and must thereby benefit, too, the employers themselves.

EMPLOYMENT.

While it formed no part of the objects of the institution to find employment for its members, it is obvious that developments which had taken place pointed to a wider and growing recognition of the professional qualification afforded by the institution diploma. The members had been made aware of views entertained for several years past by the council as to the national importance of engineers engaged in public services and works being possessed of such qualifications as would be accepted by the engineering profession as proof of competence to exercise it. The council had already indicated that they believed it to be their duty to urge the adoption of that principle, and were doing their best to secure it. The Civil Engineers' Appointments Board, while in no sense part of or associated officially with the institution, was formed with the full sympathy of the council, and had already proved of considerable usefulness both to engineering employers and to many of our younger members and students. He was informed that it was apparent that the Appointments Board's operations would be largely increased, with corresponding benefit to young engineers, if many of the latter were able to show more practical qualifications for general engineering work, such as draughtsmanship, surveying work in its various branches, and acquaintance with the simpler kinds of constructional work, than unduly specialised training was calculated to secure. He commended that to the consideration of students, and those under whose guidance they might come.

ENGINEERING WORK ABROAD.

Speaking of the labours of the civil engineer in distant parts of the world, the president remarked that there was one main difference between the methods of construction of public works at home and abroad which affected materially the qualifications of the engineer in charge of them. In the country it was to a great extent customary for the carrying out of the works to be placed in the hands of an experienced contractor, according to the designs and under the supervision of the engineer, but in Australia South Africa and the Crown Colonies the work of construction was generally carried out "departmentally"—that was, without the intervention of a contractor. In Canada, however, the plan of carrying out the work through a contractor was more generally adopted, where, in the case of bridge construction, contractors often submitted designs for the work which they tendered for, in that respect following the United States' practice.

There were many advocates for each of these methods, even to the extent of the rival systems becoming planks of political parties. In many cases, however, there was no choice when contractors possessing the requisite skill and capital were not available, and it often became necessary for the Government to provide these essentials, including plant and material. The engineer, therefore, in direct charge of works, who at home would be called on to exercise the ordinary functions of a scientific and practical designing and inspecting civil engineer, had, in the case of similar work abroad, to add to them the business aptitude, the commercial ability, and the qualifications of a successful organiser of labour, which were required by the contractor's agent. Moreover, vigorous health also must generally be his, to meet not only, in some cases, bad climates, but in nearly all the various hardships inseparable from undeveloped regions.

The remoteness of operations is often a great factor of difficulty in overseas work. Temporary houses or tents had to be provided for the engineer and his workers, who had often to be provided with rations, medical attendance and sanitary requirements; the law had to be enforced, and the construction engineer, in some instances, had to be sworn in as a magistrate, in order to meet emergencies such as might be expected in outlying districts. Then, the engineer had less means to his hand for constructional contingencies than his brother at home, and, generally, owing to distance, not equal opportunities of consulting his superior officer. Frequently, in the case of railway construction, the object of which was to convert an uninhabited country into an inhabited one, the engineer was called upon to fix and lay out the sites for future towns which would be suitable as regards foundations, water supply, drainage, and generally conformable to surrounding conditions. All these considerations pointed to the necessity of greater resourcefulness on the part of the civil engineer abroad over and above that required at home; and in judging of the great works which had been accomplished they could not lose sight of those particular factors which had formed such an important part in their successful achievement.

THE INSTITUTION'S NEW PREMISES.

In the course of his remarks Mr. Elliott-Cooper stated that, although they had been somewhat disappointed in the progress made, the hope and expectation which the council expressed at the end of last session that some part of the institution's new building would be brought into use early in the year—was likely to be realised, and they were assured by the architect and builders that they might look forward with confidence to the work being sufficiently completed to ensure the building's official opening during the coming summer.

"The Surveyor" for Reference.—As an indication of the value placed on back numbers of THE SURVEYOR, it is interesting to note that copies of two issues published in 1904 at 3d. each recently brought the high price of 3s. 6d. They were probably bought to complete volumes for reference.

The Colne Tramways.—The Colne Town Council on Wednesday week decided to enter into negotiations with the Colne and Trawden Light Railway Company to effect a purchase of the whole plant, the price to be fixed by arbitration, and instructed the town clerk to take the necessary steps promptly. The total length of the line is 6 miles, and the system serves Trawden, Shawbridge, Nelson, Barlowford and Burnley, in addition to Colne itself.

Improvement in Sewage Treatment.—The new sewage works built by the Brentwood and Billericay joint authorities, at a cost of £20,000, were opened lately by Dr. Thresh, medical officer of Essex. Dr. Thresh said the new works were unlikely to be superseded for many generations, as the bacteriological process had been so improved that in these, the most modern works in the kingdom, the sewage effluent could be made pure enough to use over again as drinking water

Construction of Surfaces with Bituminous Materials.*

By ARTHUR H. BLANCHARD, M.AM.SOC.C.E., Professor of Highway Engineering, Columbia University.

Various kinds of bituminous materials have been used in the United States in the construction of roads and pavements for over fifty years. The introduction of the use of bituminous surfaces and bituminous pavements in the construction of highways outside of built-up districts is of comparatively recent origin in this country, dating practically from 1906. Since that period the growth of the use of asphalts, asphaltic oils and tars has been exceedingly rapid. For example may be cited the increase in the yardage of bituminous surfaces and bituminous pavements constructed with bituminous materials, not including light oils, under the jurisdiction of eight State Highway Departments of the East. In 1908 the total yardage was 416,700, while in 1911, 17,749,000 yds. were constructed. The discussion of this subject will be presented in the form of a brief *resume* of typical current practice, and a review of some of the causes of failure of the different types of bituminous surfaces and bituminous pavements.

In order to avoid misunderstandings, the various methods of using bituminous materials referred to in this paper will be explained by the following definitions:

(1) Bituminous surfaces are those consisting of superficial coats of bituminous materials, with or without the addition of stone or slag chips, gravel, sand or materials of a similar character.

(2) Bituminous-macadam pavements are those consisting of broken stone and bituminous materials incorporated together by penetration methods.

(3) Bituminous-gravel pavements are those consisting of gravel and bituminous materials incorporated together by penetration methods.

(4) Bituminous-concrete pavements are those having a wearing surface composed of stone, gravel, sand, &c., or combinations thereof, and bituminous materials incorporated together by mixing methods.

BITUMINOUS SURFACES.

Bituminous surfaces are usually constructed on macadam or gravel roads, or on bituminous pavements or cement concrete pavements. A notable innovation is the use of bituminous surfaces on brick and wood block pavements. In the case of roads, the mode of procedure is to thoroughly clean the surface by sweeping with hand-brooms or horse-sweepers, or combination of these methods. The bituminous material, which is generally heated, is applied to the surface with the aid of pouring-cans, hose attached to gravity tanks, hand-drawn gravity distributors, horse-drawn or power-driven gravity distributors and pressure distributors. After a varying interval, some kind of mineral coating is generally applied to cover the bituminous material.

The causes of failure of bituminous surfaces are numerous. They may be considered from the standpoint of the condition and character of the original surface, the material used, the method of construction or local conditions.

The failure of bituminous surfaces from the standpoint of the character of the original surface is many times due to failure on the part of those in charge to place the surface in satisfactory condition before the application of the bituminous material. Many cases are noted where bituminous materials are applied over a surface in which are found many potholes and ruts, or which is dirty, due either to accumulated dust and dirt, or to the original method of construction. With certain kinds of materials a damp condition of the surface has resulted in failure.

From the standpoint of the physical and chemical properties of the material, many instances may be cited in which failure is due to materials not having the proper characteristics for the conditions under which they are employed. As an example might be cited the case of a prominent thoroughfare in one of our large cities which is subjected to motor-bus traffic and a large amount of motor-car and horse-drawn vehicle traffic. This road is constructed of gravel, upon which has been applied an asphaltic oil and gravel top dressing. The surface at the present time in many sections is full of ruts caused by the traffic pushing the material from side to side. Again, the large percentage of volatile constituents contained in certain asphaltic oils has rendered surfaces constructed with them unsatisfactory, because of the long period required for these surfaces to "set up," so that the bituminous material will not track or the carpet thus formed will not creep and form waves and humps. In certain cases the use of light oils on tar or asphalt surfaces has softened the original bituminous surface to such an extent as to render the road or pavement unsatisfactory for use.

From the standpoint of construction, we find failures due both to the use of too small an amount of the bituminous material and an excess of material. Improper application, resulting in uneven distribution, is accountable for many failures of bituminous surfaces, while in other cases a lack of sufficient covering of stone chips or material of a similar character has rendered the surface sticky, mushy, sometimes in the first season, but sometimes not until the second summer.

There are numerous instances where bituminous surfaces have been adopted under conditions which call for the construction of bituminous-concrete pavements, or even some type of block pavements. A mat type of construction, which has been employed to a considerable extent, has proved inefficacious in cases where horse-drawn vehicle traffic has been more than a certain amount in combination with motor-car traffic, which in amount was not sufficient to satisfactorily iron out the calk holes caused by the horse-drawn vehicle traffic. There are cases where æsthetics should govern the selection of the type of surface, and generally in such cases the black or brown surface resulting from the use of bituminous material does not harmonise well with the environments.

BITUMINOUS-MACADAM AND BITUMINOUS-GRAVEL PAVEMENTS.

Bituminous-macadam and bituminous-gravel pavements are of many types, one of the primary differences in construction being the use of one or two applications of the bituminous material. The efficacy of many of the types depends upon the combinations of sizes of broken stone or gravel, and the combinations of bituminous materials used when two applications are employed. Variations in types also exist dependent upon the manner in which the different courses may be filled and the treatment of the filled course prior to the application of the bituminous material. The one-application method is very similar in its simplest form to the construction of a bituminous surface, except that the bituminous material is applied upon a much more open surface. In the case of the two-application method, in certain instances an attempt is made to build up a two-course pavement, while in others the second application is in reality used as a seal coat.

Unfortunately many are the instances where improper bituminous materials have been employed. In some cases the materials were satisfactory in themselves, but were used improperly. Many engineers having charge of bituminous work do not appreciate the cold fact that different types of bituminous materials have entirely different physical properties, and require entirely different treatment in use, although they may have been purchased under one and the same specification, covering chemical and physical properties. In some cases entirely unjustifiable combinations of materials are employed. For instance, one case is in mind where an asphalt of excellent characteristics was used for the first application, while for the second application an asphaltic oil, having decidedly solvent and fluxing properties, was employed. Overheating of the material has likewise proved the cause of many failures, as thus the properties of the materials are sometimes changed, and in many cases the materials are ruined.

Under the heading construction we find failures due to the uneven distribution resulting, especially from the improper use of hand pouring pots and hand-drawn distributors, and also in many cases when horse-drawn or power-driven distributors are employed. Many unsatisfactory bituminous-macadam

* Paper read before the American Road Congress at Atlantic City on October 4th.

pavements result from the use of the wrong sizes of broken stone. One instance will be cited where a hand-broken stone, ranging from 2 in. to 3½ in., was used for the wearing surface. After rolling, 1½ gallons of bituminous material were applied, and the road finished with a layer of chips. The rapid formation of fine cracks due to the rocking movement of the individual stones under traffic, finally resulting in ravelling and general disintegration, is of common occurrence. Segregation of sizes of stone preventing uniform penetration results in weak spots in some cases and "fat" spots in others. In certain cases after a rain the construction has been carried on before the broken stone immediately below the surface has dried out. Many of the causes attributed to the failures of bituminous surfaces may likewise apply to bituminous-macadam and bituminous-gravel pavements.

BITUMINOUS-CONCRETE PAVEMENTS.

Bituminous-concrete pavements, other than sheet asphalt and pavements laid by companies as proprietary articles, have received more attention during the past season. . . . Less fear of litigation proceedings, and the introduction of economical mixing machines equipped with heating attachments, have exerted a marked influence. But, furthermore, the rapidly growing recognition of the inherent advantages of bituminous pavements constructed by the mixing method has been largely instrumental in its adoption for traffic conditions, for which it is believed to be economical and suitable.

This type of bituminous pavement is constructed usually by one of three methods. These methods, although overlapping to a certain extent, may be described as follows, when broken stone is used as an integral part of the mineral aggregate:—

Type A consists of so-called one-size crusher run broken stone mixed with bituminous material. It should not be considered that the designation "one-size crusher run stone" means an aggregate composed of broken stone of uniform size. This term, as used here, refers to the product obtained at a crushing plant which passes over one size of screen holes, and through the next larger, or passes through a screen of one size of holes, and is retained upon a screen having smaller holes. It is evident to those familiar with the operation of crushers that the product thus obtained does not usually consist of stone of uniform size. For example, broken stone commercially designated as "¾-in." used in the vicinity of New York City, is obtained in some cases by passing over ½-in. and through 1¼-in. openings. The size of the stone varies from 1 in. to ⅛ in. It is self-evident that this variation in size produces a more stable pavement than if the aggregate consisted of broken stone of uniform size. Type A has been constructed by both hand-mixing and machine-mixing, and by using both unheated and heated stone. Many kinds of bituminous materials have been used, while in some cases one kind of bituminous material has been used in the mix and another kind for the seal coat, one of the most common combinations being the use of tar in the mix and asphalt for the seal coat.

Type B consists of coarse sand or fine broken stone and sand, or other fine mineral matter, mixed together with bituminous material. The wearing surface of the mix is sometimes finished by rolling in fine stone chips, but generally a seal coat is used together with fine mineral matter for a top dressing. When constructed on a commercial scale the mineral aggregate is always heated and mixed in a suitable constructed machine. Usually the same grade and type of bituminous material is used for the mix and the seal coat.

Type C consists of a wearing course composed of a graded aggregate of broken stone and sand with or without other mineral matter, which aggregate is mixed after being heated with a bituminous material in a specially designed machine. As with Type B this pavement is finished with and without seal coats of bituminous material. The Topeka and the bitulithic pavements may be cited as examples of Type C.

FAILURES.

Having reviewed the fundamentals of the various types, consideration will now be given to causes of failure of some bituminous concrete pavements. It should be noted that the percentage of failures of bituminous concrete pavements is much smaller than in the case of bituminous macadam and bituminous gravel pavements.

Poor and unsuitable materials have been accountable for certain failures. Attachment for a material of a certain type has led to a blind adoption of any material belonging to a given class. For instance, in one case coming under the writer's observation crude coal tar from one gasworks had given good results on the average. Based on this fact any crude coal tar was finally used, although those in authority had had an object-lesson in a failure due to the haphazard purchase of crude coal tar. Experiments in Rhode Island and in the borough of Queens seem to have demonstrated that high carbon tar of a certain consistency is not as satisfactory or advisable for a seal coat as come types of asphalts, when the percentage and volume of horse-drawn vehicle traffic is large. In some cases an apparent cause of failure has been an excess of flux or of the volatile constituents in asphalt cements. Pavements constructed with such materials many times are wavy, due to the movement of the surface under heavy traffic. Many cases are reported where materials have been overheated at the construction site, due to the belief that all materials may be and even should be heated to the same temperature before using, and that it is impossible to injure bituminous materials by heating to high temperatures.

During construction there are various details which demand careful supervision. Either too large broken stone or stone of too uniform size may cause a failure. Especially is this the case with very hard and tough broken stone. The rocking of the stone causes the formation of fine cracks which eventually lead to disintegration. Naturally the amount and character of the traffic is intimately connected with the condition of the pavement, but cases have occurred where failure, even under very light traffic, was due to using large uniform-size broken stone for the mineral aggregate of the mix. Poor combinations of sizes of broken stone and sand have resulted in segregation during mixing, transportation or spreading, resulting in a pavement of varying density and stability. Overheating of the mineral aggregate has caused burning of the bituminous material in some instances, or the formation of a thin film of bituminous material over the broken stone, which is not of sufficient amount to bind the adjacent stones together. The use of a wet aggregate will usually result in a poor mix with consequent unsatisfactory results. In many instances the seal coat has been applied ununiformly. The result is either uneconomical, due to the necessity of a second application before 75 per cent of the surface requires treatment, or the disintegration of the pavement wherever bare spots occur in pavements where a coarse aggregate was used, and where there is considerable horse-drawn vehicle traffic. Although of minor import to-day, some failures have been caused by using with unheated stone bituminous cements which will not adhere satisfactorily or which only mix with great difficulty under such conditions.

Many failures are due in part, or in full, to poor foundations. Sufficient attention has not been paid to this important part of the pavement.

Many of the above causes of failure would be eliminated if engineers would have more regard to a consideration of the mineral and chemical properties of the materials which they employ. Records should be kept showing the kind, and details of the specifications of every road noted. If a bituminous material laboratory is not connected with the department it should not be a matter excessive or difficult to secure certified analyses made by reputable chemical engineers.

In closing the writer wishes to emphasize the fact that a careful consideration of the causes of failure of bituminous surfaces and bituminous pavements constructed during the past five years will result in material benefit, inasmuch as a comprehensive knowledge of the various causes of failure is one of the most valuable assets of engineers having in charge the construction and maintenance of bituminous surfaces and bituminous pavements.

Sunderland Municipal Golf Scheme.—A municipal golf course scheme at Seaburn, near Sunderland, has been approved by the Parks Committee of Sunderland Corporation. It is proposed to rent 80 acres, and experts have pronounced the land suitable for an eighteen-hole course.

THE TRAINING OF SANITARY ENGINEERS.

By GEORGE C. WHIPPLE,
Professor of Sanitary Engineering in Harvard University.

Within the last quarter century a new profession has come to the fore—sanitary engineering. It represents the application of a new science to a new product of civilisation. The new science is bacteriology; the new product of civilisation is the modern city. How important sanitary engineering is to the world to-day is scarcely realised, so gradual has been its evolution, but its importance may be appreciated by comparing the conditions of life in our cities to-day with the conditions that existed in ancient days, or even a few generations ago. . . .

The problems of the sanitary engineer are so vast and so varied, they bring him into contact with so many branches of science and with so many classes of people, that an exceptionally broad education is demanded. . . . Not only must the sanitary engineer be versed in mathematics and mechanics, but he must have a working knowledge of parts of chemistry, biology, bacteriology, microscopy, meteorology, geology, hygiene, preventive medicine, vital statistics. Unlike other branches of engineering, sanitation is concerned not alone with iron and stone and other inert building materials, but with organic matter and living things. The purification of water and sewage is due largely to biological action, and the knowledge of bacterial processes is scarcely less important to the sanitary engineer than that of the laws governing the flow of water in pipes and the strength of materials.

While this is acknowledged, it is also true that first and foremost the sanitary engineer must be an engineer, and the collateral sciences must be subordinated. Hence, the student must be trained primarily in engineering, and secondarily in sanitation. The emphasis is important. It cannot be successfully reversed. Sanitary science teaches the student why this or that structure is needed, but it does not teach him how to design or how to construct, and these are for him the very fundamentals of his profession. The wisely arranged curriculum will therefore cover the field of sanitation in a broad and general way, without taking too much of the student's time from his detailed studies in structures and hydraulics.

But sanitary science is becoming so important that there is room not only for the constructing engineer, but for the sanitary specialist, and for him whose duty it is to operate the works after they are built, to take charge of the water filters and the sewage treatment plants, to manage the garbage works and superintend the cleaning of the streets and buildings. Such men need a slightly different training from the others, and the ideal course would give less attention to civil engineering features and more attention to mechanical engineering and laboratory work. Also more attention should be given to the subject of accounting and scientific management. This need for capable managers of sanitary works will soon be a pressing one, and our technical schools must be prepared to furnish men for this service.

Besides the sanitary engineer and the specialist in sanitation, the world to-day needs—and the need is very great—a kind of man just beginning to make his appearance—namely, the sanitary executive, or, as he is more often called, the health officer. . . .

In the pursuit of the elements of sanitary science the sanitary engineer, the sanitary specialist and the health officer meet on common ground, and to a certain extent their education may be appropriately conducted together. But for the most part their work, although mutually helpful, lies apart, and their education in the main should follow separate channels. . . .

HARVARD UNIVERSITY COURSES.

As an illustration of modern tendencies in the training of sanitary engineers, mention may be made of the newly established courses in the School of Engineering, Harvard University. Here sanitary engineering does not lead to a special degree, but is considered as a branch of civil engineering—in fact, all students in civil engineering are expected to take the general course in this subject. The same course is also open to candidates for the degree of Doctor of Public Health in the Medical School. For those who intend to engage in sanitary work at once after graduation, courses in water supply engineering and sewerage engineering are offered during the last term, and in these the students receive such detailed instruction as will fit them for the actual kinds of work that will be expected of them in practice. This instruction is not given as class-room exercises, but as individual work carried on as it would be in the office of a practising engineer. Much, too, is made of the study of actual works in operation for the benefit of those who intend to enter this field.

The extent to which specialised subjects in sanitary engineering should be taught is a difficult matter to decide. Generally speaking, experience has shown that specialisation in our technical schools has been carried somewhat too far. In the writer's opinion it ought to be carried only far enough to incite the permanent interest of the student and enable him, on graduation, to take up some particular line of work intelligently, and with such a degree of skill that he can earn a reasonable income during the early years in which he is getting his real experience in his chosen profession. In later years it is the effect of his general studies rather than of his special studies that make for his success.

One feature of interest in connection with the Harvard School of Engineering is the fact that it continues through the entire year, utilising the time usually devoted to the long summer vacation. This enables the student to accomplish his engineering studies, and obtain his Master's degree in two full years after receiving his Bachelor's degree. The summer work is of particular advantage in the study of certain phases of sanitary engineering, as it enables field work to be carried on at a season when the biological processes are at their maximum, and when material for study is readily available.

LONDON COUNTY COUNCIL ENGINEERSHIP.

APPOINTMENT OF MR. C. W. HUMPHREYS.

The London County Council on Tuesday adopted the recommendation of its General Purposes Committee, and promoted Mr. G. W. Humphreys, M.INST.C.E., from the position of deputy chief engineer to that of chief engineer and county surveyor, when that post will become vacant by the resignation of Sir Maurice Fitzmaurice, C.M.G., taking effect at the end of the year. Mr. Humphreys was appointed deputy chief engineer in March last, having served under the chief engineer since the beginning of 1910; and has been engaged on the design of all main drainage and improvement work and the preparation of Parliamentary plans. He entered the service of the London County Council in 1902, when he was selected in open competition as a chief officer of the council, and took over the control of the council's Works Department, which carried out a great deal of the council's construction work. Works to the estimated value of between £3,500,000 and £4,000,000 sterling were executed under Mr. Humphreys' supervision, the most notable being the enlargement of the northern and southern outfall sewers, and the whole of the formation of Kingsway and Aldwych, including the tramway subway from the Embankment to Southampton-row.

Mr. Humphreys' experience before entering the council's service has been extended to many kinds of work. He received his early training on the construction of new works for the Great Western Railway, and under Mr. Woodman Hill, ASSOC.M.INST.C.E., and later as an assistant engineer with Mr. Hill's firm, with whom he continued until his appointment with the London County Council in 1902, he was engaged on the construction, survey and design of works for water supply, sewerage, fortification, piers, harbours, roads, &c., in various parts of the United Kingdom. In 1890 he went to France, and was engaged for three years on the new dock and harbour works for the port of La Pallice, adjacent to La Rochelle. He afterwards spent five years at Plymouth, directing the works of the rectification and deepening of the Hamoaze entrances to Devonport dockyard, and designing all the special machinery used in the removal of nearly 1,000,000 tons of rock below water. Subsequently he directed the work of constructing the new naval harbour and its subsidiary works at Portland.

"The Civic Engineer's Who's Who."—The first issue of "The Civic Engineer's Who's Who" (London: St. Bride's Press, Limited, 24 Bride-lane, E.C., 2s. 6d. nett) gives wonderfully complete lists of the engineering officials of England and Wales. For a first issue it is very creditable.—*Glasgow Herald.*

CAPE TOWN MUNICIPAL WORK.

CITY ENGINEER'S REPORT.

The construction of a new high-level road to the suburbs of Cape Town is referred to in the report of the city engineer and surveyor, Mr. W. J. Jeffries, for the year ended June 30th last. The new road is some 2¾ miles in length. There is a road reserve of 100 ft.—the actual carriageway is 26 ft. wide, excluding channels 2 ft. wide on either side—and provision is made for footpaths 6 ft. wide. The remainder of the road reserve will be planted with a double row of trees. The watercourses are all well culverted, and of ample dimension for dealing with the storm water from the mountain side, the actual waterway being of concrete, and the retaining walls of rough-dressed sandstone. The minimum radius of curves is 170 ft., and this only for a very short distance on a reverse curve. The remainder of the curves are 200 ft. and over. The minimum gradient is 1 in 15, and this does not occur very often. When completed it will make one of the most charming drives in the Peninsula, and will considerably reduce the quantity of fast motor traffic on the main road.

The returns relating to some of the matters which have required the attention of the building surveyor show that there has been an increase in the activity of the building trades so far as new works are concerned. The approximate value of the works now in hand is £50 510, and that of the work submitted for consideration £205,543.

STREET MAINTENANCE.

There has again been a large extension of the area of streets treated with tar. Taking the streets as a whole, there has been a slight increase in the cost of maintenance, due partly to the fact that the untreated macadam roads have demanded more attention, and partly to the large number of streets treated with tar this year.

Out of a total length of 17 miles of tarred streets, there have been under maintenance for the whole of the year 5¼ miles. It has been possible, therefore, to take out the cost of maintenance in those streets for the purpose of comparing them with the paved streets and the untreated macadam streets, and from a table appended to this report it is evident that the tar-dressed streets give very favourable results.

The city engineer observes that the experiment is, of course, still new, but he is inclined to think that when a street has been treated with tar two or three times the process will be still more effective, and each application of tar more durable. He adds that there is a good prospect that the process, in addition to its other advantages, will actually result in economy.

SCAVENGING.

The work of the street cleansing branch has proceeded satisfactorily, the further extension of the area treated with tar having been of considerable assistance. The cost of the operations for the period covered by the report is given as £7,276.

There has been an increase of about 3,000 in the number of loads of house refuse removed. A return attached to the report shows that, although the number of cart loads has increased, the number of truck loads has been reduced. The tonnage, which is calculated at the rate of 4½ tons per truck, therefore also appears to have reduced. This apparent discrepancy is accounted for by the fact that special attention has been given to the loading of the trucks with a view to a reduction of the railway account, and more loads have been packed into the trucks than formally.

The watering of the streets was responsible for an expenditure of £2,403, and the flushing of catchpits and street gullies £878. The consumption of water for these purposes amounted to 16,521,100 gallons. The cleansing and flushing of the catchpits are now carried out during the night, thus obviating the annoyance formerly caused during the progress of this work in the daytime.

SEWERAGE.

The report states that the total length of sewers and outfalls is 92 miles. No extension to the main drainage system was made during the year.

WATER SUPPLY.

In a summary of inspections made during the year, it is obvious that a great amount of waste is taking place through defective pipes and fittings. "With the number of defects equal to 60 per cent of the number of inspections made," must be apparent to anyone," observes Mr. Jeffries, "that all is not being done that could be done in the direction of preventing waste; but although the advisability of increased inspection work has been repeatedly advocated, I regret to say that I have, as yet, met with little or no encouragement. I trust, however, that when the estimates are being framed for the ensuing year more favourable consideration may be given to the matter."

WATERPROOF CONCRETE AND MORTAR.

THE USE OF RESIDUAL PETROLEUM.

The properties of concrete containing a small proportion of heavy oil have for some time been under investigation by the United States Office of Public Roads, and with these studies the name of Mr. L. W. Page, director of the office, is especially associated. A recently issued bulletin gives the results of experiments which were made to find the best proportions and the best ways of mixing the materials for the mortar and concrete, describes their qualities, and suggests various purposes for which they may be employed in preference to ordinary concrete and mortar, or instead of more elaborate or costly methods of securing waterproofness combined with strength.

MATERIALS AND PROPORTIONS.

Experiments were made with a fluid petroleum residuum oil, and with a "cut back" oil asphalt, and the former, having given the better results in both laboratory and service tests, is recommended. The specification provides for a petroleum residual oil with specific gravity 0·930 to 0·940 at a temperature of 77 deg. Fahr., soluble in carbon disulphide at air temperature to at least 99·9 per cent, and containing not less than 1·5 per cent nor more than 2·5 per cent of bitumen insoluble in "86 degree B. paraffin naphtha." The oil must yield not less than 2·5 per cent nor more than 4 per cent of residual coke. When 240 cc. of the oil is heated in an Engler viscosimeter to 50 deg. Cent., and kept at that temperature for at least three minutes, the first 100 cc. which flows out shall have a viscosity of not less than 40 nor more than 45. When 20 grammes is heated for six hours in a dish 2½ in. in diameter and 1 in. in height, at a constant temperature of 163 deg. Cent., the loss in weight shall not exceed 2 per cent.

The proportion of oil used should for most purposes be 5 per cent by weight of the cement, 4·7 lb. per 94-lb. bag, or "about 2¼ quarts." In British measure the quantity would be little over 2 quarts, say 2·01 quarts for oil of specific gravity 0·935.

PHYSICAL PROPERTIES OF THE MORTAR AND CONCRETE.

The tensile strength of 1 to 3 mortar is not altered much by the inclusion of the oil, and the oil-mixed mortar gains substantially in strength during the twenty-eight day and six-month periods, compared with the strength at seven days. The addition of 5 per cent of oil delays the time of initial set by 50 per cent, and final set by 47 per cent. The crushing strengths of mortars and concrete are reduced by the addition of the oil. At twenty-eight days concrete with 10 per cent of oil has ·75 per cent of the strength of plain concrete. At the age of one year the crushing strength of 1 to 3 mortar with amounts of oil up to 10 per cent is but little less than that of the plain mortar. The addition of oil affects but slightly the resistance to impact or the stiffness of the concrete. Oil-mixed mortar and concrete containing 10 per cent of oil have very little absorption, and under low pressures both are waterproof.

Oil-mixed mortar containing 10 per cent of oil is absolutely watertight under pressures as high as 40 lb. per square inch. The addition of the oil much decreases the grip of concrete on steel reinforcement. The bond of deformed bars, it is stated, is not seriously weakened by the addition of oil in amounts up to 10 per cent.

MIXING THE MORTAR AND CONCRETE.

The sand and cement are mixed dry, and sufficient water added to make a "mushy" mortar. The oil is then added and the mortar turned until no trace of oil is visible. This mortar is then ready for use. To make concrete by hand the mortar is first made as above, and the stone added afterwards. When a mixing machine is used the cement, sand and water are mixed first, the oil and some of the stone being then added, a little of each in turn, and, finally, the remander of the stone is mixed in.

PURPOSES FOR WHICH THE PROCESS IS RECOMMENDED.

These mortars and concrete are recommended generally for the purpose of making waterproof walls and

floors, specific mention being made of basement and cellar walls and floors, barns, roofs, cattle troughs, cisterns or tanks, silos, concrete blocks and stucco for basement floors. A 6-in. foundation of porous material is recommended, and, if the ground be very wet, drain pipes in addition. Over the foundation a 4-in. layer of ordinary concrete may be placed, and, before this has hardened a top layer of the waterproof mortar. It is pointed out that the floor will dry very quickly after being washed, because it will absorb hardly any of the water used in washing it, and it is stated that such a floor will not be made slippery by the addition of the oil to the mortar.

For cellar walls the proportion of oil recommended is 10 per cent of the weight of the cement, and a thickness of about 12 in. for 6-ft. depth of earth is suggested, or a thinner wall of reinforced concrete when the top is held by floor joists. For existing walls a plaster of 1 part of cement to 2 of sand, with 5 per cent of oil, is recommended. The proportion of oil for work such as the construction of the walls of sunk tanks is 10 per cent.

To prevent the percolation of long-continued driving rain, the waterproof concrete may be used for the walls of buildings such as barns. Concrete building blocks need not be made so as to withstand the penetration of water under pressure, and a 1:2:4 concrete will be made sufficiently impermeable by the addition of 5 per cent of the oil, that is, 5 per cent by weight of the cement used. For stucco work either the first or both coats may be made with the waterproof plaster.

STORM-WATER SEWAGE DISPOSAL AT LEICESTER.

BOROUGH ENGINEER'S SCHEME.

As already reported in these columns, Leicester Town Council last week gave their approval to a scheme of the borough engineer and surveyor, Mr. E. George Mawbey, M.Inst.C.E., for dealing with the storm-water sewage of that town, the proposals including provision for additional pumping plant at the existing main sewage pumping station, and the expenditure being estimated at £118,916. There has been considerable opposition to the scheme locally, but Mr. G. Midgley Taylor, M.Inst.C.E., who, on Mr. Mawbey's suggestion, was called in to report on it, has expressed himself as being entirely satisfied that it is the most economical and convenient one that could be devised for overcoming the difficulties that present themselves, proposing only one or two minor alterations in the arrangements. Alternative suggestions which were brought forward were shown to be quite impracticable as compared with the scheme adopted. Eighteen years have elapsed since the present sewage disposal scheme was carried out, and in the interval 130 miles of new sewers have been laid down, 16,700 houses erected, and water carriage has been adopted in no fewer than 7,000 instances. The necessity for the large expenditure upon which the corporation have decided to embark will at once be apparent.

The present method of disposing of the sewage of the borough of Leicester is as follows. The sewage is conveyed to the Abbey pumping station by two main trunk sewers, one for the eastern and larger portion of the borough, the other for the portion of the borough lying on the western side of the river. The sewage is pumped to the Beaumont Leys Farm for combined bacterial land treatment. The average dry-weather flow is about 8,500,000 gallons in the twenty-four hours, but the flow during the daytime is at a much greater rate than this, and, of course, proportionately less during the night-time. It now requires during a large portion of every day three of the four engines to pump the dry-weather flow. The main sewers discharge at times at the rate of nearly 100,000,000 gallons of sewage and storm water per twenty-four hours, to pump which would require sixteen additional engines of the same power as the present ones.

Every available method of dealing with the question has been under consideration from time to time, and, having regard to local circumstances and the geographical position of the town, the borough surveyor is of opinion that the most practical and economical course to adopt is to construct screening plant, detritus and storm-water sedimentation tanks at the most suitable point to enable the water passing over the weirs down to the river to be freed as far as possible from deleterious matter.

Mr. Mawbey considers that, in order to bring the pumping plant up to the Local Government Board's requirements of the present day, the corporation should be able during rain to pump to Beaumont Leys, and purify on the bacteria beds and land, a minimum volume of crude sewage and storm water combined up to three times the ordinary dry-weather flow. To do this, and to have one stand-by set off for repairs and so forth, two more sets of engines and pumps, with boilers, are required, together with new buildings, the latter to be large enough to receive two further sets which will be required in the future. Another cast-iron rising main, 44 in. in diameter, he suggests, should be laid to Beaumont Leys, and two more sedimentation tanks there, for the extra sewage pumped, are required. Further, a set of motor-driven screens is necessary in order to intercept the floating solid matters in the sewage before passing to the pumps delivering to Beaumont Leys, and from all the excess storm-water sewage not so pumped, before allowing it to go over the weir at the Abbey pumping station to the storm-water tanks for treatment, and thence to the river. Mr. Mawbey insists that these screens must be large enough to deal with volumes up to 100,000,000 gallons a day.

The whole of the sewage and storm water, immediately after passing the screens, is to be sent through comparatively small detritus tanks, in order to deposit a large proportion of the very heavy mineral matters which now seriously damage the sewage pumps, and cause expensive repairs and renewals. The same heavy matters have choked the rising mains, which have on several occasions cracked, partly from that cause, serious sewage flooding of the road and houses being only narrowly averted. After going through the screens and detritus tanks, the ordinary daily flow of sewage in dry weather, and in wet weather the additional flow due to the storm-water washings of the sewers, will pass to the pumping engines to be delivered for purification to Beaumont Leys up to the before-mentioned volume of three times the dry-weather flow. The storm-water tanks will be placed at the Abbey pumping station, and constructed at such a low level that the excess storm water will gravitate into and through them and thence to the river below Wanlip through the outfall culvert.

The borough surveyor's proposals provide for four detritus tanks, each having a capacity, in normal conditions, of 85,000 gallons, or a total of 340,000 gallons; four covered storm-water tanks, having, including channels, &c., a total impounding capacity of 2,600,000 gallons; a set of four screens, 40 ft. wide; apparatus for emptying detritus tanks; sludge pumps, sludge pump-room and delivery main; electrical plant and engine-room for operating sludge pumps, screens, telpher plant, &c.; water-softening plant and condensing water supply, and the diversion of culverts and sewers. The estimated costs of these works, including 15 per cent contingencies, would be £73,167. Two additional sedimentation tanks at Beaumont Leys Farm are estimated to cost, including 15 per cent for contingencies, £2,558; and two sets of sewage pumping engines, boilers and other machinery, connections to rising mains, &c., pumping station and boiler-house buildings and sewage pumps for four sets of pumping plant, are estimated to cost, including 15 per cent for contingencies, £26,530. A sum of £16,530 is allowed for a new 44-in. rising main from Abbey pumping station to Beaumont Leys bacterial works, this including 15 per cent for contingencies. The consulting engineer's fee is £131.

At last week's meeting of the town council Alderman Patey, in submitting the proposals outlined above, paid a warm tribute to the work of the borough engineer, commenting in particular on the approval which had been given to the scheme by Mr. Midgley Taylor. It was not asserted that the scheme spelt finality, for if the town continued to grow, as it was hoped it would, further extensions of the works would be required. The scheme, however, would bring the sewage works up to date, and would have the effect of removing all possible grievances in regard to the pollution of the Soar.

Carters against Tar-macadam.—Festiniog Urban District Council received a petition last week from all the horse owners and carters in the district, urging the council not to proceed with the proposed improvement of the roads in High-street and another thoroughfare, as the tar-macadam had already been condemned in other towns as being most dangerous in wet and frosty weather. The petition was referred to the Road Improvement Committee.

WATER TOWER FOR VILLAGE SUPPLY.

The accompanying illustration gives a general view of a water tower of 6,000 gallons capacity recently erected at Yedingham for the Norton Rural District Council, Yorkshire, for supplying the village of Yedingham.

The floor and roof are designed on the square slab system, giving a light and at the same time a very strong construction. The lateral pressure of the water

Water Tower at Yedingham.

is sufficient to supply the tank, the top level being 14 ft. above ground level.

The work was carried out by Mr. Alfred Barnes, of Malton, from the Indented Bar Company's designs, under the direction of Mr. R. Richardson, the consulting engineer to the Malton Urban District Council.

London Water Supply. The eighth annual report of the Metropolitan Water Board states that the total amount of water supplied by that body during the year ended March 31, 1911, was 82,170,400,000 gallons, representing a weight of 366 8 million tons and a daily average of 225,000,000 gallons. The total quantity of water abstracted from the Thames was 49,962,000,000 gallons, the remainder being obtained from the Lea and from ground lands, natural springs and wells. The supply from the Metropolitan sources amounted to 114-4 6 gallons. The number of meters in use was 6,397, nearly 61 per cent. of the meters having been laid during the past year. The report states that both the river Lea and the wells are approaching their limits of maximum yield.

Bridge Building.—Students, young engineers, and surveyors will find much useful information in "Preliminary Studies in Bridge Building," by Reginald Ryves, Assoc.M.Inst.C.E. (London: St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. nett.) The book is described as the "first of a series of small volumes, each complete in itself, dealing with the design of ordinary highway bridges of moderate span." Though highway bridges alone are referred to, the matter contained in this volume is largely applicable to railway bridges, aqueducts, and similar engineering undertakings. The five primary types of bridges are described, and the conditions determining the best site for each of the three types of streams are discussed in detail; while, in connection with wandering streams various modes of designing abutments or approach spans are dealt with. Improvements of fords and the effect of eccentric loading of vehicles on the girder loads are among the numerous other items touched on.—*Scotsman.*

CONCRETE FOUNDATIONS FOR CARRIAGEWAYS WITH TAR-MACADAM AND BITUMEN-BOUND MACADAM WEARING SURFACES.

(Contributed.)

In a paper read before the Institution of Municipal and County Engineers at the Eastern District meeting held at Leigh-on-Sea on May 28, 1910, reference was made by the engineer and surveyor of that town (Mr. J. W. Liversedge, Assoc.M.Inst.C.E.) to a specification adopted by his council for new private street works which provided for the construction of carriageways with 6-in. Portland cement concrete foundations and 3-in. tarred granite-macadam finish. Considerable interest was evinced at the time by the members in regard to the adoption of these materials in respect of private street works, and in friendly criticism the adhesiveness of tar-macadam and concrete was called into question.

At that time one street, 40 ft. wide, had been constructed, at a cost of £2,235. The council, being thoroughly satisfied with the results, have adopted the specification for general use.

In the period between the reading of the paper and the present time the following roads have been made up and completed under this system:—

Road.	Length of road in feet.	Width in feet.	Total cost.	Remarks.
				Sections:—
Glendale-gardens ...	1,003	36	£3,148 0 0	Part Tarmac, part tarred granite macadam.
Western-road	404	36	892 0 0	Tarred granite macadam.
Salisbury-road	248	36	552 0 0	Plascom grouted granite macadam.
Leigham Court-drive	513	36	1,296 10 0	Plascom grouted granite macadam.
Leighton-avenue ...	1,286	36	2,91 10 0	Part Plascom grouted, part tarred granite macadam.
Oakleigh Park-drive	660	36	1,146 0 0	Plascom grouted granite.
Leigh Hall-road	1,464	40	2,470 0 0	Part Plascom grouted, part Tarmac.
Dawlish-drive	892	36	1,140 10 0	Part Tarmac, part Northern Quarries.
Queen's-avenue ...	263	36	561 10 0	Tarred macadam.
Totals	8,552		£13,794 0 0	

Note.—Separate surface water drains are included in all streets except Queen's-road, in which gullies and traced drains only are included. In the case of Glendale-gardens and Western-road a number of cross roads account for the increase cost.

The council have been successful in upholding its specification before the magistrates, having been able successfully to show and prove that the cost of making up the carriageways under the system can be carried out at practically the same cost as the previously adopted specification of 3-in. ordinary granite macadam, 3-in. flints and 9-in. metalling. In the case of Glendale-gardens there was a difference of only £50 in a £3,000 contract between the two methods of construction. In all cases alternative tenders have been asked for.

The materials used for the foundation are Thames ballast and best standard Portland cement, the proportions of 9 to 1 and 8 to 1 having been adopted and found to give good results. The subsoil in the district being for the most part heavy, stiff clay, every care is exercised to obtain a good substratum before laying the concrete, the surface excavated to contour being well and solidly rolled throughout with 8 to 10 ton steam rollers before commencing to lay the concrete. By this means it is assured that all gas, water and sewer trenches are properly solidified. The concrete is then laid to the required camber and is allowed three weeks to set before placing the top tar-tarred macadam or bituminous-grouted granite finished surface.

The advantages of adopting this class of construction over the ordinary macadam are:—

(1) Less excavation necessitated.

(2) Substrata kept in good condition, free from excessive moisture, frost in winter, and excessive heat in summer. (Considerable movement takes place in heavy clay soils under these varying conditions.)

(3) No possibility of clay substrata working up to surface through the foundations, to be cleared from the road by scavengers in the shape of mud.

(4) Foundation maintains regular shape under varying traffic conditions.

(5) Tar-macadam and bituminous surface materials form a cushion which prevents undue shock to foundations, being suitable for motor van and car traffic.

(6) Adequate adhesion takes place between the concrete and surfacing, the concrete is roughed or rubbed to prevent slip and form a key.

(7) On roads with fairly heavy gradients bituminous-granite macadam is preferable to tar-macadam, as a rougher surface can be produced, giving the necessary foothold. On more level roads tar-macadam, being brought to smoother surface, has an advantage in enabling water to get off more quickly.

(8) By the use of tar-macadam or bituminous-granite surfaces, the objectionable tar-painting process is in the main dispensed with, although a tar coat, even on tar-macadam surfaces, will be found beneficial every three or four years, although not absolutely essential.

(9) Reduction in scavenging and watering.

In view of the fact that concrete foundations and tar-macadam or bituminous-grout surfaces can be carried out at a cost no greater than the cost usually incurred in forming road with hard-core foundations and the ordinary macadam surface, there is absolutely no reason why this method of construction should not be more generally adopted. In the case of roads required to bear heavy traffic, an asphalt surface under suitable conditions might be adopted in lieu of tar-macadam. The principle of adopting concrete foundations in lieu of the Telford or broken-stone methods of construction has been proved practicable in respect of private street works carried out in this district, it has been found sound in principle and practice, and in view of the elastic wearing surface afforded by the use of bituminous materials with increased life and less upkeep charges than ordinary macadam, one looks for a more general adoption of this method of construction in the future, both in regard to private streets and in connection with our main county roads, which latter are so sadly lacking in many cases of the first essential of construction—*viz.*, a solid, firm and non-porous foundation.

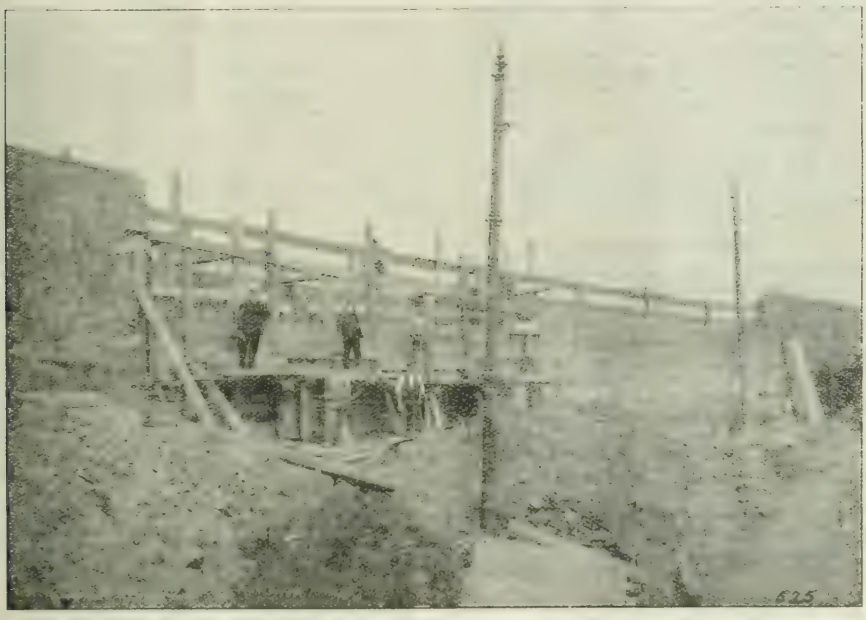
Swimming Bath Water.—Lancaster Town Council have negatived a proposal to instal a filtration and aeration plant at the corporation swimming baths. Which it was generally agreed that the scheme, the cost of which was estimated at about £1,000 was a good one, it was decided that the present was not an opportune time to proceed with the work.

REINFORCED CONCRETE RETAINING WALL AT BASFORD, STAFFS.

An existing retaining wall, separating Etruria-road, Basford, Staffs, on the high level, from the low-level road, showing signs of failure in places, it was recently decided by the borough engineer of Stoke-on-Trent, Mr. A. Burton, ASSOC.M.INST.C.E., to substitute a reinforced-concrete retaining wall. As considerable improvements are to be effected in this locality in the future, the new reinforced-concrete wall was designed to carry all the pressure that was ever likely to come upon it, and that part of the wall shown under construction in the illustration attains a maximum height of 20 ft. above future ground level.

It was essential that the high-level road should be interfered with as little as possible. Buttresses were, therefore, out of the question, and a cantilever wall was adopted with a base projecting under the low-level road, about 2 ft. beneath future road level.

The design and drawings were prepared by the



Retaining Wall at Basford, Staffs.

Indented Bar Company, Queen Anne's Chambers, Westminster, S.W., for Mr. Burton, and the contractors were Messrs. F. Barke & Son, Stoke-on-Trent.

Edinburgh Tramways.—A recommendation of the Tramways Committee of the Edinburgh Town Council in favour of municipalising the tramway service upon the expiry of the present company's lease has been agreed to.

Runcorn's Hard Water.—Runcorn's water supply is considered among the hardest in England, and some time ago it was decided to mix it in equal proportions with Liverpool Corporation water. Recently, owing to a breakdown of the engine, an unmixed Vyrnwy supply was used for several weeks. At this week's meeting of the council Mr. Pringle moved that Runcorn should take its water supply from Liverpool. It would mean 6d. in the £ on the rates, he said, but people demanded it, saying that they would save the money in soap alone. Mr. Gibbs said that the council had recently put electric pumping plant at the waterworks, which would be rendered useless under the proposal. Mr. Pritchard reminded the council that £70,000 was spent in purchasing the Runcorn waterworks in 1895, and that the ratepayers would have to provide £2,700 a year for 40 years yet in interest and principal. Finally it was decided to continue the use of mixed water.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top, left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

283. Strength of Materials.—What is meant by the following terms: (*a*) Modulus of elasticity, (*b*) elastic limit, (*c*) permanent set, (*d*) plastic elongation, (*e*) ultimate elongation, (*f*) contraction of area? ("Inquirer.")

284. Wood Paving.—What are the comparative advantages and disadvantages of soft and hard wood for street paving? ("Suburban.")

285. Building Construction.—Explain, with sketches where necessary, the meaning of the following terms: (*a*) Larrying, (*b*) pugging, (*c*) gib and cotter joint, (*d*) lead soakers. ("Pupil.")

286. Hydraulics.—A hemispherical cistern is 20 ft. in diameter, and it is full of water. How long will it take to lower the depth of the water 5 ft., if the water escapes through a 3-in. diameter sharp-edged hole in the bottom of the cistern? The coefficient of discharge for the hole is 0·60. (H. V. O., *West Bromwich.*)

REPLIES TO QUESTIONS.

281. Surveying.—Upon what trigonometrical rule does triangulation depend? Prove that the sides of a triangle are proportional to the sines of the angles opposite to them.

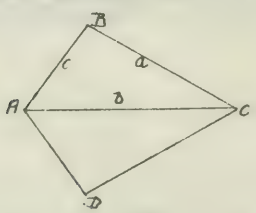
Answer (*a*).—Triangulation depends upon the fact that the sides of a triangle are proportionate to the angles opposite to them, and that the relationship between any side and the angle opposite to it is the same, no matter which side of the same triangle be taken.

This can be expressed in the following manner:

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

where a, b and c represent the lengths of the sides opposite to the angles at A, B and C.

Application.—Let A B C D E be part of a triangulation survey. Suppose the length B C be known.



Measure the angles A B C and C A B with a theodolite. Then, by applying the formula

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

$$b = \frac{a \times \sin B}{\sin A} = a \times \sin B \times \operatorname{cosec} A.$$

This gives the length of A C.

Measure the angles C D A and D A C; then, by applying the above formula again, the length of D C is obtained.

NOTE.—Before proceeding with these calculations, the student should read all three angles of the triangle, and test his work by totalling them to see how near his readings are to 180°.

The lengths of the sides A B and D A may be found in like manner.

Example.—To find the lengths of A B and A C, having given the length of B C as 804 links, and the angles A B C = 97° 50′, B C A = 30° 24′, C A B = 51° 46′,

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

$$\therefore b = \frac{a \times \sin B}{\sin A}$$

$$= a \times \sin B \times \operatorname{cosec} A$$

$$= 804 \times \sin 97° 50' \times \operatorname{cosec} 51° 46'$$

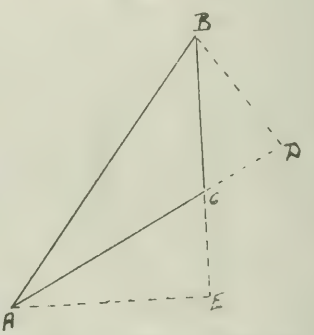
log 804 =	2·9052560
L sin 97° 50′ =	9·9959284
L cosec 51° 46′ =	10·1048555
log 1014 =	3·0060399

Similarly $c = a \times \sin C \times \operatorname{cosec} A$

log 804 =	2·9052560
L sin 30° 24′ =	9·7041795
L cosec 51° 46′ =	10·1048555
log 518 =	2·714291

Answer (*b*).—

In Δ A B C $\sin A = \frac{BD}{AB}$ or $\frac{p}{b}$



$$BC \text{ or } a = BD \times \operatorname{cosec} BCD = \operatorname{cosec} BCA \times BD$$

$$\therefore \frac{a}{\sin A} = \frac{BD \times \operatorname{cosec} BCA}{\frac{BD}{AB}}$$

$$= \frac{BD \times \operatorname{cosec} BCA \times AB}{BD}$$

$$= AB \times \operatorname{cosec} BCA$$

Again consider $\frac{b}{\sin B}$

$$b = AE \times \operatorname{cosec} ACB$$

$$\sin B = \frac{AE}{AB}$$

$$\therefore \frac{b}{\sin B} = \frac{AE \times \operatorname{cosec} ACB \times AB}{AE}$$

$$= AB \times \operatorname{cosec} ACB$$

$$\text{and } \frac{a}{\sin A} = AB \times \operatorname{cosec} ACB$$

$$\text{likewise } \frac{c}{\sin C} = AB \times \operatorname{cosec} ACB.$$

Hence the sides of a Δ are proportional to the angles opposite to them, for the relationship may be expressed by the equation

$$\frac{a}{\sin A} \quad \frac{b}{\sin B} \quad \frac{c}{\sin C} = AB \times \operatorname{cosec} ACB$$

282. Hydraulics.—Explain simply what is meant by the "hydraulic gradient" of a pipe, and how this may be obtained in any given case. ("Pupil.")

The hydraulic gradient or virtual slope of a pipe is the *loss of head per unit length* of the pipe.

The Surveyor

And Municipal and County Engineer.

What is a Garden City?	645

That is, if between two sections of the pipe, l ft. apart, the difference of head is h ft.

Thus $\frac{h}{l}$ is the hydraulic gradient between the two sections.

The difference in head between two sections of a pipe may be determined (*a*) practically or (*b*) by calculation.

(*a*) Pressure tubes or piezometers are inserted at the sections, and the difference in level of the water in the tubes gives the loss of head in that length of the pipe.

(*b*) The most important loss of head is that due to friction, which, in a pipe of uniform cross-section, is constant. The loss of head due to friction may be calculated by

$$\text{H loss} = f \cdot \frac{l}{m} \times \frac{v^2}{2g}$$

where f = an experimental friction coefficient, usually between ·005 and ·006.

m = hydraulic mean radius of pipe.

v = velocity of flow.

In long pipes only the loss due to friction need be considered, but stop valves, bends and changes in diameter of the pipe cause loss of head.

Having found the loss of head between the sections, the hydraulic gradient may be found as above by—

$$\text{Hydraulic gradient} = \frac{h \text{ loss}}{l}.$$

(H. V. O., *West Bromwich.*)

SEA-COAST EROSION.—For a very complete and inexpensive library on the cause, prevention and repair of coast erosion the following three works are recommended: "Coast Erosion and Foreshore Protection," by John S. Owens, M.D., Assoc.M.Inst.C.E., F.R.C.S., and Gerald O. Case (price 7s. 6d., post free 7s. 10d.), with numerous illustrations and diagrams; "Sea-Coast Erosion and Remedial Works," by R. C. Allanson-Winn, M.Inst.C.E.I. (price 1s., post free 1s. 1d.); and "Erosion of the Coast and its Prevention," by F. W. S. Stanton, Assoc.M.Inst.C.E., F.S.I. (price 3s., post free 3s. 2d.), with numerous maps and other illustrations. The publishers are the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesie."
— GEO. HERBERT, "*The Temple.*"

WHAT IS A GARDEN CITY?

To the Editor of THE SURVEYOR.

SIR, I am reluctant to trespass further on your space, but as Mr. Price has challenged my definition of a garden city perhaps you will allow me briefly to reply.

Mr. Price is only quibbling when he talks about 5 per cent return proving speculation. He uses these words, "These schemes are essentially promoted by building speculators;" and without wasting a column I say this is not so.

As your columns bore witness only recently, many schemes are being dubbed "garden city" which have no claim whatever to the name, except an attempt to delude the public, but it is no more just to blame the movement for this than it is to blame the medical profession for the quackeries of a charlatan.

The primary object of the garden city scheme is to stem the tide of population townwards, and to get the people back to the land under conditions where they may live in reasonably rented houses, and where their work may be close to hand. Can it be said that the men and women who are trying to do this are building speculators?

Mr. Price has entirely mixed up the garden city movement with other things. In his last letter he said he has "visited a number of garden cities." Well, there is only one in the world. And he quotes as "a leader of this movement" a gentleman whom every student of housing and town planning will always hold in the highest esteem, but who never was and who never posed as a leader of the garden city movement. No wonder, then, that if he has confused his subjects his deductions are erroneous.

He is very funny when he describes the drunken-looking posts and wire suffering from a nervous breakdown, but even if this were true the method employed by any particular architect or engineer does not affect the principles of the movement, which are in the main sociological, and which, although they have influenced to a considerable extent the adoption of town planning—altogether a different matter—cannot in any way come under the description of building speculation or jerry road making.

I do not need to be reminded that there is speculation in every enterprise, and that there are building speculators and building speculators. The term has its defined meaning, and as used by Mr. Price is an unworthy reflection upon the entirely disinterested motives of a band of men and women who have devoted their time and, in many instances, their substance in an endeavour to solve one of the most pressing problems of our modern civilisation.—Yours, &c.,

EWART G. CULPIN,
Secretary, Garden Cities and Town Planning Association.

MIXING CEMENT WITH "BITUMEN."

To the Editor of THE SURVEYOR.

SIR,—While repudiating Mr. W. J. Howard-Smith's statement that I am engaged in "bitumen manufacture," I quite agree with his remarks that a proper classification of the various bituminous materials at present being used as binders in road construction is highly desirable, in evidence of which I refer him to the following articles from my pen which recently appeared in your journal—*viz.*, "What is Asphalt?" March 8, 1912, p. 404; "Asphalt-Macadam," July 19, 1912, p. 108.

If Mr. W. J. Howard-Smith is still desirous of learning why a percentage of cement is employed in the manufacture of asphaltic paving mixtures, he may do so, at the small cost of 8d., by obtaining a copy of my Patent Specification, No. 23064/1910.—Yours, &c.,

CECIL NATHAN.

Law Notes.

Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used

Private Street Works Act, 1892. Objection to Final Apportionments: Disputed Ownership. "A.S.L." writes: A new street was laid out by an estate owner in the form of bottom foundation, and partly metalled for one portion of its length in the year 1907, and the remaining portion of the street was similarly constructed by the estate owner in the year 1908. The estate owner then leased the land abutting upon the street in building plots, and houses were erected on both sides thereof. The plans for enforcing the provisions of the Private Street Works Act of 1892 were prepared early in the year 1910, but they were not approved of by the council until June of 1911, eighteen months having thus elapsed before the service of provisional apportionments. When preparing the specification of the works the surveyor provided what, in his opinion at the time, and as far as could be gathered from superficial inspection, would have been sufficient to put the street into proper order, but in carrying out the work two years after preparation of plans, &c., it was found that, owing to excessive haulage from the estate quarry, and in consequence of building developments, the foundation of the carriageway had become defective, waterlogged, and out of level, and it was necessary partially to reconstruct it. This work, not being provided for in the estimate, was ordered to be carried out by resolution of the council after an inspection visit, while the preliminary works were in progress. The contractor having been ordered partially to reconstruct the carriageway, this necessitated an extra amount on the contract, which was afterwards apportioned against the respective frontagers. After the works had been completed the surveyor prepared his final apportionment under sec. 8 of the Act, and notices of such apportionments were duly served upon the respective frontagers, the apportionment being based on frontage, as in the case of the provisional apportionments. Within the month allowed under sec. 8 of the Act some of the owners have lodged objections on the grounds that there has been an unreasonable departure from the specification, plans and sections, and that the actual expenses have without sufficient reason exceeded the estimated expenses by more than 15 per cent. The questions are: (1) Can the extra work carried out—namely, partial reconstruction of the foundation of the carriageway—be termed an unreasonable departure from the specification and plans, having in view the time that elapsed between the preparation of the necessary plans, estimates, &c., and the execution of the street works, inasmuch as the true condition of the street could only be disclosed when the street works were actually in progress? (2) Having regard to the above facts, can the council show that there was sufficient reason for the extra cost incurred, and thereby recover from the frontagers the amount apportioned against them, which, in some cases, is over and above the 15 per cent allowed by the Act? (3) Can extra work of this nature, additional to the contract be charged against the frontagers, or can it be held to be an unreasonable departure from the specification? The object of the extra work was for the proper completion of the street, inasmuch as its true condition was only apparent when the works were in progress. (4) Kindly quote cases (if any) bearing on the question of departure from specification. In connection with the above street works a further question arises, namely, leading off the street in question there is a lane 15 ft. in width, which forms the only means of access to some stable premises at the rear of the houses fronting and abutting upon the said street. The frontage of the lane abutting upon the street was included in the provisional apportionment prepared by the surveyor, and described by him as a "private lane." The provisional apportionment was duly served upon the owner of the stable premises, inasmuch as he was believed to be the owner of the private lane, he having from time to time repaired the said lane; and although he lodged an objection to the council's proposals, being an owner of other property abutting upon the street, he never disputed the question of the ownership of the private lane. He, however, subsequently withdrew his objection to the works. Just before the expiration of the month allowed for objections to the final apportionment, the apportionment notice in respect of the lane frontage was returned by his solicitor repudiating ownership of the private lane, and thus the liability for the apportionment of the crossing. The questions are: (5) Inasmuch as the person served with the provisional apportionment in respect of the lane frontage did not raise the question of ownership at the proper time, that is to say, within one month allowed for objections, is he not now prevented from raising this question? Sec. 8, sub-sec. 2 states: "No objection which could be made under this Act shall be otherwise made or allowed in any court proceeding or manner whatsoever." (See *Woodford Urban District Council* v. *Henwood*, 64 J.P., 1900; *Wirral Rural District Council* v. *Carter*, 1903; *Wallasey Urban District Council* v. *Walker & Co.*, 1906.) (6) If you are of the opinion the person already served can sustain an objection to the ownership of the lane at this juncture, can the council recover the apportionment from the supposed owner, and, if so, under what section can such recovery be made? (7) Is the fact of returning the final apportionment with an accompanying letter pointing out that the person served is not the owner a valid objection under sec. 12 (2) of the Act? If not, what is the procedure for recovery of the amount claimed, as the council cannot dispose of the lane in the manner provided by the Act? (8) Please quote cases in support.

(1) Assuming that the additional works were essential to the effectual making up of the street, the departure from the specification would not appear to have been unreasonable. (2) Upon the same assumption the council could, I think, make out a good *prima facie* case. (3) No general rule can be laid down. The question whether the departure from the specification was reasonable or unreasonable would have to be decided by the magistrates upon a consideration of all the circumstances. (4) I do not know of any reported cases on this point. (5) Having regard to the decisions in *Woodford Urban District Council* v. *Henwood*, and *Wallasey Urban District Council* v. *Walker & Co.*, the person served not having objected within the time allowed by sec. 7, it would appear that he is now precluded from doing so. *Wirral Rural District Council* v. *Carter* shows that service on a reputed owner will not entitle the authority to recover from the real owner, but apparently they can recover from a reputed owner who has been served and has failed to object. (6) See reply to No. 5. (7) In my opinion it is not sufficient. The council can recover either by summary proceedings before the magistrates or by action. (8) I am not aware of any further cases in point.

Auctions on Private Land.—"S.V.R." writes: Will you please state what is the position, and if an adjoining owner could successfully apply for the injunction from facts stated hereafter, and if there are any test cases upon similar points? A firm of auctioneers recently purchased a plot of land immediately fronting a street or road which has two entrances communicating with main roads. A ratepayer who is the owner of adjoining property has written through his solicitor a letter to the auctioneers stating that if the ground is converted into a private sale ground and auctions are held there, it is his intention to apply for an injunction to restrain them from selling, on the grounds of the noise caused. This ground has for years past been used about four times a year for the large fair sales. There is no public market provided, but the council have powers under a special charter granted in the reign of Queen Elizabeth to compel any auction to be held in the streets. They have, through their clerk, written in this instance saying they do not intend to take any action in the matter. Can any ratepayer or owner of adjoining property object?

Unless there is anything in the charter giving private individuals power to enforce the provisions as to auctions, any person applying for an injunction in order to succeed, would have to prove that the auctions were a nuisance. Injunctions have been granted to restrain nuisances from noise caused by a peal of bells, by building operations at night, by the vibration of machinery, fireworks, a circus, merry-go-rounds, a rifle gallery, Sunday horse-racing, collecting disorderly crowds, &c. But I can find no instance of an injunction to restrain sales by auction. In considering cases of nuisance from noise, the Court has regard to the character of the neighbourhood, and the matter is emphatically a question of degree.

THE CONSTRUCTION OF WORKMEN'S DWELLINGS.

SCOTTISH LOCAL GOVERNMENT BOARD MEMORANDUM.

The Local Government Board for Scotland have had under consideration the principles which should be observed in the construction of houses for the working classes, and in a memorandum issued on Tuesday have summarised their views upon the more important of these principles so far as they are applicable to the erection of cottages or two-storey houses (whether semi-detached or in rows), with separate dwellings on each floor.

It is suggested that in designing such houses the first consideration should be that they meet the reasonable needs of the class of persons whom it is proposed to accommodate; and, while it is desirable that simplicity of design and economy in construction and general arrangements should be aimed at, houses erected by a local authority ought generally to be such as will be a model or standard for houses for the working classes which may be erected by private persons. Moreover, if a local authority propose to borrow money to defray the cost of the erection of houses, the board, in fixing the period for the repayment of the loan, could not allow the maximum period adopted by them for this purpose, namely, sixty years—unless the houses were to be built substantially. As a general rule, therefore, the standard of construction should, in the board's opinion, be such that, with only a moderate annual outlay for repairs, the houses should be capable of being maintained in a state in all respects fit for human habitation for a period of sixty years.

Special circumstances may exist in some cases rendering it desirable for the local authority to construct houses of a less permanent character, and to repay the loan in a much shorter period than sixty years. The saving effected in such a case in the cost of the erection might be such that a loan for the shorter period would not involve a larger annual outlay in respect of loan charges than if the houses had been constructed more substantially, and a loan for the greater cost of construction obtained for the full period of sixty years. In considering this point it was to be borne in mind that, taking interest at 3½ per cent, an annuity of £6 0s. 4d. would repay a loan of £150 in sixty years, £144 in fifty years, £128 in forty years, or £110 in thirty years.

As a general rule experience showed that houses suitable for the accommodation of persons of the better paid working-class community who could afford to pay a rent which would provide a fair return on the capital employed) were more likely to be provided by private enterprise than houses at low rents which were necessary for the accommodation of the poorer classes. It would therefore frequently be the case that the efforts of the local authority would be directed mainly to the provision of houses of the latter class.

The types of houses that might perhaps be regarded as the most suitable in ordinary circumstances for buildings on new sites were: (1) Cottages, either semi-detached or in rows, and (2) two-storey houses, either semi-detached or in rows, with separate dwellings on each floor.

ARRANGEMENT OF BUILDINGS.

The arrangement of houses on the site and, to some extent, the design of the houses would depend upon the size, situation and character of the land, but the site should be so utilised as to secure ample open space in connection with the houses and the best possible aspect for the living-rooms. Overcrowding of houses on a site should be avoided, and care must, of course, be taken to comply with any town planning requirements, by-laws, or other local provisions in force in regard to new streets or open spaces in connection with buildings.

On the question of the number of houses to be erected on a site, the local authority would doubtless consider it necessary to have regard to the cost of the site and the extent to which street works would be necessary; but it would be well to bear in mind that the annual charges in respect of a loan for the land, spread over the maximum period of eighty years, would in most cases constitute a comparatively small proportion of the total annual cost of providing the houses. On the basis of ten houses to the acre, and land at £100 per acre, the loan charges per house for land purchase would be less than 2d. a week. If the land cost £500 per acre the loan charges per house would be less than 9d. a week.

Where the houses were built in rows, it was desirable that they should be set back from the street line, so as to allow small gardens or forecourts to intervene between the houses and the street. It was undesirable that long rows of houses without a break should be constructed, and as a rule the number of houses in a continuous row should not exceed eight to ten. Long rows were open to objection, not only because overcrowding of houses on the site might be the result, but also because they gave a monotonous and depressing appearance and prevented easy intercommunication between streets. It was advisable where cottages were erected in rows to have the gardens placed back to back, without any back street intervening, except in cases where there were no water-closets, or daily removal of household refuse. In the case of houses of more than one storey the system of entering from balconies had many advantages, provided that these were so arranged as not to interfere with the lighting of the rooms.

In areas where land was less costly the dwellings would with advantage be built in pairs or singly, so as to secure better light and ventilation and larger gardens. Larger ground areas and frontage would, as a rule, be more often possible in rural areas than in urban areas, and where large gardens were provided and a slightly increased rent was charged the tenants should be able to secure some return in the form of garden produce, &c.

Where the statutes and by-laws admitted, it might be desirable to consider other arrangements of streets and buildings which might reduce the expenditure on land and on street construction, &c. (1) The formation of groups of houses on back land, access to the houses being either from comparatively narrow streets if the houses were set well back in the street line and if the streets were not intended or likely to become important thoroughfares, or from streets of full width, of which portions might be turfed or planted with trees; and (2) the grouping of a number of houses round an open space which would serve as a recreation ground for the occupants of the houses (sec. 11 of the Housing of the Working Classes Act, 1903).

In the laying out and development of sites for building, the execution of the necessary street works was frequently a source of heavy expense, and there was a tendency, especially where the streets were wide and of costly construction, to make the greatest use of the frontage. As a result, houses were sometimes built with an unduly narrow frontage, the necessary internal space being obtained by making the houses deep from front to back, or with projections at the back. These methods of construction interfered with the due access of light and air to the rooms, and in order to avoid these objections the frontages should not be unduly restricted.

ACCOMMODATION.

Although the actual arrangement of rooms might not lend itself to any great variety of planning, the dimensions of the rooms, and the arrangement of doors, windows, fireplaces, &c., needed careful attention, and some suggestions in regard to these matters are made in the memorandum.

The opinion is expressed that houses for the poorer working classes should contain at least a kitchen, a bed-room, a scullery, a large press for food, a water-closet, and a coal cellar. In such a house the ordinary necessities would be met by the following arrangement:—

Kitchen.—This was the living-room used by all the family in common, and ought to be as large and commodious as possible. It should contain a large press for food, ventilated from the outside, and a range with a boiler for hot-water supply.

Scullery.—The scullery should have a washing boiler and a sink.

Bed-rooms.—A bed-room should be as large and airy as practicable, and should be provided with a fireplace. The door, window and fireplace should be arranged so as to secure convenient space for bed and furniture, and to insure the freest circulation of air. If the bed-room is at the front of the house, a passage should be formed alongside for direct access from the front entrance to the kitchen. In this way the bed-room will not be used as a passage-room.

Height of Rooms.—Sec. 172 of the Burgh Police (Scotland) Act, 1892, provided that in new houses the height of rooms on the ground floor should be at least 9 ft. 6 in., and on the other floors, except attics, at least 9 ft. For working-class houses these heights might be considered too liberal, and burghal local authorities might with advantage consider the discretionary powers afforded by sec. 39 of the Burgh

Police (Scotland) Act, 1903, to secure a relaxation of these requirements. The advantage of such a relaxation would be either a reduction in the cost of the building or, as was frequently more desirable, an increase in floor space.

Water-closet Accommodation.—Water-closet accommodation should be provided for each house, and the entrance to it should be preferably from the inside of the house.

Bath.—Where practicable, the water-closet apartment should be made large enough to accommodate a bath.

Coal Cellar.—A coal cellar should be provided either inside or outside the house.

Windows.—Sec. 173 of the Burgh Police (Scotland) Act, 1892, provided that the window area of each room shall be not less than one-tenth of the floor area of the room unless in any case the town council otherwise determine. The windows should be made to open at top and bottom, and should be placed not more than 12 in. from the ceiling, in order that the upper as well as the lower portion of the room might be ventilated. At the same time windows should be sufficiently low to enable children to see out of them.

MATERIALS.

The materials of which the houses should be constructed would vary according to the locality. Brickwork, covered externally with harling or cement, was an economical form of construction. A cheap wall could be formed of two 4½-in. bricks, with a 2½-in. space between, and tied together with iron cramps at intervals. The outside face of the wall should be harled, and the inside face of the wall plastered directly on the brick.

The floors of kitchens and bed-rooms should be constructed of wood flooring—those of sculleries and outbuildings being of concrete finished in cement. Strongly framed and lined doors were preferable to panelled doors of inferior quality.

The memorandum adds that in order that the cost of construction might be reduced as much as possible special attention should be paid to arrangement of planning, detail of construction, and type of fittings, in order that these might be standardised for the whole scheme.

The board intimate that they are prepared to allow the maximum period of repayment only in the case of land; for houses, sixty years might be regarded as the maximum period to which consent would be given. In a further note, the board impress on local authorities the importance and value of effective management of their houses and tenants. Experience showed that this management should be retained in the local authority's own hands, and should be undertaken by a capable officer whose status and powers would secure from the tenants more regard than is given to private factors.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

India Office Appointment.—An assistant sanitary engineer is required for service under the Government of Bengal, on a five years' engagement. Candidates must be between twenty-five and thirty-two years of age, and should have a good engineering degree or should have passed the A.M.I.C.E. examination. They should also have worked on some sanitary engineering works under a first-class firm of specialists in that line for not less than five years, of which at least three should have been spent in supervising the actual construction of water or sewage works. The salary offered is Rs. 500 a month, rising by annual increments of Rs. 50 to Rs. 700, with travelling allowance and for a married board house rent allowance. Forms of application can be obtained from the Secretary, Revenue Department, India Office, Whitehall. Applications should be submitted to that address not later than December 1st.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Ltd. Price 10s. 6d.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Exmouth U.D.C. (October 24th. Mr. A. G. Drury).—£8,500 for the purpose of constructing a marine-drive across the Maer and the building of a retaining wall.—The surveyor, Mr. S. Hutton, stated that the works for which the loan was asked were a marine-drive 65 ft. wide: (1) Across the Maer, with certain defence works, from the Coastguard Station to the end of the Queen's-path, 780 yds. in length; (2) a continuation under the cliffs, inside certain sea-defence works, to be carried out by Lord Clinton, 910 yds. long, giving a total length of 1,690 yds. The question of a continuation of the Esplanade as a carriage drive across the Maer had been before the council for many years. Considerable falls of the cliffs had, during the past four years, materially injured the cliff paths, and the council, anxious to retain the walks, appealed to Lord Clinton to consider the defence of the cliffs. His lordship, after due consideration, adopted the proposals of his engineer, and decided to build a sea-wall at the foot of the cliffs, some 970 yds. in length, at a cost of about £10,000, but, at the suggestion of the council, decided to place the sea-wall in such a position that a marine-drive could be constructed, subject to the conditions of the agreement.

Manchester T.C. (November 1st. Mr. T. C. Ekin).—£87,160 for purposes of the electrical undertaking. £30 630 for works of private street improvement, and £3,985 for tank extensions at the Withington sewage disposal works, Chorlton-cum-Hardy.—The deputy town clerk, Mr. P. M. Heath, stated that the chief expenditure now proposed was £68,820 for new plant at the Stuart-street station, which would complete the installation at that station, and enable the corporation to meet demands for the next three years. Then £2,640 was required for plant at the Dickinson-street station, £10,700 for plant at the other distributing stations, and £5 000 for hired motors. In the course of the inquiry the inspector said that from figures put in the undertaking had made a total profit so far of £523,281 and had paid £125,981 in aid of rates. There was no opposition with respect to the other applications.

Portsmouth T.C. (October 29th. Mr. R. H. Bicknell).—£8,000 for the purpose of the provision of a salt-water supply for street watering and sewer flushing in the northern part of the borough.—The borough engineer, Mr. A. W. Ward, stated that the scheme included the construction of a tank and an engine-house, on land now held by the corporation at Stamshaw. The water could be pumped either from the harbour or the bathing pond. The pond was filled by gravitation from the sea at high tide, and provision was made for pumping if the pond should be empty, so that there would be no difficulty in ensuring an adequate supply at all times. The tank would be depended on if the pond should be empty. Mr. Bicknell observed that he was not very sweet on a ferro-concrete tank for sea water, and suggested the possibility of the sea water affecting the steel rods in the walls. A representative from the contractors explained that the same method had been successfully applied to other sea works at Dover and elsewhere, and at Manchester there was a tank on the same principle with capacity for 300,000 gallons. In many other places there were similar tanks, and there was no fear of salt water affecting the concrete or the steel.

Prudhoe U.D.C. (October 22nd. Mr. Courtenay Clifton).—£1,527 for the purchase of land and buildings for council offices and the provision of a recreation ground. It was stated that at the present time the council were without any building or offices of their own. The surveyor's offices were in the rooms of the local co-operative society, and at certain periods in the quarter, when the society were paying out dividends, Mr. Burnie had to conduct his work in a smaller and more inconvenient room. He had no books or plans in his private house or to carry out his work in private. The council were also without any place to store their materials, and the tools and materials were scattered all over the district, which was a wide one. The council had purchased a fire engine, which was still at Messrs. Merryweather's, who were awaiting instructions to deliver, but as yet the council had no place to house it.

Ramsbottom U.D.C. (October 22nd. Mr. M. K. North). £4,300 for the purpose of erecting a refuse destructor and steam disinfector on the site in Stubbins-lane; and the sum of £1,280 for the purpose of sewerage works at Holcombe Old-road, Crow Wood and Pinfold, and Dearden Clough, three outlying portions of the district.—The surveyor, Mr. T. H. Bell, told the inspector that the estimate for the construction of the destructor was £3,775, and that was based upon the provisional contract they had entered into with Messrs. Dawson & Mansfield, whose tender had been accepted after careful consideration. There were several costs in addition to that, however, such as the construction of the approach road. At the present time they disposed of the refuse at five tips, situated in isolated parts of the district.

Southport T.C. (October 30th. Mr. F. H. Tulloch).—£8,500 for the further extension of the South Marine Park.—It was stated that the area was 5 acres, and the tender which was accepted was £6,895. Questions were asked whether the work was to be done by local labour, including the unemployed, and the reply was in the negative, but an assurance, it was stated, had been received from the contractor that local labour will be employed as far as possible. It was also stated that the previous scheme for extending the Marine Garden was delayed twelve months, and cost £1,300 extra, owing to the fact that unskilled labour and numbers of unemployed were engaged on the work.

Stockport T.C. (October 30th. F. O. Stanford).—£38,550 for the purposes of the gas undertaking and £5,024 for the purchase of land in Hempshaw-lane to provide a site for a new school, recreation ground, playing fields and a dry refuse tip.—It was explained that it was proposed to enlarge the condensing plant and put in new gas-tar extractors and an ammonia washing plant at the gasworks, and spend £24,000 on new mains, services and gas meters. It was also proposed to purchase 32 acres of land, and use 6 acres of it as a site for a new school, to take the place of the existing Banks-lane school, and a playing field for the school, and the remainder for a recreation ground and playing fields. The dry refuse tip would eventually form a new road.

Stoke-on-Trent T.C. (October 29th. Mr. T. C. Ekin). —£17,196 for the purposes of their electricity works.—The town clerk, Mr. E. B. Sharpley, stated that the loan for which sanction was asked was for sums which had been spent on the electricity undertakings in excess of sanction to March 31st last. A further application would be made also, with the inspector's permission, to borrow £10,000 for prospective expenditure, of which £7,000 was for extensions to mains and £3,000 for transformers and sub-stations. The Electricity Committee were constantly spending considerable sums on mains, sometimes amounting to £1,000 a month, and they understood the board would not be against a prospective sanction. The inspector examined the financial position of the four branches of the undertaking and visited the works.

Ulverston U.D.C. (October 8th. Mr. A. W. Brightmore).—£3,000 for the erection, as a Coronation memorial, of a public hall, estimated to cost £6,000, including the proposed site on the Wytarn estate.—Mr. F. W. Poole, clerk to the council, stated that of the £3,000 to be raised voluntarily £1,000 had been generously promised by Messrs. Kennedy Brothers, bringing the total amount already subscribed or promised to £2,600. It was considered there would be no difficulty in raising the balance needed. A poll of the ratepayers showed that 615 had voted for and 268 against. Mr. J. Y. Schofield and Councillor J. Mount opposed the application, and the inspector then heard the evidence of the supporters of the scheme.

Wellingborough U.D.C. (October 19th. Mr. F. H. Tulloch).—£3,500 towards the cost of carrying out an important improvement in the town. The work the council contemplate taking in hand is intended to remove a frustful source of danger at the spot where the road from Finedon discharges its traffic into Cambridge-street, one of the main thoroughfares of the town. It is proposed to acquire the site on which stands a factory, and also that occupied by a cottage adjoining, and clear it, so that there will be a wide open space extending from York-road down to Cambridge-street. At the same time Victoria-road, the street communicating to Midland-road, will be widened at the northern end by clearing away the properties now occupied as butcher's shop, house and yard. In the centre of the open space an underground public convenience will be built.

APPLICATIONS FOR LOANS.

Bacup T.C.—£1,000 for the electricity undertaking.

Brighouse T.C.—£225 for main sewerage works.

Briton Ferry U.D.C.—£20,000 for gasworks extensions.

Buckley U.D.C.—£15,000 for the sewerage scheme.

Carshalton U.D.C.—£5,250 for the purchase of land for a recreation ground.

Colne T.C.—£923 for paving with granite setts and £203 for flagging.

Halstead R.D.C.—£7,500 for Earls Colne water scheme.

Ilford U.D.C.—£10,000 for advances under the Small Dwellings Acquisition Act, 1899.

Kendal T.C.—£9,800 for improvements at the sewage disposal works.

Little Lever U.D.C.—£1,128 for street improvement works.

Maidenhead T.C.—£1,700 for extensions to the electricity equipment and buildings.

Newhaven U.D.C.—£150 for public lavatories.

Whitstable U.D.C.—£33,500 for a sewerage scheme.

LOANS SANCTIONED.

Barnard Castle U.D.C.—£450 for public conveniences.

Briton Ferry U.D.C.—£16,000 for the provision of workmen's dwellings.

Chester-le-Street R.D.C.—£2,500, additional cost of a new road and bridge over the Wear.

Cork T.C.—£2,621 for water supply works.

Epsom R.D.C.—£8,462 for sewage disposal works.

Essex C.C.—£2,290 for school extensions.

Forehoe R.D.C.—£1,500 for the erection of cottages.

Islington B.C.—£11,500 for repaving work (repayable in twelve years).

Knaresborough R.D.C.—£1,770 for the Goldsborough water supply.

Lewisham B.C.—£4,000 for street improvement purposes.

Liversedge U.D.C.—£626 for the provision of new screening and storm-water chambers.

Newry U.D.C.—£2,500 for the extension of the town hall.

Notts C.C.—£1,900 for main road improvement.

Penge U.D.C.—£3,537 for street improvement works.

Settle R.D.C.—£1,075 for a sewerage scheme.

Shanklin U.D.C.—£1,500 for the purchase of the literary institute buildings.

Stepney B.C.—£10,250 for electricity mains.

Sunderland T.C.—£37,200 for new plant and extensions at the electricity works.

Todmorden T.C.—£7,013 for works of street improvement.

FORTHCOMING INQUIRIES.

NOVEMBER.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Barrow £16,000, Clacton £8,000, Croydon £4,000, Leeds £6,000, Middlesex, Pontefract £5,600, Sheffield £45,000; housing and town planning—Barrow; roads and materials—London; sewerage and sewage disposal—Belfast; water, gas and electricity—Alnwick; miscellaneous—London.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Barnstaple T.C.—The question of providing public swimming baths is to be decided by a poll of the ratepayers.

Barrow T.C. Public baths are to be erected in Abbey-road, at a cost of nearly £16,000.

Brighouse T.C. A public mortuary is to be erected at a cost of £175.

Chelmsford T.C. The provision of public slipper baths is to be the subject of a report by the borough engineer, Mr. P. T. Harrison. - New stables are to be erected at a cost of £1,550.

Clacton-on-Sea U.D.C.—The question of erecting a bandstand, at an estimated cost of £8,000, is to be decided by popular vote.

Croydon T.C. Extensions and alterations are to be carried out at the South Norwood and Thornton Heath baths, at an estimated cost of £4,000.

Deal T.C.—The borough surveyor, Mr. T. C. Golden, has received instructions to prepare plans for a pavilion.

Durham C.C.—A new school, built from plans by the county architect, Mr. W. Rushworth, at a cost of £7,552, has been opened at Seaham Harbour.

Ellesmere R.D.C.—A bridge is to be erected at Llanfelin at a cost of £240.

Lancashire C.C.—It is proposed by the Main Roads and Bridges Committee to replace Scarisbrook Canal Bridge with a new bridge 33 ft. wide between the parapets. Application will be made to the Road Board for a grant towards the cost of the erection of the new bridge, estimated at £2,300. The canal company have agreed to contribute £500 towards the cost, and to undertake the ordinary maintenance and repair of the new bridge.

Leeds T.C.—New schools are to be erected in the Parish of St. George's at a cost of about £6,000. They are to accommodate some 550 children of both sexes.

Lymm U.D.C. Alterations are to be carried out at the isolation hospital, at an estimated cost of £500.

Middlesex C.C.—The Highways Committee have under consideration the important question of widening or reconstructing Richmond Bridge.

Newhaven U.D.C.—Three new lavatories are to be provided, one in South-lane and two in the recreation ground.

Northampton C.C. The Education Committee have accepted the tender of Messrs. J. G. Pullen & Sons, of Northampton, at £16,635, for a new secondary girls' school at Northampton.

Notts C.C.—The Education Committee have accepted the tender of Mr. J. Greenwood, of Mansfield, at £7,709, for the erection of a new school at Warsop.

Pontefract T.C.—It is proposed by the corporation to expend a sum of £5,600 on the provision of public baths. Under the plans of Mr. A. Nunweek, of Sheffield, the accommodation will include swimming bath, 75 ft. long by 30 ft. wide with thirty-nine dressing-rooms, and a public gallery for 250 spectators, a children's swimming bath, 30 ft. long by 15 ft. wide, five slipper baths and one Russian bath for each sex, and caretaker's house.

Rotherham R.D.C.—In connection with the scheme for the extension of the water supply to Ulley and neighbourhood the Council have accepted the tender of the Sheepbridge Coal and Iron Company, Limited, at £9,000 for the supply of pipes, and the tender of the Staveley Coal and Iron Company, Limited, at £3,151 for laying the pipes.

Sheffield T.C.—It is proposed to extend the town hall, and thus complete the building architecturally, at an estimated cost of £45,000. The extension will complete a rectangle, and will close up a gap on the Cheney-row side of the building. It has been designed by Mr. F. E. P. Edwards, F.R.I.B.A. (city architect)—who carried out the Bradford Town Hall extension, completed in 1909—to be in general harmony with the rest of the building, but it will be carried to a considerably greater height in order to increase the accommodation as much as possible.

HOUSING AND TOWN PLANNING.

Barrow T.C.—Two hundred houses are to be built to meet the pressing needs of the borough.

Leeds T.C.—The Improvements Committee recommend that an application be made to the Local Government Board for authority to prepare a town planning scheme for an estate off Buckingham-road, Headingley, which is about to be laid out for building. The estate is over 6 acres in extent.

Swansea T.C.—A letter has been received from the Local Government Board stating that they were prepared to sanction the purchase of land at Townhill from the Duke of Beaufort and another owner, subject to the following conditions: "That within eighteen months the council shall submit to the board plans for the erection of 300 houses for the working classes on part of the estate, and within five years definite proposals shall be submitted for entering the remainder of the land. The period for repayment of the money to be borrowed will be eighty years.

PARKS AND OPEN SPACES.

Brighton T.C.—It has been agreed to purchase, for £35,000, 1,067 acres of land between Brighton and Ovingdean.

Newcastle-on-Tyne T.C.—Six acres of land are to be purchased as a recreation ground for Scotswood, at a total cost, including laying out, of £7,500.

REFUSE COLLECTION AND DISPOSAL.

Horsham U.D.C.—The tender of Messrs. Heenan & Froude, at £1,450, has been accepted for the construction of a destructor. Buildings will involve an expenditure of £300, and a hopper £115, making the total cost of the scheme £1,865. The consent of the Local Government Board has been asked for a loan of £2,000.

Swansea T.C.—The borough surveyor, Mr. G. Bell, has prepared a special report on refuse collection and disposal, in which he proposes a rearrangement of the disposition of the cleansing districts and the district men. He deprecates the use of the old type of refuse receptacle, the ashpit, and advocates the adoption of iron ashbins. The practice in regard to trade refuse is to remove, without extra charge, reasonable quantities and he believes that a haggling policy in respect of this matter is not consistent with the duty of a sanitary authority. One of the gravest defects in Swansea's present arrangements is the presence of refuse receptacles and scavenging wagons collecting in the central part of the town within business hours. Rectification cannot be effected, however, he says, without a good understanding between the tradespeople and the cleansing staff, because there is the difficulty of the premises that do not open until about 9 a.m. There would be more satisfaction if the number of houses that have daily collections of refuse were increased. The conveyance of refuse to the tips by means of traction engines, he adds, is fraught with great possibilities, but required very earnest consideration, as it might spell a considerable gain or loss. At Westminster six motors supplanted thirty horses. The weekly cost of a motor is shown to be £10 3s. 10d., and the weekly cost of a horse is £3 4s. 6d.

ROADS AND MATERIALS.

Croydon T.C.—It has been agreed to construct a connecting road between Crowther-road and Birchanger-road, at an estimated cost of £700.

Dewsbury T.C.—A sum of £1,000 is to be spent upon the purchase of property in furtherance of the Northgate widening scheme.

East Grinstead R.D.C.—It has been agreed to support a resolution passed by the Hailsham Rural District Council urging that the revenue received from petroleum and motor licences should be distributed among all the road maintenance authorities in the area of collection, and the distribution should be proportioned according to the amount expended on materials by such authorities.

Headington R.D.C.—The tenders of Messrs. Thompson & Co., at £1,288 and £768, have been accepted for works of improvement in Ferry-road and William-street.

Hampton Wick U.D.C.—The tender of Messrs. Lavender & Bateman, of Sutton Bridge, for 200 yds. of broken granite, at 13s. 3d. per yard, has been accepted. There were fifteen tenders.

Hornsey T.C.—The tender of the Praed Road Construction Syndicate, Limited, at £3,072, has been accepted for road repair works.

Kensington B.C.—The council have adopted the recommendation of the borough engineer, Mr. A. R. Finch, to provide two pedestrian island refuges in Ladbroke-grove, at the junction of that thoroughfare and Lancaster-road, when the wood paving is renewed in Ladbroke-grove, which work will shortly be commenced.

London C.C. It was decided on Tuesday to apply to Parliament for authority to widen the Strand between Adam-street and Durham House-street, at an estimated cost of £135,000.

North Riding C.C.—It has been agreed to accept the offer of the Road Board of a grant of £2,750 towards the cost of the improvement of the Yarm, Thirsk, and York main road, and the loan, free of interest, of £10,000, repayable by annual instalments, and to make application to the Local Government Board for their consent to the borrowing of £10,000 in two instalments, the whole to be repayable in six years.

Seaton (Devon) U.D.C.—Broken Cliff is to be laid out at a cost of £200.

Staffordshire C.C.—The county surveyor, Mr. J. Mowatt, has informed the Midland Centre of the Roads Improvement Association that the county council have now decided to pull down the bridge over the river Stour near Stourton and to erect a wider one, and widen the approaching highways. The county council are also in negotiation with the landowners to complete a similar improvement to a bridge near the same place on the Wolverhampton side.

SEWERAGE AND SEWAGE DISPOSAL.

Belfast T.C. The terms of the Bill to be promoted in Parliament for powers to reclaim Sleibtands, and for other purposes, have been agreed to. The land, where a nuisance has arisen from the sewage, lies between the Connswater river and the Kinnegar, Holywood, and the work has been recommended by the Royal Commission on Sewage Disposal in their seventh report. Between 600 and 700 acres of land will be reclaimed, and the cost of constructing the huge embankment between the points already mentioned is estimated at something over £100,000.

Exeter T.C.—The Sanitary Committee have reported in favour of the purchase of necessary renewal plant (washers, screens, dredging apparatus, rails and pump), and clinker for the sewage disposal works, and of the work of washing the clinker being undertaken by the city surveyor, Mr. T. Moulding.

WATER, GAS, AND ELECTRICITY.

Alnwick R.D.C.—A committee has been appointed to consider and report upon the question of a water supply for Acklington.

Holborn B.C. It has been decided to light half of Holborn by electricity and half by gas. The electrical portion has just been completed. It extends from Chancery-lane to Kingsway. High efficiency Mazda drawn-wire lamps have been chosen, and a very fine lighting effect is obtained.

Morpeth T.C.—A new pumping apparatus has been installed in connection with the water supply, at a cost of £484.

Wellingborough U.D.C.—The council have accepted the tender of the Wellingborough Gas Light Company for the street lighting of the town. The contract is for seven years, at £1,085 per annum, which sum includes the disposal by incineration of all house and trade refuse delivered to the works by the council's carts.

MISCELLANEOUS.

Doncaster T.C.—The tender of Mr. I. W. Pearce, of Morecambe, at £2,424, has been accepted for the extension of the Bentley tramway route to the new colliery village. The contract is exclusive of the supply of rails, fish-plates and bolts, which will be provided by the tramways department. The estimated cost of the extension is £3,650, and the electrical work about £1,400. A further £2,550 will be required for additional cars, bringing the gross cost up to £7,600.

Edinburgh T.C.—It has been agreed to approach Parliament for powers to run motor 'buses over three routes in the city.

Hastings T.C.—A resolution has been passed objecting to the promotion of a Bill by the tramway company to establish an overhead system of traction on the Front.

London C.C.—The Highways Committee on Tuesday recommended that the tender of Messrs. John Batt & Co. (London), Limited, to supply 6,000 driving-wheel tyres for electric cars, at the price of £1 2s. each, and 5,000 pony-wheel tyres for electric cars, at the price of 18s. 10d. each, be accepted. The firm proposed to sublet the work to German firms. Mr. Whitaker Thompson moved that the recommendation be referred back to the committee, urging that the contract should go to a firm which would carry out the work in England. The amendment was carried on a division by fifty-six votes to forty-two.

PERSONAL.

Sir Alexander Binnie has been engaged to report on the whole question of the water supply of Rangoon.

Mr. John Bryce, burgh surveyor of Partick, will take service with the Glasgow Corporation under the scheme of incorporation.

Mr. F. G. Holmes, burgh surveyor of Govan, will transfer his services to the Glasgow Corporation under the scheme incorporating Govan with Glasgow.

Mr. Duncan Burns, burgh surveyor of Pollokshaws, in connection with the annexation of the district, has elected to serve under the Glasgow Corporation.

Mr. S. Gilbert, one of the surveyors to the St. Columb Major (Cornwall) Rural District Council, has been appointed highway surveyor of the Northern District of Truro, at a salary of £120 per annum.

Mr. Lewis Wynne-Roberts, son of Mr. R. O. Wynne-Roberts, M.INST.C.E., has gained second-class honours in his B.Sc. examination, London University, and a First-Class Diploma and Gold Medal at the Battersea Technical College.

Mr. T. Jones, surveyor to the Crediton Urban District Council, has been authorised by the council to attend the general conference of the National Housing and Town Planning Council, to be held in the Guildhall, London, on the 26th and 27th inst.

Mr. Wilfrid Wright, ASSOC.M.INST.C.E., of the town surveyor's department of Sutton (Surrey), has had his salary increased to £150 per annum, rising £10 annually to a maximum of £180, while the salary of Mr. H. Whetstone has been increased by £13 a year.

Mr. William Page Robinson, for over twenty years surveyor to the Skelton and Brotton Urban District Council, was found dead recently, and it was stated at the inquest on Saturday last that he had been depressed since the death of his wife. The coroner and jury expressed sympathy with deceased's three sons and other relatives.

Mr. Thos. McKie, ASSOC.M.INST.C.E., lately of Glasgow, has been appointed engineering assistant to Mr. Herbert E. Bellamy, resident engineer on the main southern and western ocean outfall sewer works for Sydney and suburbs. Mr. G. Paulin, B.SC., B.E., engaged on the same work as assistant, has accepted the appointment of district engineer in the Fiji public works department.

Alderman Pinkham, at the meeting of the Middlesex County Council on Thursday of last week, congratulated the council on being able to retain the services of Mr. H. T. Wakelam, the county surveyor, in reference to his withdrawal as a selected candidate for the engineership to the London County Council. The chairman, Alderman W. Register, also referred simi-

larly to the matter, and both speeches were received with applause.

Dr. L. W. Darra Mair, whose death in a London nursing home on Sunday is reported, has done work of much public value as medical inspector under the Local Government Board. He carried out many important investigations into outbreaks of infectious diseases in different parts of the country, the reports on which have formed valuable contributions to epidemiology, while other reports have had important bearing on the sanitary administration of rural districts.

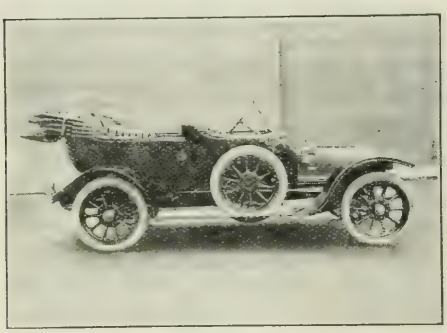
Mr. F. S. Oldfield, resident engineer at the Barnet sewage disposal works, and assistant teacher of sanitary engineering at the London County Council School of Building, Brixton, has been appointed lecturer on road making and drainage at the Northern Polytechnic, Holloway. Mr. Oldfield commenced his career in 1896 by serving for three years under Mr. J. Patten Barber, borough engineer of Islington, after which he became assistant engineer at West Ham, subsequently serving as sewerage engineer to the Durban Corporation, Natal, for a period of seven years. In 1910 he was appointed assistant resident engineer at the Para sewage works, Brazil.

OLYMPIA EXHIBITS.

THE TALBOT CARS.

Clement Talbot, Limited, Barlby-road, Ladbroke-grove, W., have arranged an attractive exhibit at Stand 69 at the Olympia Motor Show, which opens to-day.

In the twelve months which have elapsed since the last show many important improvements have been effected in this firm's cars. For example, their 12-h.p.,



12-h.p. Talbot Car.

15-h.p. and 25-h.p. cars are all being fitted with a new type of front axle, with ball-bearing pivots, this previously only being fitted to the 20-h.p. model. Enclosed valves will be a feature of all models, giving a neat appearance to the engine, and ensuring freedom from dirt and grease, while in future only two-gear wheels cut with silent helical teeth will be used. To the 12-h.p., 15-h.p. and 25-h.p. cars Talbot detachable wheels are fitted, with either Sankey steel wheels or artillery wooden wheels. To the 20-h.p. Dunlop detachable wire wheels are fitted without extra charge. In addition, all models have a new and improved aluminium dash, giving an exceptionally smart appearance. Other excellent advantages are the stiffening of the frame and steering column, the countersunk fitting of recording instruments, and the ease of detachment of the body without disconnecting any wires or engine fittings.

BENZ CARS.

Three types of Benz cars are being shown at Stand 28 by the Brompton Motor Company, Limited, 78 and 80 Brompton-road, S.W. A new model of their 12—20-h.p. chassis, which has taken a place in the front rank of small touring cars, is in particular an exhibit which is likely to impress all by its clean lines and simple design. A really magnificent car is a 35—45-h.p. limousine-landaulette of the latest torpedo type, painted dark grey and upholstered in grey cloth, a 15—25-h.p. Torpedo-de-luxe, painted dark mole-grey and upholstered in green leather, being another fine example of the Benz productions, which include no fewer than nine different models for 1913.

New City of London Subway.—A contract for a passenger subway at the junction of Cannon and Queen Victoria streets has been placed by the Corporation of London with Messrs. Mitchell Brothers, contractors, Limited, of 34 Victoria-street, S.W., who will carry out the work to the designs of the engineers, Messrs. Mott & Hay.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF PORTSMOUTH.

PORTSEA IMPROVEMENT RECONSTRUCTION SCHEME.

TO BUILDERS AND OTHERS.

Tenders are invited for the Erection, Completion and Maintenance in thorough repair for six calendar months from the completion thereof of the following works—namely:—

(1) The Erection of 22 Houses on the West Side of Curzon Howe-road, Portsea (Section X).
(2) The Erection of 17 houses on the East Side of Curzon Howe-road, and 4 houses in Kent-street, Portsea, together with a Wall and Iron Fence (Section Y).

On the deposit of the sum of £2 2s. (which will be returned on the receipt of a *bonâ-fide* Tender), a lithographed copy of the Bills of Quantities, with Form of Tender for each or both of the above works, can be obtained on application to the undersigned, and the Specification, General Conditions and Plans of both the above works can be seen at the Borough Engineer's offices at the Town Hall, Portsmouth, where any further particulars can be obtained.

The Contractor may tender for either or both of the above works, and Tenders, marked "Tender for the Erection of Houses, Portsea, Section X" (or "Section Y," as the case may be), must be filled up, signed and returned, together with the Bills of Quantities duly filled in, so as to reach the undersigned not later than 10 a.m. on Tuesday, the 26th day of November, 1912.

The Council do not undertake to accept the lowest or any Tender, and the acceptance of any Tender will be subject to the sanction of the Local Government Board being received to borrow the amount required to carry out the work.

G. HAMMOND ETHERTON,
Town Clerk.

The Town Hall, Portsmouth.
November 6, 1912.

CLEETHORPES URBAN DISTRICT COUNCIL.

TO GRANITE MERCHANTS.

The above Council invite Tenders for the Supply of 350 tons (more or less) of Granite, broken to 2-in. gauge. The whole to be delivered in trucks as and when directed at Cleethorpes Station (G.C. Railway).

Samples of material to be supplied must be sent to Mr. C. H. Waithman, A.M.I.C.E., Engineer and Surveyor, Town Hall, Cleethorpes. Sealed Tenders, endorsed "Granite," to be sent to me, the undersigned, not later than Tuesday, November 19th, 1912.

(By order)
B. GREAVES,
Clerk to the Council.

Town Hall,
Cleethorpes.
November 6, 1912.

TO MANUFACTURERS OF MUNICIPAL APPLIANCES.—An Engineering Firm, having Five First-class Specialities of considerable interest to Surveyors, Waterworks and Sewerage Engineers, and in which a valuable connection has already been established, desires to amalgamate with a firm already engaged in this line of business who possess good selling facilities: there is a good demand for these specialities, and a large number are already successfully at work, and the whole of the pioneer work has been carried out; excellent opportunity for the right firm seeking expansion. Principals only dealt with Address Box 1,198, office of The Surveyor, 24 Bride lane, Fleet-street, E.C.

MUNICIPAL WORK AT SHEFFIELD.

HIGHWAYS AND SEWERS.

The surveyor of highways and deputy city engineer of Sheffield, Mr. W. J. Hadfield, has just published the annual report of the department of highways and sewers for the year ended March 25th last, and from this we gather that the total expenditure upon highway and sewer construction and maintenance for the period under review was £120,575, compared with £107,313 in 1910—11. The gross expenditure in 1911—12 was £245,172, as against £215,575 in 1910—11. The increase is entirely accounted for by the more rapid progress of rubble-sewer conversion and the construction of the Tinsley tramways. Expenditure on insanitary back lanes shows an increase; many of the back lanes in and near the central district have been permanently paved and put into good sanitary condition, and others, more especially in the Park district, are on the list for the current year.

A table showing the classification of paving gives the following figures: Granite, 64 miles; whinstone, 1·99 miles; freestones, 69 miles; wood, 10 miles; combined wood and granite, ·17 mile; tar-macadam, 29 miles. The total mileage of adopted roads is 316, and of unadopted 85. It is intended to lay down 1 200,000 new wood blocks. During the greater part of the year a small gang of men was employed solely in repairing wood-paved streets, and 123,895 old wood blocks were cleaned, sawn to a uniform size, and re-used.

The new creosoting plant has been completed, and was at work during the winter. It is capable of dealing with 10,000 blocks in an ordinary working day, and the creosoting chamber is of sufficient length to accommodate the longitudinal wood sleepers used for tramway purposes. The whole of the wood blocks used for street paving are now being creosoted under pressure, which should add considerably to their life. Tramway sleepers are being dealt with by the plant, instead of being purchased ready creosoted, and a considerable proportion of the timber used by the department for other purposes, which was not formally treated in any way, is now being creosoted.

TAR-MACADAM ROADS.

The most notable feature in the table of street mileage is the increase in tar-macadam roads. Including tar-macadam roads along the centre of which are tramways paved with wood or other material, the length has increased during the last twelve months from 22½ miles to about 29 miles, and further extensions are, at the time of writing this report, in rapid progress. During the last four years the mileage of roads coated with tar macadam has increased by about 100 per cent. Special care has been taken on gradients to finish tar-macadam roads with surfaces affording suitable foothold for horses, and in order to provide this dry material has been rolled into the final coat. About 15,000 tons of tar macadam were made and used during the year, and arrangements have been made to largely increase the output.

The Road Board have sanctioned a loan of £11,000 free of interest for six years towards the cost of tar-macadamising certain main roads. The tar macadam, Mr. Hadfield states, will be carefully maintained, and it is anticipated that if present traffic conditions continue, the greater part of the roads will be in good condition at the end of six years, with several years' life before them. The area treated with calcium has been increased, largely because where tarring was omitted in consequence of the probable conversion of the roads to tar macadam a dressing of calcium was applied as a temporary measure. Longer experience of this class of work confirms the opinion previously expressed (Mr. Hadfield states), that both tarring and treatment with calcium are not only a great advantage in that they decrease the amount of dust, but both processes are found in the long run to be an economy from the point of view of maintenance. Road surfaces after treatment with either tar or calcium are much less liable to disintegrate, and the tarred roads on the whole produce much less mud during the winter. No work done by the department, Mr. Hadfield comments, seems to be more appreciated by the public than these efforts to reduce dust.

SEWERAGE WORK.

The returns show a great increase in the amount of sewerage work, it having been decided to raise, for the conversion of defective rubble sewers, loans amounting to £25,000. The total expenditure upon sewerage work (capital and revenue) was £39,803, and it is hoped that by March, 1914, all the rubble sewers urgently needing attention will have been dealt with leaving approximately 25 miles to complete, compared with an original total of 119 miles.

WORK AND WAGES.

Dealing with workmen and wages, Mr. Hadfield states that the number of men employed was 1,383 in 1911—12, compared with 1 252 in the preceding year, the total wages bills being £97 052 and £86.108 respectively. The average weekly wage is £1 7s., an all-round increase of 7d. weekly. The relation of wages, team work, establishment charges, &c., to the total expenditure of the department is tabulated below:—

	Year ended March 25, 1911.		1912.	
Wages	£86,108	39·98%	£97,052	39·59%
Hired team work ...	14,671	7·32%	18,313	7·47%
Materials, rent, rates and other expenditure	107,578	49·43%	122,648	50·02%
Establishment charges	7,043	3·27%	7,159	2·92%
	£215,400	100·00%	£245,172	100·00%

The amount spent upon renewals was much greater than in any previous year, due chiefly to the reconstruction of the Tinsley track. The principal item of this year's constructional programme is the doubling of a great part of the Fulwood track from Manchester-road to the point where the work was terminated last year, near Tapton Park-road. Mr. Hadfield states that for this work rails of a specially heavy section (120 lb. per yard) are being employed; the joints are being welded, and the rails are laid on longitudinal wood sleepers bedded on concrete and thoroughly anchored.

SOME RECENT PUBLICATIONS.*

Law of Repairs and Dilapidations. By T. Cato Worsfold, M.A., LL.D. Price 3s. 6d. net. London: Sir Isaac Pitman & Sons, Limited.

There can be few branches of law which are so far reaching in their effect, or which touch the personal interests of so many persons, as that which is the subject of this book. While of special interest to lawyers and surveyors, the law of repairs also directly affects a vast number of laymen in their capacity either of landlord or tenant. In writing this little book Dr. Worsfold has kept in view, so far as possible, the requirements of all these classes. He has dealt with the various aspects of his subject in an easily comprehensible way, and at the same time has given ample authority for the propositions of law which he discusses. The book is complete so far as its scope is concerned, dealing with ecclesiastical repairs, agricultural repairs, and repairs to settled property in addition to the more ordinary cases. As a concise handbook of the law Dr. Worsfold's book has much to recommend it.

Surveying and Surveying Instruments. By G. A. T. Middleton. Price 5s. nett. London: Whittaker & Co.

The popularity of Mr. Middleton's concise work on surveying is evidenced by a third edition having been called for. The welcome which has been accorded to the earlier editions is due to the fact that the book gives a concise account of modern instruments and modern methods of working. Thus, while it does not presume to compete with the well-known standard works on the subject which are larger in size and higher in price, the student will find in it all that he requires for the ordinary routine of daily surveying practice. In issuing the new edition, opportunity has been taken to illustrate the new Leiss level, and to add examples of a hasty plane-table survey, a completed traverse survey, and a tunnel survey. The general elementary character of the work has been retained, and it will doubtless maintain the position it has achieved as a popular text-book for students.

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

Royal Institute of British Architects.

MR. REGINALD BLOMFIELD'S PRESIDENTIAL ADDRESS.

On Monday evening last Mr. Reginald Blomfield, A.R.A., delivered his inaugural address as president of the Royal Institute of British Architects, the points to which the attention of the members was directed being: The position of this institute; the position of the architect; registration; and education.

Dealing first with the position of the institute, Mr. Blomfield said they had, in the last two or three years, incurred a large expenditure, which had induced some anxiety among the members in regard to the future. He thought he could safely reassure any member who had an uncomfortable feeling of insecurity. As a body the institute had never been so strong as it was to-day, the total of its membership, including licentiates, amounting to some 4,700, in addition to the numerous [illegible] and students from whom the members of the future would be drawn. The network of allied societies, working in close relation with the central body, now covered not only the United Kingdom, but practically the whole of the English-speaking dominions, and the council had recently taken in hand the consideration of the relations of the allied societies *inter se* and to this institute, in order that no district should be without a representative body to assist the architects practising within its boundaries.

POSITION OF THE ARCHITECT.

Continuing, Mr. Blomfield said: The position of the architect as a professional man has given ground for a good deal of anxious consideration in the last year or two. Adverse verdicts have been given in the Courts, which appear to saddle us with unfair and impossible responsibilities, and there can be no doubt that the position of a practising architect to-day is more difficult than it was forty years ago. He is expected to know a great deal more, and to do a great deal more for his money, than was expected of his predecessors in the halcyon days of the 'seventies. Applied science has developed so fast and in so many directions that it is impossible for an architect to keep pace with every branch of it; and, beside all this, he has his own art to master. For when all is said and done, the first business of the architect, that which differentiates him from other men, is his power and knowledge of design, and that, in the chaos of [illegible] [illegible] of the practice of building. At the same time, I think [illegible] in this matter.

[illegible] is higher, but this is due in the one case to causes beyond our control, in the other to our own efforts; and what we have to do is, on our part, to qualify [illegible] in the public a more intelligent appreciation of the [illegible] less of the regrettable misunderstandings that sometimes occur in the practice of architecture—but architects should not forget that the only effective passport [illegible]

REGISTRATION.

[illegible] 1907,

and your council has for some years endeavoured to give effect to that policy. Your council can hardly hope to produce a scheme that will at once satisfy all, or nearly all, shades of opinion, and also be within the range of practical politics—this last is important—for I think you will agree with me that if you run a horse you should run him for all he is worth, and that it is unworthy of serious men of affairs to waste time and money on mere *ballons d'essai*. We are after a practical scheme—one that will protect both the public and architects.

Various solutions have been proposed. So far none of them have met with general acceptance, but it must not be supposed that the labours of the last few years have been wholly in vain. They have at least shown us some of the difficulties in the way, and have brought it home to thoughtful men that this is a very difficult and intricate problem not to be settled off-hand, and that if a real and satisfactory solution is to be found for it, that solution will have to be built up by careful and exhaustive consideration of the case in all its aspects—of what is required by the public, of what is due to the architect, and of the effect of any such scheme on other professional bodies whose interests may be affected. And if, after this careful consideration, it is found to be impossible to go quite so far as some of the more ardent of our registrationists might desire, I would remind them that half a loaf is better than no bread, and I would appeal to them, and, indeed, to all of our critics, to have patience and not to take the bit in their mouths and bolt. It is no use striking before the iron is hot, and it has become clear that there are many issues to this question, all of which must be dealt with before it will be possible to reach the psychological moment of solution. . . . One of the first acts of your new council has been to appoint a large and carefully selected committee to consider the whole question of registration, and it has strengthened it by the addition of a number of representative members from the provinces. I would ask you to give this committee time to deal with the question in all its bearings, and, when the recommendations of the council come before you, not to look for impossibilities, but to give it your careful consideration as practical men of affairs, and with an anxious regard to the future of architecture. . . . On one point I feel sure we shall all agree. The object of a registration scheme should not be to make architecture a close profession, regardless of professional skill. . . . Our object is to put a stop to incompetence, and to establish and maintain a reasonable level of accomplishment, and to see that that level is reached by those who undertake the very responsible work of an architect. There is not a man in this room who would not say "la carrière ouverte aux talent," but what we insist on is that the "talent" should really be there, and that is the substantial issue to which registration should be directed. It should be really and effectually the hall-mark of professional competence.

PROFESSIONAL TRAINING.

So, by this roundabout way, we come back to the vital question of education, or rather, as I should prefer to put it, a sound and thorough professional and artistic training as the basis on which any form of registration must be founded. If we are to obtain public and formal recognition of the fact that architecture is not an art that can be practised by Dick, Tom and Harry with advantage to the community, and that there is a difference in kind between the work of the trained designer and the architectural efforts of the gentleman who combines the practice of architect, auctioneer and estate agent, we shall see to it, not only that our present standard is maintained by all who enter our ranks, but also that it is slowly and surely raised, so that there can be no question as to who is and who is not qualified to undertake the work that legitimately falls to an architect.

It is to this object that the institute, through its Board of Architectural Education, has steadily applied itself during the last few years. . . . The syllabus of training for architectural students has been thoroughly overhauled, and quite recently a serious attempt has been made to render our examination a more effective and intelligent test of architectural capacity, and also a real stimulus to the artistic enthusiasm of our students.

Design, the adequate invention of buildings which are good to live in and to look at, is, after all, the essential object of our training. Many studies are necessary as subsidiary to this, but the aim of our training must always be to make our students competent architects, artists to whom the methods and materials of building are as his canvas and colours to the painter, or his bronze and marble to the sculptor. . . .

ARCHITECTS AND ENGINEERING.

Under modern conditions it is more than ever imperative that power of design and knowledge of construction should go hand in hand—that the architect should have the technical knowledge of building necessary to realise the flights of his imagination. . . .

At the meeting of the British Association in September last Prof. Archibald Barr gave a very able address on the duty of the engineer to the community, and in the course of it called attention to the unfortunate severance of engineering from artistic design. The engineer, he said, takes a too exclusively utilitarian view of his calling, and architects have not sufficiently mastered the science of steel construction to be able to design in it freely. I think there can be little doubt that Prof. Barr is right in his contention; and the conclusion to be drawn from it is that in the modern practice of architecture the necessity of the study of scientific construction becomes more and more urgent. That is a point that will not be lost sight of in our scheme of architectural training, and I may assure you that on this point our examiners are adamant.

Yet there are one or two considerations which I venture to offer, to reassure the old-fashioned lover of bricks and mortar. I do not believe that the whole future of architecture rests with steel construction or reinforced concrete. . . . Brickwork and masonry must always hold their place in building, and though architects will do well to avail themselves of all the resources of applied science, that is no reason for throwing up their familiar tools and rushing headlong into methods, however brilliant their promise, which have not yet stood the test of time. . . .

I do not think that architecture is going to be stranded high and dry by the engineer; but I heartily endorse Prof. Barr's appeal for more thorough study of construction, and for closer co-operation between the engineer and the architect. The two should pull together, and should do so from the first. It is no use asking an engineer to design a bridge, or even a shop-front, as was recently suggested, and afterwards calling on an architect to invest it with "artistic merit." Both architect and engineer will have their views on the main form and distribution, but they will have studied the problem from different points of view, and it is only by laying their different points of view together, before the treatment of the problem as a whole is decided on, that it will be possible to attain the unity of effect essential to monumental architecture.

Chelmsford Housing. The completion of the first section of the Chelmsford Corporation housing scheme was signalised recently by the laying of a commemoration-stone. Over 140 dwellings are to be erected at a cost of £26,000.

Derwent Valley Water Dispute. The award of the arbitrator, Mr. C. A. Russell, K.C., in the dispute between the Derwent Valley Water Board and the Corporation of Sheffield, was issued on Tuesday. The hearing, which took place in London, was to determine whether the four constituent authorities composing the board—namely, the Corporations of Nottingham, Derby, Leicester and Sheffield—should pay for the entire Derwent Valley water undertaking in the proportions laid down by the Act of Parliament, or whether those works which were not needed for the common use of all four towns were to be paid for only by those corporations for whose benefit such works were needed. The former view was taken by the joint board, but the Sheffield Corporation disputed its ruling. The total cost of the works has been £3,500,000, and the amount in dispute was about £170,000. In his award, the arbitrator has upheld the contention of the three southern corporations that all the reservoirs, lands and easements are to be charged to the four towns in the statutory proportions, but as regards the 50-mile aqueduct, which is used to carry the water south, Sheffield is only to bear its statutory proportion of a part of this, Nottingham, Leicester and Derby having to defray all the cost of the remaining portion.

SPALDING HOUSING SCHEME.

CHEAP COTTAGES.

The erection of thirty-six cottages is proposed by the local authorities of Spalding, Lincs, where the housing problem has been acute for many years. It has been decided to construct a street through the allotments about 1¼ miles from the centre of the town, this land being already the property of the town, and the cottages are estimated to cost £5,176 to build.

The plans show the cottages in pairs and in blocks of four, with spaces of 10 ft. and 15 ft. respectively between each for access to back premises and the allotments, which remain at the rear.

Each cottage contains on the ground floor an entrance lobby, with door opening into a living-room, 14 ft. by 10 ft. 6 in. and 8 ft. high, overlooking the street; a kitchen, 14 ft. by 12 ft., with good pantry and stores adjoining, overlooking the yard and allotments; and rear premises. On the upper floors are bedrooms, 14 ft. by 10 ft. 6 in., 12 ft. by 8 ft. 6 in., and 9 ft. by 8 ft. 6 in. respectively, and 8 ft. 6 in. high.

At the proposed rent of 3s. 6d. per week the scheme will be entirely self-supporting, and although the plans have not yet been passed by the Local Government Board, there are already many applicants for the houses.

Baltimore's Municipal Motors.—The Municipality of Baltimore owns thirty-four automobiles and fourteen motor cycles to do the work of its numerous departments. In spite of the bad streets and heavy grades, the automobile, both for pleasure and business, has found favour, and the number is steadily increasing. Of the municipally owned cars, there are eleven in the fire department, twelve in the police department and eleven in what is known as the "city hall," the latter including the departments of sewerage, park board, commissioners for opening streets, paving commission, street cleaning, building inspector, subway, water, health, and so forth.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

The council of the Institution of Municipal and County Engineers are offering premiums to members, associate members and students of the institution amounting to twenty-eight guineas for the best plans for laying out a seaside pleasure resort.

The drawings are to be delivered prior to the annual meeting in July next at a date to be fixed hereafter. Further particulars will be issued shortly.

Thomas Cole.
11 Victoria-street, S.W. *Secretary.*

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

At the ordinary monthly meeting of the above association, held at the Town Hall, Twickenham, on Saturday last, there was a very good attendance. The meeting had under consideration the re-drafting of the rules and regulations, among other matters discussed being that of the construction of public mortuaries, post-mortem rooms and by-laws in connection therewith. The association also discussed, at some considerable length, the question as to what is a new building, the points raised being those which are not specifically mentioned under Act of Parliament, one being whether the different classes of buildings and alterations and circumstances surrounding the cases could be classified in such a manner as to bring them within the scope of the various acts and the by-laws.

At the next meeting consideration will be given to a paper on the intercepting trap, by Mr. E. Willis, Assoc.M.Inst.C.E., of Chiswick.

The association have noted with pleasure the appointment of Mr. J. H. Brierley (one of its members), the borough surveyor of Richmond, to the South-Eastern District Committee of the Institution of Municipal and County Engineers.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Frank Latham, M.Inst.C.E.I., F.S.I., Borough Engineer and Surveyor, Penzance.

COUNCIL MEETING.

At a meeting of the council held on October 30th the following applicants were recommended for admission:—

To Membership: Messrs. W. Yeo, surveyor, Lynton Urban District Council; C. W. Denny, engineer's office, Redditch Urban District Council; J. Seddon, surveyor, Little Lever Urban District Council; R. Rosbotham, chief surveyor, West Lancashire Rural District Council; W. F. L. Thomas, city engineer, Georgetown, British Guiana; A. O. Callear, water engineer, Harrington Water Scheme, Borough of Wenlock, and R. G. Coles, surveyor, Wells-next-the-Sea Port and Urban District Council.

Transfer to Membership: Mr. P. G. Eckersall, city surveyor's office, Manchester.

Transfer to Associate-Membership: Messrs. W. Walker, borough surveyor's office, Chesterfield, and H. K. Jordan, borough engineer's office, Wandsworth.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

New Members, &c.—From the applicants recommended for admission at the last meeting three members and five associate-members were elected, and two transfers were made to the membership class.

Finance Committee.—The following members of the council were elected: Messrs. Carr, Cutler, Elson, Ennals, Farmer, Mundy, Whitwell and Veale.

Special Purposes Committee.—The following members of the council were elected: Messrs. Barralet, Boot, Cutler, Elson, Fidler, Lewis, Mundy and Shenton.

Chairman of Council.—Mr. E. A. Stickland was elected.

Honorary Librarian.—Mr. John Robinson was elected.

Delegates to the N.A.L.G.O.—The president and Messrs. J. T. Pegge and A. E. Prescott were elected.

Council Meetings.—It was decided that these be held alternately on the last Wednesday and the last Saturday in the month.

Provincial Council Meetings.—This matter was again considered, and a definite pronouncement upon it will be made at the next meeting.

District Boundaries.—Approval was given to the alteration in district boundaries as set out in the new List of Members.

JOINT SOUTHERN AND SOUTH-EASTERN DISTRICT MEETING.

A Joint Southern and South-Eastern District meeting will be held in the council chamber, No. 4 Southampton-row, London, W.C., on Wednesday, November 27th, 1912, at 8 o'clock, when a paper, "The Effect of Recent Decisions upon the Arbitration Clause," by Mr. W. Valentine Ball, M.A., barrister-at-law, author of "The Law Affecting Engineers," joint editor of "Emden's Building Contracts," 4th edition, will be read.

The subject of Mr. Valentine Ball's paper is of wide importance to engineers and others engaged in municipal work, and it is hoped that each member will, where possible, bring to the meeting his town clerk, chairmen of committees, and others interested in the matter. The discussion will be an open one, and an advance copy of the paper may be had upon application.

The building No. 4 Southampton-row, is almost opposite the Holborn Station of the Great Northern and Piccadilly Tube, and within a minute of the British Museum Station of the Central London Railway. Omnibuses from all parts practically pass the door.

Arthur Palmer,
J. Woolford Brook,
Joint Hon. District Secretaries.

NORTH-WESTERN DISTRICT.

It has been decided to hold a social evening at Manchester on Saturday, December 7th. The approximate expense per head will be 4s., and it is desirable that members should give notice, at the earliest possible moment, of their intention to attend. Full programme will be issued later.

"Brantwood," Jas. W. Gleave,
Commercial-street, *Hon. District Secretary.*
Heywood.
October 12, 1912.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

ROYAL SANITARY INSTITUTE.

MEETING IN LONDON.

A Sessional Meeting of the Royal Sanitary Institute will be held at 90 Buckingham Palace-road on Tuesday next, when a discussion will take place on "The Report of the Departmental Committee on Intercepting Traps and House Drains," to be opened by Mr. H. Percy Boulnois, M.Inst.C.E., chairman of the council of the institute.

The following hope to be present and take part in the discussion: Prof. H. R. Kenwood, M.B., medical officer of health, Stoke Newington; Messrs. J. Patten Barber, M.Inst.C.E., Islington; Philip Boobbyer, M.D., M.R.C.S., medical officer of health, Nottingham; William Butler, M.B., D.P.H., assistant medical officer of health, London County Council; C. H. Cooper, M.Inst.C.E., Wimbledon; T. W. A. Hayward, M.Inst.C.E., Battersea; T. de Courcy Meade, M.Inst.C.E., Manchester; T. J. Moss-Flower, Assoc.M.Inst.C.E., Bristol; Louis C. Parkes, M.D., D.P.H., medical officer of health, Chelsea; W. H. Prescott, M.Inst.C.E., Tottenham; Ernest Van Putten, M.Inst.C.E., Lewisham; R. Read, Assoc.M.Inst.C.E., Gloucester; H. Alfred Roechling, M.Inst.C.E.; H. Scurfield, M.D., medical officer of health, Sheffield; F. Sumner, M.Inst.C.E., City of London, and W. C. Tyndale, M.Inst.C.E.

General discussion is invited.

The chair will be taken at 8 p.m. by Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E.

E. White Wallis,
Secretary.

Sewage Disposal at Solihull.—New sewage outfall works, constructed at Barston by the Solihull Rural District Council at a cost of £40,000, have been formally opened. Operations in connection with the scheme commenced in 1906, when the engineer and surveyor, Mr. A. E. Currall, received instructions to prepare a scheme and estimate.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, but those responsible for their despatch are recommended to arrange that they shall reach The Surveyor office by noon on Wednesdays to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.

ROAD FOREMAN.—November 11th.—Maidstone Rural District Council. £1 1s. a week.—Mr. R. Hoar, clerk.

TWO TEMPORARY ASSISTANTS.—November 11th.—Corporation of Swansea. £10 16s. 8d. per month.—The Town Clerk.

CLERK OF WORKS.—November 11th.—Lichfield Rural District Council. £3 13s. 6d. per week.—Mr. R. Green, 37 Waterloo-street, Birmingham. Applications to be endorsed "Clerk of Works."

JUNIOR ASSISTANT.—November 11th.—Clacton Urban District Council. £1 1s. per week.—Mr. Geo. T. Lewis, clerk.

SURVEYOR'S ASSISTANT.—November 11th.—Lewisham Borough Council. £80—£120.—Mr. E. Wright, town clerk.

CLERK OF WORKS.—November 12th. Stalybridge and Dukinfield Joint Sewerage Board. £3 3s. per week.—Mr. W. Moss, clerk, Market-place, Ashton-under-Lyne.

INSPECTOR OF NUISANCES.—November 12th. Southborough Urban District Council. £104 per annum.—Mr. Philip Hanmer, clerk.

INSPECTOR OF NUISANCES.—November 15th.—Westhampnett Rural District Council. £100 per annum.—Mr. W. D. Rasell, acting clerk.

SURVEYOR'S ASSISTANT.—November 16th.—East Suffolk County Council. £90—£120.—Mr. A. Townshend Cobbold, clerk, County Hall, Ipswich. Applications to be endorsed "Surveyor's Assistant."

SURVEYOR.—November 19th.—Upper Brue District Drainage Board. £115 per annum.—Mr. R. Bath, clerk, 11 Chilkwell-street, Glastonbury. Applications to be endorsed "Eastern District."

CLERK OF WORKS.—November 20th. Hackney Borough Council. £4 4s. per week.—Mr. W. A. Williams, town clerk.

MUNICIPAL ENGINEER.—November 21st.—Municipal Board of Cawnpore. Rs.800–1,000 per mensem.—Mr. C. E. Goument, C.S.I., M.INST.C.E., c/o Messrs. Thos. Cook & Son, Ludgate-circus, London.

ENGINEER AND SURVEYOR.—November 25th.—Rawmarsh Urban District Council. £200 per annum.—Mr. J. W. Bellamy, clerk. Letters to be endorsed "Engineer and Surveyor."

DEPUTY CITY SURVEYOR.—November 30th.—Corporation of Manchester. £750 per annum.—Mr. Thos. Hudson, town clerk.

ARCHITECTURAL DRAUGHTSMAN.—Public Works Department, Kedah, Malay States. £350 per annum and free quarters.—Box No. 1,194, THE SURVEYOR office.

ASSISTANT DRAINAGE ENGINEER.—Corporation of Madras. Rs.500—700 per mensem, and motor bicycle allowance. Age not to exceed thirty-five.—James Mansergh & Sons, agents to the corporation, 5 Victoria-street, Westminster. Envelopes to be endorsed "Drainage Assistant."

ENGINEER'S ASSISTANT.—Municipal Commissioners of Singapore. $350 per month. Age under thirty-two.—Mr. C. C. Lindsay, M.INST.C.E., 180 Hope-street, Glasgow.

DRAUGHTSMAN (Temporary). Corporation of Hertford. £3 3s. per week.—Mr. John H. Jevons, borough engineer.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1369 Holborn), subject to later confirmation by letter.*

RHYL.—November 18th.—Plans, specifications and estimates for strengthening Rhyl pier, for the urban district council.—Mr. A. Rowlands, clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

DUBLIN.—January 1st.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A.—The Town Clerk.

HARROGATE. February 3rd. Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

DURSLEY.—Competitive designs for thirty cottages, for the rural district council.—Mr. J. Collett, clerk to the Parochial Committee, Dursley.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Minutes of Proceedings.

The Intercepting Trap.

The meeting which was held at the Royal Sanitary Institute this week to discuss the Local Government Board report upon the use of the intercepting trap in house drains was a success so far as the attendance was concerned, and served to indicate the great interest which has been aroused among sanitarians by the publication of this report. In addition to the opening address of Mr. H. Percy Boulnois, nine speakers contributed to the discussion, and it was then decided to adjourn the meeting until next week in order to give an opportunity for others who wished to voice their opinions upon the subject.

Of the nine speakers who have given their views so far five were in favour of the abolition of the intercepting trap and four in favour of its retention, and unless the proceedings take a different turn at the adjourned meeting next week the discussion will, in our opinion, produce very little practical result. We cannot help feeling that this repetition of the pros and cons of the subject is futile. It does not appear to have occurred to the speakers that the Departmental Committee of the Local Government Board spent four years making special investigations and considering arguments for and against the trap from fifty-two witnesses, and to continue the procedure now is simply beating the air. To our mind, two courses are open to the Royal Sanitary Institute. If the general consensus of opinion is to the effect that the conclusions arrived at by the Local Government Board Committee are not justified by the evidence laid before them, it is open to the Institute to set up an impartial committee of its own to carry out similar investigations and take evidence afresh with the view of demonstrating where the conclusions published in the report are wrong; but if this is done as fully and as impartially as by the Local Government Board Committee, it would be necessary to carry out a larger number of experiments extending over a longer period of time and with more perfect apparatus which would deal with every possible condition. Further, it would be necessary to examine more than fifty-two witnesses whose qualifications were superior to those of the persons examined by the Local Government Board Committee, which is absurd.

On the other hand, it is open to the Royal Sanitary Institute to appoint a committee of experienced men selected from the various professions which are concerned in the matter to consider the best means of putting into effect the recommendations of the Local Government Board Committee, and, if it is found desirable to devise some means for providing additional security against the entry of sewer air into buildings in the event of the intercepting trap being omitted from the house drain, to make investigations to decide what new or improved methods of construction or appliances may be introduced for that purpose. If this idea were adopted some practical good would be done, but it is waste of time to continue the rehearsal of the divergent views of the experts. It is not a question of adopting some new, unproved theory. There are a number of towns where the intercepting trap is not used, and no ill results have followed its omission from the house drains. No arguments will alter these facts; but there is room for discussion of the methods which should be adopted to bring the omission of the trap into general practice. The wastes from sinks and baths are already disconnected from the drains at the gullies, and it is not to be supposed that the inventive ingenuity of our experienced sanitary engineers and manufacturers of sanitary appliances is unequal to the task of discovering some means of effectively disconnecting the water-closets and rain-water pipes from the drains without having recourse to an appliance which would perpetuate the defects of the intercepting trap. In these days of progress in sanitary science surely it cannot be necessary to accept the intercepting trap as finality! Limits of space prevent us from dealing with the subject at greater length on the present occasion, but we venture to hope that the Royal Sanitary Institute will rise to the occasion and utilise the splendid opportunity afforded by the adjourned meeting next week to deal with the subject in a more useful manner.

Money Wasted on the Roads: Who is to Blame?

We have given earnest and careful attention to an important editorial article which appeared in a recent issue of *The Commercial Motor*, in which an attempt is made to get at the root of some of the unsatisfactory features of road maintenance in the United Kingdom. In the view of our contemporary highway surveyors do much that is wrong, and waste a great deal of public money against their will, being forced to do so by the corrupt councils of which they are the servants. In some cases, for instance, the surveyor "knows full well that it is to his best interests to let the road get into such a bad state that stone will be required to resurface it, and necessary labour, so much the sooner;" and again, "the method which requires a road to be re-metalled for its whole width, say, once in two years is retained, in preference to the newer method which would give it a life of six or more years." The council is not, however, to be regarded as primarily responsible, for we read:—"Councillors who vote in favour of changes of road construction methods which will reduce annual outgo

upon maintenance do so at imminent risk of the loss of their seats at the next election." In so far as this is a true picture, the state of affairs is, of course, to be deplored, but more as a matter affecting the public purse than as tending to the maintenance of roads in a state prejudicial to the use of motor vehicles. As our readers know, our own solution is the carrying out of such administrative changes as would bring the highway engineers of the country generally into an organisation of sufficient strength and vitality to resist such evil influences: Road Board, county surveyor and district surveyor all working together for the same ends—economy and efficiency. At the same time we are bound to suggest that the view taken by our contemporary seems to be unduly influenced by the contemplation of a relatively small number of bad cases. We cannot, for instance, accept as a statement applying to the country as a whole, "most surveyors simply ignore potholes, or have loose stones dropped into them;" and even so far as this is true the counsel of despair comes quite as often from the would-be road "improver" as from the local councillor. The power for wrong-doing which local councillors possess, and their desire to do it, are neither so great nor so general as to lead to such a result. Many members of local bodies are anxious to do their duty by the community, and have local influence and force of character enabling them to succeed to a large extent; in plain words they are wise and good, not bad and foolish. As regards the responsibility of the ratepayers, there are, in many districts, strong parties in favour of economy, and although the influence of such parties is sometimes adverse, owing to their following a policy of penny wisdom and pound foolishness, this is by no means a general condition. Taking the country as a whole, a large proportion of the electors of local bodies makes efforts to counteract the influence of those who rob the elector *quâ* ratepayer to pay the ratepayer *quâ* elector, and themselves [illegible]

* * *

Why Tar, Particularly?

While recognising that the trend of *The Commercial Motor* article is on the whole towards the light, and welcoming its wholesome outspokenness, we find ourselves in opposition to it as regards contentions made in engineering matters. "Why is it," we read, "at the present time, that there is so much resistance from the departments of some road surveyors against changes in methods of road construction and maintenance? Why was it that the use of tarry and bituminous binders was adopted so tardily, and why are these systems still regarded with disapproval in many districts?" The answers to these questions are to be found in recent issues of The Surveyor, their immediate effect being to suggest another question: Why is it that it is impossible for any person to be connected in any way with motor vehicles without adopting almost fanatical views, one result of which is that the importance of tar and bituminous materials is magnified fourfold relatively to that of other materials? Surveyors are bound to make road crusts which will serve for horses and cyclists as well as for motor vehicles, and we are confident that on the whole they have done as best and as far as can reasonably be expected. Some of the experiments made with bituminous road crusts point very strongly to the need for carrying out such operations more as a matter of engineering work and less as a matter of trial and error. There are, moreover, very good reasons why materials which may ultimately prove widely serviceable cannot be adopted otherwise than very gradually. As regards the construction of roads to suit motor vehicles there are [illegible] signs that the ordinary macadam is better able to overcome road difficulties than almost any other vehicle which is less an authority than Mr. E. Shrapnell Smith himself has assured us that the commercial motor vehicle is to a large extent an instrument of trade rivalry rather than an economic advantage. 'Minutes of Proceedings,' Civil Engineers, Vol. clxxxvi., p. 254.] As regards antagonism to the Road Board, our contemporary is to be thanked for pointing out where this is due to the fact that the Board is letting light into dark places; but with regard to differences of opinion on engineering questions, we are concerned to maintain that any district surveyor is as much entitled to an opinion as any one else. It may be admitted that there is a certain amount of uneasiness abroad as to the influence which may be exerted by the motorists' societies and the Roads Improvement Association upon the practice of British highway engineering. We do not share in this uneasiness. The Roads Improvement Association, we hope and believe, is tending to become a more generally representative body than it is at present, and the Road Board is fully alive to the necessity for a careful sifting of all evidence with respect to the merits of different materials and methods. While we welcome, then, the bold assertion that the Road Board is "stirring up the mud of not a few monstrous examples of wasted public money," we regret that considerations of this kind should be accompanied by remarks which suggest an attitude of—we will not say antagonism, but rather tutelage—towards road surveyors. Referring to London's local bodies, our contemporary states that: "They nearly all still dearly love wooden blocks and asphalt, and use one or other where modern tar or bituminous systems might well be laid." With this gaping crack in its lute *The Commercial Motor* will pipe in vain—to London borough surveyors at any rate. We can hardly bring ourselves to believe that the sentence quoted actually lies before us on the printed page. If it is intended to apply to only a small mileage of streets with comparatively light traffic it is singularly ill-placed. And why "modern tar"? Just as there is "no merit in procedure *quâ* procedure," so is there no value in modernity *quâ* modernity, and the expression "dearly love" suggests that the writer is, for all his moderation of language, straining in a leash.

* * *

Officials as Architects.

Mr. Percy B. Tubbs, F.R.I.B.A., the president of the Society of Architects, dealt at some length in his inaugural address last night with the subject of the desirability of officials to various public bodies being called upon to design important buildings requiring special knowledge and skill. In certain quarters it is sometimes suggested that the design of practically every class of building should be left to the practising architect. When such a [illegible] advanced by architects themselves, they are evidently open to the criticism that their contentions are based on self-interest. Mr. Tubbs, however, regarded the question from the point of view of the public, and in his admirable address very properly confines his plea to the design of original creative works of architecture. We may say at once that we entirely concur in what he said with such commendable moderation. The employment of the official architect or surveyor in such work is fair neither to the authority, the official, nor the public. As Mr. Tubbs observed, a life of official routine faithfully performed does not foster the development of the imaginative faculties or make for that high standard of skill in design which our great public buildings ought to show. He freely admitted, however, that the co-operation of the official architect with the skilled practitioner is wholly desirable, and pointed out that many of our public authorities maintain a staff of assistants of a high standard of knowledge and experience who are intimately acquainted with the practical requirements of every class of public building, and that if this knowledge and experience could be placed at the disposal of the most brilliant creative designer obtainable, when any original work was contemplated, the result would be a blending of the practical with the artistic and the production of a well designed and thoroughly satisfactory public building.

Housing in Ireland.

The practical impossibility of building houses for the working classes at a cost sufficiently low to render it practicable to let them at rents which are economically possible, having regard to the means of those for whom they are intended, is a question which has been pressing upon housing reformers for a long time. Some time ago the National Housing and Town Planning Council determined to urge upon the Government the desirability of practically contributing to the solution of this problem by giving financial assistance to local authorities to enable them to build houses for rural labourers in special areas, and for the poorest classes in the towns, who are at the present time quite unable to pay an economic rent for a sanitary dwelling. The idea of a State subvention of this kind has been severely criticised in certain political quarters, but with this aspect of the question we have nothing to do. We have to call attention, however, to a very careful report which was recently made by a deputation appointed by the National Council to visit Ireland for the purpose of investigating on the spot the effects of the various Irish Labourers Acts for the provision of cheap dwellings for the labouring classes in that country. A perusal of this report shows that, while the general way in which the Acts are being administered is open to some criticism on certain points of minor detail, the policy of a State grant in aid has been abundantly justified by the results which have been achieved. The report states that the supreme merit of the work accomplished in Ireland rests in the fact that local authorities have been enabled to clear away the hovels which existed in all parts, and to build up new houses and a new people in a way which no other method has accomplished elsewhere. In an earlier memorandum published by the council a strong appeal was made for the adoption by the Government of a similar policy in regard to the housing of the poor in country and town in Great Britain. The inquiries in Ireland have convinced the deputation of the wisdom and justice of the appeal then made for the granting of some similar measure of State aid. In conclusion they point out that no other practical remedy has yet been suggested by which British local authorities may be adequately assisted to perform the difficult task of clearing away unfit houses and providing homes in which the poorest families can be reared in decency and comfort.

The Sewerage of Sydney.

The sewage from the Western Southern, Illawarra and Botany districts of the city of Sydney, New South Wales, has hitherto been treated at the Botany Sewage Farm, which is situated on the south side of Cook's River, where the latter enters Botany Bay. This farm, which was originally intended to deal with the sewage from the Southern District only, has from time to time been called upon to serve other divisions of the city, with the result that it is now inadequate to meet the demands made upon it. This fact was recognised some four years ago, when a report was presented by the Parliamentary Standing Committee on Public Works, in which it was recommended that the farm should be totally abolished, and that a system of disposal by discharge into the ocean should be adopted. It was ultimately decided by the authorities to act upon this recommendation, and the work—which is now in hand—is being carried out to designs prepared by the Department of Public Works in consultation with Sir William Matthews, Sir Alexander Binnie and Dr. G. F. Deacon. The magnitude of the works may be gauged from the estimated cost, which is £457,400. The main outfall sewer is being constructed partly in aqueduct and embankment, partly in open trench, and partly in tunnel through sandstone, and there is a syphon under Cook's River, designed with such a fall between its inlet and outlet as will give a velocity of over 5 ft. per second when discharging at its full capacity. The execution of a work of such magnitude and importance is of interest to all municipal and sanitary engineers, and we therefore feel confident that the article which we are enabled, by the courtesy of Mr. Herbert E. Bellamy, the resident engineer, to publish this week will meet with general appreciation.

* * *

Insanitary Rural Cottages.

That the building laws should be enforced without fear or favour is, of course, a truism; but the difficulties of doing this in the case of old properties can only be appreciated by officials concerned with carrying out the law. One of these was alluded to recently at a meeting of the Tiverton Rural District Council, where the suggestion was made by a member that in sanctioning plans "it should be mentioned as a defect that there were no fireplaces in the upstairs rooms." This is a particularly mild way of putting a matter as to which the law lays down specific instructions. The outstanding feature of the discussion, however, was the admission that there are plenty of old cottages with no fireplaces upstairs, and the further suggestion by a councillor who is an owner of cottages that if fireplaces were enforced in all bedrooms "poor people in the country would suffer far more from lack of cottages than they do now," as owners would be compelled to close the houses altogether. The Tiverton Council allowed the matter to drop, with the expression of a pious opinion—for nothing was formulated—that owners should be recommended to provide fireplaces where possible. The practical line, of course, would be for the local authority to consider seriously the question of promoting a housing scheme, and thus seek to replace ancient insanitary dwellings with houses of an improved type. Judging from the comments of councillors, however, this would be the very last thing they would think of doing. This *laissez-faire* attitude should receive in due course attention from the higher authorities, considering the supreme importance of the human interests involved.

* * *

The Surveyors' Institution.

The question of rural housing was referred to by Mr. Edward Gerald Strutt in his presidential address to the members of the Surveyors' Institution on Monday. Mr. Strutt pointed to the absolute necessity for securing improved housing conditions in agricultural districts if the tide of rural depopulation is to be stemmed. At the present time it is practically impossible to build decent and sanitary dwellings at a remunerative cost. Mr. Strutt regarded the question as of so serious a character as to demand an immediate solution. Existing conditions may be mitigated to a slight extent by suitable amendment of the building by-laws, but such a course is by no means sufficient to meet the present need. It is interesting in the light of the report of the deputation appointed by the National Council (which is referred to elsewhere) to observe that Mr. Strutt suggested the possibility of following the example of Ireland under the Labourers Acts. He pointed out, however, that if such legislation were passed for this country, it would be incumbent upon landlords to do their part by finding the necessary sites for the cottages at a low rate.

The Manchester Appointment.

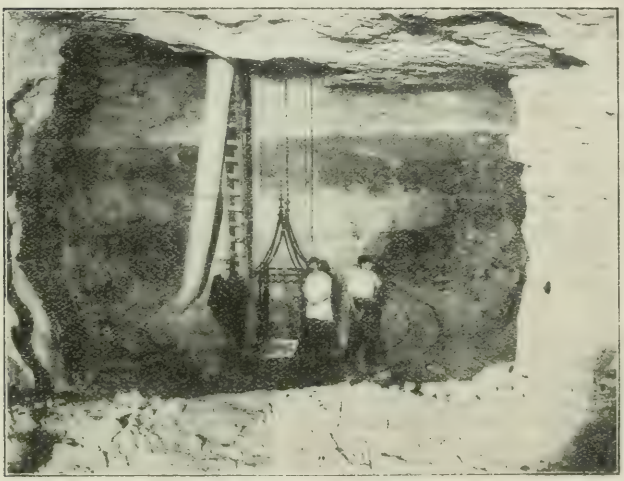
We venture to congratulate the City Corporation of Manchester on the revision they have made in the terms of the contemplated appointment of a deputy city surveyor. As will be seen from the official advertisement (see p. xvii.), the commencing salary offered is now £750; and the scope of the appeal is widened by the removal of the previous restriction of applicants to full members only of the Institution of Civil Engineers. Obviously the prospects of the appointment are attractive, and we have no doubt there will now be keen competition for the post.

Sewerage Construction in Sydney, New South Wales.

GRAVITATION SCHEME FOR WESTERN, SOUTHERN, ILLAWARRA AND BOTANY DISTRICTS.

By the courtesy of Mr. Herbert E. Bellamy, resident engineer in charge of the construction of the first Pacific Ocean outfall section, we are afforded the opportunity of giving a few brief particulars of the scheme now under construction for the disposal of the sewage from the Western, Southern, Illawarra, and Botany districts of Sydney, New South Wales.

Sydney, the capital of New South Wales, is situated on the shores of the land-locked harbour of Port Jackson, which has a coast line of some 200 miles. The population of the city, according to the last census, was 119,800, and that of the suburbs 502,430, making a total of 622,230, distributed over an area of about 140 square miles. The general death-rate, which was 26·77 per 1,000 in 1875, has gradually fallen to 10·36 per 1,000 in the year 1910. For the year ending December 31, 1910, for Sydney and suburban municipalities, the improved capital value of properties was £101,318,074, the unimproved capital value was £43,776,191, the assessed annual value was £6,336,165, the total rates levied was £647,762, while the limitation of rating was £1,081,556.



Sydney Sewerage Scheme: Excavation of Outfall Chamber in Solid Sandstone 100 ft. below Surface.

The areas, population in the years 1908, and prospective population of the districts the scheme now in hand is required to serve are as follows:—

—	Area in acres.	Population, 1908.	Prospective population
Western suburbs	13,010	122,000	360,290
Southern suburbs drained by southern outfall sewer	973	55,080	65,000
Illawarra suburbs	4,879	8,720	60,000
District from Cook's River to ocean	8,000	8,040	182,000
Totals	25,862	193,820	667,290

The prospective population is estimated on a basis of from 20 to 35 per acre for the Western suburbs, 67 per acre for the Southern suburbs, 17 for the Illawarra suburbs, and 20 per acre for the area between Cook's River and the Ocean. Seventy-five gallons per head per day is the quantity of sewage and waste water provided for as the maximum flow, any excess over that, due to storm water finding admission to the sewers, will, when the maximum estimated population is reached, be dealt with by storm-water overflows at the creeks and at Cook's River.

The ordinary average daily volumes to be dealt with as per population in 1908 are as follows:—

Suburbs.	Population, 1908.	Rate per head per day.	Average flow per day. Gallons.
Western suburbs	122,000	21·5	2,623,000
Southern suburbs	55,080	50·8	2,797,048
Illawarra suburbs	8,720	36·15	605,874
District from Cook's River to ocean	8,040		
Totals	193,820	—	6,025,922

At the present time practically all the sewage from the above districts is treated at the Botany sewage farm, which is situated on the south side of Cook's River, where the latter enters Botany Bay. This sewage farm, originally determined upon for the purpose of dealing with the southern sewerage system of Sydney, and in 1898 extended to allow of the sewage of the Western suburbs being treated there, has an area of 620 acres, and the system of disposing of the sewage is partly by irrigation and partly by intermittent downward filtration. It is intended that this farm shall be abolished in its entirety when the works now under construction are completed.

In the year 1908 the Parliamentary Standing Committee on Public Works reported, among other matters, as the result of a most exhaustive and thorough inquiry:—

(1) That the unsuitableness of the soil on the Botany sewage farm, its exposure to tidal influence, the fact that even if used to its full capacity the area of land available would not meet requirements, and the large and increasing population in the locality, to whom the farm is now reasonably a nuisance, render it advisable that the farm should be abolished, and the sewage now treated there, and that which with the retention of the farm would probably be treated there, dealt with by some other method.

(2) That, though the biological or septic tank system of treatment would be a considerable improvement upon the present sewage farm, it is a system not free from conditions which make it, to a certain extent, offensive and otherwise objectionable, and such as should not be adopted if some more effective method, practically inoffensive and capable of being carried out at a reasonable expenditure, can be found.

(3) That the most effective system, if the circumstances justify its adoption, is that of disposing of the sewage by discharging it into the ocean.

(4) That of the different schemes placed before them, the gravitation scheme of the Public Works Department is the most suitable.

(5) That the site chosen for the outfall—the north head of Long Bay—is the most suitable for the purpose.

(6) That, with the abolition of the Botany sewage farm and the adoption of the Long Bay Ocean outfall scheme, all nuisance to the residents of the Illawarra suburbs caused by the present method of sewage disposal will disappear, and

Botany Bay and Cook's River will be greatly improved.

Four schemes for conveying the sewage to the ocean were put before the committee, three by the Department of Public Works, and one by the Metropolitan Board of Water Supply and Sewerage—these prepared by the Department of Public Works comprising an all-gravitation scheme (the scheme proposed), a partial pumping and partial gravitation scheme, and an all-pumping scheme; and that submitted by the Metropolitan Board of Water Supply and Sewerage being a partly pumping and partly gravitation scheme.

Briefly, the proposed gravitation scheme as submitted to the committee at the opening of their inquiry consisted in the construction of a duplicate sewer, with a grade of 1 in 4,400, from the Botany sewage farm to and under Cook's river, and thence, partly through sand and partly through rock, to the north headland of Long Bay, the discharge level being fixed there at 15 ft. below high-water spring tides. The sewer was to be of sufficient capacity to deal with the sewage from the whole of the drainage areas when they are carrying a prospective maximum population of 657,200 persons—but one barrel it was considered would meet requirements for the ensuing twenty years, and therefore, when the service would be in trench or in tunnel through sand, it was proposed to construct one barrel then and the second when required. In aqueduct and in rock tunnel, however, it was considered advisable to construct the sewer of the full size at the outset.

Throughout the investigations of the committee there was a direct conflict of statement and opinion respecting the two principal points in the proposed scheme—grade and outfall—between the officials of the Department of Public Works and those of the Metropolitan Board of Water Supply and Sewerage. Consequently it was deemed advisable to obtain expert evidence from competent witnesses entirely independent of both the department and the board. Several witnesses were examined, and eventually it was decided to obtain a report from the three following experts in England—Sir William Matthews, K.C.M.G., Sir Alexander Binnie, and the late Dr. G. F. Deacon. These engineers made several important recommendations relative to the amendment of the scheme, the principal being as follows:

(1) That the proposed grade of 1 in 4,400 be increased to 1 in 3,650.

(2) That, if possible, the trade effluents be reduced when the sewer is first brought into use.

(3) That the soffit of the outfall discharge pipes be 20 ft. below high water of spring tides, instead of 15 ft.

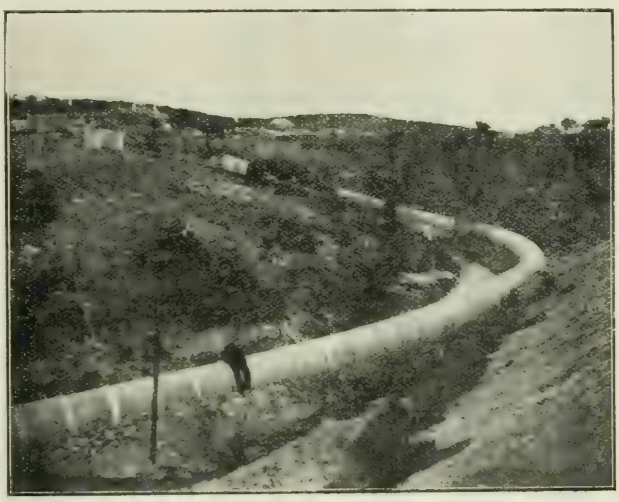
(4) That, instead of the two outfalls from the air-shaft at the end of the main sewer being parallel, they should be spread out, so that, on reaching the sea face of the rock benching, they shall not be at a less distance apart than 150 ft., and that the mouth of each outfall be tapered by means of iron pipes to a distance of 3 ft.

(5) That, wherever the work will be in rock tunnel or cutting, a single instead of a double sewer be constructed; the single sewer to be of a size capable of discharging the maximum quantity of sewage proposed to be dealt with, and the covering of the sewer to be carried out with some curvature.

The following extract from the "Minutes of Proceedings" in September, 1908, shows the resolution passed by the committee: "That, having considered the various schemes submitted to them for the disposal of the sewage from the Western, Southern, Illawarra and Botany districts, the committee are of opinion that the gravitation scheme prepared by the Department of Public Works, and referred to them by the Legislative Assembly, should be carried out, with modifications as recommended in the joint report of Sir William Matthews, Sir Alexander Binnie and Dr. G. F. Deacon, by which the grade of the main sewer shall be 1 in 3,650, and the soffit of the outfall discharge pipes 20 ft. below high-water spring tides: the total cost of the scheme not to exceed £452,400.

The estimated cost of the scheme, at that time amended in accordance with the recommendations of the English engineers, was: capital cost, £452,400; annual cost, £14,120; the details being as follows:—

ESTIMATED COST.	
Sewer across farm (duplicate with screening chambers)	£49,332
Syphon	13,200
Sewer on aqueduct—north side (duplicate)	39,883
Sewer in trench—in soil (duplicate)	24,271
Sewer in trench—in rock (single)	25,854
Sewer in tunnel—in wet sand (duplicate)	134,624
Sewer in tunnel—in rock (single)	93,296
Pumping plant, buildings, &c. (low level)	8,000
Interception of southern outfall	4,920
Engineering and contingencies, 10 per cent	39,320
Interest on cost during construction	15,200
Land resumption	4,500
Capital cost	£452,400
ANNUAL COST.	
Interest on capital cost, at 3½ per cent	£15,900
Renewal fund—buildings, machinery, c.i. pipes, &c.	180
Pumping charges	1,340
Screening sewage, western side of syphon	250
Maintenance of sewers	250
Gross annual cost	£17,920
Less estimated ultimate cost of working farm	3,800
Net annual cost	£14,120



SYDNEY SEWERAGE SCHEME. 48 IN. DIAMETER REINFORCED CONCRETE MONIER PIPES BEFORE FILLING.

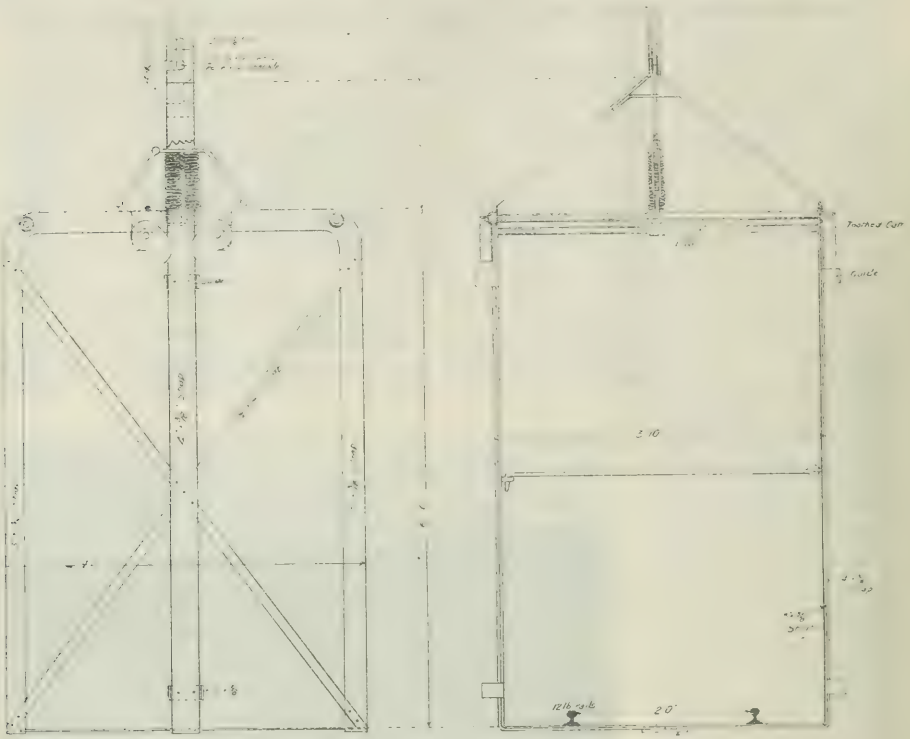
The works now in hand are being executed under the direction of Mr. H. H. Dare, M.E., M.INST.C.E., engineer-in-charge of water conservation and drainage; while the engineer responsible for their design was Mr. L. A. B. Wade, M.INST.C.E., chief engineer of irrigation and drainage.

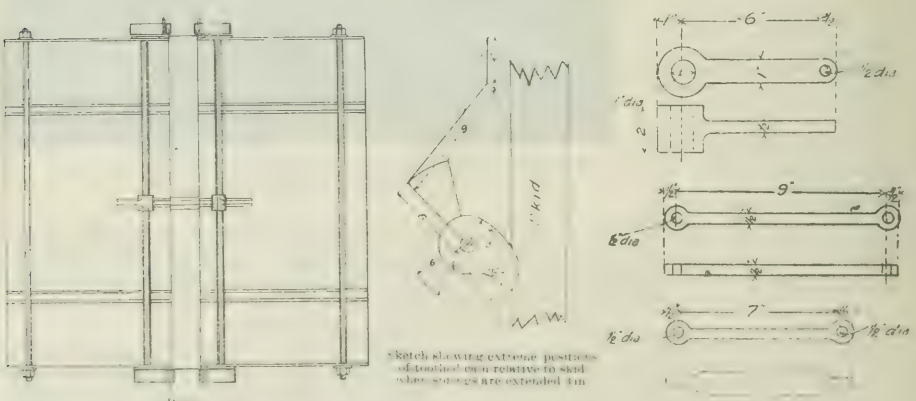
The length of the sewer is about 6¼ miles, with a uniform gradient of 1 in 3,650 throughout, and the average flow velocity in feet per second is calculated at 2·21 with a maximum flow of 2·53 ft. per second. The maximum daily discharge for prospective maximum population on the whole drainage area on this basis will be 153 cusecs.

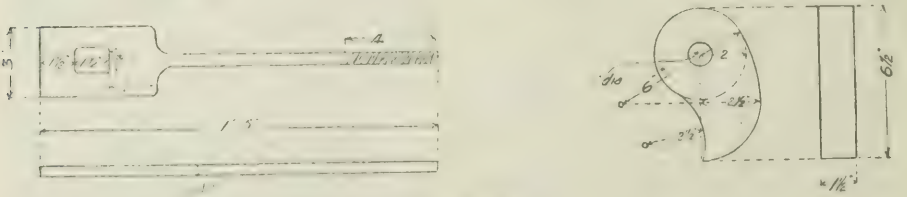
The sewer is being constructed partly in aqueduct and embankment, partly in open trench, and partly in tunnel through sandstone. The syphon under Cook's River is designed with such a fall between its inlet and outlet as will give a velocity of over 5 ft. per second when discharging at its full capacity. Provision has been made for intercepting the present southern outfall on the river side of the screening-house, and carrying it in aqueduct along the river frontage to connect with the ocean outfall sewer near the old Botany water supply pumping station. This sewer is 5 ft. 6 in. in diameter. Provision has also been made for the connections of the triplicate 6-ft. western suburbs sewer, and the main sewer from the Illawarra suburbs. Within the area, the sewerage requirements of which the scheme is expected to meet, there is some low-lying land from which the sewage

...ed, have to be pumped, and for this provision will be made under a separate scheme.

The system existing in the Southern suburbs is a ... is also a "partially combined" one, providing for 75 gallons per head per day and a rainfall of 2 in. per day over a catchment of 200 sq. ft. per head. The





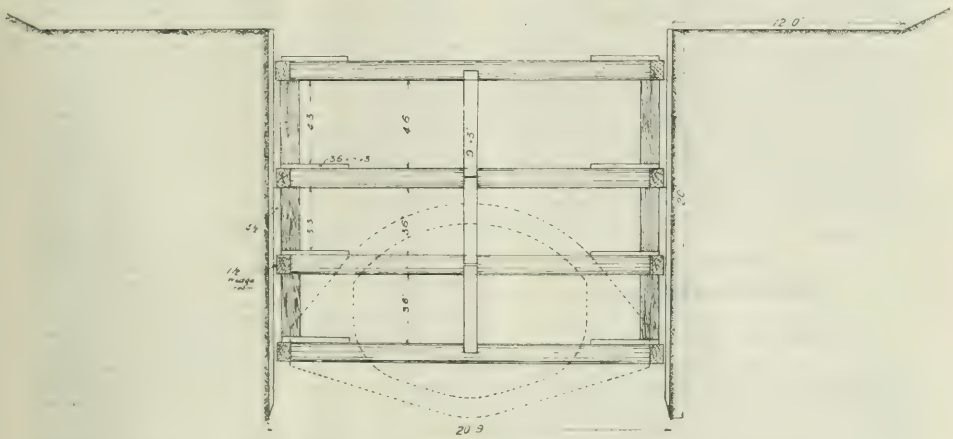


SUBWAY SANITARY SCHEME. SAFETY CAGE FOR LIFTING AND LOWERING WORKMEN IN SHAFTS.

...partially combined one, and designed for 75 gallons per head per day and 1 in. per day rainfall on ... area. In the Western suburbs the system ... estimated maximum prospective population taken into consideration in both cases.)

Regarding the outfall, advantage was taken of the

conformation of the ocean bottom to design the ocean outfall at such a depth below the surface that waves during an ordinary storm would not cause interruption to the flow of the sewage. The outfall at Long Bay on the Pacific will be subject to the influence only of waves of oscillation, owing to its discharge from a vertical cliff with deep water in front of it. The photograph shows the excavation for a chamber formed in the sandstone rock at the bottom of a 12-ft. by 6-ft. ventilating shaft sunk to a depth of 100 ft. This chamber is 24 ft. in height, 30 ft. wide at its widest part, and 32 ft. in length in the line of the sewer, and is 100 ft. back from the ocean cliff. The size of the sewer as it enters this chamber is 12 ft. 3 in. wide at springing level, and 7 ft. 6 in. high from invert to soffit. From the chamber two tunnels are being driven to a submerged cliff standing 200 ft. out from the ocean cliff. The cliff is of hard sandstone, dipping south 70 deg., west about 2 deg., and presents a bold escarpment to the east. The land cliff is about 90 ft. high, and the base is 10 ft. above high-water springs. The sea cliff is about 42 ft. high, and practically vertical, the top being at the high-water level of spring tide, and the base 37 ft. below the level of low water. The bottom for at least ½ of a mile seawards is composed of large rough boulders, swept by the prevailing southerly current, and has a mean depth of about 100 ft.



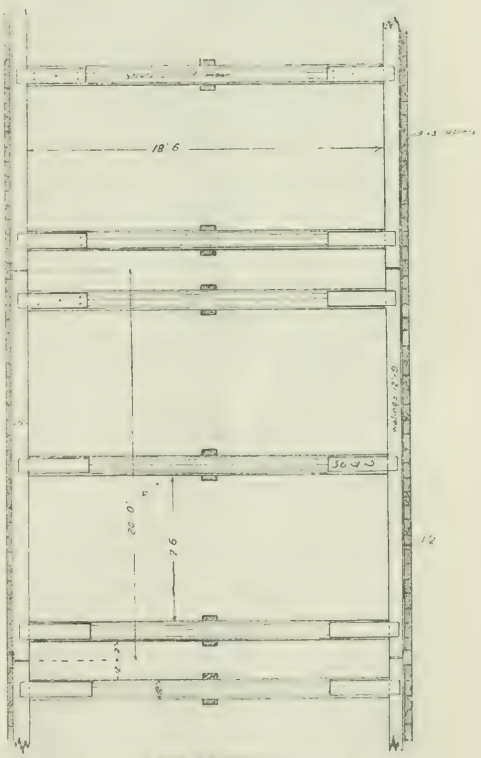
Section of Open Cut

The outfall pipes, two in number, are each 5 ft. in diameter, with falls of 1 in 14·41 and 1 in 12·36 respectively, and the ends are splayed out in the form of a V about 20 ft. apart. The object of spreading out the outfalls is that a wave striking the rock would be less apt to cause a simultaneous pulsation in the two branches of the outfall than if adjacent to each other and on parallel lines. Moreover, with the forked or V system, a pulsation up one of the branches would tend to clear out the sewage from the adjacent branch.

As steps are not provided in the invert, the sewer has been widened in cross-section for certain lengths at such places where important branch sewers enter the main sewer. This was necessary so that the water surface would not have a reduced gradient and velocity just above each junction. The greatest cross-section of the sewer is 12 ft. 3 in. by 9 ft. high. The work of tunnelling through the sandstone rock for 2 miles (nearly completed) is being done partly by machine and partly by hand. With regard to the rate of progress in the various drives, experience proved that driving through soft sandstone rock and shale could be done rather quicker by hand than by machine. Nine shafts, each 12 ft. by 6 ft., were sunk, and vary in depth from 38 ft. to 133 ft. respectively. The greatest depth of the sewer below ground level is 170 ft. The longest tunnel drive is 1,586 ft. The cost of excavation in tunnel through the rock for labour only averages about 24s. per cubic yard, and the cost for explosives about 1s. 9d. per cubic yard removed. The ordinary average forward lineal progress per miner per week in a drive having a sectional area of 92 sq. ft. equals about 2½ ft. The work of scabbling or trimming the tunnels before concrete lining is put in is being done with jack hammers and poppers worked by compressed-air plants, all of which were manufactured and supplied by the Ingersoll Rand Company.

The sketches show the safety cages in use as designed by the writer for lowering and lifting the workmen in the shafts.

As is to be expected on a works of the magnitude of the one in question, a considerable sum has had to be expended on plant. Fortunately, electrical power generated by the Sydney City Council is accessible, and has been utilised throughout, the charge for power being 1½d. per unit. In the water-bearing sand strata, interlocking steel piles in 40-ft. lengths have been driven. These piles were obtained from the Carnegie Steel Company, and are 12 in. wide, and weigh 40 lb. per lineal foot. A travelling gantry, 52 ft. high, equipped with a 2-ton Arnott pneumatic hammer, has-



Plan of Timbering.

Sydney Sewerage Scheme.

been constructed for driving the sheet piling, and two water jets are being used, one at the back and one in front of the toe of each pile.

A drawing shows the system of numbering adopted, another including a dotted outline section of the 12-ft. 3-in. by 9-ft. sewer in an open cut through sand 48 ft. deep.

Disposal of surplus soil is nearly always an expensive item. In one case, where a natural creek ran through a public park, the creek was culverted and filled up for about 20 ft. with 40,000 cub. yds. The photo shows 48-in. diameter reinforced concrete Monier pipes laid before filling is done.

The whole of the works described are being carried out by the Government on the day-labour system. It is estimated that another eighteen months or two years will elapse before they are finally completed.

For information dealing with the whole of the sewerage systems of Sydney, readers are referred to the paper on the subject by Mr. Joseph Davis, M.Inst.C.E., presented to the Institution of Civil Engineers on January 28, 1902, and published in vol. 148 in the "Proceedings" of that body.

OFFICIALS AS ARCHITECTS.

By Percy B. Tubbs, F.R.I.B.A., President of the Society of Architects.*

The question of official architects is one which most seriously affects the future of our profession. Just when a generation of able men has arisen who have devoted their lives to the study of the more monumental aspect of architecture, we find the growth of a system which threatens to deprive them of their livelihood and of any opportunity of placing their special attainments at the disposal of the community. But, although the growth of the practice of employing official architects deprives the independent and specially trained men of the bulk of the public work, it is necessary to endeavour to approach the subject from the broadest possible point of view, in the interest of the public and the advancement of architecture, for, after all, architects exist for the good of the community. I think that the present system only exists because the public is misinformed, and it will only continue to exist just as long as the indifference and ignorance of the public lasts. The public has a right to the services of the best talent in the country, but under the present system it does not get it, although it may be under the impression that it does.

There can be no doubt that every building erected by public authorities should be designed by the one man in the country who is best able to solve the particular problem involved. The system of employing the official architect does not insure this, and the public interest suffers in consequence. Instead of securing the best available architect by public or limited competition or otherwise, we find corporations and Government departments entrusting important buildings, requiring special skill in design, to the officials who were appointed to their positions for qualities of an entirely different character, such as administrative ability or because of their special qualifications as surveyors.

The result has not been able to close effectively between knowledge and skill, the knowledge of the requirements of a building or of a public department, on the one hand, and the architectural skill in the designing of that building which, although acquired, which is the property of an architect can possess.

I do not think that the arguments which apply to the appointment of surveyors and engineers to the boards, do not apply to the appointment of architects. One never hears of a medical man being called upon to perform surgical operations or a lawyer being asked to act as a doctor, but the official architect is being called upon to design buildings requiring special knowledge and skill and it seems to me that a life of this sort, faithfully performed does not foster the development of the imaginative faculty or make for the high standard of skill in design attained not by long experience which a new public building should possess. Nor can I see the public benefit in having to make room, that the ablest designers we possess and will need in official positions under present conditions, and that when a public body advertises for an official architect the very men to whom the public work should be entrusted refuse to apply for the post.

Figures have lately been produced to prove that it is as economical to employ officials as to employ independent architects, but even if this is true the value of the article obtained is not the same. The lower standard of design produced by officials compared with what might be produced by the very best of our designers destroys the value of the comparison. If the conditions of official service were so revolutionised as to tempt the most gifted designers to sacrifice their independence and produce the best possible architecture in their capacity as officials, the cost of official architecture would be far in excess of what it is at present, and far in excess of what it would cost to employ the same man as an independent architect, under conditions that entail no sacrifice on their part.

It appears to me that there is a certain obligation resting on the president of such a society as this to place these facts before the public without fear or favour, for, after all, the public suffer most by the present system, and it must be clear that if the present tendency increases till all the public work is done by officials, the ablest men, finding no opportunity in this direction, will no longer devote their attention to public work, but will concentrate on private work, and the standard of public buildings will be permanently fixed at that level of respectable mediocrity that is now characteristic of nearly all the official architecture in the country. I venture to think that when the public realise that they get better work for less money by employing an independent architect they will not hesitate to demand an alteration in the present system, and will not be content till they get it.

It must not be supposed, however, that an architectural department for routine and advisory work is not capable of doing good public service; on the contrary, I think it almost indispensable, but it should not be employed in original creative works of architecture. Many of our public authorities maintain a staff of assistants of a high standard of knowledge and experience who are intimately acquainted with the practical requirements of every class of public building, and if this knowledge and experience could be placed at the disposal of the most brilliant creative designer obtainable, when any original work was contemplated, the result would be a blending of the practical with the artistic and the production of a well designed and thoroughly satisfactory public building.

* [illegible] address as president of the Society of Architects, the matter contained forming part of the [illegible].

Address Wanted.—A firm of engineers require the address of the Watkins Heat Recorder Company. Please address "H. N." c/o The Editor.

Architectural Competitions. In his presidential address to the Society of Architects last night, Mr. Percy B. Tubbs, F.R.I.B.A., said the remedy for the unsatisfactory conditions existing in this connection rested very largely with the profession itself. The promoting bodies did not always purposely err, but were sometimes in ignorance of the existence of the conditions which the profession considered should be laid down for competitions. Something might be done by having a statement issued in the first place to every local authority in the kingdom, and from time to time to other promoters of competitions, giving the details on which it was suggested a competition should be conducted, and making it clear that if these lines were departed from architects who were members of architectural societies would refrain from competing. This circular should be signed by the responsible officials of every architectural society in the kingdom. He also felt that if an advertisement were inserted each week in the professional journals making it clear to promoters of architectural competitions that the conditions had to be approved by the society [illegible] any of their members would be asked, and suggesting that the conditions governing the competitions should be drawn up to agree with the printed particulars issued by the society and the Royal Institute of British Architects, it would very soon educate the promoters up to a proper standard. Some architects hold the view that in the case of limited or local competitions, if the invited competitors or the architects within the defined area were agreeable to the conditions laid down, whatever they were, such competitions should not be barred by architectural societies, but he personally felt that all competitions should be conducted on recognised lines, and that there should be no exception to the rule.

Intercepting Traps in House Drains.

THE DEPARTMENTAL COMMITTEE'S REPORT: ROYAL SANITARY INSTITUTE DISCUSSION.

A largely attended meeting of the Royal Sanitary Institute, presided over by Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., was held in London on Tuesday evening, when a discussion on the recently issued report of the Departmental Committee of the Local Government Board on Intercepting Traps in House Drains was initiated by Mr. H. Percy Boulnois, M.INST.C.E., chairman of the council of the institute. The number of speakers made it impossible—even with a time limit vigorously enforced—to finish the discussion in a single evening, and it was therefore adjourned until next Tuesday. Mr. Boulnois' paper is really a review of the report. The author did not read it, but touched briefly upon its main points, which are also the main points of the report, concluding with the query: What are to be the substitutes for the trap?

Mr. Boulnois said: The controversy with regard to the question of intercepting traps is not new. At a sessional meeting of the Royal Sanitary Institute held in London on February 4, 1906, Dr. Butler, medical officer of health of Willesden, read a paper entitled "Is the Intercepting Trap a Failure?" and Mr. Read, the city surveyor of Gloucester, followed with a short paper on the same lines. Both these gentlemen condemned the trap as a failure to secure isolation from the sewer. An interesting discussion followed, in which various opinions were expressed. Dr. Butler evidently did not let the matter rest, for in 1908 the Willesden Urban District Council approached the Local Government Board with a proposal to adopt a series of building by-laws in which the requirement as to the provision of an intercepting trap was to be omitted. The Local Government Board refused, but promised that an inquiry into the question should be made. A departmental committee was formed, investigations and inquiries proceeded, and after four years' work the report of the committee has been published.

The report practically condemns the intercepting trap. Our long-cherished belief in the efficacy of the trap has been rudely shaken, and it behoves us very seriously to consider this report and the conclusions at which the committee have arrived. For at least thirty years the Local Government Board have insisted on the provision of an intercepting trap, and proper air circulation, in all by-laws relating to house drainage; and it will be interesting to see what line will now be taken by the board in view of this report from a committee of their own officials. The members of the committee are all personally known to me, and are all highly experienced in their respective professions. The report has taken four years to produce, and bears evidence of the extreme care and labour with which the investigations were made, and the manner in which the conclusions were arrived at. We shall all of us agree, whatever our opinions may be on the merits or demerits of the intercepting trap, in thanking the committee for their labours, and for the very interesting and valuable report which they have produced.

I will endeavour to deal, during the short time at my disposal, with the various indictments which are raised in the report against the use of the intercepting trap, and the conclusions at which the committee have arrived in each case.

No. 1.—That, as the trap forms an obstacle to the passage of sewer air through the house drain its use renders the ventilation of sewers more difficult and costly.

This contention raises the whole question of the ventilation of sewers, on which much time has often been spent, and many papers written and discussed. We are all of us acquainted with the difficulties which surround this subject, and the committee have evidently been thoroughly aware of these difficulties, with which they deal at some length, and it is interesting to observe that on page 41, par. 119, they state:

> "Too much importance has been attached to the question of sewer ventilation, for there is a considerable amount of evidence which indicates that the necessity for ventilation of sewers has been exaggerated."

In connection with this, I may perhaps be allowed to point out that at the Sanitary Congress at Dublin, in September, 1884, I read a paper which I called "Isolation versus Ventilation," in which I endeavoured to point out that the practice of openings in the streets for the so-called purpose of ventilation of sewers then in vogue was unsatisfactory and unnecessary, and that it was more important to isolate the house "by means of simple and effective traps" than to make these openings in the sewers, and that all that was needed, if this were done, was to erect a few "relief pressure shafts" at proper positions on the sewer.

I gave a chronological list of different methods suggested and tried for the purpose of ventilating sewers, from the year 1840 to 1884 and it is interesting to note that in regard to the year 1882—

> "Mr. Read, the surveyor of Gloucester, suggested that all house drains should be used as upcast shafts to ventilate the sewers, for he argued that, as the sewer was used for the benefit of owners of house property, so should they contribute to the ventilation."

Which shows, I think, that even twenty-eight years ago the question of the advantage of the intercepting trap was doubted.

The Departmental Committee's report goes very fully into this question of ventilation of sewers, and arrives at the following conclusion:—

> "If, therefore, the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection." (Page 42, par. 121.)

Personally, I agree with this conclusion, though no doubt the advocates for the abolition of the trap may have many arguments in favour of the free ventilation of sewers through the house drains as being the solution of the problem.

It is contended by many persons, and the report also deals with the question, that the presence of the trap in the house drain containing sewage, often in a state of decomposition, largely contributes to the formation of gases and offensive smells in the sewer, and there is some considerable weight in this contention, if it can be shown that a house drain, without an intercepting trap, would never contain decomposing sewage. I propose to deal later with this contention.

No. 2.—It is asserted that the presence of an inlet necessitated by the practice of the intercepting trap often acts as an outlet for foul air and creates a nuisance.

This contention is supported by considerable evidence in the report especially by Dr. Butler, of Willesden, who stated, *inter alia*, that diphtheria had prevailed in his district more, by scores of years, in areas where the intercepting trap is universal than in other areas where the trap was absent.

The report says [page 3, par. 10]: "With few exceptions the evidence was unanimous that the inlet is an objectionable feature of the house drainage system," not only as an outlet for smells, but also as being sometimes responsible for blockage of the trap through earth and detritus getting into it. The committee, moreover, were not sure that a fresh-air inlet is essential for an intercepting trap, and they quote some experiments made by Mr. Steele in support of this contention.

We shall, I think, all agree that if the fresh-air inlet is placed in an inappropriate position it may at times become a nuisance by acting as an outlet for drain air instead of as an inlet, even if provided with a mica flap; but even if this is so, it may be argued that a smell coming from this inlet indicates that there is "something wrong" with the drain which requires remedying. In other words, the fresh-air inlet becomes a useful "detective." The remedy also if a remedy is required, would appear to be that of placing the mouth of the inlet in such a position that, even if it did act as an outlet, it would be harmless.

No. 3.—It is contended that the provision of a trap and its companion ventilation of the house drain increases the cost.

This is obvious, and the report does not deal with this question beyond stating it as a fact. It is not of much importance, for if the trap is really required the question of cost need not be considered.

No. 4.—The final indictment, and that which is of the greatest importance is that the intercepting trap "forms a serious impediment to the passage of sewage from the house drain to the sewer, and that this frequently results in more or less complete blockage of the drain."

It was this alleged blockage by the presence of traps in the house drains at Willesden that first called the

attention of the Local Government Board as to whether the intercepting trap was not more of a danger to the occupiers of a dwelling-house than a safeguard against the intrusion of the air from a sewer. The whole trend of the report is in the direction of proving that this indictment is correct, that such blockage may and does often occur by reason of the trap failing to clear itself, and that this objection causes a greater danger to health than the possible admission of sewer air into the house drains.

The contentions by the opponents of the intercepting trap in this respect are:—

(*a*) That it is always a positive obstacle, and is never clean;

(*b*) That it is the main cause of the blockage of house drains, with all the attendant evils;

(*c*) That it contains sewage which, under certain circumstances, is in an advanced state of decomposition, and is the chief cause of bad smells in the sewers;

(*d*) That the primary object of good drainage—*viz.*, to get rid of the fouled water expeditiously—is defeated;

(*e*) That it is at best an insufficient safeguard, liable to be forced by air pressure at any moment;

(*f*) That it forms no obstacle to the passage of rats;

(*g*) That the supposed dangers of sewer air have been greatly exaggerated.

With regard to these indictments the report contains some exceedingly interesting evidence, and the results of careful investigations and experiments.

The report gives the results of the systematic examinations by Dr. Butler of intercepting traps in his district, which show a total number of blocks of 3·7 per cent of the total drain inspections. In addition to this the committee caused examinations to be made of traps in other districts throughout the country, with the result that of the traps examined 6·9 per cent were found to be blocked at the time of examination, and 16·2 per cent "gave evidence that at one time and another they had been blocked sufficiently to cause an accumulation of sewage in the inspection chamber." The total number of traps either blocked at the time or indicating previous blocks amounted to no less than 23 per cent of the total traps examined for both purposes. But this is not all. Mr Patten Barber, the borough surveyor of Islington, carried out a series of exhaustive trials in order to ascertain what amount, if any, of the solid matters usually flowing in a house drain would be retained in an intercepting trap placed in the usual manner upon a house drain. These experiments showed conclusively that with every class of trap he tried (seven in number) more or less solid matter was always retained in the trap. In some cases this amounted to from 42 to 49 per cent of the solid matters, and in others from 73 to 78 per cent. If it were not for these experiments it might be argued that some, if not all, the blockages might have arisen from one or other of the following causes: The improper fixing of the trap, the choice of an improperly designed trap; the insufficient fall of the house drain; or, from its size, the admission of some foreign matter into the house drain; or from some other cause for which the intervention of a trap *per se* was not responsible; but in view of Mr. Barber's experiments, which appear to have been carried out with great skill and care, these arguments appear to be inadmissible.

It may, of course, be argued that the 2-gallon or even the 3-gallon flush is insufficient to keep the trap or even the house drain clear of obstruction. In this connection I may perhaps be permitted to mention that about twenty years ago I carried out some experiments with house drains laid at similar gradients to those in Mr. Barber's experiments, which conclusively proved that such flushes were insufficient to clear a drain (laid without any trap), except by many successive flushes. It was very interesting to observe how it required flush after flush to induce the faecal or other solid matter to move a few inches at a time in a drain, and it showed that until there was sufficient obstruction to raise a slight "head" of water on the obstruction itself, it remained unmovable. If this was so in the drain itself, we can, I think, quite understand that there must arise at times a considerable accumulation in the intercepting trap. I do not know if Mr. Barber found the same difficulty in moving the solid matter in the drain itself when carrying out his experiments. If there is this difficulty in keeping the house drain clear of deposit, the indictment against the trap to which I have already referred, that it is one of the principal causes of foul smells in the sewer, must be greatly modified, as the drain itself becomes a greater contributor.

The remedy, if the trap is to be retained, appears to be either that a larger flush of water is necessary, or that the drain must be laid with a steeper gradient, or that the design of the present trap must be altered. Mr. Barber's experiments go to show this, for whereas a 4-in. trap, "No. 4," retained 79 per cent of solids, an "experimental" trap he tried only retained 8 per cent of the solids, and this after ten experiments, in which on six occasions no solids whatever were left in the trap. Mr. Barber does not give the design of this trap, but no doubt he will pursue his investigations in this direction.

With regard to the possible forcing or unsealing of an intercepting trap by air compression in a sewer, the committee deal with this question at some length, and refer to the Bristol experiments. They come to the very proper conclusions that—

> "When a trap is forced by air pressure the water seal though reduced in depth, is not liable to be destroyed."

and they further state [page 16, par. 50]—

> "On the whole, therefore, it would appear, according to the evidence presented to us and according to our own experimental observations, that under practical conditions the intercepting trap usually answers its purpose as a barrier to the passage of air from the sewer into the house drain."

With which conclusion I cordially and entirely agree; it is well known that air will always take the least line of resistance.

As to the passing of rats through a trap, the report states that, in the opinion of the committee, it is doubtful whether the trap is a barrier, and they give two instances of chased rats seeking refuge through traps into house drains. In the cases quoted it would appear that the rats were actuated by fear, and that in order to escape they preferred a bath to sudden death! I am personally of opinion that the trap is a barrier to rats under normal conditions, and that they will not pass through the water in a trap except under some dire pressure. I have known several cases of houses connected to old sewers which were infested with rats, and that these pests disappeared when the house drains were properly trapped and disconnected. It is evident that rats, like sewer air, will take the line of least resistance.

I will now pass on to one of the most important investigations of the committee—*viz.* that of the chemistry and bacteriology of sewer and drain air, on which considerable time and thought appear to have been devoted. Evidence on the chemistry of sewer air was laid before the committee by such well-known experts as Dr. T. S. Haldane and Dr. Hurtley, and the report of Prof. Delépine on the Manchester sewers is also referred to. The conclusion to which the committee arrived [page 20, par. 62] is as follows:—

> "The results obtained by these observers are practically identical, and they indicate that in sewers, whether old or new, ventilated or unventilated, in which sewage is moving and is not lying stagnant, the air differs but little from that of the atmosphere outside."

Carbon dioxide was only found to the extent of from 17 to 20 parts per 10,000, as compared with 3 or 4 parts per 10,000 outside, the excess of ammonia and organic matter was also negligible, and the sewer air was free from any appreciable trace of methane or carbon monoxide, and I presume must have been due to the admission of coal gas. Sulphuretted hydrogen also, they state, is not present in the air of sewers. In some sewers notably at St Helens, Lancashire, the gas is found due to the nature of the trade effluents discharged into the sewers, but, of course, this is a rather abnormal case. Dr. Haldane, however, has found that this gas is given off in considerable quantity from the traps of house drains in which sewage is apt to be retained, such as large grease traps. The evidence by Dr. Haldane is another serious indictment of the trap, although in this case he refers specially to "large grease traps."

With regard to the smell of sewer air, which is evidently not due to unpurified hydrogen, but more probably from "the presence of minute quantities of a variety of volatile substances," the report says, "it is doubtful whether the smell of sewer air is usually more offensive than drain air," and that "untrapped waste pipes of sinks and lavatories discharging into the open air" may cause a "serious nuisance." The committee are further of opinion that the effect of smell on the human body may not only be repugnant,

but that "there seems to be no reason to doubt that it may produce definite ill-health."

With regard to the bacteriology of sewer air, they made many investigations, and, *inter alia*, they say:—

"The bacteriology of sewer air has been the subject of many investigations, and in one respect the results obtained have been practically uniform—namely, in showing that, notwithstanding the immense number of microbes in sewage, the number to be found in sewer air is extremely small."

Further, they say that—

"It seems also clearly established that not only the bulk of the bacteria of sewer air are derived from the atmosphere, but also that bacteria of sewage origin (that is, those that may be pathogenic) are very rarely present in sewer air, and that, when their presence can be detected at all, their number is very small."

They then deal with the bacteriology of *drain* air as distinguished from *sewer* air, and quote the experiments made by Colonel Horrocks, Dr. Andrews, Dr. Renney, and Prof. Winslow, and they arrive at the conclusion that there are more microbes in drain than in sewer air, and that this is mainly accounted for by "splashing," which occurs in the passage of sewage in a house drain, "especially when falling from a height or passing through a trap." This makes a further and rather unexpected condemnation of the intercepting trap, and I do not see how splashing could be prevented in a soil pipe unless it were made in the form of a spiral, and even then I fear there would be some splashing. The question of the possible passage of microbes from sewers into drains is dealt with at very considerable length, and altogether no less than fourteen pages of the report are devoted to these questions of the chemistry and bacteriology of sewer and drain air. The conclusions at which the committee arrive are as follows [page 33, par. 97]:—

"The results of these experiments emphasise the point to which we have already referred—namely, that the bacteriological evidence indicates that if any bacterial danger exists at all in house drainage, it is to be found in the drain air that may escape from the outlets of ventilating shafts of house drains. But even this danger requires to be regarded in its true perspective, as we have pointed out. [Pars. 91 and 92.]"

The paragraphs here referred to are of considerable length, and refer, so far as I understand them, to the important point as to whether disease germs from a neighbouring house can find their way through an untrapped drain into the house in question. This seems to be the crux of the whole question. The object of the intercepting trap, as I have always understood it, is to sewer, or isolate, the house from the joint drainage of other houses in order to secure safety from possible infection from other houses.

It would appear from this important report that it is extremely doubtful if this result has been obtained, and that, notwithstanding the numerous legal cases that have been fought and won on the question of sewer air entering houses and causing disease and even death, we are now told that drain air is more dangerous than sewer air, and that the intercepting trap is not only a delusion and a snare, but that it is a positive danger to the health of the inhabitants owing to its liability to choke, the accumulation of sewage which it holds, the germs which it emits, the splashing which it causes, and its interference with the proper ventilation of the sewers. To those of us who have been brought up in the belief that great reliance was to be placed on the proper trapping and pneumatic severance of a house drain, this report is bound to shake our faith, for in view of the evidence that was laid before the committee, and the care with which they carried out their investigations, we are, I think, bound to accept the conclusions at which the committee have arrived.

In connection with this vital question, and in conclusion, it is very interesting to refer to a book published in the year 1898 by Mr. Alfred Roechling, M.Inst.C.E., a Fellow of our institute, entitled "Sewer Gas and its Influence upon Health," in which the author deals with the question of sewer air and its dangers, and he gives a number of quoted cases in which sewer air had been held by the Courts to have produced disease, and even caused deaths. Time only allows me just to call attention to this book without discussing it, but, in view of the departmental report on which this paper is written, I feel that attention should be drawn to the book, as it is in some respects contrary to the evidence and conclusions of the committee. I have endeavoured in this short paper to lay before you some of the most interesting points contained in the report, and I trust it may be productive of an interesting and useful discussion.

THE DISCUSSION.

Considerations of space prevent our giving in the present issue more than a comparatively brief outline of the discussion on the paper, but a full report will appear next week.

Mr. R. Read, the city surveyor of Gloucester, in opening the discussion, said he was sorry that Mr. Boulnois did not appear to be convinced as yet as to the wisdom of the abolition of the intercepting trap. His own experiments from the year 1879 onwards had shown that the trap was a dangerous and useless obstruction, and that thirty-five years of "tinkering" had failed to remedy its defects. The experiments of the committee had shown that no pressure of sewer gas came upon the intercepting trap when water rose in the sewer; this might be so, but he urged that when it rose above the end of the house connection the air in that connection—which was more foul than the sewer gas—would then be compressed and forced through the interceptor into the house system. If, as frequently occurred, the cleaning eye stopper were blown out it would fall into the mouth of the trap, and block it so that sewage would find its way out only through the cleaning eye, and thus leave the house drain permanently partly full of sewage. Rats could easily dive through a trap, but they could not get past the grids of gullies. He estimated that in a town system there were 5 yds. of house drain beyond the interceptor to every yard of sewer; these drains needed ventilation. The flow in drains was intermittent, that in sewers was constant. Hence drains were more likely to be foul than sewers. The committee had not been asked to report upon sewer ventilation, but they had expressed a pious opinion based chiefly upon experiments at Bristol. He claimed that no system of sewers was unventilated. A sewer was a breathing machine affected by the external force of the wind, and by the internal force of the sewage flowing down the sewer. Messrs. Mawbey and De Courcy Meade had found that a vent pipe would act alternately as an inlet and outlet; it therefore followed that the currents of air in a sewer were alternating. The flow of the sewage would induce a current of air in the same direction as the flow. When one found a shaft acting as an outlet, it would be found that the vent shaft on the uphill side acted as an inlet. He expressed the hope that the Local Government Board would now have the courage of their convictions and withdraw the by-law demanding intercepting traps.

Dr. Philip Boobbyer, medical officer of health of Nottingham, stated that he accepted the scientific results of the committee, but he demurred at their general application to cases essentially different to those reported upon. The behaviour of sewers differed according to a number of conditions. Sewers of steep or flat gradient required different treatment. The gradient affected the ventilation and the amount of deposit. Certainly there were sewers like those mentioned in the report, in which the air did not smell badly, but there were others! Sewers taking the wastes of slaughter-houses or offensive trade wastes at high temperature smelt very badly. He did not consider that there could be any relation between drain air and diphtheria, as inferred by the report. Personally he was in favour of retaining the intercepting trap. He considered that the results obtained in the experiments of the committee were probably due to badly constructed apparatus. Sewer air was much more likely to create a nuisance than drain air; it was not more dangerous to health, but it was apt to smell much worse. It was impossible to make the average person believe that the smell of sewer gas was not dangerous to health. If some sewers were ventilated by house-drain vent pipes the smell would be drawn in at chimney tops, windows and ventilation openings. He further quoted an instance of an 8-in. vent pipe fixed on the wall of a vicarage. This pipe was connected to a sewer with a gradient of 1 in 6, and the nuisance caused thereby was so great that it had to be removed. Similar results were very likely to happen in hilly districts if the sewers were ventilated through the house-drain vent pipes. Again, unoccupied houses in which the traps of water-closets became unsealed would be filled with sewer gas, which would be very objectionable. The committee's experiments had apparently been made with defective traps. He did not think that traps became stopped up as a rule. In three large hospitals, two having six traps and one sixteen traps, only one trap had been stopped up during twelve years. These drains were constantly inspected, so that stoppages would have been detected.

Mr. T. de Courcy Meade, city surveyor of Man-

chester, stated that he had made a number of tests, the results of which he had tabulated. He had made these tests, not only with artificial excreta, but also with real excreta. His results made with artificial excreta agreed with those made by Mr. Patten Barber and quoted in the report, and also with those made in 1892 by Mr. Rogers Field, but it appeared that the results of the experiments made with real excreta differed from the others. He had submitted these results to the Departmental Committee, but he had not given evidence. Out of a large number of traps used at Manchester, only 0·64 per cent per annum were found to be clogged. This he attributed to the fact that all the traps had been fixed within the last twelve or fifteen years under very careful supervision, and generally by the contractors of the corporation.

Mr. Frank Sumner, chief engineer to the Corporation of the City of London, said that he was strongly against the use of intercepting traps on long drains, where the flow naturally dwindled. Traps on such drains became clogged owing to an insufficient flush. He found that all sewermen were healthy, and regarded this a proof of the harmlessness of sewer gas. He was in favour of the removal of all intercepting traps on the drains of small houses where the flush was poor. In the case of large houses or City offices, where there were, say, from thirty to forty water-closets connected to the drains, the removal of the trap might be optional. There were prejudices to be overcome. He strongly advocated the use of iron drains, and was of opinion that the additional expenditure for such work would not exceed 20 per cent of the whole cost.

Dr. Wm. Butler, medical officer of health, London, deprecated the partisan spirit shown in approaching the subject of the intercepting trap. He considered that a percentage of 0·64 of complaints of stopped traps in Manchester was high, and indicated that there were many undiscovered cases of stoppage. In Willesden inspection showed that traps were in very many instances stopped without the fact being discovered. Inspection also proved that 10 per cent of the stoppers were out and that 4 per cent of the traps were choked, but there had been few complaints nevertheless. The Willesden drains were as well laid as those in Manchester. The ordinary vent-shafts on a sewer were inadequate, and hence a single vent-pipe on a house might cause a nuisance, but if sewers were ventilated at every house this condition would be done away with, and there would be no nuisance. The intercepting trap caused drains to become foul, and should therefore be removed. Fresh-air inlets were often placed close to windows. Such openings might well allow sewer gas, as well as drain gas, to come out when the stopper came out of the trap. This was happening in about one case in ten at present.

Dr. Louis C. Parkes, medical officer of health of Chelsea, said that in considering the stoppage of traps, one should also consider how much of this was due to the faulty laying of drains, to the bad form of the older traps, and to traps being of a larger diameter than necessary. Also, it was customary to leave the old connecting drain beyond the trap untouched when laying a new system. This old drain was often [illegible] In Chelsea it was often found that the stoppage of [illegible] was due to blockage at the flap on the sewer end. He did not consider that the experiments made with artificial excreta were convincing. [illegible] as a rule. The artificial excreta contained clay, tow [illegible] Dr. stated that Mr. Harper had said at the Departmental Committee [illegible] ing through house vent-shafts. If smells issued [illegible] the need for a fresh-air inlet in order to keep drains [illegible] Mr. Percy Boulnois, barrister, [illegible] air. If drains were defective the interceptor would [illegible] and other objectionable wastes entered. Sewers gave off smells which needed ventilation, and if interceptors were abolished there would be better ventilation. Rats could not get out of a drain unless it were defective, and it was useful as a proof that they were defective if rats did come out. There were eighty-nine sewer ventilators in Lewisham, which had been attached to houses on condition that they should be removed if required. None of these had been removed. The stoppage of traps was considerable. He contended that their removal should be optional.

Mr. A. J. Dickinson, surveyor to the Redditch Urban District Council, said he was in favour of the abolition of the intercepting trap.

Mr. G. B. Hartfree, surveyor to the Alton Urban District Council, stated that he had made a careful investigation of the causes of the chokage of traps. These were due to such things as bath towels, brushes, and so forth, finding their way into the drains, as well as to improper fixing of the traps. Leaking drains permitted the water to escape before it reached the trap in other cases. Also he found that the joint immediately beyond the trap, which could not be cleared by the man who laid the pipes, generally had a ridge of cement projecting on the inside which caused an obstruction and produced blockage. An improvement was required which would make it possible for the pipe layer to make certain of leaving the pipe beyond the trap clean inside. Personally he had been poisoned by streptococci in sewer air, and he therefore considered that the air was dangerous to health and ought to be excluded from the drains.

DEPARTMENTAL COMMITTEE CHAIRMAN'S DEATH.

On taking the chair at Tuesday's meeting, Sir Maurice Fitzmaurice said he was sure all present would have heard with very great regret of the death [reported in last week's Surveyor] of Dr. L. W. Darra Mair, the chairman of the Departmental Committee, whose report they had assembled that evening to discuss. He would ask Mr. Boulnois to move a resolution on the subject.

Mr. H. Percy Boulnois observed that it was his painful duty to move a resolution of condolence with the family of Dr. Darra Mair on his most lamented decease. It was indeed a regret to himself personally when he heard of his death. He (Mr. Boulnois) was associated with Dr. Darra Mair at the Local Government Board; he was one of his colleagues, Dr. Mair being in the medical, while he was in the engineering department, and the news of his death came to him as a great shock, particularly after he had written his paper and published it. If the paper had not been published he would have seriously considered whether they should have held that meeting. Dr. Darra Mair's death would be a great loss to the department, a great loss to the Government, and a great national loss. Without further remarks he moved the following resolution:—

"Resolved, that this sessional meeting of the Royal Sanitary Institute, held on November 12, 1912, in order to discuss the report of the Departmental Committee of the Local Government Board on Intercepting Traps in House Drains, have heard with deep sorrow of the death of Dr. L. W. Darra Mair, who was chairman of the committee. The meeting wish to record their appreciation of the valuable services which Dr. Darra Mair rendered in the cause of public health by his many years of official service and by his researches in connection with preventable disease, and they desire to express to Mrs. Darra Mair and the members of his family their sincere sympathy in their sad bereavement."

Dr. Buchanan seconded the motion and associated himself with every word that Mr. Boulnois had so well said as to the great public service which Dr. Mair had rendered, and the loss to the public health service which his unexpected death would be. Dr. Darra Mair was in his prime, and he gave promise of greater achievement a promise which they all hoped would be fulfilled. The work he had done in many respects in which it was available for the public had appeared mostly in Blue-books, but they would find one characteristic running right through it, and that was that in every investigation he made he showed a determination to get at the fundamental facts, and in his writings he always showed a logical sequence of ideas, extracting every lesson that could be learned, either scientifically or otherwise, from the inquiry. He would refer to two reports for which he was responsible those on back-to-back houses, and the

causation of the excessive mortality from fever in Belfast, as showing what he meant. He (the speaker) and Dr. Mair entered the Local Government Board within a few years of each other. They both learned their work and inspiration under the same master, and they worked together for often years constantly, and almost side by side. In the circumstances it might be natural that he should say a word about Dr. Mair's personal characteristics, but he would content himself by saying that, with reference to the subject to be discussed that night, there was no man who was more keen in his search after the truth, no matter whether the results were likely to lead in the direction which he hoped they would or in a contrary direction. No man welcomed criticism of his work more than he did, and as to the work he devoted his life to, and upon which he bestowed the closest attention, he was sure no one could wish for freer discussion or welcome the fullest possible criticism more than his old colleague, whose loss they all so greatly deplored.

The audience remained standing while the resolution was passed in solemn silence.

INTERNATIONAL ROAD CONGRESS.

THE ROAD EXHIBITION.

The Exhibition of Road Materials, Appliances, and Machinery used for the Construction, Maintenance and Improvements of Roads, which will be held at the Royal Horticultural Hall, Vincent-square, Victoria-street, London, S.W., in connection with the International Road Congress in London, in June, 1913, will be opened on Monday, June 23rd, by the Right Hon. Earl Beauchamp, First Commissioner of H.M. Office of Works, chairman of the Exhibition Committee, and closed on Saturday, June 28th.

The exhibition is to be international, and is open to all classes of machinery, apparatus, materials, models, drawings, plans and maps illustrative of road construction. A piece of ground adjoining the Royal Horticultural Hall will be completely roofed and walled in, and paved with wooden sleepers to form an exterior section of the exhibition, for the exhibiting of heavy machinery. A room, fitted up as a writing-room, will be available for the use of members of the congress and exhibitors, and at a marquee in the ground tea will be served to all members and exhibitors on production of their membership cards.

All the leading firms engaged in the industry have decided to exhibit. They are representative of all branches of the industry, and include:—

Tar-macadams, &c.—Messrs. Tarmac, Limited, Gas Light and Coke Company, Limited, Canadian Rubber Company, Limited, Roadamant, Limited, F. E. Bristowe & Co., Anglo-American Petrol Products Company, Limited, Taroads, Limited, Rocmac, Limited, Roadite, Limited, Lacmer Asphalte Company, Limited, Neuchatel Asphalt Company, Limited, Dussek Bitumen Company, Limited.

Machinery.—Messrs. J. & P. Hill, Limited, Batford & Perkins, T. Green & Sons, Aveling & Porter.

Quarries.—Messrs. Ellis & Everard, Enderby & Stoney Stanton Granite Company, Limited, London Granite Company, Limited.

Publishers, &c.—Messrs. Dirk & Sons, Limited, John Hutchinson, Road Improvement Association, Good Roads, Crompton & Co.

Mr. H. P. Maybury, county surveyor of Kent, is hon. secretary of the Exhibition Committee, which also includes Colonel R. E. Crompton, C.B., Major Fitzmaurice, R.E., Messrs. Alfred Dryland, Howard Humphreys, T. Richards, Wallace E. Riche, Gibson Thompson, J. Walker-Smith, John Williams, and Captain L. A. Kingston, assistant secretary.

The traders have also been invited to form an Exhibition Sub-Committee, and their assistance will add to the success of the exhibition. This committee is presided over by Mr. H. Pitts, and includes Messrs. F. E. Bristowe, D. C. Comyn, H. D. Blake, and W. Manuelle.

Royal Institute of British Architects.—The second examination of licentiates desiring to qualify for candidature as Fellows commences on January 13, 1913. Applications must be sent in on the official form on or before December 14th.

SURVEYORS' INSTITUTION.

PRESIDENT'S OPENING ADDRESS.

In his presidential address to the members of the Surveyors' Institution on Monday evening Mr. Edward Gerald Strutt took his audience "among the hedges and the fields," to quote his own words. His address was devoted to the subject with which he is most familiar—agriculture—and contained, therefore, little of interest to those engaged in other branches of the surveyor's business.

Discussing the problem of rural depopulation, Mr. Strutt insisted that before this could be overcome the difficulty connected with the question of housing would require to be removed. Much had been done by the larger and richer landowners in the building of healthy cottages on their estates, and though in most cases the smaller landowners had done their best with considerable self-sacrifice and pluck, it was difficult for those whose sole income was derived from land to face the cost of erecting cottages which would not return 2 per cent on the outlay. The problem, however, was one which must be faced in a serious spirit if anything was to be done materially to increase the numbers of those employed on the land. It was possible that something might be done to reduce the initial cost of erection by amendment of the building by-laws, permitting the use of a greater variety of materials, or by taking advantage of the public credit to provide loans to landowners or local authorities at a low rate of interest, while additional garden ground attached to cottages might enable higher rents to be paid in many instances. But where the difficulty could not be met in this manner it might become advisable to follow the example of Ireland under the Labourers Acts. There the district councils formulated schemes for the erection of houses and securing garden plots in accordance with the requirements of their districts, the Local Government Board being the department responsible for holding local inquiry into any schemes put forward, and for sanctioning them if satisfied that they were reasonable. If a scheme was sanctioned the necessary capital was advanced by the Land Commission, repayable in sixty-eight and-a-half years by equal payments. The interest was £3 5s. per cent—2¾ per cent representing interest and ½ per cent sinking fund. The number of houses authorised to March 31st last was roughly 49,000, of which 40,000 had been built and occupied, and 9,000 were in process of erection. Parliament voted £5,250,000 altogether in connection with these Acts, and it had all been earmarked for housing purposes. Some such scheme would surely be justified in this country even though it might necessitate a call upon the national purse, for it would do much to assist in the solution of the housing problem of rural England. If, however, such legislation were passed, it would be incumbent upon landlords to do their part by finding the necessary sites for the cottages at a low rate.

Sympathetic reference was made by Mr. Strutt, in the course of his address, to the recent death of the institution's past-president, Mr. Robert Vigers. "No surveyor in the United Kingdom," he observed, "was better known or stood higher in the estimation of his fellows than Mr. Vigers, who had probably settled more important cases as umpire than any other man in the profession. From its foundation he manifested a strong interest in the institution, and was until the last few months a constant attendant at the council meetings and the gatherings of members. Everyone with whom he came in contact regarded him with reverence and affection, and he left behind him a very high example of what professional conduct should be."

Reduction of Loan Indebtedness.—Lecturing on Wednesday at the Institute of Chartered Accountants, Mr. P. D. Leake, F.C.A., declared that the existence of a sinking fund gave a false sense of financial security, the danger of the method being that it lightened the financial burdens of the present by forestalling future income which might never be available. It would be far better to use the money now applied to building up sinking funds in reducing loan indebtedness, either by annual drawings and repayment, or by purchase in the open market and cancellation of the loan stock. Future temptation would thus be removed from the path of State, municipal, and commercial administrators, which, as matters stood might prove irresistible when the need of money for other purposes happened to become very pressing.

WHAT IS A GARDEN CITY?

To the Editor of The Surveyor.

Sir,—I am afraid Mr. Culpin has read my letter very cursorily, for he either appears to be unable to quote them accurately, or attributes statements to me that I have never made. In your last issue he says that I have challenged his definition of a "garden city," but I can find no evidence in my previous letters of having done so, nor can I find that Mr. Culpin gave any such definition in the letter to which I replied.

I stated in my first letter, in speaking of competitions for so-called town planning schemes, that "the main feature of *most* of the garden 'city' or garden 'suburb' schemes is the effort to cheapen roadmaking," and that "these schemes are essentially promoted by building speculators." It is somewhat disingenuous for Mr. Culpin to apply these remarks as referring only, or chiefly, to the company of which he is secretary, especially as he says in his last letter that "many schemes are being dubbed 'garden city' which have no claim whatever to the name, except an attempt to delude the public." Probably this is not quite what he meant to have written, and is only one of those things which, as *Punch* would say, "might have been expressed differently"; for one can hardly expect him to mean that his company attempts to delude the public.

He appears terribly indignant at my calling these "garden city" schemes, but I was only giving them the name by which they are called by leaders of the movement for the restriction of the number of houses per acre, the provision of open spaces, &c. Instead of there being a number of garden cities, he now informs us that "there is only *one* in the world," and that one, presumably, Letchworth, of which he is the guiding spirit.

I believe that in America any collection of wooden shanties housing a thousand people is called a "city," but in England we have not come to this yet, though if it is open to anyone to dignify a village or district of some 8000 inhabitants with the name of "city," we may soon reach the Yankee level. Being a native of a city whose history dates from the Roman invasion, I can only wonder at Mr. Culpin's assurance, and am sorry I cannot congratulate him on his modesty in claiming that Letchworth is a city. A "city" in England must either be the seat of a bishop, a royal borough, or have the dignity conferred on it by royal patent; and if this definition is correct, I can only say that I must plead guilty of not having heard of the bishop, the palace, or the royal patent which has conferred this dignity on "city" on Letchworth. Again, I fail to see why Letchworth should be called a "city" and Ruislip-Northwood a "suburb." Ruislip-Northwood has an area at least 25 per cent larger than Letchworth, is self-contained, town planned, and will probably have a much larger population than Letchworth shortly.

If planning the district before laying out, with due regard to the convenience, health and amenities of the inhabitants, by restricting the number of houses per acre, providing open spaces, and preserving the natural beauties of the district, makes a "garden city," then the district in which I live, and the neighbouring town of St. Annes, probably have at least an equal claim to be considered "garden cities" as Letchworth, even though they owe their character to the enlightened self-interest of a single landlord and the experience and sound judgment of his agent, and not to a number of capitalists practising philanthropy with 5 per cent interest.

Mr. Culpin is very indignant because I do not subscribe to his opinion that the shareholders in his company are "entirely disinterested." Well, it appears to me that if the shareholders in this company, with a capital of £300,000 are so entirely disinterested as Mr. Culpin says, they would give a greater proof of their disinterestedness by foregoing their 5 per cent interest and letting it go to the relief of rents, or in providing greater pleasure or comforts for their lessees. I wonder what proportion of the capital would be left in the company if the directors declared that no more dividends would be paid, but shareholders would be allowed to withdraw their capital.

Everyone agrees that the "garden city" movement is doing good work and sympathises with its object, but it is neither wise nor desirable to claim for it virtues and a character it does not possess.

The majority of the building societies in this country were started from sociological motives, but good motives have not prevented them becoming highly speculative; and when directed by a Jabez Balfour, and religion is called in to aid philanthropy, the combination has frequently resulted in the ruin of the unfortunate shareholders.

The original point raised by Mr. Wilkes appears to have been lost sight of by Mr. Culpin, and I am sure many of your readers would be glad to know whether the lecturers on town planning sent out by Mr. Culpin are to be architects or engineers. If one might add to this, I should like to ask why we should be expected to take as our model town a country district of some 8,000 inhabitants with ambitions limited to providing for a future population of 30,000?—Yours, &c.,

A. J. Price.

Lytham.

THE INSTITUTIONS OF MUNICIPAL ENGINEERS.

To the Editor of The Surveyor.

Sir,—I trust that you will allow me the valuable services of your widely circulated columns to make the following appeal to the profession at large.

In your issue of the 25th ult. reports, comments and papers from the Institution of Municipal Engineers claimed the larger portion of your space, while previous issues have also devoted many columns from the same source. This being the case, surely no further proof is necessary that this young institution is now fully established, and receives full recognition from the technical press, the profession and the public generally.

Surely the time has now arrived when this institution and the Institution of Municipal and County Engineers should combine forces for the common good of the profession as a whole, and the members as single units of that profession. Undoubtedly there are minor difficulties and differences to be overcome, but these should not prevent the ultimate good to be derived by having one united institution using its influence for the cause of the profession.

The British Medical Association to the professions, and the Balkan States to the world, are both demonstrating, if such is still necessary, the value of unity and combined effort, and I trust we will no longer delay the acceptance of these forces in our cause.

The Society of Engineers and the Society of Civil and Mechanical Engineers joined forces some two years ago, with results beneficial to both societies. I trust that their example will now be followed by the above institutions in a similar manner. The fusion of our professional associations must not stop here, however, and I trust a continuation of a scheme for the general consolidation of the profession will be carried out. Surely it is not impossible for the following fusion of the professional societies:—

Group I. (Sanitary Section):—
Royal Sanitary Institute.
Institute of Sanitary Engineers.
Sanitary Association of Scotland.
Sanitary Inspectors' Association.
And various other similar associations.

Group II. (Engineering Section).—
Society of Engineers.
Junior Institution of Engineers.
Liverpool Engineering Society.
And various other local and similar societies.

Group III. (Municipal Section).—
Institution of Municipal and County Engineers.
Institution of Municipal Engineers.
County Surveyors' Association.
And similar societies

The above to be but as a preliminary effort, specifying a few of the many societies as an example, for further extension, so as to bring the profession as

a consolidated whole as one, or affiliated to one institution, such as the Institution of Civil Engineers.

Effort alone is required, and much may be accomplished. Let the seniors and juniors work hand in hand, and put their shoulders to the wheel, and success to the profession and its members is assured.

May I appeal to the members of the profession to make this effort—and history, so far as the profession is concerned?

I thank you, Mr. Editor, for this privilege of so extensively occupying your columns, which are always so freely open to the interests and subjects of the profession, and accordingly greatly appreciated by its members.—Yours, &c.,

A Member.

November 8, 1912.

PRIVATE STREET WORKS ACT, 1892: PUBLIC FOOTPATH WITH ADDED STRIP.

To the Editor of The Surveyor.

Sir,—Having regard to the number of queries appearing in your columns on this subject, and to the number of streets being dealt with annually by your readers under sec. 150 of the Public Health Act, 1875, or the Private Street Works Act, 1892, I think the following case, decided last week by the local bench of justices, may not be without interest:—

A footpath 4 ft. wide was awarded along the west side of an allotment, and the owner of that allotment was saddled with the upkeep. The owner of the adjoining property sold off his property for building purposes, but alleges that he reserved 18 in. next to the footpath before mentioned. The owner of the property on the eastern side of the footpath laid out a back street along the west side of his property, and by arrangements with the local authority made its width 10 ft. in addition to the 4-ft. footpath—i.e., 14 ft.

The reservation of 18 in. appears to a large extent to have been ignored, or absorbed, by purchasers from him. The 4-ft. footpath was never fenced off. The local authority, under the provisions of the above Act, which has been adopted by them, decided to do certain works in this street with a view to taking over the whole width of 14 ft. to 15 ft. 6 in. The apportionment was based on frontage, and the council resolved to bear one-third of the total cost under the provisions of sec. 15 of the Act, but, notwithstanding this resolution, the owners on the western side of the footpath objected. The principal grounds of objection were: (a) That the alleged street, or part of a street, is not, or does not form part of a street within the meaning of the Act; (b) that the alleged street, or part of a street, is in whole or in part repairable by the inhabitants at large; (c) That the provisional apportionment is incorrect in respect of some matter of fact, viz., that the said premises — do not front, abut, or abut upon the said alleged street.

At the hearing it was contended for the objectors that the cost of repairing that portion, being an ancient awarded public footpath, could not be included, and that the intervening reserved strip, 18 in. wide, precluded those properties from fronting, abutting, &c., upon the said street. On behalf of the council it was shown that the 18-in. strip was never fenced off, the public had full use of it, and therefore that it constituted part of the whole street. The decision of the justices was entirely in favour of the council, and was as follows: (1) That Frodingham footpath is not a street repairable by the inhabitants at large; (2) that the council's requirements are reasonable and sufficient. Yours, &c.,

C. Curtis Gray.

MIXING CEMENT WITH "BITUMEN."

To the Editor of The Surveyor.

Sir,—After the protest in my previous letter against such a misquotation, I am not a little surprised that Mr. Cecil Nathan still persists in changing my query, "Is it a good thing to mix cement with 'bitumen'?" (*i.e.*, pitch and tar) into "Why a percentage of cement is employed in the manufacture of asphaltic paving mixtures." This is not only reprehensible, but stultifies his own preaching (March 5, 1912, p. 405) that "the word asphalt should never be applied to coal tar products."

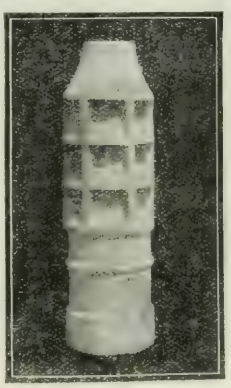
I am afraid Mr. Nathan is not able to render me much good service in this matter, for he does not appear to have comprehended the purpose and practical bearing of my simple words, "Is it a good thing?" &c. Surely it is not difficult to understand therefrom that what I am questioning is whether any practical purpose is served by mixing cement with tarry liquids. Mr. Nathan, in his first letter, said "the veriest tyro" could answer my query, but after having failed to do so himself in any of his three letters, he now says that to obtain the information one must pay 8d. for his patent specification. Is he quite sure I shall get my money's worth? If such information is only thus obtainable, he seems hardly justified in dubbing me an ignoramus for not being conversant with it. Merely to tell anyone they are ignorant without attempting to enlighten them is not a very gracious proceeding, to say the least. If, again, this information is of the simple character Mr. Nathan says—somewhat illogically—why not have given it at once, without making so much mystery about it? Others beside myself would doubtless find interest in any practical information upon the point in question, but like me, they may be chary of spending 8d. with no certainty that they will get value for their money.—Yours, &c.,

W. J. Howard-Smith.

Westminster.
November 12, 1912.

DOWN-DRAUGHT IN CHIMNEYS.

We illustrate herewith a device of an extremely simple character, which the makers, Messrs. J. H. Sankey & Son, Limited, Essex Wharf, Canning Town, E., strongly recommend for the prevention of the familiar trouble of down-draught in chimneys. It is well known that smoke issuing from a chimney shaft when a wind is blowing has a tendency to be drawn down the side of the shaft. The reason advanced for this is that a partial vacuum is formed by the wind



Sankey's Down-draught Preventing Pot.

rushing past the shaft, causing the smoke to be drawn down as stated. With Sankey's pot this partial vacuum is utilised to draw the smoke out of a chimney, the wind as it strikes the pot rushing up the louvre openings and forcing the smoke out, at the same time drawing it out of the other side. The simplicity of the pot, upon which we have already commented, is such that it can be swept in the ordinary way, while other advantages are that there are no small holes to block and no movable parts to get out of order.

London New County Hall.—The Establishment Committee of the London County Council report that they are now in a position to ask the council to proceed with the erection of the superstructure of the new county hall, and they will recommend that tenders be invited from selected firms.

Titanium Steel Tramrails.—Liverpool Corporation has ordered from Messrs. Walter Scott, Limited, Leeds Steel Works, a sample lot of 100 tons of titanium alloy steel tramrails. This is the first use in this country of this alloy steel for tramrails. In America its claimed advantages are being tested on several leading tramways.

Law Notes.

Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

In order that we may be pleased to answer any questions relating the practice, enactments and decisions to local authorities, queries both should be written clearly on foolscap paper, and should consist of one question only. The letter should be addressed to "The Law Note Editor," at the office of this newspaper, accompanied by the querist's name and address, but correspondents who do not wish their names to be published should write through a "nom de plume." Where necessary, copies of documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are observed we cannot undertake to reply to queries.

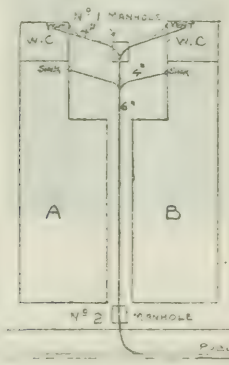
QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinguishing words as noms de plume. The letter X, combinations such as X Y Z, and words such as "engineer" and "surveyor," should never be used.

BY-LAWS. OPENING IN EXTERNAL WALL. EXTENT.—"W. M." writes: Recently I submitted plans of proposed extensions to the surveyor to an urban district council, who has advised his committee to disapprove the plans on the grounds that they do not comply with the by-laws in force in the district in that "the walls between the openings are not of sufficient thickness." The by-law to which he refers [illegible] is exactly the same as By-law 20 (pp. 197 and 198 in King's Annotated Model By-laws, 1898 edition)—viz., "Every person who shall erect a new building, and shall leave in any storey or storeys of such building an extent of opening in any external wall which shall be greater than one-half of the whole extent of the vertical face or elevation of the wall or walls of the storey or storeys in which the opening is left, shall construct—(*a*) sufficient piers of brickwork or other sufficient supports of incombustible material so disposed as to carry the superstructure, and (*b*) a sufficient pier or piers or other sufficient supports of that description at the corner or angle of any street on which the building abuts, or (*c*) such a pier or other support in each wall within 3 ft. of the corner or angle of the street." The point in question is whether the word "extent" in this case refers to the width of openings in relation to the length of external walls, or to the area of openings in relation to the area of external walls.

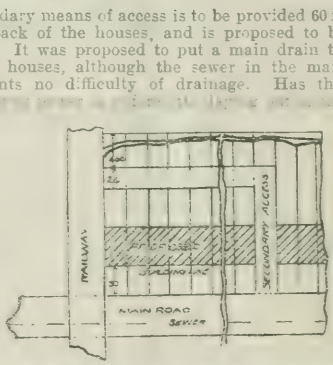
In my opinion "extent" means the area of the openings in relation to the area of external walls.

COMBINED DRAIN.—"W. R. A." writes: A and B are two houses, owned by two different people, draining down the passageway as shown in sketch. Would not the main length between manhole No. 1 and



[illegible] No. 2 manhole [illegible] from both houses?

[illegible] chased a parcel of land, divided it into thirty-two [illegible] on to a public main road, in which is laid water [illegible] pulling with the by-laws were submitted to the [illegible] Local Government Board, but could not receive [illegible] Town Planning Act. All the [illegible] the Act, and [illegible] the proposed [illegible] the Act. A secondary means of access is to be provided 60 ft. from the back of the houses, and is proposed to be 24 ft. wide. It was proposed to put a main drain to serve these houses, although the sewer in the main road presents no difficulty of drainage. Has the local [illegible] the Housing and Town Planning Act 1909, or any other Act, and to demand a 36 ft. roadway at the back? It may be added that the Public Health Act, 1875, is only in force, other Public Health Acts not having been adopted.



The local authority, if authorised by the Local Government Board, may prepare a town planning scheme, but the scheme has the effect until approved by the Board. It can be approved, and the plans comply with the existing by-laws, the authority are not justified in refusing to approve them.

REFUSE REMOVAL: "HOUSE REFUSE."—"G. J." writes: I have a garden at the back and side of my house, and have always placed cabbage stalks, creeper cuttings and refuse from it in the house refuse receptacle for collection by the urban district council, who [illegible] the collection of "house refuse" on condit on it is placed in the forecourt. The council now decline to collect the garden refuse, saying it is not "house refuse," whereas I contend that as the refuse referred to is not trade refuse it must be "house refuse" within the meaning of the Act. Can I force the district council to collect the refuse from my [illegible]

I am [illegible] assumed that everything that is not trade refuse must be house refuse, and that garden refuse is house refuse within the meaning of the Act.

URBAN DISTRICT COUNCILLOR. RESIGNATION.—"Interested" writes: I should be much obliged if you could tell me if a member of a council could take [illegible] the present time a member, supposing he resigned immediately and paid the usual fee. Could he take office at once, or does he have to resign at least twelve months beforehand?

A member of an urban district council can resign at any time by writing signed by him and delivered to the clerk on payment of the [illegible] Act, 1882, and the General Order and Rules as to the Election of [illegible] complete by the delivery of the writing and the payment of the fine [illegible]

[illegible]—"A M [illegible] I should like to know, *re* traction-engine hauling, the maximum [illegible] the latest Act or Order?

[illegible] (*i.e.*, of the same diameter on the inside as on the outside). By this [illegible] April 1st [illegible] of a borough or county council. And by sec. 1 (3) of the same Act the weights above mentioned do not apply to a wagon carrying one [illegible] article of greater weight than 16 tons if the tyres are 8 in. wide or upwards but any damage arising from the use of any such wagon [illegible] the Highways Act, Act 1878.

The Surveyor
And Municipal and County Engineer.

VILLAGE WATER SUPPLY IN LINCOLNSHIRE.

FERRO-CONCRETE WATER TOWER AT SCOPWICK.

The Sleaford Rural District Council have again added to the large number of village water supplies inaugurated by them during the past fifteen years within the large area coming under their jurisdiction. The most recent undertaking of the kind is one for supplying the parishes of Scopwick and Kirkby Green, with probable extensions to the picturesque village of Blankney and to Blankney Hall, one of the seats of Lord Londesborough, the Lord of the Manor, who has contributed one-third of the total cost of the works.

The project comprises a deep bore well, 400 ft. in Lincolnshire oolite, a pumping station, pipe lines, and a ferro-concrete water tower. The first three items were executed by Messrs. W. Pattinson & Sons, Limited, contractors, of Ruskington and London, and the water tower by the Liverpol Ferro-Concrete Contracting Company, of Bixteth-street, Liverpool. The machinery for the pumping station was supplied by Messrs. R. Hornsby & Sons, Limited, of Grantham.

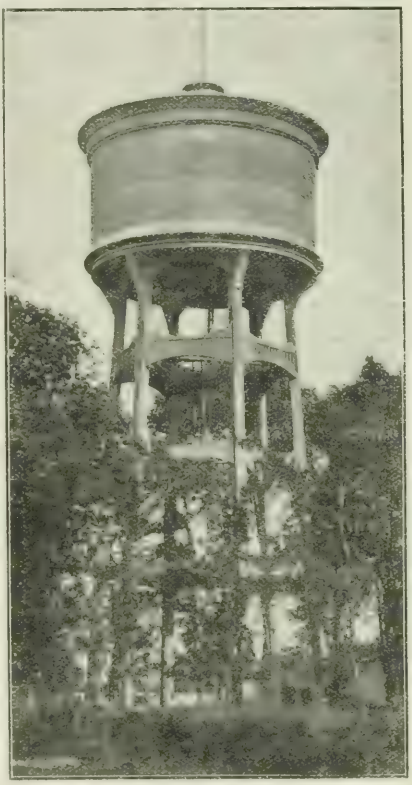
With the exception of the wrought-iron access ladders, the water tower is constructed entirely in ferro-concrete on the Hennebique system, even including the pole projecting some 14 ft. above the top of the cupola.

The elevated reservoir consists of a cylindrical chamber, 24 ft. in diameter inside, by 11 ft. 3 in. high from floor level to the under side of the roof, and has a capacity of 27,700 gallons. The outer shell of the reservoir is 5 in. thick, the bottom being of the same thickness. The roof is 4 in. thick, and is provided with an ornamental cornice about 2 ft. high, forming a parapet. At the centre of the reservoir is a ferro-concrete tube, 2 ft. 6 in. in diameter inside, affording accommodation for the ladder furnishing means of access to the roof, the top of the opening being covered by a cupola 8 ft. high. The reservoir is supported at the height of 50 ft. above ground level by a tower of hexagonal form, consisting of six inclined columns, braced laterally at five levels.

The footings of the columns are bedded on the rock occurring near the surface, and at ground level they are connected by a moulded plinth. The intermediate bracings are utilised for the support of the ladder and the landings in connection therewith. At the upper end the columns are connected with the bottom framework of the reservoir, and are additionally braced by a series of arches. Cast-iron brackets projecting from the columns provide for the support of the outer part of the cylindrical reservoir.

The ferro-concrete work is monolithic throughout, and reinforced in accordance with Hennebique standard practice, which is now so well known that detailed explanation is unnecessary. The tower, however, is somewhat unlike any of the very few ferro-concrete structures of the kind that have been constructed under a scheme granted by the Local Government Board. The interior face of the reservoir is rendered 1 in. thick in two coats of cement and Medusa waterproofing compound, and when under test the reservoir was found to be perfectly watertight, without sweating or condensation anywhere.

On the pole fixed at the top of the cupola is a spherical balance-weight, which will act as a water-level indicator, being attached to a copper float inside the reservoir, thus showing the depth of water to the



SCOPWICK WATER TOWER.

engines at the pumping station, situated 1,250 yards lower down the valley of Scopwick Beck.

As may be judged by the photograph reproduced, the tower, which is situated on the Lincoln-road, is a structure of pleasing appearance, in this respect forming a welcome contrast to some of the particularly ugly water towers erected in other parts of the country.

The whole of the works were designed and carried out under the personal supervision of Mr. W. B. Marsden, the engineer and surveyor to the Sleaford Rural District Council. Messrs. Mowlem & Partners being responsible for the ferro-concrete work. The reinforcing steel was supplied by the Whitehead Iron and Steel Company, Limited, of Tredegar, the Portland cement by Messrs. Martin Earle & Co., Limited, of Rochester, and the aggregate for the concrete by the Groby Granite Company, Limited.

Change of Address. — The Ransome-verMehr Machinery Company, Limited, announce that they have found it necessary to move to larger offices, and that from to-morrow (Saturday) their address will be Brunswick House, Matthew Parker-street, Westminster, S.W.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

283. Strength of Materials.—What is meant by the following terms: (a) Modulus of elasticity, (b) elastic limit, (c) permanent set, (d) plastic elongation, (e) ultimate elongation, (f) contraction of area? ("Inquirer.")

284. Wood Paving.—What are the comparative advantages and disadvantages of soft and hard wood for street paving? ("Suburban.")

285. Building Construction.—Explain, with sketches where necessary, the meaning of the following terms: (a) Larrying, (b) pugging, (c) gib and cotter joint, (d) lead soakers. ("Pupil.")

286. Hydraulics.—A hemispherical cistern is 20 ft. in diameter, and it is full of water. How long will it take to lower the depth of the water 5 ft., if the water escapes through a 3-in. diameter sharp-edged hole in the bottom of the cistern? The coefficient of discharge for the hole is 0·60. (H. V. O., *West Bromwich.*)

287. Street Culley.—Will some reader kindly supply a sketch of some form of street gulley, the grid of which is in the [illegible], the kerb and not in the channel of the roadway? ("Anxious.")

288. Mechanics.—Explain clearly the distinction between a vector, a scalar and a [illegible] quantity. ("Beginner.")

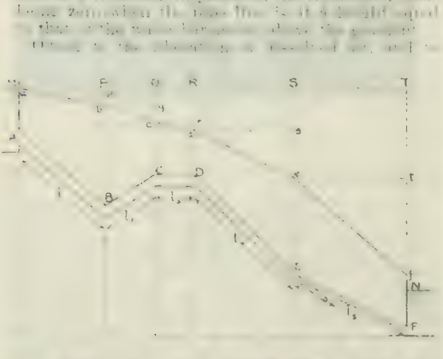
REPLIES TO QUESTIONS.

282. Hydraulics.—Explain simply what is meant by the "hydraulic gradient" of a pipe, and how this may be obtained in any given case. ("Pupil.")

The "hydraulic gradient," or "virtual slope" of a pipe is that gradient or slope on which the pipe must be laid if there is to be only atmospheric pressure throughout.

If the pipes are laid below this line there will be at any point an excess of pressure over atmospheric pressure equal to a head of water of height equal to the vertical distance between the pipe and hydraulic gradient at the point considered. Similarly, if the pipe line is above the hydraulic gradient [illegible] [illegible] the pressure [illegible] [illegible] when the pipe line is at a height equal [illegible]

[illegible]



[illegible] ... [illegible] flow [illegible] than 34 ft., unless [illegible] the air.

When water is flowing steadily in a pipe, the [illegible]

[illegible] the work done, measured in terms of feet-head of water, and divided by the length of the pipe gives the slope of the line or hydraulic gradient. Its position relative to the pipe line, either above or below, can only be determined by considering the system as a whole.

The hydraulic gradient in a particular case, such as a pipe line from an impounding reservoir to several service reservoirs, may be considered as follows:—

Let ABCDEF be an elevation of the pipe, and M and N the usual water levels in the reservoirs.

Let the diameter from A to D be d_1 and the velocity v_1
.. .. .. D to E be d_2 .. .. v_2
.. .. of the branch EF be d_3 .. .. v_3

Let the lengths of AB, BC . . . &c., be l_1, l_2 . . . l_5

As the flow is steady, the rate of discharge at all sections is constant, and the velocity will only vary with change of area.

Let f be the coefficient of resistance to flow, or coefficient of friction, and assume a bell-mouth entrance at A, so that there is no loss of head at entrance.

The loss of head due to friction is given by the expression:

$$4f\frac{l}{d}\frac{v^2}{2g}$$

The pressure at the point A is the static pressure due to head MA.

In passing from

A to B, loss of head due to friction $= 4f\frac{l_1}{d_1}\frac{v_1^2}{2g} = Tb$

B to C, ... $= 4f\frac{l_2}{d_1}\frac{v_1^2}{2g} = bc$

C to D, ... $= 4f\frac{l_3}{d_1}\frac{v_1^2}{2g} = cd$

D to E, ... $= 4f\frac{l_4}{d_2}\frac{v_2^2}{2g} = de$

E to F, ... $= 4f\frac{l_5}{d_3}\frac{v_3^2}{2g} = ef$

At F the kinetic energy dissipated in eddies

$$\frac{v_3^2}{2g} = fN$$

The pressure at the point F is the static pressure due to the head NF.

The total loss of head is the difference in level of the water surfaces, *i.e.*, TN.

$$\therefore TN = Tb + bc + cd + de + ef + fN.$$

The solution of these equations will enable the [illegible] values of Tb, bc, &c., to be found and the hydraulic gradient, a, b, c, d, e, f, N, to be drawn for flow from the upper to the lower reservoir.

The division of the portion ABCD into three separate lengths, owing to difference of slope, is seldom necessary in practice, as the difference in length of a pipe line in plan and elevation is rarely appreciable.

If tubes were inserted in the pipe, the top of the water in each would lie on the line ab . . . f, so that the hydraulic gradient may also be defined as the locus of the water levels in gauge tubes. (H. E. L., *[illegible]*.)

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *[illegible]*.)

There is no method of actually calculating the [illegible] [illegible] good practice [illegible] each particular case.

A [illegible] from the foot of each principal to the apex of the adjoining truss. Convenience [illegible] the shape of the cross-section, and for this form of bracing Prof. Henry Adams has suggested a diameter of ¼ in + ¼ in per 10 ft. of span.

An alternative method for a long roof is to connect the feet of the first truss with the apex of the fourth, and from that point to the feet of the seventh, and so on, the braces being fixed to the principal rafters crossed. A suggested size for a rectangular section is $\frac{3}{4}$ in. per 10 ft. span for width, and $\frac{1}{8}$ in. per 10 ft. span for thickness.

The attachment of a longitudinal tie connecting the feet of the king rods, if any, helps to stiffen the roof.

Fig. 1 shows an example of bracing (American practice) for a roof subject to vibration. The diagonal bracing shown is formed of 3-in. × 2½-in. × $\frac{3}{16}$-in. angles.

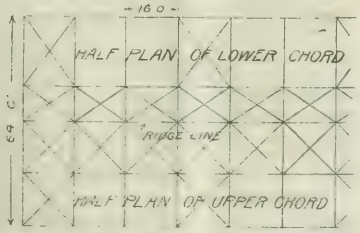


FIG. 1.

Fig. 2 is a cross-sectional elevation of a Continental railway station roof in an exposed situation.

The roof is of the bow-string form, span 120 ft., trusses 25 ft. centres, and is 300 ft. long. Each truss is divided into eight bays.

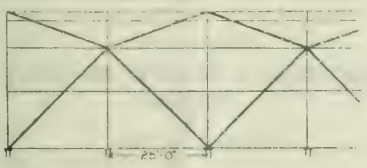

FIG. 2.

The wind-ties, shown by thick lines, are 4 in. × ½ in. wrought-iron bar, and are symmetrically placed in the roof. (H. E. L., *Islington*.)

Superannuation. At last week's monthly meeting of the East Molesey Urban District Council it was reported that a circular-letter had been received from the secretary of the Urban District Councils Association on the subject of the Local Government Officers' Superannuation Bill, which has been prepared by the National Association of Local Government Officers. It was pointed out that the Bill provided for superannuation allowances to the officers and servants of all local authorities, and for contributions towards such allowances by such officers and servants, and it was decided by the recent Chelsea Conference that, as the Bill was one which closely concerned all urban district councils, it would be desirable that the proposals of the Bill should be taken into consideration by the individual urban district councils. The principle of superannuation, it was further mentioned, had been applied repeatedly in the case of officers employed in the public service, and of those now entitled to superannuation might be mentioned Poor-law officers, asylum officers, teachers in elementary schools, certain officials of education authorities and Civil servants. The Urban District Councils Association, before taking any active steps in support of the Bill, wished to be assured that the urban district councils throughout the country approved the principles of the Bill, and desired that it should be introduced into Parliament. Mr. J. Ray, the chairman of the district council, said it was evident from the Bill that if there was any deficiency the councils would have to make it up, and he thought the better had better "lie on the table." It was, however, agreed to refer it for consideration to the General Purposes Committee.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bath T.C. (November 4th. Mr. R. H. Bicknell).—£4,000 for the extension of the city refuse destructor.—The city surveyor, Mr. C. R. Fortune, stated that the present capacity of the destructor plant was 45 tons a day. The future capacity would be 80 tons a day. The daily collection averaged about 46 tons in the lightest season, and from 80 tons to 86 tons in the heaviest season. The inspector said he would require further particulars showing the amount of loan sanctioned on the destructor land to date, the area now occupied for destructor purposes, the area that would be occupied when the new works were put down, and the surplus that would then be remaining.

Chadderton U.D.C. (October 30th. Mr. Edgar Dudley).—£1,860 for street improvements and the provision of an open space.—The road work, it was explained, had become necessary in Foxdenton-lane owing to the increasing volume of traffic, and it was also proposed to widen Burnley-lane and reserve about 1 acre of land as an open space.

Darwen T.C. (October 31st. Mr. T. C. Ekin).—£37,000 for various works of improvement.—It was stated by the borough surveyor, Mr. R. W. Smith-Savile, that a sum of £20,000 is to be expended in making and sewering streets adjoining new property which has sprung up on the outskirts of the town in recent years. A second sum is for repairs to the main road, 90 per cent of the interest and sinking fund on which the county council are liable for under agreement. It is proposed to spend £10,000 on the main road in the near future, and it was stated that while some of this outlay would in the ordinary course of events have been imperative, it has been rendered more so and in a largely increased measure by the heavy motor traffic which has sprung into being with increasing force in recent years.

Goole U.D.C. (November 8th. Mr. W. O. E. Meade-King).—£1,550 for the purchase and laying out of land for a park. Mr. R. Tyson, clerk to the council, explained that the Aire and Calder Navigation, the largest ratepayers, acquired about 4½ acres of land with a frontage to the river Ouse for £1,000, and the Goole Council received 3 acres for £666. The navigation on the portion which faced the river had constructed a wide flood bank at a further cost of £1,000. On the remaining portion the council intended to provide a bowling green and shelter, and generally lay out the plot as a park. There was no opposition.

Lytham U.D.C. (November 7th. Mr. H. R. Hooper).—£8,959 for new carburetting plant at the gas-works.—The present plant, it was stated, has a maximum capacity of 3,000,000 cub. ft. per day, and the new installation will give 500,000 cub. ft. There was no opposition.

Morley T.C. (November 6th. Mr. W. O. E. Meade-King).—£3,300 for planting and fencing Lewisham Park.—The town clerk (Mr. Fred Thackray) said it was intended to lay one-third out as a pleasure resort for adults, and the remainder as recreation grounds for boys and girls respectively.

Oakengates U.D.C. (November 1st. Mr. F. O. Stanford).—£14,370 for works of sewerage and sewage disposal.—The clerk, Mr. J. A. Holmes, stated that at the present time about two-thirds of the urban district was already sewered, and the present application was in respect of the remaining one-third. The medical officer of health for the county had pointed out that more land should be brought under irrigation, and that was now being done. The farm land which had been previously let to a tenant had now been taken over by the council. Mr. R. E. W. Berrington explained the scheme, and evidence was also given by Mr. V. Wilson (surveyor to the council).

Southgate U.D.C. (October 22nd. Major J. Stewart). £4,350 for the improvement of Highfield-road, Greenlanes and Fox-lane; £2,532 for works of private street improvements in Haslemere-road, Chenies-avenue and Kelvin-avenue; and £2,350 for the construction of an open-air swimming bath at Barrowick Green: and also for consent to the appropriation for the purposes of the proposed swimming bath of certain land formerly used as a gravel pit.—The necessary evidence

was given by the Clerk, Mr. W. M. Elliston, and the surveyor, Mr. C. G. Lawson.

Totnes R.D.C. (October 27th. Mr. A. G. Drury).—£1,600 for works of water supply at Marldon.—It was stated that an arrangement had been come to with the Paignton Council to obtain a supply from their main.

APPLICATIONS FOR LOANS.

Bath R.D.C. £3,000 for works of drainage.

Cheltenham T.C. £4,000 for sewage disposal purposes.

Cuckfield U.D.C.—£2,200 for the provision of workmen's dwellings.

East Cowes U.D.C.—£550 for the repair of the seawall.

Glastonbury T.C.—£4,250 for the extension of the gas undertaking.

Harwich T.C.—£400 for auxiliary sewerage.

Llandrindod Wells U.D.C.—£4,250 for the extension of the water works.

Peterborough T.C.—£1,000 for electricity mains.

Sunbury U.D.C.—£2,500 for additional sewage plant.

Wellingborough U.D.C.—£1,700 for a drainage scheme.

LOANS SANCTIONED.

Ashbourne R.D.C.—£1,030 for a housing scheme.

Cannock U.D.C.—£4,240 for kerbing and channelling purposes.

Cookham R.D.C.—£350 for surface-water drainage works.

Dover T.C.—£600 for wood paving and other works.

Frome U.D.C.—£886, further loan in connection with the sewage scheme.

Kettering R.D.C.—£4,380 for a sewerage scheme.

Poole T.C.—£1,408 for public conveniences.

Queenstown U.D.C.—£12,500 for the provision of workmen's dwellings.

Quorn U.D.C.—£524 in connection with the provision of a village hall.

Silsden U.D.C.—£700 for street improvements.

Southgate U.D.C.—£2,400 for improvements at a public park.

Stoke T.C.—£3,380 for works of street improvement and surface-water drainage, and £350 for culverting.

Wallasey T.C.—£4,490 for the erection of a school at Egremont.

Walmer U.D.C.—£2,598 for sewerage purposes.

FORTHCOMING INQUIRIES.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

DISTRICT MEETINGS.

We have received from the secretary of the Institution of Municipal and County Engineers, Mr. Thomas Cole, notification of the following district meetings of that body which are to be held in the course of the next two months:—

North-Western at Blackpool, November 16th.
East Midland at Nottingham, November 16th.
South-Western at Taunton, November 16th.
Metropolitan at 11 Victoria-street, Westminster, S.W., November 20th.
West Midland at Birmingham, November 21st.
North-Eastern at York, November 30th.
Eastern at Westminster, S.W., December 7th.
South-Eastern at 11 Victoria-street, S.W., December 7th.
Metropolitan at 11 Victoria-street, Westminster, S.W., December 18th.
South-Eastern at Sidcup, and Dinner, January 8, 1913.

Public Slipper Baths. — The borough engineer of Chelmsford Mr. P. T. Harrison, would be glad to hear of other towns with a population of from 20,000 to 30,000 in which public slipper baths have been erected.

Motor Traffic and Maintenance of Highways.—The National Conference proposed by the Wood Green Council is receiving considerable support from all classes of road authorities. Up to the present about 150 authorities have promised the conference their support, and expressed their sympathy with its objects, and these include many county councils and most of the principal City and county borough councils, municipal corporations and urban district councils throughout the country. We understand that, as a result of this, the Urban District Councils Association is in communication with the County Councils Association, the Association of Municipal Corporations, and the Rural District Councils Association, the object being to arrange for their co-operation, so that the conference shall be convened under the auspices of the four organisations representing all classes of authorities in England and Wales.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Durham £7,625; housing and town planning—Chelmsford, Southwick; roads and materials—Bermondsey £3,900, Carnarvonshire £3,000, East Sussex £27,744, Lancashire £50,000, Whitby £20,000; sewerage and sewage disposal—Bath £3,000 Dewsbury, Kendal, North Bromsgrove; water, gas and electricity—Chelmsford, Frieshire, Stourport; miscellaneous—Sheffield.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Ardsley (Yorks) U.D.C.—The local authority have instructed their surveyor to proceed without delay with the construction of a public mortuary.

Coalville U.D.C.—The surveyor, Mr. L. L. Baldwin, has been instructed to prepare plans and estimate for a mortuary.

Durham C.C.—The Ferryhill Station school is to be enlarged at an estimated cost of £3,025, and a new school for 400 scholars is to be erected at Fishburn, at a cost of £4,600.

East Cowes U.D.C.—It has been decided to repair the damage to the sea wall, at an estimated cost of £550.

East Molesey U.D.C.—It has been decided to apply to the county council to erect a much-needed bridge over the water-splash in Summer-road.

Kirkham (Lancs) U.D.C.—It is proposed to build a public bath in Station-road.

Lindsey (Lincs) C.C.—The county medical officer has been instructed to provide open-air shelters for the treatment of tuberculosis, to the amount of £250.

Llantarnam U.D.C.—It has been decided to purchase the Tennis Court Hotel buildings for the purpose of council offices at a cost of £1,250.

Lowestoft T.C.—The borough surveyor, Mr. G. H. Hamby, has prepared the sketch of a new concert pavilion at Sparrow's Nest.

Lurgan R.D.C.—Knock Bridge is to be rebuilt at an estimated cost of £450.

Wellingborough U.D.C. The surveyor to the council, Mr. E. Y. Harrison, has been instructed to prepare plans for a cart shed and steam-roller shed at the council's yard, Cannon-street.

HOUSING AND TOWN PLANNING.

Chelmsford T.C.—The Housing of the Working Classes Committee reported recently that the surveyor, Mr. P. T. Harrison, had submitted two alternative schemes for the erection of 104 or 98 cottages on the remainder of the site to complete the scheme. Before approving either of the schemes the council decided that steps should be taken to ascertain the demand for houses of the Class C type (4s. 3d. and 4s. 6d. per week). They therefore recommended that applications be invited by advertisement in the local newspapers for cottages of Class C type, the advertisement already issued having been for houses of Class A (rent 6s. 3d. and 6s. 6d. per week), and Class B (rent 5s. 3d. and 5s. 6d. per week).

Criccieth T.C.—The council have arranged terms for the purchase of land for the purpose of erecting workmen's dwellings, of which there is a great scarcity in the town.

Honiton T.C.—Inquiries are being made for a site on which to erect workmen's dwellings.

Okehampton R.D.C.—It has been decided to erect three dwelling-houses at Bratton Clovelly under Part 3 of the Housing of the Working Classes Act, to be let at rents of 3s. 6d. and 4s. weekly.

Pembroke (Co. Dublin) U.D.C.—Forty-nine cottages are to be erected at Irishtown, at an estimated cost of £12,000, subject to the sanction of the Local Government Board. The rent proposed is about 3s. 10d. per week.

Southwick U.D.C.—A special meeting will be convened to discuss the question of a town planning scheme, as to which a report has been prepared by the surveyor, Mr. Geo. W. Warr, together with a plan showing in detail the area for which the scheme should apply. It also shows the route of a suggested new through road into Hove and Brighton. He suggests that the county council and the neighbouring local authorities be approached in order to ascertain what extent of approval it would meet with.

St. Germans R.D.C.—The tender of Mr. W. Petherick, of Notter Mills, St. Stephen's, at £595, has been accepted for the erection of three cottages at St. Stephen's, and that of Mr. J. F. Ashton, of Burraton, at £436, for the erection of two cottages at Polbarder.

Ystradgynlais R.D.C.—Sixty workmen's dwellings are to be erected in three batches of twenty at Colbren, Abercrave, and Ystradgynlais.

PARKS AND OPEN SPACES.

Plymouth T.C.—Subject to departmental sanction, it is proposed to purchase portions of the West Hoe estate for the sum of £8,000. The land is required for the purposes of swimming baths, and of a place of winter shelter and entertainment and for the further embellishment and improvement of the western part of the Hoe.

Swindon T.C.—The borough surveyor, Mr. H. J. Hamp, has received instructions to proceed with the construction of bowling greens in the Town Gardens and Rodbourne Recreation Ground, at an estimated cost of £50 each.

REFUSE COLLECTION AND DISPOSAL.

Horsham U.D.C.—The tender of Messrs. Heenan & Froude, at £1,450, has been accepted for the erection of a refuse destructor.

Lincoln T.C.—Approval has been given to a draft contract for the purchase for £7,673 of 30 acres of land at Canwick for refuse disposal purposes.

ROADS AND MATERIALS.

Ashburton U.D.C. The tender of the Devon Traction Company, at 22s. 6d. per day, has been accepted for steam rolling.

Bermondsey B.C.—It has been decided to repave with hard wood, on new concrete foundations, the carriageway (outside the tramway area) of Tooley-street, from Bermondsey-street to Duke-street, at a cost of £3,900.

Bristol T.C.—West-street, St. Philip's, is to be widened, at an estimated cost of £675.

Carnarvonshire C.C.—A road improvement scheme, estimated to cost £3,000, has been approved.

Cheriton (Kent) U.D.C.—The scheme of the surveyor, Mr. O. A. Sherren, has been adopted for the improvement of High-street and Risborough-lane.

East Sussex C.C.—The Roads and Bridges Committee have adopted a scheme for the improvement of the Lewes to Newhaven road, the cost of which is estimated at £27,744. This, it is stated, will provide a highway 30 ft. wide from bank to bank, with macadam 18 ft. wide. The cost will be defrayed by the Road Board, who will contribute £11,700, the Newhaven Rural Council, whose contribution is given as £8,000, and the East Sussex County Council, who will find the remaining £8,044.

Faversham T.C.—The tender of the Faversham Gas Company, at 3½d. per gallon, has been accepted for next season's tar supply.

Greenwich B.C.—Application has been made to the Road Board for a loan to cover the cost of laying improved paving in the main roads.

Hampstead B.C.—The sum of £2,000 has been set aside for snow clearing and gritting roads during the ensuing winter season.

Lancashire C.C.—The Main Roads Committee are spending £50,000 on the improvement of the diverted main road from Preston to the sea at Blackpool. Recognising the growing cost of road repairs, the committee do not intend to increase the council's liabilities in this direction, either in the Fylde or elsewhere.

Lurgan R.D.C.—The portion of the main road between Lurgan and Portadown is to be treated with "Rocmac."

Northumberland C.C.—Seven motor cycles have been purchased for the use of the surveyors, at £53 each.

St. Germans R.D.C.—It has been decided to recommend the county council to discontinue tar spraying in the St. Germans district, owing to its alleged danger to horses and its costliness.

Shoreham U.D.C.—The tender of the Penlee and St. Ives Stone Quarries, Limited, has been accepted for the supply of 700 tons of granite quartzite or elvan stone, at 10s. per ton (delivered).

Southwick U.D.C.—The tender of Messrs. Parsons & Sons, of Hove, has been accepted for steam rolling, at 24s. per day.

Teignmouth U.D.C.—Plans providing for the widening of Bishopsteignton and Mill-lane, at an estimated cost of £1,630 and £470 respectively, have been approved by the council.

Uckfield R.D.C.—Certain road constructions are to be carried out, and the Easons Green-road is to be widened from 13 ft. to 15 ft., at an estimated cost of £1,115.

Whitby U.D.C.—An extensive improvement scheme at Whitby Spa has been under consideration. The proposal would involve the placing back of the top railings to the edge of the cliff, and the laying out of the "reclaimed" portion for the public use; the construction of two or three good shelters on the top, along the front, also for the public use; a new concrete pavilion in place of the present "conservatory," with a continuation of the promenade in front of it; and an easier drive down to it. These, it is believed, are the main features of a scheme involving a cost of something like £20,000.

SEWERAGE AND SEWAGE DISPOSAL.

Ballymena R.D.C.—The consideration has been adjourned of a report by Messrs. Patterson & Graham stating that, in company with a committee of the council, they had inspected the sewerage arrangements of the town of Kells, and found the existing system very defective and obsolete, causing the town to be in a highly insanitary condition, and, in their opinion, endangering the health of the inhabitants. They recommended certain work which, if carried out, would greatly improve the sanitary condition of the town.

Bath R.D.C.—It is proposed to expend a sum of £3,000 in connection with the sewerage of Freshford.

Bristol T.C.—At a meeting last week of the Sanitary Committee, the city engineer, Mr. L. S. Mackenzie, drew attention to a circular-letter which had been received from the Ossett Town Council with regard to the admission of trade effluents into sewers, and asking Bristol to support a resolution declaring the urgent necessity of amending the law, as recommended by the Royal Commission on Sewage Disposal, so as to ensure effectual preliminary treatment of the refuse on the payment of a reasonable charge to the local authority, and asking the President of the Local Government Board to introduce legislation on these lines in the next session of Parliament. It was agreed to support the resolution.

Dewsbury T.C.—Approval has been given to a scheme for extending the sewage farm and erecting pumping stations.

Kendal T.C.—The Sewerage Committee have approved the scheme of the borough engineer, Mr. F. W. Oxberry, for an improvement at the sewage disposal works, and plans and estimates of the following additional plant: Screening chamber, storm-water tanks, additions to septic tanks, humus tanks, sludge beds and sewers, £2,893; pumping plant, pump-house and pipe lines, £993; three filters, £5,136; contingencies (5 per cent.), £451; clerk of works, £325.

Neath T.C.—The tender of Messrs. Waring, Cole & Waring, at £23, has been accepted for carrying out the sewerage work at Llantwit Lower.

North Bromsgrove U.D.C.—The engineer, Mr. Robert Green, M.Inst.C.E., has been instructed to prepare a scheme for submission to the Local Government Board for the sewering of the Rednall portion of the district, and to make arrangements with the adjoining district for the disposal of the sewage.

St. Columb R.D.C.—The tender of Mr. James Budge, of St. Columb, at £236, has been accepted for carrying out improvements at the sewage farm.

Sunbury U.D.C.—At its monthly meeting last week the council decided to apply to the Local Government Board for sanction to a loan for the provision of additional engine power at the sewage works and for installing a pair of ejectors. Mr. H. F. Coales, the surveyor, explained that the approximate cost of the two 500-gallon ejectors would probably be £1,650, the sewage and air mains being already provided for. As to the nature of the additional power, he had made careful inquiries of neighbouring councils, and it would appear that engines working on suction gas were the most economical. They were cheaper in the first cost, and with the oil market in such an uncertain state, it would probably be better to rely upon coal, especially seeing that a few months ago crude oil as used by the Diesel engines was 40s. a ton, and was now nearly 70s. To compete with suction gas made from anthracite at 33s. per ton, town gas would have to be supplied at from 8d. to 1s. per 1,000 cub. ft. Steam plant could not be entertained on the score of cost. He suggested that in the first instance one 40 b.h.p. engine and compressor should be put down in the engine-house, and that oil engine No. 2 (12½ b.h.p.) should be taken out and disposed of to make room for it. This would be establishing a gas plant of rather more than half the power required at its maximum. The producer plant could be installed in a corrugated-iron shed attached to the present building. The approximate cost of one 40-b.h.p. engine with producer plant, compressor and erection would be about £580, and the cost of foundations, engine bed and corrugated-iron shed for producer plant would be approximately £150, making a total of, say, £730. The annual cost of the vaporising oil used at the works during the last six years ranged from £400 per annum in 1907-8 to £231 in 1911-12, the average being £306. A 1d. rate (½d. each half-year) would meet the loan charges for the work, assuming that the loan was for fifteen years as before.

Swindon T.C.—After considering a report on the subject by the borough engineer, Mr. H. J. Hamp, and the electrical engineer, the council have decided to adopt steam plant for the purpose of pumping the sewage at the sewage disposal works. The capital cost of the system is £1,456, and maintenance £544.

Wellingborough U.D.C.—The surveyor, Mr. E. Y. Harrison, has presented alternative schemes for the storm-water drainage of the Park-road district, and the General Purposes Committee have recommended the adoption of the second scheme, at an estimated cost of £1,700. The scheme provides for the interception of the storm water from an additional 5 acres of paved streets, footways, forecourts and roofs of houses, which at present finds its way into the foul-water sewers, and there will therefore be a proportionate decrease in the amount to be dealt with at the sewage farm pumping station, and also upon the sewage farm itself. The committee also recommend the council to apply to the Local Government Board for a loan of £1,700.

Witham (Essex) U.D.C.—The surveyor, Mr. W. P. Perkins, has reported to the council that the annual sale of mangold on the sewage farm realised £157, which was about £7 10s. per acre, against £15 an acre last year.

WATER, GAS, AND ELECTRICITY.

Chelmsford T.C.—It is proposed to spend £1,000 in sinking a borehole.

Cleveden U.D.C.—At the last meeting the surveyor, Mr. G. W. Knowles, presented a report of the Lighting Committee, which dealt with the lighting of the main thoroughfares. Incandescent gas lighting will generally take the place of the now prevalent flat-flame burners, from which it is hoped a better system of lighting will result. The report was adopted.

Cwmamman U.D.C.—The council are being urged to proceed with the adoption of electricity for street lighting.

Dunfermline T.C.—It has been decided to promote a private Bill or a Provisional Order to obtain a supply of water from the river Devon and its tributaries, and to provide the necessary reservoirs for such supply.

Fifeshire C.C.—The Local Government Board have written to the Cupar District Committee emphasising that a gravitation water supply should be introduced to Strathmiglo, adding that, in their opinion, the mere fact that a majority of the ratepayers of Strathmiglo had voted in a plebiscite against the introduction of a supply of wholesome water should not be allowed to override the interests of the public health.

Halstead R.D.C.—The scheme of Messrs. Sands & Walker for extensions of the Earls Colne water supply

has been approved as follows: Engineer's cottage, £270; main along Coggeshall-road, a distance of 1,166 yds., £260; main along Station-road, as far as the station, 1,030 yds., £230. This brings up the amount of the loan to be obtained to £6,460.

Hinckley R.D.C.—The new water supply for Barwell and East Shilton was opened last week. The supply is taken from the Hinckley Urban District Council's Snarestone Waterworks, and the scheme will eventually cost over £11,000.

Mid-Lothian C.C.—It was reported at the Lasswade District Committee that arrangements have been made for the introduction of a gravitation water supply to Carberry, Wallyford, and the intervening district.

Perth T.C.—Additional gas plant is to be provided, at a cost of £2,800.

Stourport U.D.C.—The council have approved of the plans and estimates of Mr. W. Fiddian, of Stourbridge, for the waterworks scheme, and have decided to send the document to the Local Government Board. The proposal is to obtain a supply from Bewdley.

MISCELLANEOUS.

Lincoln T.C.—Authority has been given for the purchase of an additional 50-ft. fire escape.

Newcastle-on-Tyne T.C.—The Tramways Committee recommend the council to accept the tender of an English firm for the supply of steel rails of German manufacture, at a cost of £3,660, being £500 less than that of a Leeds firm.

Sheffield T.C.—The Fire Brigade Committee suggest that in place of a motor first turn-out machine, to cost £700, a motor fire engine should be purchased, at a cost of £1,050.

PERSONAL.

Mr. Michael Irwin, of Feenagh, Kilmeedy, has been appointed assistant county surveyor of Limerick.

Mr. E. M. Bate, surveyor to the Frinton-on-Sea Urban District Council, has been elected a Fellow of the Surveyors' Institution.

Mr. H. J. Godfrey, surveyor to the Cricklade and Wootton Basset (Wilts) Rural District Council, has had his salary increased by £40 a year.

Mr. Edmund Jeeves, surveyor to the Melton Mowbray Urban District Council, has been granted a month's leave of absence owing to illness.

Mr. F. J. Wood, county surveyor of East Sussex, has had his salary increased from £650 to £750 per annum, rising by annual increments of £25 to a maximum of £850.

Mr. A. C. Wallingford, district surveyor under the Sussex County Council, has been appointed county surveyor and draughtsman to the Soke of Peterborough County Council.

Mr. G. A. Taylor, F.A.S.I., assistant surveyor of Frome, has been selected from a list of ninety applicants to a similar post in the surveyor's department at Wath-on-Dearne.

Mr. A. McArthur, surveyor to the Cuckfield (Sussex) Rural District Council, has been authorised to attend the International Road Conference in June next on behalf of the council.

Mr. Edward Blakeway I'Anson, F.R.I.B.A., a well-known architect and surveyor, practising in the City of London, and a vice-president of the Surveyors' Institution, died on Sunday last, we regret to learn, at his residence in Kensington.

Mr. H. A. Clarke, surveyor to the Briton Ferry Urban District Council, has been complimented in open council upon the fact that the Local Government Board, in sanctioning a loan of £16,368 for a housing scheme, had approved his plans without suggesting any alteration.

Mr. W. Plant, borough engineer of Stafford, was last week the recipient of a souvenir album from the members of the Waterworks Committee in recognition of his services in connection with extensions and alterations at the Milford pumping station. The chairman of the committee, Councillor T. Dunn, in making the presentation, spoke of the excellent way in which Mr. Plant had carried out a complicated work, and Mr. Plant, in reply acknowledged the loyal assistance he had received from his staff.

SEA WALL CONSTRUCTION ON THE FIFESHIRE COAST.

In a paper describing a new dock at Methil, on the east coast of Scotland, Mr. B. Hall Blyth, junr., ASSOC.M.INST.C.E., at the Institution of Civil Engineers on Tuesday evening, supplied some interesting particulars with regard to the construction of a sea wall which, running along and outside low-water mark, encloses the dock and entrance channel.

The wall is nearly 1 mile long; it is built for three-fourths of its length of concrete, and continues with a pitched slope, where it is well above high-water mark. It was the first work started, the idea being to build the wall and use it as a cofferdam to enable all the works inside to be done in the dry. The wall was constructed on a bag-work foundation up to 2 ft. 6 in. above low water, and from that point to quay-level of block-work and mass concrete *in situ*. The width of the wall was originally 8 ft. at the top—*i.e.*, quay-level—with counterforts every 25 ft., and a backing of 20 ft. of rubble from the excavations. This, however, was not carried out, as no suitable rubble was found in the excavations, and the wall was built of concrete, 17 ft. thick. The height of the wall varied according to the level of the bottom. At the north end it is about 20 ft. high to quay-level, and at the south end the maximum height is 40 ft. Quay-level is 5 ft. above high water, and the parapet on the wall is 10 ft. above that level. For the first 400 yds. from the south end the side wall of the entrance channel and the sea-wall run parallel, and they were built together, making the wall in all 27 ft. wide at quay-level.

Two and a-half years were required for the building of the wall. During the first two years very bad weather was experienced and very little progress was made. Frequent storms and rough seas delayed the work, and often washed away the temporary stagings and roads. Difficulty was also experienced in shifting the sand overlying the rock. This was in some cases as much as 11 ft. deep, and all of it had to be removed before the bag-work could be put in. The bag-work was all put in position by divers. Goliath cranes were employed for building the wall at the north or shallow end, and derrick cranes at the south end.

After two bad years a very fine summer in 1910 enabled the wall to be finished, more than 800 lin. yds. being constructed in six months. The wall was closed in October, 1910, and after the parapet was erected and a bank of soft material was put in along the inside, the water was pumped out, and the wall was found to be practically watertight.

Along the front of the old breakwater and the south end of the old sea-wall 50-ton concrete blocks had been thrown in pell-mell to break up the seas and protect the walls. Some of these had to be moved to allow the new wall to be built, and were then replaced outside the new wall. After the completion of the new sea-wall more of these blocks were made and placed along the front where the wall is on a curve concave to the sea, so that now the wall is protected in this way practically from the south end to opposite the dock gates.

Messrs. Blyth & Westland, of Edinburgh, were the engineers for the works, the contractors being Messrs. Robert McAlpine & Sons, of Glasgow.

Motor Traffic over Richmond Bridge.—At a Local Government Board inquiry held at Richmond (Surrey) on Thursday of last week, as to a joint application by the Richmond Town Council and the Middlesex County Council (for the Twickenham Urban District Council) for an Order imposing a 5-mile speed limit for heavy motor vehicles on Richmond Bridge, the growing extent of London's suburban automobile traffic was brought out by Mr. J. H. Brierley, the Richmond borough surveyor, who gave the measurements of the bridge and the gradients, and put in a census which showed that on August Bank Holiday motor vehicles numbered 2,096, of which 1,286 were motor omnibuses. Horse-drawn vehicles numbered 667. On Sunday, September 22nd, motor vehicles numbered 2,177, of which 1,317 were motor omnibuses. The figures for Tuesday, November 5th (a wet day), were motor vehicles 1,401, 822 of these being motor omnibuses, and horse-drawn vehicles 862. Mr. Brierley emphasised the danger of motor omnibuses mounting the pavement. Mr. F. W. Pearce, surveyor to the Twickenham Urban District Council, also dwelt upon the danger, pointing out that the footways were narrow, and low above the carriageway.

FOR OTHER ADVERTISEMENTS

See End of Paper.

THE WOODBRIDGE RURAL DISTRICT Council invite Tenders for Road Material delivered as under:—

Granite or Basalt, broken to pass through a 2½-in. and to be rejected by a 1½-in. gauge. Whole Chalk Flint, Washmill Flint, Kentish Rag, and any other Road Material.

(1) The Council's Wharf at Wilford Bridge, or at Melton (G.E.R.) Station.
(2) Levington Creek and Nacton Hard, or at Orwell (G.E.R.) Station.
(3) Westerfield (G.E.R.) Station.
(4) Boyton Dock and Hollesley Bay Labour Colony Wharf.
(5) Waldringfield.

Granite will only be required at 1, 2 and 3, and not at 4 and 5.

All materials to be delivered between the 1st day of April and the 1st day of October, 1913, at such times and in such quantities as the Surveyor may direct, and will be subject to his approval. Any materials rejected by the Surveyor will remain at the Contractor's risk and expense.

The Council do not bind themselves to accept the lowest or any Tender, and reserve to themselves the right to accept any part of a Tender, not being less than a barge freight.

Tenders, accompanied by Samples, to be delivered (carriage paid) to Mr. H. E. Kell Council Office, Newstreet, Woodbridge, endorsed "Tender for ——," on or before 10 a.m. on Wednesday, the 20th day of November, 1912.

No Form of Tender will be supplied.

Any further information may be obtained of the District Surveyor by enclosed stamped envelope.

GEORGE COOK.
District Surveyor.

Ipswich-road, Woodbridge.
November 12, 1912.

TWICKENHAM URBAN DISTRICT COUNCIL.

STONE PITCHED EMBANKMENT.

The above Council hereby invite Tenders for the Construction of a length of about 650 ft. of Stone Pitched Inclined Embankment along the river frontage at Radnor House Pleasure Ground, Cross Deep, Twickenham.

Plan and Specification may be seen, and further particulars obtained, on application at the Office of Mr. Fred W. Pearce, F.S.I., Surveyor to the Council, Town Hall, Twickenham.

Sealed Tenders, endorsed "Tender for Radnor House Embankment," to be delivered to the undersigned not later than noon on Wednesday, the 27th day of November, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
H. JASON SAUNDERS,
Clerk to the Council.

Town Hall, Twickenham.
November 13, 1912.

EAST SUSSEX COUNTY COUNCIL.

APPOINTMENT OF DISTRICT SURVEYOR OF MAIN ROADS.

The Roads and Bridges Committee of this Council are prepared to receive Applications for the Office of District Surveyor of Main Roads for the No. 1 or West District, containing at present about 91 miles of main road.

The District Surveyor, who will be under the direction and control of the County Surveyor, will be required to devote his whole time to his duties and to reside in such place as may be fixed by the Committee, and will receive an annual salary of £160, rising by yearly increments of £5 to £200 per annum, payable quarterly, exclusive of such travelling expenses as may be allowed by the Committee.

Canvassing for the office will be considered a disqualification.

Candidates must be between the ages of 25 and 35 years and have had practical experience in the maintenance and improvement of roads. Preference will be given to those who are Members or Associate Members of the Institute of Municipal and County Engineers.

Applications for the appointment, accompanied by copies of not more than three recent testimonials, marked on the outside "District Surveyor," to be sent in on or before Tuesday, the 3rd December, 1912, addressed to the Clerk of the County Council, County Hall, Lewes, from whom further particulars can be obtained on application by letter.

F. MERRIFIELD.
Clerk of the County Council.

November 12, 1912.

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

CLERK OF WORKS.

SHORT NOTICE.

The above Council invite applications for Clerk of Works for a period of about six weeks to supervise the construction of three lengths of Sewers at Eastcote and Ruislip.

The salary will be at the rate of £3 3s. per week, and the successful applicant will be required to commence his duties on or about Monday, the 2nd December next.

Applications, accompanied by copies of not more than three recent testimonials—which will not be returned—must be endorsed "Clerk of Works," and be in the hands of the undersigned not later than the first post on Monday, the 25th instant.

Selected candidates will receive an intimation on the 26th instant, but no intimation will be given to unsuccessful applicants.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Oaklands Gate,
Northwood,
Middlesex.
November 14, 1912.

BRACKLEY RURAL DISTRICT COUNCIL.

HIGHWAY SURVEYOR.

The Council invite applications for the Office of Surveyor of Highways. Salary £110 per annum.

The person appointed will be required to devote the whole of his time to the duties of the office.

Applications, in candidate's own handwriting giving particulars of age and previous experience, accompanied by not more than five recent testimonials, and stating when the candidate could commence work if appointed, must reach me not later than the 25th of November, 1912, marked "Surveyor."

Canvassing in any manner will disqualify applicants.

Full particulars can be obtained on application to me.

C. E. BARNES (Solicitor),
Clerk to the Council.

Brackley.
November 14, 1912.

THEORY OF ENGINEERING CONSTRUCTION. A reference-book for Civil Engineers and Students. By Ernest H. Essex, A.M.I.C.E. 8¾ in. by 5¾ in. 216 pp. Cloth gilt, 5s. Post free, 5s. 3d. Comprising a selection of Notes and Formulæ on the Theory of Construction, arranged in the form of Answers to the Questions set at Examinations for the Election of Associate Members of the Institution of Civil Engineers.

"Students of engineering construction are indebted to Mr. Essex for his book. . . . The book will have its use for students who are preparing for examinations, and to go through it will be found an excellent exercise for all who have to follow construction as a business."—*The Architect.*

"The examples chosen refer to problems of general professional interest, and the solutions are well reasoned and lucidly expressed. As an adjunct to scientific text-books the volume ought to be useful, and it may also be serviceable as a guide to candidates for examination."—*The Builder.*

London: St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C.

LAND SURVEYING. Private practical FIELD INSTRUCTION for APPOINTMENTS ABROAD, by ex-Australian Government Surveyor. Traversing, Closing, and Plotting by Latitude and Departure, Triangulation, Areas by double Longitudes, Setting Out Railway Curves, Levelling, Astronomical Observations for Latitude Time and True Meridian, &c. No class work, INDIVIDUAL INSTRUCTION ONLY, entailing rapid progress.

M The Bungalow,
Pevensey Bay, Sussex.

Road Efficiency.

IS MUCH OF THE ANTAGONISM TO THE ROAD BOARD DUE TO A DISTURBANCE OF CORRUPT METHODS?

By THE EDITOR of *The Commercial Motor*.

[The following article by Mr. E. Shrapnell Smith, the well-known Editor of *The Commercial Motor* appeared in the issue of that journal for October 31st, and is here reprinted by permission. Some comments upon it appear in our "Minutes" pages.]

King George has asked for efficiency in all national affairs, and it has been pointed out by more than one able writer that this request from the throne must be cordially supported by workers in all branches of commercial and public activity if it is to be of real and lasting effect.

The Road Board and its advisers are popular in some counties. In other counties they are extremely unpopular. The same divergence of attitudes is also noticeable in respect of the pose that is adopted by many London borough councils towards the Road Board. London's local bodies, it is true, have so far failed to get any financial aid from the board, so our references to them can be held more particularly to concern degrees of unreadiness in respect of new methods of road construction which do not involve the use of proprietary articles. They nearly all still dearly love wooden blocks and asphalt, and use one or other where modern tar or bituminous systems might well be laid.

CLEANER THAN THE U.S.A.

Municipal life in the United Kingdom is usually reckoned to be conducted upon clean lines. Lapses are occasional, not systematic. The subtlety and extent of American graft, while that curse is not unknown, has no parallel over here at least so we persuade ourselves as a nation. That view is the opinion of competent observers, is based upon fact and practice. Experience bears it out. In spite of this, in certain ranks of civic employment connected with road construction and maintenance there appear to be good grounds for believing that all is not as it should be. Thus, in part, is progress hindered. There is not that free accommodation to expedient change which is needed.

Chief officials and heads of departments are seldom, we have every confidence in asserting, involved in transactions which transgress the laws of bribing and the provisions of the several Acts that are now in force for the prevention of corruption. It is their underlings, in those cases where results are governed by considerations other than merit and efficiency, who take the harmful courses which we have in mind.

WHY RESIST NEW METHODS?

Why is it at the present time, that there is so much resistance from the departments of some road surveyors against changes in methods of road construction and maintenance? Why was it that the use of tarry and bituminous binders was adopted so tardily, and why are these systems still regarded with disapproval in many districts? Why do municipal authorities even in London continue to lay waterbound roads with high percentages of useless dust in them? Why do so many surveyors fail to patch macadamised roads when embryonic potholes appear, in spite of methods and economies which are shown to be possible of achievement in other counties which do not so neglect to give a stitch in time?

Three fundamental explanations have been tendered to us by those who know much more about the subject than we do, and we give them for what they are worth in the first instance, and then add some comment of our own.

The first is that the delinquent surveyors are handicapped by the directions of corrupt or inefficient committees; the second is that the surveyors themselves, in the areas where the changes of methods which ought to have taken place have not been adopted, are either incompetent or negligently lazy, or suffer from a combination of the two faults; the third is that some surveyors, try as they may, are the victims of corrupt methods which suborn their foremen.

In no case have we heard it asserted that the surveyors themselves, or even individual surveyors, are guilty of being influenced by bribes, and we are glad, in that many road surveyors are personally well known to us and are personal friends of many years' standing, to add our unreserved endorsement to the view that such probity is one of their outstanding characteristics. We scout any such general aspersion with indignation. It remains a fact, none the less, that new methods, even when satisfactorily proved in other counties, are not welcomed as they might be, and that modern traffic requirements are allowed to be prejudiced in consequence. This result, from the standpoint of a journal which is devoted to the interests of commercial motoring, clearly justifies our action in giving a measure of publicity to possibilities and suggestions regarding the true causes. What is the reason for this ultra-conservatism?

We find, in addition to the above-mentioned three possible explanations, yet another. It is, that surveyors have too often made mistakes in the past by showing undue readiness to move forward on a large scale solely upon the apparent success of a small-scale experiment in a particular locality. There is no doubt that such an explanation deserves to be recognised, for road surveyors, as technical advisers to their committees, are the men who really have in the end to bear the blame or the credit for any big change of system.

THE PLEA THAT IT IS PREMATURE.

We wish that we could conscientiously state that all cases of adherence to old methods of construction were to be explained on the score of its being premature to change, but we fail to see how the use of badly-laid water-bound macadam can be so justified under many traffic conditions where that class of metalling is still being laid, or where it has been laid within the last three years. Poor and badly-laid water-bound macadam is still used in London highways which bear much traffic. That is indefensible.

LOCAL COUNCILLORS AND LOCAL LABOUR.

Systems which are not patented, and which it is open to the surveyors of the country to adopt, do not, of course, include the desirable or undesirable factor of "a turn" for parties who are not really entitled to any financial benefit. We refer both to trading deals and arrangements with contractors. With both of these the more serious problem affects upon labour and the labour vote must be coupled. That efficiency for which so many road surveyors have to be content merely to contend in the abstract is often sacrificed to the dictates of the Labour party.

Councillors who vote in favour of changes of road construction methods which will reduce annual outgo upon maintenance do so at imminent risk of the loss of their seats at the next election. For pride of place in the local council, which counts for much with many a tradesman who has to make his social mark according to his own lights, the method which requires a road to be remetalled for its whole width, say, once in two years, is retained, in preference to the newer method which would give it a life of six or more years. For the same reason, the destructive pothole, destructive alike to the road and to the traffic which rolls upon it, is allowed to form and to grow unchecked. The surveyor, with reluctance and true regret, finds it better to pretend that his organisation does not permit of his doing patching work. He, a slave to his small-minded committee—knows full well that it is to his best interests to let the road get into such a bad state that stone will be required to resurface it, and necessary labour, so much the sooner.

Most surveyors simply ignore potholes, or have loose stones dropped into them. Few do the essential patching and ramming there and then.

It is against laggard and unprogressive handicaps such as the foregoing that the road surveyors of this country are struggling. We decline to believe that there is any direct corruption. There is jealousy, we know, and we have frequently wondered how some county surveyors can have the effrontery to raise their voices in support of their own system, or lack of system, when other counties, at no greater expense, have done so much better than they in all respects.

Can this apathy last? Will not the slower men

stand condemned on comparison with those who have been wasteful and assumptive."

Our sub-heading to this article has been deliberately chosen. The Road Board and its officials, with their indirect right to look into detail, arising from the legal obligation upon them to grant money only for purposes of improvement, are stirring up the mud of not a few monstrous examples of wasted public money. They possess at the moment, and they will do so increasingly in the near future, a collection of data which for the first time in history enables a central office to put its finger upon the county and other authorities in which negligent or wasteful methods are pursued.

The next step will be, we opine, to get down to the root cause of the bad returns per pound spent per annum, and it is then that certain corrupt factors will probably for the first time be forced to disappear, and that many local councils who now approve courses which they know full well to be out of date and wrong in relation to altered conditions, will be provided with a much-needed and satisfactory excuse to put before their Labour constituents. They can say: The Road Board insists upon efficiency, and we, the local people, really are not to blame. At present many of them are pandering to the uninformed mob—to the type of men whose intellect does not permit them to appreciate the wisdom of higher first cost in order to secure lower annual cost.

WATER SUPPLY IN CANADA.

WASTE AND POLLUTION AT TORONTO.

It appears from a statement of the deputy city engineer, Mr. C. L. Fellowes, which accompanies the report for 1911 of Mr. C. H. Rust, the late city engineer, that an inspection has been made of the water mains and services of Toronto in order to ascertain the cause of the waste which has been going on there. The results show that practically 95 per cent of the leakage is in the houses, and is due to leaky fixtures, wilful waste or carelessness, and about 5 per cent in mains and services to stop-cocks.

Mr. Fellowes remarks: "That by far the greater part of this waste in houses can only be stopped by the installation of meters is the opinion of all waterworks men who have given the subject consideration. No amount of inspection can put a stop to wilful waste; and, in addition, any sounding of stop-cocks on the street is practically impossible in a climate such as ours where the stop-cock boxes are covered with snow and ice a great part of the time. With the enormous yearly increase in the consumption, it is imperative that proper means should be taken to stop waste, otherwise the city must be prepared to go into very large expenditures for improvements if the supply and pressure is to be kept up in all sections."

In January of last year the city engineer reported in favour of duplicating the existing 6-ft. steel conduit into Lake Ontario, the intake to be situated at a point about 1,000 ft. west of the existing intake. This recommendation was made for the reason that the existing conduit could only be depended upon to deliver about 90,000,000 gallons per twenty-four hours during low stages of the lake, and as the maximum rate of pumpage during the busy hours of the day was 45,000,000 to 47,000,000 gallons per twenty-four hours, the capacity of the existing intake and conduit would no doubt be taxed to its utmost extent by the time the duplicate intake was constructed and ready for use. This recommendation was not acted upon till June of the same year. In the meantime a violent storm occurred on the said lake beneath the existing intake to a depth of 6 ft., and for a distance of 600 ft., causing the conduit to drop, shearing off the bolts connecting the several lengths, blocking the mouth of the pipe with sand, and cutting off the supply to the city. Steps were immediately taken to provide a duplicate intake, a tender of $51,900 being accepted for the carrying out of the work. A contract was also let for the construction of the 6 ft. steel conduit, the total length of pipe being about 3,000 ft., made up in lengths of 150 ft. each approximately.

The report of the city's chemist and bacteriologist on his examination of the water supply shows that there is strong evidence of sewage pollution on the north shore of Toronto Island. One series of samples taken indicated considerable contamination at 7 miles out and at a depth of 50 ft., and this is considered by the investigator to condemn as a fallacy the contention that the great body of the lake is pure, and that the present difficulty is merely the engineering one of reaching it. The report adds: "If the lake is contaminated 7½ miles south of Toronto, there is no reason why it should be much purer at greater distances, and it is possible, if not probable, that it is less pure. It is well known that the water on the south shore of Lake Erie is far from satisfactory, and this condition is aggravated by the discharge of the sewage of the City of Buffalo. This quantity is estimated at 160,000,000 gallons per day, and during flood times the Buffalo river, draining a well-populated area, discharges as much as 20,000 cub. ft. per second. The quality of the water at the entrance to the Niagara river is therefore very unsatisfactory, and any purification that may be effected by oxidation in the Niagara river is nullified by the pollution that is caused by the sewages of the Tonawanda, Lockport and Niagara Falls. These towns obtain their water supply from the river, and the typhoid rate shows clearly the dangerous condition of this water. . . . All the bacteriological studies that have been made show that, although dilution and oxidation are fairly complete, traces of matter of fæcal origin can still be detected, and that the water is, in its raw state, unfit for alimentation. This being the case, it is highly desirable that Toronto, before undertaking the responsibility of sewage sterilisation, should have guarantees that other cities on the lakes will adopt similar methods. Even if this were adopted, Toronto would still require purification works, to guard against uncontrollable pollution, and to remove the excessive turbidity that is occasionally found in the lake supply."

The great progress made in the growth of Toronto, and the addition of new territories and the consequent demand for municipal improvements, resulted in the expenditure in the department of the late city engineer during the last year being the heaviest on record. Work on the main drainage scheme has progressed very satisfactorily, and it was expected that the low-level intercepting sewer would be completed by the present autumn. The sewage disposal works are practically finished, and the outfall sewer has been entirely laid with the exception of expansion joints. Work on the substructure of the pumping station was carried out departmentally by day labour. The plans for the superstructure were prepared by the city architect, and work is progressing very satisfactorily. Mr. Rust's report states that there are now 412 miles of streets and 120 miles of lanes in the city, 129 miles of streets being unpaved. A modern and complete system of street cleaning, watering and scavenging is operated by the city, the area of which, excluding land covered by water, is 28 square miles. The population is over 425,000.

Cincinnati Road Congress and Exhibition. The American Road Builders' Association will hold its annual convention at Cincinnati on December 3rd, 4th, 5th and 6th next. Papers on the practical questions relating to highway work will be read and discussed, and there will also be an exhibition of road-building and street-paving machinery, materials and appliances. In addition to the exhibits of manufacturers, a number of the principal cities will be assigned spaces in which to illustrate their road systems, kind and extent of pavements, and materials used.

A Local Government Board Inspector on Loans.—In the course of an equity recently into an application of Wembley Urban District Council for sanction to borrow £7,000 for gasworks extensions, Mr. R. H. Hooper, the Local Government Board Inspector, called attention to the fact that the works were producing an annual profit of £2,400, the surplus of which was handed to the relief of the rates, but he failed to see how the gas works were benefited when the council were borrowing money at interest. The £7,000 that the council required would ultimately cost them something like £16,000. A far better way was to keep those moneys in hand as they went along, by paying for improvements out of revenue. The clerk to the council, Mr. P. M. Walker, pleaded that considerable sums had been spent on the undertaking out of revenue without going to the Local Government Board, but this was considered a big thing, and the council thought the future generation as well as the present should bear their share of the burden.

Some Recent Publications.*

RAIL CORRUGATION. Interim Report of Special Committee appointed by the Municipal Tramways Association. Price 10s. 6d. Bradford: Mr. G. Spencer, 7 Hall Ings, Hon. Secretary.

The phenomena of corrugation on tramway and railway rails—but more especially the former—has for the past ten or twelve years been a prominent subject of discussion throughout the tramway world, and continues to excite deep interest among engineers and others concerned in tramways in every part of the globe.

And well it may, for the economic loss alone imposed by corrugated rails is a matter of much gravity. This is emphasised in a recent official statement that this item involves an expense of about £10,000 a year to systems like Manchester and Glasgow, and a proportionate sum to other systems. The aggregate cost involved by corrugation to tramway authorities in this country is computed at not far short of £100,000 a year.

The cause or causes that produce these troublesome effects have been vainly sought by expert investigators in every country. On the Continent and in America a number of committees have been at work for some years in trying to unravel the mystery. In England three special committees have undertaken a similar purpose, respectively appointed by the Institution of Municipal and County Engineers, the Tramways and Light Railways Association, and the Municipal Tramways Association. The last-named association has now issued an interim report upon the results of the investigations of its "Corrugation Committee."

The work of this committee was initiated as far back as 1906, when a number of the managers of the principal tramways in this country were appointed to deal with the question, but it was not until 1909 when the services of Mr. A. C. King, formerly permanent-way engineer to the Glasgow tramways, were secured by his appointment as their advisory engineer, that systematic work was entered upon.

The first procedure of that gentleman was to formulate and circulate a list of queries comprising about 100 questions, covering what appeared to him the more pertinent points involved. Over 6,000 replies were received and tabulated, the summarised data being classified in three divisions, (1) Permanent way, (2) rolling stock, (3) general. It is remarked that noteworthy features of these replies were the remarkable diversity and vagaries of occurrence, and, in some instances, the quite contradictory character of the phenomena reported.

It is the astonishment of the perplexity as to the subject that the great majority, it is said, entered no reply to the query, Have you arrived at any conclusion as to the cause of corrugation? Even some who a few years since confidently expressed their opinions now admitted their inability to assign the cause.

When the highly technical nature of these replies was seen, and the abstruse character the inquiry would take was realised, it was deemed advisable to form a sub-committee of technical experts and the permanent-way engineers of Glasgow, Manchester, Sheffield and Leeds undertook, in connection with Mr. King, the detailed investigations and practical work that form the main subject-matter of this report.

It has rarely happened that a comprehensive study of a technical subject has been undertaken under equally favourable conditions. Not only has financial assistance been willingly rendered by tramway authorities, both company and municipal, throughout the country, but the technical officers of many authorities have readily afforded all the information and assistance desired of them.

Again, the fact that foreign commissions were at work with the same object, and that their professional findings had in several instances been made public, no doubt gave additional zest and incentive, as well as provided valuable data whereon to compare results.

The German Committee which has been at work considerable period engaged in making an exhaustive inquiry into the subject is, we understand, expected to present its report early next year.

That in the report we are at present dealing with the committee have to acknowledge that success has not yet attended their endeavours to ferret out the trouble to its root cause is undoubtedly a misfortune, but, at the same time, it is only fair to say that we gather that this report has in a manner been obtained from them against their inclination at an intermediate stage in their labours by the pressure of the general anxiety to know what had been accomplished. It is scarcely to be hoped that before long their labours will be crowned with complete success.

That they have done excellent work is undeniable, and not only the extraordinary complexity of the problem and the immensity of the trouble involved by its investigation are evidenced in this report, but also the scientific, systematic and painstaking manner in which their inquiry has proceeded.

One very wise preliminary was to prepare a glossary of the terms employed in connection with corrugation, and to give a clear definition to each.

A definite mode of procedure was mapped out, the first objective being to study the replies *re* the "Occurrence and Characteristics of Corrugation," with regard to which the report contains much interesting information, accompanied by a number of photographs.

Difficulties were, however, immediately experienced from the absence of reliable data wherewith properly to analyse and probe the statements received. Special experiments were accordingly devised and made, not only on tracks and their details, but on rolling stock and equipments, and included numerous intricate tests, the co-operation of Prof. Carpenter, of Victoria University, being enlisted in making the experiments upon metallurgical factors.

The reliable data thus evolved enabled the drawing of some important general conclusions which should assist materially to the final solution of the problem.

In particular, the committee were able to arrive at certain definite "findings," and at the same time this data served to dispose in a clear view of a number of theories as to the probable producing cause of the mischief.

From the circumstance that the effect of corrugation becomes visible on the rail, it is perhaps not surprising that the latter has been very generally suspected as somehow or other embodying in itself the predisposing cause.

The committee, however, exonerate the rail from this charge; they say definitely that "corrugation does not exist on tramway rails as received from the rolling mills," and that "the cause of corrugation is external to the rail." It is gratifying to learn that, though their tests covered some 30,000 tons of rails of various English makes, no instance of permanent corrugation was found.

This is perhaps the most outstanding feature in the report, and is the more noticeable as being directly contrary to the views expressed by Continental Committees that "corrugation is inherent in the rail."

That English-made rails should be found exempt from corrugation when new, and that, on the contrary, Continental-made rails are pronounced to have corrugation when received from the makers, is especially satisfactory from the circumstance that foreign rails have been sometimes extolled as being much superior to English-made rails in this respect.

Corrugation has been ascribed by many to "cold rolling." A number of facts are set forth in this report to combat this view, one being that "Bradford, with the softest rails by composition, has comparatively little corrugation." Incidentally this also upsets the idea that the softer the rail the more the corrugation.

Another pronouncement in this report is that "no one class of paving has more effect that another on corrugation," and there are a number of other valuable and interesting "findings" and "tentative conclusions."

While frankly admitting their inability to assign a definite cause to the phenomenon, the committee append a list of "further experiments recommended." Included in these is a suggestion that the cinematograph should be employed.

Concurrently with their investigations the committee have conducted "researches into the mitigation of corrugation," among these being the possibility of obtaining rails of a more durable character than those now generally used, better able to resist corrugating forces.

They claim that to overcome the evil [illegible]

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride Press, Ltd., on receipt of published price.

does not suffice for this purpose. "The steel should be tough as well as hard;" but they admit that "they realise the impossibility of attempting to prescribe a standard analysis" for obtaining such a steel. They think, however, that "it should be relatively high in manganese, carbon and silicon" (a somewhat vague stipulation), and should comply with certain tests which are prescribed.

It is perhaps open to doubt whether they are on entirely safe ground here. An admixture with high silicon has been generally found to induce brittleness in rail steel made by ordinary processes (i.e., other than the Sandberg patent process), and the use of the latter is apparently not contemplated.

An appendix contains a brief bibliography (in which, however, there are some notable omissions) of papers and reports on corrugation and a number of diagrams and photographs illustrate various references.

All who read this valuable report must appreciate that those responsible for its contents have done an immensity of solid practical spade work which has at least had the advantage of clearing the way for a further assault, and it is hoped to a final solution of this complex question.

Though a lengthy document, it certainly merits most careful study. Tramway engineers who have been puzzling themselves for years over the intricacies of the problem will find many of their doubts and difficulties explained and much original information of technical interest given. The thanks of all are due to the committee for making this report generally available.

The Cheap Cottage and Small House. By J. Gordon Allen, A.R.I.B.A. Price 1s. 6d. paper, 2s. 6d. cloth. Letchworth: Garden City Press, Limited.

In this book the author attempts—and with considerable success—to throw light on the subject of cheap building. The importance of this may be realised in a moment by reflecting upon the close connection which exists between rural depopulation and overcrowding, and the possibility of providing cheap cottages which can be let at a rent which is at once remunerative to the landlord and economically possible for the tenant. Mr. Allen has studied the subject of cheap building systematically, and in this book he deals with it in considerable detail, commencing with the site and water supply, and dealing in turn with the design, both exterior and interior, materials, fittings and furniture. The book is copiously illustrated with excellent designs, and it will be valuable to all who are concerned, either as land-owners, members or officers of local authorities, or social reformers, with the provision of cheap and healthy dwellings for our rural population.

Engineering and Metallurgical Books 1907-1911. By R. A. Peddle. Price 7s. 6d. net. London: Grafton & Co.

This exceedingly useful compendium is a complete catalogue, arranged alphabetically under subject headings, of all British and American books on engineering metallurgy and allied subjects which have been published during the period indicated. A classified list of subject headings and an index of authors facilitate reference. The value of a book of this kind is obvious, inasmuch as it enables anyone who consults it to see at a glance the titles and authors of all the recent books on any given subject, and to select that which is most likely to suit his immediate requirements. It should be on the shelves of every engineer. We ought to mention that the subjects include, among many others, Hydraulics, Pipes and Piping, Bridges, Roofs, Roads and Pavements, Sanitary and Municipal Engineering, Heating and Ventilation.

National Insurance Questions and their Answers. By Gilbert Stone, B.A., LL.B., Barrister-at-Law. Price 1s. net. London: Butterworth & Co. and Shaw & Sons.

In this book the author has sought to expound the National Insurance Act by propounding concrete questions and providing their answers. The Act is one which affects people of all classes, and a simple yet accurate explanation is a necessity for the layman. Mr. Stone's work fulfils the requirements of the ordinary man admirably in this respect, inasmuch as his well-selected questions cover the ground thoroughly, and he has in the answers managed to give a complete and simple exposition of a long and complicated statute. Among the many books for laymen which the National Insurance Act has brought forth, this should take a high place.

"Eason's Diaries" (London Dublin and Belfast: Eason & Son, Limited).—Messrs. Eason have ready for the coming year their usual assortment of indexed diaries "for people who know the value of time." Among them we notice the "Every Hour" Diary (price 1s. 6d.), stoutly bound in a thick terra-cotta cover, with a roomy pocket for loose memoranda, a pad of blotting sheets, and another good practical feature in a diary arranged for a week's engagements on the facing pages of one opening, each day being further ruled off for engagements for the hours of the day. The "Swift Diary" (price 1s.) is of waistcoat-pocket size, in leather-cloth case with rubber band, back-loop pencil and two pockets. "Eason's Penny Diary," cheap as it is, is quite a serviceable little memory aid to carry about with one.

Vol. iv., Part 2, of the "Transactions of the Concrete Institute" contains, in addition to much matter of "domestic" interest, papers by Mr. Reginald Ryves, Assoc.M.Inst.C.E. ("High Dams of Great Length"), and Mr. Maurice Béhar ("The True Bending Moments of Beams with Various Degrees of Fixity"), together with the discussions thereon. The volume also includes the Report of the Tests Standing Committee on the Testing of Reinforced Concrete Structures on Completion. Its interest is such as to appeal to all who are concerned with concrete construction, whether members of the Institute or not.

DETECTION OF WATER WASTE.

ST. AUSTELL SURVEYOR'S REPORT.

In a report on the consumption of water in St. Austell since meters were adopted by the urban district council with the view of detecting waste, Mr. E. D. Groves, the surveyor, says:—

"The work of house-to-house inspection carried out during July, August and September had good results. The inspector made 1,980 visits, and discovered 239 leaks, the majority of which were repaired on request, while there were others which caused several visits to be made and requests sent before having the matter attended to. Such consumers are those who will not realise that the water is theirs to use and not to waste, and as long as it is available will waste it.

"A general idea prevails among consumers that waste, although bad for the waterworks, is good for the drains and sewers; but that is not true, because if the waste is due to defective fittings it goes on in the day time, plus the consumption, which in itself is, or ought to be, enough flushing for all purposes. A short, sudden rush at intervals has a good effect in flushing drains, but a continual dribble has none.

"Although not generally the case, many householders are indifferent to the waste of water. It is therefore a matter of indifference to them whether, for example, a tap is running the whole night or not. Although the average consumption has been reduced considerably, we lose every night, between the hours of midnight and 6 a.m., 7,000 to 8,000 gallons of water. The major portion of this must be waste, part of which could be prevented by the consumers.

"The average consumption per head for twenty-four hours for the months of April to September inclusive was 30·2 gallons, which, even taking into consideration the reduction made during the winter months, is too high considering the wet season that has been experienced. This is largely due to the old fittings that exist. If consumers would only realise the economy of up-to-date fittings, the consumption would be still further reduced. Every consumer should realise that it is his duty to prevent waste, as by so doing he is effecting a saving in the council's expenditure. This is most important, because the town is growing, and each year means additional demands on the supply."

Commenting at a recent meeting of the council on the satisfactory character of Mr. Groves' report, Councillor Smith said he considered the expenditure in this connection had been amply justified, having regard to the enormous amount of waste that had been stopped, and Councillor Hodge emphasised the importance of impressing the significance of the last paragraph of the report, for in preventing the misuse of water consumers were saving their own pockets.

CRYSTAL PALACE OLD STUDENTS' SOCIETY.

EIGHTEENTH ANNUAL DINNER.

The eighteenth annual dinner of the Crystal Palace Old Students' Society was held at the Connaught Rooms, Kingsway, on Thursday of last week, Mr. Sidney R. Lowcock, M.INST.C.E., M.I.MECH.E., the president, being in the chair. The dinner was very well attended, several of the honorary members and many guests being present. These included the Rt. Hon. the Earl of Plymouth, Colonel Sir Edward Raban, late Director of Works of the Admiralty, Lady Raban, and Mr. and Mrs. J. W. Wilson.

The loyal toasts were proposed by the president. Mr. Percy Griffith proposed the toast of "The Crystal Palace School of Practical Engineering," which was responded to by the principal, Mr. J. W. Wilson.

The Earl of Plymouth, in proposing the toast of "The Old Students' Society," very naturally referred also to the Crystal Palace, the home of the school, towards the future existence of which he has already done so much. That Lord Plymouth's public-spirited act in saving the Palace and its 200 acres of grounds from being sold and built over will ultimately lead to a satisfactory result is clear. In his speech his lordship definitely stated that the original high ideals upon which the Palace was started would be maintained, and that, even if a new building had to take the place of the old one, it was to be of such a character that the unique sculptures and objects of art would be preserved, and the best traditions of art, science, literature and music upheld. The great work of education undertaken and fulfilled by the Palace in the past would be continued, and in particular the School of Practical Engineering would continue its present work with unabated energy. Lord Plymouth also stated that he had been asked to become one of the honorary members of the Old Students' Society, and that he had accepted the position, a statement which was greeted with acclamation.

The president, in responding to this toast, announced that not only had Lord Plymouth accepted the position of honorary member, but that Rear-Admiral Gordon Wilson-Moore, Third Lord of the Admiralty and Comptroller of the Navy, had also accepted the position of honorary member. He referred to the fact that the Engineering School started in the year 1875 with seven students, and that since then 2,041 students had passed through the school. Mr. Lowcock stated that he had entered the school in the year 76, and that Mr. Jacomb Hood, the present chief engineer of the London and South-Western Railway, was a fellow-student in the same year with him. Keen rivalry had existed between the two students in their work. The present membership of the society was 330, or about one-sixth of those who passed through the school, which was not a bad percentage, seeing that the members were scattered throughout the world. Among the old students there were 15 chief engineers of railways, 10 borough engineers, and many others who had held responsible positions upon almost every large work that had been in progress within recent years. It was impossible to keep in touch with all the members, but it was known that there were 648 old students actively employed in Europe, 251 in Asia, 147 in Africa, 111 in America, and 56 in Australia.

Mr. Robert J. Simpson proposed the toast of "H.M. Forces," which was responded to by Colonel Sir Edward Raban.

The speech of Sir Edward Raban was particularly impressive. The colonel, during his twenty-two years of service as Director of Works at the Admiralty, employed many old students, to whom he has endeared himself by his unfailing kindness. He therefore spoke not only as a newly elected honorary member, but as a very old friend, for whom many of the members have an affectionate regard. Having shown that the Army and the Navy were now under the control of civilians, he emphasised the great responsibility which rests upon the shoulders of the people. What is done and what is left undone for the Army and the Navy depends upon the popular vote. He referred to a touching incident in the Boer War, where a private soldier was found carving an epitaph on the wooden cross marking the grave of a friend. This man, having small knowledge, and probably little religious training, nevertheless felt that things would not go amiss with the man who had died for his country, and carved the words "Pass, friend, and all's well." Sir Edward said that the work of the soldier or the engineer should be so done that at the close of an honourable career the words "Pass, friend, and all's well" might be said truly.

The toast of "The Visitors" was proposed by Mr. Maurice Wilson, and was responded to by Mr. J. A. Botham.

An excellent musical entertainment, under the direction of Mr. James Chilcott, formed part of the proceedings.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. THOMAS, M.INST.C.E., County Surveyor, Buckinghamshire.

The council of the Institution of Municipal and County Engineers are offering premiums to members, associate members and students of the institution amounting to twenty-eight guineas for the best plans for laying out a seaside pleasure resort.

The drawings are to be delivered prior to the annual meeting in July next at a date to be fixed hereafter. Further particulars will be issued shortly.

THOMAS COLE,
Secretary.
11 Victoria-street, S.W.

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, DONCASTER.

A sessional meeting of the Royal Sanitary Institute will be held on Saturday, November 23rd, in the Mansion House, Doncaster, at 11 a.m., when a discussion will take place on "Town Planning in Relation to the Development of the South Yorkshire Coalfield," to be opened by Dr. A. B. Dunne, medical officer of health, Doncaster Rural District Council.

Among those whom it is hoped will take part in the discussion are Messrs. R. A. MacBrair, M.INST.C.E., city engineer and surveyor, Lincoln; R. G. Whitley, surveyor, Bentley Urban District Council; C. F. Wike, M.INST.C.E., city engineer and surveyor, Sheffield; and John W. Wilson, surveyor, Bolton-upon-Dearne Urban District Council.

The chair will be taken by Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute.

Tickets for admission of visitors may be had on application to Dr. A. B. Dunne, medical officer of health, Doncaster Rural District Council, 7 St. Georgegate, Doncaster, who is acting as the local hon. secretary of the meeting; and of Mr. E. White Wallis, secretary of the institute, 90 Buckingham Palace-road, S.W.

The members will be entertained at lunch by the Corporation of Doncaster, and later in the day will proceed on a visit to the Woodlands Model Colliery Village.

An adjourned sessional meeting will be held at the Royal Sanitary Institute, 90 Buckingham Palace-road, S.W., on Tuesday, November 19th, at 8 p.m., for the purpose of continuing the discussion on "The Report of the Departmental Committee on Intercepting Traps in House Drains," opened by Mr. H. Percy Boulnois, M.INST.C.E.

E. WHITE WALLIS,
Secretary.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. JOHN D. WATSON, M.INST.C.E., F.R.S.N.E.

ANNUAL GENERAL MEETING AND DINNER.

The eleventh annual general meeting and dinner of the Association of Managers of Sewage Disposal Works will take place on Thursday, December 12th, at the Holborn Restaurant, London.

PROGRAMME.

11 a.m.—Council meeting.
2 p.m.—Annual general meeting; chairman's annual report; balance-sheet; reading of papers; discussion.
6.30 p.m.—Reception.
7 p.m. Annual dinner

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

NORTH-WESTERN DISTRICT COMMITTEE.

A meeting of the above will be held at the Victoria Hotel, Manchester, on the 20th inst., at 7.30 p.m.

Business.

Sub-Committee's proposals re "social" to be held at the Victoria Hotel, Manchester at 6 p.m. on Saturday, December 7th; arrangements for year 1913; discussion on "The Merits of the Intercepting Trap."

J. W. Gleave.
Hon. District Secretary.

JOINT SOUTHERN AND SOUTH-EASTERN DISTRICT MEETING.

A Joint Southern and South-Eastern District meeting will be held in the council chamber, No. 4 Southampton-row, London, W.C., on Wednesday, November 27th, 1912, at 8 o'clock, when a paper, "The Effect of Recent Decisions upon the Arbitration Clause," by Mr. W. Valentine Ball, M.A., barrister-at-law, author of "The Law Affecting Engineers," joint editor of "Emden's Building Contracts," 4th edition, will be read.

The subject of Mr. Valentine Ball's paper is of wide importance to engineers and others engaged in municipal work, and it is hoped that each member will, where possible, bring to the meeting his town clerk, chairmen of committees, and others interested in the matter. The discussion will be an open one, and an advance copy of the paper may be had upon application.

The building, No 4 Southampton-row, is almost opposite the Holborn Station of the Great Northern and Piccadilly Tube, and within a minute of the British Museum Station of the Central London Railway. Omnibuses from all parts practically pass the door.

Arthur Palmer.
J. Woolford Brook,
Joint Hon. District Secretaries.

JOINT WESTERN AND SOUTH-WESTERN DISTRICT MEETING.

A Joint Western and South-Western District Meeting will be held at Gloucester and Exeter on Friday and Saturday, November 29th and 30th.

Programme.

Gloucester Meeting, Friday, November 29th.

3 p.m.—Meet at the New Inn, Gloucester.
Business meeting of the Western District.
Short address by the president.
4 p.m.—Discussion on Mr. A. Winter Gray's paper, "Superannuation and Security of Tenure," which will be taken as read.
5 p.m.—Adjourn for tea.
6 p.m.—Informal meeting at which Mr. Latham will preside.

Exeter Meeting, Saturday, November 30th.

10 a.m.—Meet at the Bude Hotel, Exeter.
Business meeting of the South-Western District.
Short address by the president.
11 a.m.—Discussion on Mr. A. Winter Gray's paper, "Superannuation and Security of Tenure," which will be taken as read.
Discussion on the question of "Workmen's Cheap Housing," when two or three short papers will be presented. Members are requested to contribute what information they can on the question, in order that it may be fully discussed with a view to [illegible] experience.
1 p.m.—Adjourn for tea.
7 p.m.—Social evening with musical programme, at the Bude Hotel, to which members and their friends are invited.

Members are requested to make every effort to attend on at least one of the above days. As stated, Mr. Latham will be present on both days, and would be glad to meet as many members as possible.

Louis Brook
C. Owen Baines,
Joint Hon. District Secretaries.

November 11, 1912.

B. Wyand,
39 Victoria street, S.W. *Secretary.*

INSTITUTE OF SANITARY ENGINEERS.

President—Mr. A. J. Martin, M.Inst.C.E., F.G.S., F.R.San.I.

SESSIONAL MEETING.

At Caxton Hall, Westminster, on Monday, the 18th inst., Mr. Ernest Van Putten, M.Inst.C.E., borough engineer and surveyor of Lewisham, will open a discussion on the subject of intercepting traps in house drains.

The chair will be taken by the president, Mr. A. J. Martin, at 8 p.m.

FOUR BOOKS FOR MUNICIPAL ENGINEERS.—There is a field for enterprising local authorities to lead the way by providing municipal crematoria. Mr. Albert C. Freeman's book—"Crematoria in Great Britain and Abroad," with 70 illustrative plans and designs, price 5s. (post-free 5s. 4d.)—is the standard work on the subject. Mr. Freeman is also the author of "The Planning of Poor-Law Buildings and Mortuaries," price 7s. 6d. (post-free 7s. 10d.), a companion work in which the illustrations are again a valuable feature. "Roofs and Floors of New Buildings: their Structure and Stability," by Ernest H. Essex, Assoc.M.Inst.C.E., price 2s. 6d. (post-free 2s. 8d.), embodies in a most concise manner the calculations necessary for the strengths of timbers in floors and roofs. "The Housing of the Labouring Classes and Back-to-Back Houses," by H. Percy Boulnois, M.Inst.C.E., price 1s. (post-free 1s. 1d.), contains 41 diagrams, and comprises, says "The Architect," "valuable information on one of the most embarrassing of social problems." The above four works are all published by the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, but those responsible for their despatch are recommended to arrange that they shall reach The Surveyor office by noon on Wednesdays to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.

SURVEYOR'S ASSISTANT.—November 16th.—East Suffolk County Council. £90—£120.—Mr. A. Townshend Cobbold, clerk, County Hall, Ipswich. Applications to be endorsed "Surveyor's Assistant."

ASSISTANT SANITARY INSPECTORS.—November 18th.—Corporation of Burnley. £78 per annum each.—Mr. P. Thomas, town clerk.

CLERK OF WORKS.—November 18th.—Dartford Rural District Council. £2 10s. per week.—The Clerk.

SURVEYOR.—November 19th.—Upper Brue District Drainage Board. £115 per annum.—Mr. R. Bath, clerk, 11 Chilkwell-street, Glastonbury. Applications to be endorsed "Eastern District."

CLERK OF WORKS.—November 20th.—Hackney Borough Council. £4 4s. per week.—Mr. W. A. Williams, town clerk.

SURVEYOR. — November 20th. — Newtownards Urban District Council. £100 per annum.—Mr. H. McCartney, clerk. Applications to be endorsed "Town Surveyorship."

MUNICIPAL ENGINEER.—November 21st.—Municipal Board of Cawnpore. Rs. 800—1,000 per mensem.—Mr. C. E. Goument, C.S.I., M.Inst.C.E., c/o Messrs. Thos. Cook & Son, Ludgate-circus, London.

SURVEYOR OF HIGHWAYS.—November 23rd.—Southwell Rural District Council. £100 per annum.—Mr. John Ellis, clerk.

ENGINEER AND SURVEYOR.—November 25th.—Rawmarsh Urban District Council. £200 per annum.—Mr. J. W. Bellamy, clerk. Letters to be endorsed "Engineer and Surveyor."

SURVEYOR AND INSPECTOR OF NUISANCES.—November 26th.—Eton Urban District Council. £150.—Mr. J. E. Gale, clerk, 3 Sheet-street, Windsor. Envelopes to be endorsed "Surveyor, Eton."

CLERK OF WORKS.—November 29th.—Queenstown Urban District Council. £2 10s. per week.—Mr. J. H. Campbell, clerk.

INSPECTOR OF NUISANCES.—November 30th.—Newquay Urban District Council.—Mr. G. F. Nicholls, clerk.

DEPUTY CITY SURVEYOR.—November 30th.—Corporation of Manchester. £750 per annum.—Mr. Thos. Hudson, town clerk.

DRAUGHTSMAN (Temporary). — Corporation of Hertford. £3 3s. per week.—Mr. John H. Jevons, borough engineer.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1369 Holborn), subject to later confirmation by letter.*

RHYL.—November 18th.—Plans, specifications and estimates for strengthening Rhyl pier, for the urban district council.—Mr. A. Rowlands, clerk.

BELFAST.—January 1st.—Designs for 126 houses of two apartments each, and 126 houses of three apartments each, for the corporation. Premiums are offered of £25, £15, and £10.—Mr. R. Meyer, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

DUBLIN.—January 1st.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A. —The Town Clerk.

HARROGATE.—February 3rd.—Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1369 Holborn), subject to later confirmation by letter.*

Buildings.

BIRMINGHAM.—November 18th.—For the erection of a school, for the Education Committee.—Mr. J. Arthur Palmer, secretary, Council House.

DURHAM.—November 18th.—For alterations at a school, for the county council.—Mr. J. A. L. Robson, Shire Hall, Durham.

CHELMSFORD.—November 18th.—For the erection of an engine-house, for the corporation.—Mr. G. Melvin, town clerk.

SALOP.—November 18th.—For the reconstruction of a school, for the county council.—Mr. H. E. Wale, secretary, Elementary Education Department, County Buildings, Shrewsbury.

STAINES.—November 18th.—For the erection of a public convenience, for the urban district council.—Mr. E. J. Barrett, engineer and surveyor.

PORTSMOUTH.—November 19th.—For the erection of stores, for the corporation.—Borough Engineer.

CHESHUNT.—November 19th.—For carrying out structural alterations, for the urban district council. —Mr. J. E. Sharpe, engineer and surveyor.

CARDIFF.—November 20th.—For the construction of a live stock market, for the corporation.—Town Clerk.

OLDHAM.—November 20th.—For the erection of shops for the corporation.—Mr. I. H. Hallsworth, town clerk.

BLACKPOOL.—November 20th.—For extensions to car shed and additions to stores, for the corporation. —Mr. J. S. Brodie, borough engineer.

CHORLEY.—November 20th.—For the erection of a slate-cleaning room at the public slaughter-house, for the corporation.—Borough Surveyor.

HACKNEY.—November 21st.—For the erection of a branch library, for the borough council.—Mr. W. A. Williams, town clerk.

BEBINGTON.—November 21st.—For the erection of a school, for the Administrative Sub-Committee.—Mr. J. Harding, clerk, Library Cottage, Bebington, near Birkenhead.

LINDSEY (Lincs).—November 21st.—For the erection of a school, for the Education Committee.—Mr. S. Maudson Grant, secretary, 286 High-street, Lincoln.

CAISTOR.—November 21st.—For the erection of cottages, for the rural district council.—Mr. A. A. Padley, clerk.

ROMFORD.—November 21st.—For the erection of cart shed and paving stable-yard, for the urban district council.—Mr. Charles T. King, clerk.

NORWICH.—November 22nd.—For the erection of a shelter at the cemetery, for the corporation.—Mr. A. E. Collins, city engineer.

WEST RIDING.—November 22nd.—For alterations to a school, for the Education Committee.—Mr. Francis Alvey Darwin, clerk, County Hall, Wakefield.

PORTSMOUTH.—November 22nd.—For the construction of cabmen's shelter and public convenience, for the corporation.—Borough Engineer.

HERTS.—November 25th.—For the erection of a school, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

PORTSMOUTH.—November 26th.—For the erection of forty-three houses, with wall and iron fence, for the corporation.—Mr. G. Hammond Etherton, town clerk.

HULL.—November 27th.—For alterations at the power station, for the corporation.—City Engineer.

MANCHESTER.—November 27th.—For alterations to boiler-house and reconstruction of main flue at generating station, for the corporation.—Mr. Thomas Hudson, town clerk.

LANCS.—December 3rd.—For the erection of an elementary school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

HUNSTANTON.—December 4th.—For the erection of shelters, for the urban district council.—Mr. J. S. B. Glasier, clerk.

Iron and Steel.

BIRMINGHAM.—November 16th.—For the supply of cast-iron pipes and special castings, for the Water Department.—Mr. E. Antony Lees, secretary, 44 Broad-street, Birmingham.

EGREMONT.—November 18th.—For the supply of materials for and construction of water supply, for the urban district council.—Mr. John Nelson, clerk.

DEPTFORD.—November 19th.—For the supply of two water supply tanks at the town hall, for the borough council.—Mr. Vivian Orchard, town clerk.

NEWMARKET.—November 25th.—For carting, excavating for and laying 5 miles of 3-in. cast-iron pipes, including fixing valves and hydrants, and erection of brick water tower, for the rural district council.—Mr. S. J. Ennion solicitor.

COVENTRY.—November 25th.—For the supply of manhole covers, gullies, pavement channels, and step irons, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

NEWMARKET.—November 25th.—Supply of 163 tons of 3-in. cast-iron pipes and specials, the erection of cast-iron tank and other works, for the rural district council.—Mr. S. J. Ennion, solicitor.

GOOLE.—November 26th.—For the supply of cast-iron pipes, for the rural district council.—Mr. G. England, clerk.

LEYTON.—November 26th.—For the supply of unclimbable cast-iron fencing, for the urban district council.—Mr. E. H. Essex, surveyor.

SOUTHWARK.—November 27th.—For the supply of fifty cast-iron street orderly bins, for the borough council.—Borough Engineer.

Roads.

METHLEY.—November 16th.—For works of flagging and kerbing, for the urban district council.—Mr. T. Thompson, surveyor.

NELSON.—November 16th.—For private street works, for the corporation.—Mr. J. H. Baldwick, town clerk.

SITTINGBOURNE.—November 18th.—For the supply of Guernsey granite and granite chippings, for the urban district council.—Mr. W. L. Grant, surveyor.

DOVER.—November 18th.—For making up two roads, for the corporation.—Mr. R. E. Knocker, town clerk.

GLAMORGAN.—November 18th.—For the diversion of a road, for the county council.—County Surveyor, County Hall, Cardiff.

BLACKBURN.—November 18th.—For works of making up and asphalting, for the corporation.—Mr. W. Stubbs, borough engineer.

REIGATE.—November 19th.—For the supply of four slop carts, two rotary horse brooms, and four hand trucks, for the corporation.—Mr. Alfred Smith, town clerk.

CLEETHORPES.—November 19th.—For the supply of 350 tons of broken granite, for the urban district council.—Mr. B. Greaves, clerk.

TRING.—November 20th.—For street and sewerage works, for the urban district council.—Mr. A. W. Vaisey, clerk.

MIDDLESBROUGH.—November 20th.—For making up a certain street, for the corporation.—Mr. S. E. Burgess, borough engineer.

LUTON.—November 21st.—For works of private street improvement, for the corporation.—Borough Engineer.

ARGYLL.—November 21st.—For works of road repair, for the county council.—Messrs. W. & W. Disselduff, district clerks, 160 Argyll-street, Dunoon.

ROMSEY.—November 21st.—For work of steam rolling and scarifying, for the corporation.—Mr. B. W. Atlee, town clerk.

BERKS.—November 21st.—For the haulage of materials, for the county council.—Mr. J. Fred Hawkins, county surveyor, Reading.

SOUTHEND.—November 21st.—For making-up work, for the corporation.—Mr. E. J. Elford, borough engineer and surveyor.

EAST SUSSEX.—November 22nd.—For the supply of materials, cartage and team labour, for the county council.—Mr. F. J. Wood, county surveyor.

HETTON.—November 22nd.—For work of making up, for the urban district council.—Mr. Gordon Young, clerk.

KNUTSFORD.—November 23rd.—For making up a certain street, for the urban district council.—Mr. R. W. Marshall, surveyor.

ROMFORD.—November 23rd.—For the supply of best blue Guernsey granite, for the rural district council.—Mr. George Lapwood, highway surveyor, Victoria Chambers, Romford.

FRIERN BARNET.—November 26th.—For work of making up, for the urban district council.—Mr. E. J. Reynolds, engineer and surveyor.

SWANSEA.—November 25th.—For carrying out private street works, for the corporation.—Mr. H. Laing Coath, town clerk.

LEWISHAM.—November 26th.—For making up main roads, for the borough council.—Borough Surveyor.

SOUTHGATE.—November 26th.—For carrying out private street works, for the urban district council.—Mr. W. M. Ellenor, clerk, Council Offices, Palmer's Green, N.

WOODFORD.—November 26th.—For making up certain roads, for the urban district council.—Mr. W. Farrington, surveyor.

WARWICKSHIRE.—November 27th.—For the supply of road material (broken and unbroken), for the county council.—Mr. John Willmot, county surveyor.

CANNOCK.—November 29th.—For the supply of road tar, to be used in accordance with the specification of the Road Board, for the urban districts.—Mr. C. A. Laxton, clerk.

PORTHCAWL.—November 29th.—For carrying out private street works, for the urban district council.—Mr. W. Chesher, clerk.

SEAFORD.—November 30th.—For the supply of granite flake and broken granite, for the urban district council.—Mr. W. H. Pawson, clerk.

HITCHIN.—December 2nd.—For the supply of broken granite, for the urban district council.—Mr. W. Onslow Times, clerk.

SOUTHAMPTON.—December 9th.—For the supply of Guernsey basalt, Clee Hill basalt, Welsh granite, setts, or similar setts, quartzite and tarred macadam, for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

Sanitary.

HALIFAX.—November 16th.—For the construction of earthenware pipe sewers, for the corporation.—Mr. J. Lord, borough engineer.

YEOVIL.—November 16th.—For laying glazed sewer pipe, and constructing manholes, sewage tanks, and fencing, for the rural district council.—Mr. J. E. Rodber, clerk.

WIRRAL.—November 16th.—For the construction of 9-in. sewer, with manholes, for the rural district council.—Mr. J. E. S. Olive, clerk, 54 Hamilton-street, Birkenhead.

STONE.—November 18th.—For the removal of house refuse, for the rural district council.—Mr. W. W. Wynne, clerk.

TAMWORTH.—November 18th.—For the construction of pipe sewers, for the rural district council.—Mr. H. J. Clarson, engineer and surveyor.

BELFAST.—November 19th.—For the construction of an outlet sewer, for the corporation.—Mr. R. Meyer, town clerk.

LEWES.—November 19th.—For the construction of sewage disposal works, including screen chambers, buildings, settlement and storm tanks, tidal storage tanks, and sludge drying beds, for the corporation.—Mr. Montague S. Blaker, town clerk.

LEWES.—November 19th.—For the construction of the low-level pumping station and contingent works, for the corporation.—Mr. Montague S. Blaker, town clerk.

MIRFIELD.—November 22nd.—For laying pipe sewer and manholes, for the urban district council.—The Clerk.

SOUTHOWRAM.—November 25th.—For work of scavenging, for the urban district council.—Mr. J. E. Oates, surveyor.

GLOUCESTER.—November 26th.—For the construction of a main outfall sewer, for the corporation.—Town Clerk.

CHEPPING WYCOMBE.—December 3rd.—For the supply of stoneware pipes and coal, for the corporation.—Mr. T. J. Rushbrooke, borough surveyor.

NANTWICH.—December 14th.—For the construction of sewage disposal works, comprising detritus, settling, storm-water and stand-by tanks, filter-beds, humus tanks, and laying sewers and manholes, for the rural district council.—Mr. Charles E. Davenport, engineer.

Stores.

WOKING.—November 16th.—For the supply of oil, sludge press-cloth, galley frames and gratings, brooms, shovels, mud scrapers, pickshafts, fagging hooks, pennant kerb, tar paving, dust skips, coke, coal, lamp standards and lanterns, Izal disinfecting fluid, Izal empty pint tins, Izal soft soap, Izal sulphur candles, Sanitas No. 2. hard soap, gummed rolls for disinfecting, disinfecting powder, lime and oats, for the urban district council.—Mr. Robert Mossop, clerk.

MANCHESTER.—November 19th.—For the supply of tramway rail bonds, block tin, and Karri or Jarrah wood paving blocks, for the Tramways Committee.—Mr. Thomas Hudson, town clerk.

HULL.—November 20th.—For the supply of scavenging and watering, cartage, iron and steel, castings, cement, lime, salt glazed pipes, tar, pitch, bituminous dust compound, paint, oils, brushes, lead, glass, plumbers' goods, slater's work and ironmongery, for the corporation.—Mr. A. E. White, city engineer.

NOTTINGHAM.—December 5th.—For the supply of cement, blue lias lime, red bricks, timber, earthenware pipes, iron castings, gulleys, Yorkshire flags, kerb, granite setts, broken granite, ironstone slag, chippings, river gravel, coal, picks, shovels, scoops, ironmongery, scavenging and other brushes, disinfectants, refined tar, pitch, and creosote oil, for the corporation.—Mr. W. J. Board, town clerk.

Miscellaneous.

COVENTRY.—November 25th.—For the supply of earthenware or stoneware pipes, bends and junction pipes, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

COVENTRY.—November 25th.—For the supply of cast-iron manhole covers, gullies, pavement channels, and stop irons, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. NOVEMBER 22, 1912. No. 1,088.

Minutes of Proceedings.

Birmingham Sewage Disposal.

The committee of the Birmingham Tame and Rea District Drainage Board early in this year instructed their engineer to prepare a description of the works of the board and of the system of purification obtaining on their works. In carrying out these instructions Mr. J. D. Watson, M.Inst.C.E., took into consideration the fact that several members of the board were unfamiliar with the history of the undertaking and the vicissitudes through which it had passed, and that such a description would be very acceptable to many of those who visit the works for inspection and study. The result is now before us in the form of a very able monograph presented in admirable form and of unexceptionable appearance. From a small farm of 260 acres in 1877 the area of the property of the board has grown to its present enormous dimensions of 2,956 acres, upon which the sewage from a population of close on 1,000,000 is now satisfactorily treated. The original method of treatment was by land filtration, but if that had been continued up to the present time it would probably have been necessary to secure nearly 40,000 acres of land in all in order to produce a satisfactory effluent at all times without causing a nuisance. The purchase of the additional 7,000 acres of land has been avoided by the construction of works for treatment of the sewage upon biological methods, including 54 acres of bacteria beds, storm-water tanks, sludge disposal and other works at an actual total cost, exclusive of land, of £386,350. This is probably much less than would have had to be expended if land treatment had been adhered to, but apart from the question of cost there are the enormous difficulties of reaching the ideal in the treatment of sewage on a farm of large size. These difficulties are set forth very clearly by Mr. Watson, and they probably explain the reasons for the failure of many other sewage farms, both large and small, in this country.

Two tables are given which indicate clearly the causes of some of the difficulties which arise in the disposal of the Birmingham sewage. In one table it is shown that the sewage is in most respects the strongest of all the large towns, the nearest being that of Bradford. The oxygen-consumed figure is actually far higher than that of all the other large towns, while the chlorine figure is exceeded only by that of South London. From the other table we learn that the rate of flow of the sewage exceeded the average daily dry-weather flow of about 25,000,000 gallons, which reaches the Saltley outfall, on 82 occasions in the year for a total period of 395 hours; that it exceeded six times the dry-weather flow on 39 occasions, and was over ten times the dry-weather flow on 19 occasions, and this in spite of the fact that there are many storm-water overflow weirs in the sewers arranged to relieve them when the flow exceeds six times the dry-weather flow. In this connection it is interesting to note that 10 acres of excess flow bacteria beds are in course of construction and a storm-water stand-by tank of 7,000,000 gallons, which is larger in capacity than the Royal Commission on Sewage Disposal recommends authorities to provide. Full descriptions, with illustrations, are given of the various sedimentation, sludge digesting, silt and separating tanks, also of the bacteria beds or percolating filters, but these have already appeared in one form or another in these columns on previous occasions, and need not be referred to here. In view, however, of the question which has been raised on several occasions as to the possibility of danger from the spraying of sewage in the air, it is only just to quote Mr. Watson's statement on this point. He reminds his readers that Dr. Bostock Hill, the county medical officer of health, stated his objection to the method of distributing the sewage over the filters by means of fixed sprays, but he was equally frank in stating that he had striven to find evidence in the neighbourhood of the filters of typhoid or other diseases likely to be produced by pathogenic organisms, and was bound to say that he had failed. In a final paragraph Mr. Watson admits that the work of sewage purification is not carried as far as science is capable of carrying it, but he points out that a purification equal to 93 per cent on the oxygen-absorbed basis is effected, and adds that, in his opinion, the cost of removing the remaining 7 per cent of impurity "would be absolutely prohibitive; indeed the cost of increasing the purification figure from 93 per cent to even 98 per cent would be out of all proportion to the benefits to be obtained, and under the present conditions would be an unwarrantable expenditure of public money."

* * *

The Intercepting Trap.

The second part of the discussion of the paper of Mr. H. Percy Boulnois upon the report of the Departmental Committee of the Local Government Board on Intercepting Traps in House Drains took place on Tuesday evening last as arranged. This discussion has been notable for the number of persons taking part in it, and for the strong differences of opinion expressed. If the evidence given in the discussion were added to that contained in the report it would prove nothing, for, while half the speakers were in favour of the continued use of the trap, the other half were in favour of its abolition. There were, however, some speakers, and notably

those who spoke towards the end and who had therefore learnt something from the preceding discussion, who considered that, while the Local Government Board ought to withdraw the by-law demanding the use of intercepting traps, this should not mean their total abolition, but rather permission to use traps or do without them, according to the special conditions of each locality or house. Mr. A. J. Martin, for instance, while of opinion that the trap is generally merely a "useless thing which panders to the prejudices of an ignorant public," considered that engineers would do wrong and stultify their previous practice if they forthwith removed the intercepting traps from all house drains. Householders should have the option of having their traps removed, and future practice would take account of the advance of knowledge.

The suggestion that the Royal Sanitary Institute should obtain the views of all local authorities throughout the country as to the merits and defects of the intercepting trap would, as Mr. Boulnois very justly observed, merely lead to the accumulation of a mass of evidence half of which would be in favour of abolition and half in favour of the retention of the trap. The wisdom of Mr. Boulnois' remarks at the conclusion of the discussion is evident. The evidence of the report is sufficient, and the intercepting trap must ultimately go; but in making this change we must remember that sewers must be properly constructed, maintained and ventilated, the drains must be connected to the sewers at a proper level so as to avoid splashing, they must be carefully laid, soil pipes must be carefully constructed and connected to the drains, all sinks, baths and rain-water pipes must be carefully disconnected, iron pipes with closed inspection boxes in the chambers should be used in place of stoneware pipes for house drains, and flushing cisterns must be larger, the use of 2-gallon cisterns being retrograde and uneconomical, seeing that several 2-gallon flushes are often required in place of one 3-gallon flush. Further, all water-closets should have double traps. Mr. H. C. H. Shenton drew attention to the fact, also mentioned in these pages last week, that whereas all other sanitary fittings such as sinks, baths and lavatory basins were trapped twice, the water-closet had only one trap, and if the intercepting trap were removed some additional safeguard would be required. Mr. Boulnois supported the idea strongly.

It appears, therefore, that while the abolition of the intercepting trap in the future is fairly well assured, the practical application of the principle will involve other changes for the better. An advance in knowledge has been made, and it remains for engineers to apply that knowledge with care and thoughtfulness. The old by-law of the Local Government Board will probably be withdrawn, and a new by-law permitting without demanding the omission of intercepting traps substituted. Local conditions and the judgment of the engineer in each case will decide the rest. We congratulate Mr. Boulnois and the Royal Sanitary Institute upon the practical result of the discussion, which should materially strengthen the hand of the Local Government Board.

* * *

The Concrete Institute.

The presidential address recently delivered before the Concrete Institute by Mr. E. P. Wells may conveniently be considered in two parts. He first dealt with certain matters of a domestic character, and then proceeded to offer some very practical observations on reinforced concrete construction. Taking into consideration its comparative youthfulness, the Concrete Institute certainly displays a very healthy vigour. The general adoption of the standard notation for reinforced concrete calculations, which was drafted by the Science Committee of the Institute, affords an excellent example of the influence which it already commands; and the enlargement of its scope so as to include structural engineering should operate still further to widen its possibilities. Various committees are at work on questions directly affecting the user of reinforced concrete—for example, testing, matters of practice, and investigation of failures, while the coming session is to be characterised not only by more frequent meetings but also by the inauguration of a course of educational lectures.

Turning now to the practical side of Mr. Wells' address (a full report of which will be found elsewhere), it will be seen that attention is directed at the outset to the deleterious effect on cement of over-aëration. Dealing next with the aggregate, Mr. Wells pointed out the danger of an excess of sand being present in some of the more ordinary ballasts, and, further, to the unsuitability of broken Fletton bricks (especially those with purple markings) for use in concrete, owing to the disrupting action of the lime which they contain. As regards the actual operation of mixing, every one who has practical acquaintance with the work will agree with Mr. Wells that none but experienced men should be allowed to take any part in this process. Even if this precaution be strictly observed, it is by no means an easy matter to obtain results which are thoroughly satisfactory. Perhaps the most interesting part of Mr. Wells' address, however, was that in which he dealt with the causes of failure, and advocated a strict and impartial investigation of the circumstances under which failures occur. These investigations would not, of course, be intended for the fixing or apportioning of blame, but merely for educational purposes, so that the practitioners of the future may learn from the errors of the past. As Mr. Wells himself said, it is advisable in all cases that the principal causes of failures should be known, in order that specifications may be made so rigid that there is little likelihood of these mishaps. It is the fear of failure that debars to a certain extent reinforced concrete from being used by many clients, and therefore it should be the object of all concerned with this matter, from a professional as well as from a commercial standpoint, to see that such care is exercised in the whole of the work, both as to designing, checking, and construction, that no one, for one single instant, should have any doubt that reinforced concrete is for certain classes of work the best that can be employed.

Bituminous Road Materials in the United States.

In a paper read before the American Road Congress at Atlantic City last month Prof. A. H. Blanchard, M.AM.SOC.C.E., reviewed typical current practice in the use of bituminous materials for highway work in the United States, and drew attention to some of the chief causes of the failure of road crusts or road surfaces of the different classes which he described. Prof. Blanchard's paper, a copy of which he kindly sent us, was reproduced in our issue of the 8th inst. It will be seen that "bituminous surfaces" corresponds to our "surface tarring" and "bituminous macadam" and "bituminous gravel" to our "pitch-grouted" road crusts. The remaining class does not, as our readers have doubtless perceived, correspond to our "tar-macadam." The American "bituminous-concrete" is made much as ordinary concrete is made, the graded aggregate being mixed with the cementing material. Our "tar-macadam," on the other hand, is usually made by coating the metal (often ungraded, but now usually graded to some extent) with the tar, rolling it down when the tar has become tacky, and adding binder in the form of chips only in so far as it penetrates when rolled in on the surface. We believe that we were the first to draw attention to the necessity for finding a middle course or adopting a compromise between a crust which is unstable, by reason of its lack of filling material, and a crust which is too dense and rigid. The methods of construction described by Prof. Blanchard do not seem to aim at maximum

rigidity, but while it is remarked that "variation in size of the aggregate produces a more stable pavement," we find no reference to the possibility of carrying this principle too far and obtaining a pavement which is too hard and rigid and, if made with hard road metal, too slippery. We should be glad to know if any engineer has, after drawing up his specification, laid down trial lengths in each of which the material of the crust contained a larger proportion of, in some cases, voids, in other cases mineral matter. It is really a question of what proportion of the voids in the stone above, say, 1 in. size shall be occupied by mineral matter, what by tarry matter, and what by air; and these proportions may depend partly upon the physical character of the stone itself. The part played by the air spaces in various road crusts and street pavings is discussed by Mr. Francis Wood, M.INST.C.E., F.G.S., in his recently-published book, "Modern Road Construction," and the success of several different kinds of paving is credited in part to the existence of cellular spaces. Mr. Wood is no doubt perfectly justified in the conclusions at which he arrives in this matter. Reverting to Prof. Blanchard's paper, from which we have somewhat strayed, we conclude by drawing attention to two references to stone which is too large or too uniform in size as a cause of failure of bituminous-bound road crusts.

The Motor 'Bus. The advent of the motor omnibus has caused considerable anxiety to many of the suburban highway authorities, and on more than one occasion it has been suggested that it might be possible to recover from the proprietors of these vehicles as "extraordinary expenses" the cost of repairing the roads which they use. The latest authority to move in this direction is the Hampstead Borough Council, whose General Purposes Committee have instructed the clerk to report as to whether any steps could be taken to recover from the omnibus companies, under the heading of extraordinary traffic, expenses towards the upkeep of the roadways recently used by them; while the borough engineer, Mr. O. E. Winter, will at the same time keep observation on the new routes being used by the companies with a view to the whole matter being considered. As we pointed out at the beginning of the present year, the question is quite novel as regards extraordinary traffic cases. The most appropriate judicial dictum appears to be that of Mr. Justice Wills in *Hemsworth Rural District Council* v. *Wakefield-thwaite* (1904), 68 J.P., 345: "Traffic must of necessity, as time goes on, vary in its character, according to the development of the various industries in the neighbourhood; and traffic which in one year or at one given time may be extraordinary traffic will, in the course of time and it may be in the course of a comparatively short time, become ordinary traffic. Therefore I think that, in considering whether traffic is extraordinary or not, it is not sufficient to take simply the year to which the question relates and compare other traffic on the road during that year with the traffic complained of. That would be a fallacious test. The test is whether the particular traffic in question has, by the usage of trade and of society, and by the varying circumstances applicable to the case, by that time become such as can fairly be called ordinary traffic."

Water Supply in the United States. The problem of water supply in the United States, which was discussed by Mr. Allen Hazen, of New York, in a paper before the Eighth International Congress of Applied Chemistry, is in certain respects similar to that in Great Britain, while in other particulars it is essentially different. The vast natural resources of the United States render the water question comparatively easy of solution in many districts. Indeed the water supply resources of the country are so great that it is impossible accurately to estimate or adequately to realise how vast they are. As Mr. Hazen said, the available supply is generally so great in comparison with the requirements of domestic use that it may be considered as practically unlimited. The importance of conservation is therefore not so great as it is here. Nevertheless, the situation in America has in some of its aspects a very close parallel in Great Britain. For example, there are cases of conflict of interest between cities where a source of supply selected by one municipality is also physically well adapted for use by another. Special legislation has been found necessary to deal with this matter even under American conditions. Much more would it appear desirable that in a country like Great Britain, small and densely populated, and possessing sources of supply which are certainly not unlimited, there should be some central control over the apportionment of available supplies. Some portions of Mr. Hazen's paper are reproduced in another column in this issue, and his observations will be found of special interest as affording a reliable basis for a comparison between British and American conditions and practice in regard to water supply.

The Institution of Municipal and County Engineers. We have frequently observed that the Institution of Municipal and County Engineers can only claim to speak with authority in the name of the profession on those occasions when representative utterance is required in proportion as the members of the profession support it by membership. The Institution has something to offer to municipal engineers of all grades, from the chief official in a large city to the humblest assistant or pupil; and we are glad to notice that an attempt is being made to secure that the claims of the Institution shall be clearly placed before all those who might appropriately join it. In order that this very laudable object may be achieved, a circular-letter has been addressed from headquarters to chief engineers and surveyors throughout the country asking for information as to the personnel of their staffs. It is to be hoped that the information which is asked for may readily be given, and that those who occupy positions of authority will bring to the notice of their technical staffs the claims of the Institution and the benefits which it is capable of conferring upon those within its ranks. As stated above, the membership qualification is very wide, the class of full member being open to all who occupy leading positions of staff responsibility; the class of associate member to all who fill positions of minor staff responsibility, while pupils, improvers, and other junior members of a technical staff may enrol themselves as students. We cordially hope that the enterprise to which we refer may be the means of considerably extending the membership and thus increasing the influence of the Institution.

A Town Planning Competition. We venture to direct the special attention of our readers to the competition in town planning which is being organised by the Institution of Municipal and County Engineers. A full announcement of it will be found in another column. Premiums—which a letter in our correspondence pages, it will be seen, suggests might be made more attractive—are offered for the designs which are ultimately adjudged the best, and two of these have been specially set apart for students. The conditions laid down for the guidance of intending competitors are such as will allow the greatest possible scope for originality or novelty of idea; and it is hardly necessary to say that rules have been devised to secure that the assessors (whose names will be announced in due course) will only know the candidates by a *nom-de-plume*. The competition affords an opportunity for a fascinating exercise in free design—with an object in view—and we hope that it will prove as popular as it deserves to be.

Intercepting Traps in House Drains.

ROYAL SANITARY INSTITUTE DISCUSSION OF DEPARTMENTAL COMMITTEE'S REPORT.

In our last issue we gave a synopsis of the papers and the discussion which followed the presentation at a meeting of the Royal Sanitary Institute in London, on the 12th inst., of a paper by Mr. H. Percy Boulnois, M.INST.C.E., on the subject of the recently published report of the Departmental Committee of the Local Government Board on "Intercepting Traps in House Drains." We now print a full report of the speeches delivered up to the time when it was found necessary to adjourn the meeting—which was presided over by Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., chief engineer to the London County Council—and next week will publish an account of the concluding proceedings on Tuesday last, when a further two hours were devoted to the consideration of the question.

The CHAIRMAN, in opening the proceedings, said they had a large number of speakers, and they had a very important subject to discuss. There were many who could speak upon it probably better than he could, so he proposed that the chairman's opening remarks should be conspicuous by their absence.

Mr. R. READ, city surveyor of Gloucester, said he was sorry his old friend Mr. Boulnois was not entirely convinced by the report of the Departmental Committee. The intercepting trap was patented in a panic in 1872, and the Model by-laws framed in 1877. These legalised the trap, and it was taken for granted by everybody. But defects began to show themselves very soon, and between 1879 and 1882 he was making experiments in sewer ventilation, and came to the conclusion that the trap was a useless, dangerous obstruction, and he had seen no reason to alter that opinion. It paralysed the action of the drain, and rendered it filthy throughout. Thirty-five years' tinkering had failed to remedy these defects, because the trap was wrong in principle, and the detective Mr. Boulnois mentioned, the so-called flushing inlet, showed that something was wrong, and that something was the presence of the trap itself. If a sanitary inspector or a building inspector, upon inspecting a drain discovered that one pipe had a back fall of ¼ in. he would have it relaid, and rightly so; but the same inspector cheerfully and legally allowed an intercepting trap which created an obstruction from 6 in. to 8 in. deep below the invert of the flattest length of the drain, and the flush was at the lower end of the drain. He had a childlike faith in the trap, but he had an utter unbelief in a similar trap placed between the water-closet and the ventilating shaft, which was an absolutely impregnable position. For nearly thirty years he had been like one crying in the wilderness with few supporters. These had gradually increased until Dr. Butler, in 1906, read a paper before the institute with the title "Is the Intercepting Trap a Failure?" Since then, in 1908, the Local Government Board had appointed the Departmental Committee, and they had conducted a thorough investigation, examined fifty-two witnesses, and had obtained statistics from all parts of the United Kingdom, and also from America and Germany. Numerous special experiments were conducted by themselves and a score other experts, and the result was a condemnation of the trap on every count of the indictment. It was true they gave it the benefit of the doubt on one claim —viz., that it cut off the sewer air from the house drain. The committee could not discover any pressure on the sewer side of the trap until the mouth of the connection was covered by sewage, but between the sewer connection and the trap there was at least 20 ft. of drain containing something like 5 cubic ft. of the most stagnant sewer air, and this air was forced through the water seal, and in many cases the stopper was blown out of the raking arm. The stopper could not fall out of itself, but when it did it fell into the sewage, and then the sewer gas was quite free. The intercepting chamber was flooded up to the entrance, and free communication was established through the raking arm to sewage and sewer. Now, here was the arrangement—let's at the bottom of the intercepting trap. The stopper was not replaced and the sewer gas came out in that condition. The advocates of the trap were hard pressed for arguments when they fell back upon rats. The rat [illegible] animal and could leap through an intercepting trap at a jump. He [illegible] was a good take-off and a good landing on each side of the trap, but he defied any rat to get through a gulley trap with a grid on. A 6-in. gulley trap with a 4-in. outlet was 10¼ in. from the top to the bottom of the trap, and the rat would have to stiffen his tail, stand on the top of it, tread water with his feet, and raise a grid weighing 3 lb. with his nose. The primary object of all drains and sewers was the quick delivery of the sewage before decomposition. A trap contained the whole of its contents for at least eight or ten hours every night, and at shorter intervals during the day. The drains were in the proportion of at least 4 to 1 of the sewers, for every yard of sewer there were 5 yds. of drains connected with it. It was like a man's hand, the fingers representing the drains and the hand the sewer, and one was no use without the other. The flow through the drain was intermittent, while the flow through the sewer was continuous, on account of the numerous drains flowing into it. The sewer was what the drains made it. Their friend Mr. Boulnois mentioned some experiments twenty years ago of drains without traps, and said he had difficulty in clearing them with an ordinary flush. He presumed he used the flushing box with the ordinary valve outlet. They did not get an efficient flush with that, as it only flushed as long as the chain was held; but with the modern syphon action box they got a discharge of 2 gallons of water at once, which would fill 4 ft. of a 4-in. pipe and 2 ft. of a 6-in. pipe, and his experience was that it very thoroughly and very rapidly cleared it. The removal of the trap made the drains and sewers cleaner; therefore there must be less risk, and not more. This was proved by experiments made at East Grinstead by Dr. Andrewes, which appeared in the report. Some people were so sensitive and fastidious that they would require a separate closet for each individual, which was manifestly absurd. The average householder knew nothing about drains or traps, and cared less until a stoppage occurred which showed on the surface, when he kicked up a row. The committee were not asked to report on sewer ventilation, but had gone out of their way to express what he should call a pious opinion on the subject, probably in consequence of their visit to Bristol. There was no such thing as an unventilated sewer; it was an impossibility. A system of sewers was a breathing machine, just the same as a man, and if they attempted to stop the breathing they created disease or choked him. There were two points to consider, one external, the other internal. The external was the force of the wind, and the internal the gravitation of the sewage down the drain into the sewer. The experiments of Mr. Mawbey, of Leicester, and Mr. de Courcy Meade, of Manchester, with ventilating shafts showed that they may act alternately as inlets and outlets, but it did not follow that therefore the air currents in the sewer were also reversed. If the shaft was acting as an outlet it meant that it was drawing in air at some shaft or other point, probably within 100 yds. above it up the gradient of the sewer, and if the shaft was acting as an inlet it meant that the air was finding an outlet probably within 100 yds. below it down the gradient of the sewer, the current of air in the sewer itself flowing continuously down the gradient in either case. If the Local Government Board would withdraw their by-law referring to the intercepting trap, and sanitary inspectors displayed as much zeal in removing them as they had done in the past in inserting them, the trap will soon be abolished and they would get rid [illegible] of sham.

Dr. PHILIP BOOBBYER, medical officer of health, Nottingham, remarked that he did not propose to review at any length the report of the Departmental Committee, for that had already been done sufficiently and ably by Mr. Boulnois, but he wished to say at once that he unhesitatingly accepted the general results of the committee's inquiry. With some of the [illegible] in the report they were all more or less acquainted through the work of Mr. Harrison some years ago. The report confirmed what they had been told about the danger of splashing, and emphasised the information they already had to a considerable extent. He only demurred to the general application of the results at which the committee had arrived,

for cases were essentially different from each other. There was a difference of construction and a difference of position. Sewers laid on a high gradient did not require the same treatment as sewers on a low gradient. In low-gradient sewers and drains there was often much deposit, and in high-gradient sewers they had almost violent movement of air. In the sewers of London and Paris one had no feeling of discomfort because there one was breathing sewer air, but there were other sewers in many provincial towns which received the drainage of slaughter-houses and other offensive trades. In London there were no such risks, but in many provincial towns they had most offensive materials discharged in the sewer, very often at a fairly high temperature. One argument used in the report they must demur to; he was sorry it appeared under such a name. They knew definitely, and were continually preaching it to their *clientèle* in the large provincial towns, that so far as they knew there was no relation between sewer air and diphtheria. In the report the inference appeared to be in a contrary direction, and it had been quoted to him by a member of his council. It seemed to him that many of the experiments had been made with badly constructed apparatus in very large drains. He favoured generally the retention of the intercepting trap, for the principal reason that the trap when acting efficiently, as in his experience it usually did, prevented the access of undiluted sewer air to the atmosphere in and around the dwelling. The sewer air in most of the places with which he was acquainted, both on account of its quality and quantity, was much more liable to create a serious nuisance than the drain air of the dwelling when allowed to escape in the vicinity of the latter. He did not allude to injury to health, but to what the public said was a nuisance. Those of them who had to do with health work in provincial towns knew how difficult it was to convince a person that a bad smell was not necessarily associated with corresponding injury to health. He had often gone into gatherings of ratepayers and had seen members of the Health Committee rendered almost sick by the smell, and who could not dissociate the offensiveness of the smell from injury to their health. He had known several instances in which an intolerable nuisance had been abolished through the ventilation of a public sewer by means of a high tubular ventilator carried up by the outer wall of the house, the sewer air being directed by air currents and air eddies into the interior of houses in the vicinity by windows and chimneys. He had in his mind the instance of an 8-in. sewer ventilator which the city engineer put at the top of the street where the gradient averaged 1 in 6 for nearly ¼ mile. It was erected at the special request of the then vicar of the parish. He died a few months afterwards, not from the behaviour of the ventilator, but, he believed, from old age. His successor was a young, active person, who, although well educated, had an ineradicable belief in the injurious effects of sewer air. He said the house was continually filled with horrible odours. He made changes that cost him a lot of money, and insisted upon the removal of the tubular ventilator. The air was, of course, specially liable to get into the houses in hilly districts. In the absence of the intercepting trap any sudden movement of the sewer atmosphere was under various circumstances exceedingly likely to occur, and frequently forced water-closet and other traps—especially when these were connected with long or obstructed soil pipes. In the absence of the intercepting trap any unoccupied dwelling-house was liable to be flooded with sewer air as soon as the closet and other traps had become unsealed by evaporation. At Nottingham Park, a residential district with large houses which became empty from time to time, it was not an uncommon thing for the houses to be almost unapproachable on account of being flooded with sewer air, owing to the evaporation of the water in the water-closet pans. As to the proportion of the traps which one found to be obstructed with excrement, the number was, in his experience, exceedingly small, and this tended to prove what he had already drawn attention to—namely, that in a large number of cases the experiments were made on defective traps. Only that evening he had been calling attention to the radical alterations which had taken place in the views held by experts as to what should be the form of the trap, and to the changes in the trap during the last twenty years. There were three large hospitals in his district, each having more than six of these traps, and one having sixteen. He had had occasion to examine the drainage system during the last twelve years, and only twice had he found the traps completely obstructed. He had frequently found cases of gross misuse and mismanagement, but these would occur anywhere. If an occasional choking or breakdown was to be considered sufficient to do away with the intercepting trap many things must go to the wall, including the water-closet itself.

Mr. T. DE COURCY MEADE, city surveyor of Manchester, said it had not been his intention to take part in the discussion. He contemplated attending as a listener only, accompanied by Alderman Wilson, who was a sanitary engineer, and was the chairman of both

INTERCEPTING TRAPS: TABLE SHOWING COMPARATIVE RESULTS OBTAINED BY THREE INDEPENDENT INVESTIGATIONS.

Name of observer.	Average percentage of total materials retained			Average percentage cleared.	Length of drain.	Inclination of drain.	Diameter of drain.	Quantity of flushing water.	Number of experiments.	Remarks.
	in w.c. trap.	in drain.	in intercepting trap.							
Field	5	14	35	46	50 ft.	1 in 40	6 in.	2 gal's.	120	Table B, page 242, vol. 24, Trans. San. Institute.
Barber	—	—	78	22	80 ft.	1 in 60	6 in.	2 gal's.	10	Table 16, page 71, Report Depart. Com., 1912.
Meade (*a*)	10	45	30	25	58 ft.	1 in 36	6 in.	2 gal's.	24	Stable manure, paper, cut oranges, &c.

* Caught on gauge scoop in sewer side of trap. † Fæcal matter, paper, grease, &c., remained on scoop during bath flush. ‡ Do. removed from both sides of trap fixed in centre of chamber § Could not be ascertained. ‖ Average length measured to midway between w.c. and scullery sink.

the Town Planning Committee and the Improvement and Buildings Committee of the Manchester City Council. He discovered, however, that his friend Mr. White Wallis had included his name in the list of those who were expected to expound their views. The report of the Departmental Committee had taken some 3½ years to mature. It no doubt required some ingenuity to frame a report reversing the settled policy of the Local Government Board. The authors (whom he had not the pleasure of knowing personally) appeared to have carefully performed their task. He was invited by the secretary, Mr. Hardwick Terry, to give evidence, and in pursuance of a resolution of the Manchester City Council, he prepared for the Departmental Committee facts and figures which were supplied to Mr. Terry on April 27, 1909, together with a *précis* of the evidence he was prepared to offer. Those documents were duly acknowledged by the secretary. The statistics showed that at that time (1909) there were 23,248 intercepting traps in use in the city of Manchester. The ascertained average number of stoppages per year amounted to 150, or ·64 per cent per annum. He did not know whether facts showing a like result were received from other large towns; if they were it would be interesting to know how they were dealt with by the Departmental Committee. He held quite an open mind on this question of the intercepting trap, but he felt bound to tell them that the facts relating to Manchester showed pretty conclusively that intercepting traps of proper construction, in conjunction with properly laid drains, did not give the trouble found in other places. The Departmental Committee's report contained particulars of some interesting experiments conducted for the committee by Mr. Patten Barber at Islington. With their per-

mission he proposed to compare these experiments with those carried out by the council of that institute under the immediate direction of Mr. Rogers Field in 1892, reported in vol. 14 of the "Transactions." He would also compare them with the results of investigations of a similar nature made by him (the speaker) many years ago. The table [reproduced herewith] showed the results of the three sets of experiments. The weak point in all those investigations was the use of artificial material, or "artificial excreta" as it was termed in the report of the council of the institute. The material used by Mr. Rogers Field was composed of a mixture of soft soap, cocoa fibre, clay, and pieces of newspaper. That at Islington consisted of clay, tow, Russian tallow, and pieces of toilet paper. That used by himself was composed of stable manure with a small percentage of cow dung, granulated cork, sliced oranges, and pieces of newspaper. His first series of experiments were made with a 6-in. stoneware drain, 58 ft. in length, with a fall of 1 in. to the yard. The experiments were particularly directed to different kinds of closets and waste-preventing cisterns, as well as to the condition of the drain and trap. In the third series of tests (c) two closets used by workmen were employed, and the observations were made without the knowledge of the men using the closets. The materials found in the traps and drain were at times instructive. The closet-traps usually retained a small quantity of excreta and paper, but occasionally large wads composed of sheets of newspaper rolled up, pieces of clay-pipe, matches, empty matchboxes, and other articles were found in the traps or in the drain. The latter always contained a considerable amount of deposit, which was gradually moved forward each time a closet was used. The intercepting trap was never quite free from deposit. In those experiments with appliances in actual use it was, of course, impossible to determine with strict accuracy the proportional quantities of material left in the drain and traps, as the total amount had to be ascertained after instead of before admission to the drain. The results were, however, carefully checked, and were believed to be accurate. Those experiments were followed by observations on closets and traps in actual use in a dwelling-house, the fittings and drain being specially prepared for that purpose. They generally confirmed the accuracy of the tests last referred to, but the results in that case could not be stated by percentages, as it was not possible under the circumstances to ascertain the total amount of matter passed into the drain. A glance at the table would show how largely the results obtained by each observer varied. That he believed might be accounted for by the difference in the character of the material, the methods of applying the tests, and in the artificial and actual use of the closets. It was in consequence of the variations in this latter respect that he did not publish the results, although he had gone so far as to photograph the appliances and prepare the manuscript. For the same reasons he did not consider that the results obtained at Islington could be accepted as conclusive, although the thanks were due to Mr. Patton Barber for the time he had expended and the trouble he had taken.

Mr. Frank Sumner, engineer to the Corporation of the City of London, said he thought every municipal official throughout the country was greatly indebted to the Willesden Urban District Council and to Dr. Butler and his old friend and chief, Mr. O. Claude Rolleston, for persuading upon the Local Government Board to make their inquiry. Personally, he was strongly against intercepting traps where the distance between the trap and the [illegible] was very great. In Willesden the majority of houses were small, and the distance was probably 100 ft. away from the interceptor. Having been in the district for [illegible] years, he found that many of the interceptors were continually being choked, that being due entirely, he considered, to the fact that the amount of water by the time it got into the interceptor was small, leaving no [illegible] of the latter being cleared. He thought the report would end the death knell of these traps, and had also proved the fallacy of the danger of sewer air. It was a good thing the question of [illegible] had come up, because everyone could admit that the most perfect in the world were possible, the healthiest one could find. Fourteen or fifteen years ago the Medical Officer of Health inspected the district of the [illegible] in the Metropolis and came to the conclusion that they were about the healthiest [illegible] London, as every [illegible] was well aged. Some eight years ago Mr. Vaux Patterson [illegible] council to urge on local authorities the advisability of removing these traps, and he (the speaker) reported to his council that he was entirely at one with the suggestion to remove the trap from small houses; at the same time, as regarded larger houses, where baths were used, and where a large number of people were employed, he thought it should be optional on the occupier as to whether the trap should be continued. He still held that view, and thought that was the proper way to look at it. So long as they found they had sufficient water and sufficient people using the drain to cleanse the interceptor, he thought it was a matter entirely for the option of the individual. They would have to overcome the prejudices of the medical officer, the architect who designed the house, and the person who used it, but he had no doubt that in a few years' time the whole of the houses would be disconnected when the fallacy of the value of the trap had been explained. In the City of London premises were each drained by a single drain, but everyone of the premises had its interceptor, and during last year they only had about three complaints of the interceptor becoming choked. It might be said that that was a point in favour of continuing interceptors, but his view was that it had no value, so far as the interceptor in suburban districts was concerned. In the City they would have twenty or thirty, or even more, water-closets connected to one drain; consequently the flush was sufficient to keep the trap clear. He was, therefore, not prepared to recommend the City to abolish the interceptor; but, at the same time, he would offer no objection to the removal if the owner desired it. As regarded house drains, he strongly recommended that they should be made of iron, and he thought he was quite outside the mark when he said that the additional expense in a reasonably sized house would not be more than 20 per cent. That was one of the cures for the whole thing, and in that case they might well dispense with the trap.

Dr. Wm. Butler, assistant medical officer of health, London County Council, said he had been struck by the scientific attitude adopted by Mr. Boulnois in his paper, for the committee obviously had reported in a manner contrary to the views he had previously held. It was an attitude of mind which might be well generally adopted. To approach that question in a partisan spirit was not to arrive at the truth, and it was astonishing how much feeling arose as soon as the usefulness of the trap was questioned. He was brought up in the orthodox faith that the intercepting trap was a revered institution not to be questioned, and it was only because of the facts that were brought before one that one was forced to question that dogma. It was not the number of complaints that raised the question, and that must be recognised from the beginning. They had been told that in Manchester only 6 per cent of the drains had been the subject of complaints, but that to his mind was a very high percentage. In Willesden the complaints of choked drains were comparatively few, but what he found was that if for any purpose they had to examine manholes, in a large proportion of cases the rags were choked, or the cap of the raking arm was missing. It was that which caused him first to make a systematic inspection of the manholes, with the result that they discovered that, although the complaints were few, 10 per cent of the caps of the raking arms were missing, and from 5 to 6 per cent of the interceptors were choked, which with some thousands of interceptors was a very serious matter. He found it was the fashion now to say that that was Willesden, and that the Willesden drains had not been laid as metropolitan drains were laid. That, however, was not so, and they found that Willesden compared extremely favourably with the other districts examined by the Departmental Committee. The percentage of choked drains was higher outside Willesden than within. He remembered how struck the chairman of the committee was by one fact. An inspector was once sent to examine the manholes to see if he could find any choking—and he might say they could always rely on finding that anywhere. They went to one house where there was a choked drain. The manhole was full of [illegible] sewage to a depth of several feet, the smell being that of the kind usually associated with sewage in a septic tank. The people in the house were asked if they were aware there was anything the matter, but they stated that they were not. That drain had probably been choked for [illegible]. People did not know when drains became choked and it was one of the things that the Departmental Committee recommended that in future, whether they had interceptors or not, drains should

be made in such a manner that there should be an early indication of any choking. At present people did not become aware of it because the brickwork of the manhole permitted percolation, and there might thus be a grossly insanitary condition of things without people knowing anything about it. They had heard Dr. Boobbyer say that without an interceptor there was great nuisance, but if every house drain were ventilated they would not have to face the sewer air which existed at present, because of the inadequate ventilation of sewers. They would do away with it as soon as they did away with the intercepting trap. Above all things what they wanted to recognise was that the reason for doing away with the intercepting trap was not because they despised sewer air, or were indifferent as to its admission to their houses, but because it was the only effective way in which they could safeguard themselves from that undesirable thing. It was because the presence of the intercepting trap really led more to the pollution of houses by sewer and drain air than its absence that one desired to see it removed. The trap necessitated a fresh-air inlet, and that in nine out of ten cases was placed in close proximity to the house. If by any mechanical device they could find that a drain deep in the clay permitted of a channel of smoke showing itself, the drain had to be reconstructed, and yet they allowed a 5-in. opening immediately below the sill of a window direct into a house, and nothing was thought about it. It was amusing how indoctrinated they had become as to close their eyes to obvious facts of that kind. The point which had been most constantly urged against the abolition of the intercepting trap was that of rats. He was not really concerned as to whether the trap prevented rats entering a drain or not, but he believed it did not. What they had to consider was the possibility of the rat getting out of the drain into the house, and that only happened when the drain was defective. If they did away with the interceptor the corollary was that the drains should be made gastight and airtight, and there was no question that that could be effected by having the drains of iron. A condition of the abolition of the trap might be the provision of drains of that kind, and that they should be cut off from manholes, so that as soon as a blockage took place it would become apparent at once at the nearest gulley.

Dr. Louis C. Parkes, medical officer of health, Chelsea, said he did not desire it to be thought that because he criticised the report he did not value it, for he regarded it as an admirable one, and one which threw fresh light on the subject, and fixed their views on this particular point in a very desirable manner. The main point was the stoppage of the intercepting traps, and he desired to ask how much of that stoppage was due to faulty laying of drains—drains not laid with true or sufficient gradients, to the bad form of trap formerly so much in use, to the use of too large a trap—as, for example, a 6-in. trap where a 4-in. one would have served—and, more important than anything, to faulty connections of the trap with the sewer. They all knew that where new drains were put into houses it was frequently the fashion not to renew the frontage. The old drain was taken out and the old frontage was generally considered to be sufficient, which meant very often that the connection to the sewer was not well laid, and a stoppage very often did occur. It had been his experience in Chelsea that a great many choked drains had been due to that. The question of experiments with artificial fæces had been raised by Mr. de Courcy Meade. The artificial fæces used by Mr. Patten Barber consisted of clay, tow and Russian tallow. Natural fæcal matter, as they knew, was approximately of the same specific gravity as water, sometimes lighter and sometimes heavier, according to the condition of the bowel; but what fæcal matter, he would ask, had ever been known to issue from a human bowel which contained clay in it? If they had matter of that sort to deal with they would have to do away with traps altogether. With respect to the infected drain, and air passing from one house to another, where there was no intercepting trap, he had had a talk with Colonel Horrocks, who had carried out the experiment at Gibraltar which shed such light on the matter. Colonel Horrocks told him he thought the Departmental Committee had misunderstood his work. The object of his work was to show that in a drain the air would become infected owing to splashing. That was accepted, but what he (the Colonel) wished to point out was that where there was no intercepting trap or where the raking arm was open such air would pass readily into the sewer and up the house drains. He did not consider sufficient attention had been given to that fact by the Departmental Committee, but it was quite easy to see how it could happen if there were no intercepting traps. Infected air would pass readily above owing to friction in the sewer, and if it were only a small sewer it would pass into the nearest house. If all the drains were connected directly with the sewer some acted as inlets and some as outlets, or it might happen that on one side of the road the exhaust shafts were acting as inlets and on the other side as outlets, so that it was quite possible for the infected drain air of a particular house to be carried to adjacent ones. That was a very important thing in towns where one might be living next door to a case of typhoid, or be in close proximity to a nursing home or hospital from which infected excreta was continually being passed into the drains. Therefore, if it were possible for drain air to carry infection, and they had no intercepting traps, there was no reliable safeguard against their drain air becoming infected. Where sewers were of a large size there was not the same possibility of infected air being carried from one house to another, for the reason that in a 3-ft. or 4-ft. sewer they had a sort of reservoir which acted after the fashion of a buffer and prevented the air travelling. In old sewers, however, they had what was probably as bad from the practical point of view—sewage deposits. These sewers were often not laid with proper gradients, and were sometimes much too large for the volume of sewage they had to carry, the result being the accumulation of deposits which gave off foul gases. If these were allowed to escape from the exhaust pipes complaints were made and the openings were stopped up, with the result that the sewer gas went into the house. Another thing suggested in the report was the abolition of fresh-air inlets on the drains where intercepting traps were used. That he considered would be a great mistake, for, although in certain cases they might be a source of danger, he thought they assisted in keeping the drains sweet. Dr. Butler looked upon the rat as quite a wholesome animal, but although that might be so in this country, they had always to keep in mind the danger of plague, an important matter in seaport towns. It was quite possible that the people in the East-end of London and in Glasgow and Liverpool owed their immunity from Oriental plague to the fact that rats had not been able to get into the drains. His experience was that intercepting traps did keep out rats. He had never found rats in a drain when the raking arm was on, but he had seen them when the raking arm was off, and he thought it was important to keep rats out, not only on account of the plague, but also because they were exceedingly destructive, for though they would not break through iron, they would soon break through a stoneware drain, and cause dangers to health to arise in that way. Although he felt bound to criticise the report of the committee, he did not wish them to think he did not value it. His belief as an individual was that the intercepting trap was a good thing which they should not give up lightly. When they came to consider the pioneers of hygienic science, and the reasons that influenced them in introducing the trap they were bound to respect them. While they recognised that sewer air in ordinary circumstances would not produce scarlet fever, diphtheria and other infectious diseases, they knew that when it got into a house it was liable to develop illness, such as anæmia in children, diarrhœa and sickness, and he did not care what bacteriologists or physiologists said, where sewer air got into a house there was a likelihood that sickness attacked the occupants.

Mr. E. van Putten, borough engineer of Lewisham, observed that for years he had been arguing against the use of the interceptor, and therefore welcomed the report of the committee, whose conclusions had been amply borne out by the evidence given. Sewer air had been found to be of better condition than drain air, and when that was once acknowledged he did not see what argument could be left for the use of the interceptor. Dr. Parkes had said that the introduction of sewer or drain air into a house was likely to produce illness, but the abolition of the interceptor did not make the drains airtight. If sewer air were less harmful than drain air, he did not see why it should not come in as much as drain air. In London, if they did not have trades which were quite as offensive as some in the provinces, there were industries carried on which produced an objectionable condition of things in the sewers. Large quantities of hot water and other matter were dis-

charged by breweries and other works, and but for ventilation very offensive smells would be created. His chief reason for desiring the abolition of the interceptor was to secure better ventilation, and if they got ventilation for the sewers through the house drains, he did not see why they should not have it, the house drains being, after all, the chief offenders in causing smells in the sewers. As to rats, he was perfectly convinced that these would not find their way out of a drain unless the latter were defective, and where the drains were not defective the rats acted more or less as scavengers. In Lewisham they had eighty-nine sewer ventilators attached to the houses, and in a period of over thirty years they had never been called upon to remove one of these. He thought much depended on the care taken in fixing the ventilator, and if it were placed a good distance from the chimneys or from windows they would never experience any trouble. In his opinion the number of stopped interceptors was no indication of the total number which became stopped during the year and which freed themselves by an extra pressure of water. Some years ago Dr. Andrewes, in a report to the Local Government Board, gave some statistics of the number which the water level in the manholes showed to have been stopped, but which had freed themselves by additional pressure afterwards. Mr. Sumner suggested that the use of the trap should be optional; he (the speaker) did not object to that, but thought it should never be compulsory on anyone.

Mr. A. J. Dickinson, engineer and surveyor to the Redditch Urban District Council, said he had attended the meeting for the purpose of supporting Mr. Read in the attitude he had so consistently adopted for many years. He had had a long experience of intercepting traps at Sheffield, Birmingham, and now at Redditch. He had seen interceptors put in under the supervision and control of the local authorities which became choked. Their thanks were due to the Departmental Committee for the impartial and thorough way they had set about a very difficult task, and he hoped they would all be as much open to conviction as the author of the paper, who, in 1903, said: "I shall take care that I will never live in a house which has not got an interceptor." From what he had said, he thought Mr. Boulnois very likely would live in such a house now.

Mr. Boulnois: No, I would not; I would see it put in myself.

Mr. Dickinson said the chief question they had to consider was as to the effect the report would have on their future policy with regard to interceptors. His own council on his advice had issued the following circular to architects and builders: "In view of the report of the Departmental Committee of the Local Government Board, the council feel that they cannot enforce their by-law requiring interceptor traps and fresh-air inlets to be provided on the drains of new buildings. In future plans will be approved if they show all drain openings to be properly trapped, and if a 4-in. vent shaft be provided at the highest point of the drains." As regarded existing interceptors, he would like to see them all abolished, but perhaps the wiser course would be to block up the air inlets that caused a nuisance, and remove the interceptors when they became choked. He did not wish it to be thought that he did not value the usefulness of traps in general, but he regarded it as an axiom that they were placed where they received the flush of a volume of sewage before it was dispersed in the drain, so that the solids were carried away. In this connection he was glad the committee drew attention to the necessity of trapping the waste pipes of sinks and lavatories discharging into the open air, as they were a serious nuisance when they acted as ventilator inlets to the house.

Mr. G. Bertram Harterre, surveyor to the Alton Urban District Council, remarked that he attended with the object of championing the cause of the intercepting trap, and so far he had heard nothing to cause him to change his views. Some years ago he introduced the Rojers Field pattern in a town where they had been rarely used previously, and as there were several cases of choking soon after he was for the time being in a difficult position. He went very carefully into the cases, and found among the obstructions bath towels, a scrubbing brush, a child's doll, house-flannel, chamois leather, rags and stiff brown paper. If these were legitimate articles to pass down a drain then the intercepting trap must stand condemned. Other causes of blockage he found to be a trap fixed with the outlet higher than the inlet; defective drains which allowed the liquid to escape, and only the solids to reach the trap; and—this being a common defect—a projecting ridge of cement inside the joint of the trap and the pipe below. The mason who laid the pipe used a badger or swab which he drew horizontally through the pipe, and this was right enough till it came to the interceptor, where the British workman did his best, but instead of drawing the badger horizontally, he drew it obliquely, with the result that there was a ridge of cement left standing up and which led to an obstruction. The indictments against the intercepting trap might be classified: (1) It rendered ventilation of the sewers more difficult and costly. If they considered for a moment, natural methods of sewer ventilation left much to be desired, and he suggested a system of extraction with cremation of gases. The effect of sewer gas, about which a great deal had been said, was a matter for medical men. Personally he had had two attacks from a germ called streptococci, or staphlicocci, and found in sewer gas. As to the eye of the raking arm being blown out, he should say it was a question of the sewer requiring better ventilation. (2) The fresh-air inlet, it was stated, often acted as an outlet for foul air, and created a nuisance. Fresh-air inlets were not enforced in his district, and there had been no bad results. Sometimes he advised that there should be two shafts, one higher than the other. If a mica flap was fixed he would suggest that it be fixed tipping slightly forward. The open-grate type of flap he regarded as a nuisance. (3) It was charged that the trap increased the cost. He agreed it did, but so did all sanitary improvements. (4) Finally, it was alleged that the intercepting trap acted as an impediment to the passage of sewage from the house drain to the sewer. The cause, he thought, would be found to be leaky drains, which allowed liquids to escape into the surrounding soil, the solids only reaching the trap. The result was partially choked drains, and the soil was converted to sludge by septic action, and slowly slipped like a glacier to the sewer and stopped at the trap. Whether they had a trap or not, the trouble was caused before they got so far. Traps were improperly fixed, and owing to the shape there were difficulties in fixing them. Inspectors should see water flowing through before passing new work. A great objection to the common interceptors was that there was no provision for a clean joint between the trap and the pipe below. He considered intercepting traps should be made with long spigots, provided with access-eye to insure a clean invert. A suitable levelling cradle was required when fixing. Instead of being so strong on the abolition of the intercepting trap, he thought the objectors would be better advised to insist strongly on ventilating sewers and sterilising the gases arising from the same. If traps were abolished it might be asked if every house drain would take an equal share in the ventilation of sewers. He thought not. The shafts at the low levels would be inlets, and those at the top levels would be outlets. Then they would have cross-currents, and leaky drains admit to houses a greater quantity of foul gases.

The proceedings were then adjourned.

DISCUSSION AT THE INSTITUTE OF SANITARY ENGINEERS.

A discussion on the subject of the intercepting trap was opened by Mr Ernest van Putten, M.Inst.C.E., borough engineer of Lewisham, at a meeting of the Institute of Sanitary Engineers held on Monday evening at Caxton Hall, Westminster. Mr. A. J. Martin, the president of the institute, occupied the chair during the proceedings.

Mr van Putten said I must apologise for the unorthodox views I hold on this question, although I am glad to say that, whereas I was looked upon as a crank some twenty or more years ago, when I first commenced my crusade against interceptors, I am now somewhat justified by the report of the Departmental Committee of the Local Government Board.

So far as I am aware, the earliest form of interceptor was the mason's or dip trap. This was formed, as you no doubt know, by building a brick pit on the drain, the bottom of the pit being from 6 in. to 9 in. lower than the invert of the drain; across the pit a stone was fixed vertically below the level of the outlet, and another stone was fixed on the top of this

horizontally, closing the area of the pit between the dip stone and the wall on the outlet side of the pit. Of course, this was an exceedingly primitive arrangement, as more often than not the bottom of the pit was quite flat, and, there being no scour, the 6 in. to 9 in. at the bottom of the pit was a veritable cesspool. Although I thought at one time that these arrangements were of a very ancient date, I was surprised some fifteen years ago to find that there was one on the drain of our town hall, which was built as recently as 1874, and was designed by a very eminent architect.

These traps were succeeded by the bent pipe (usually termed the running syphon). This at first was buried without any means of access. The next improvement was similar in shape, but with a means of access in the middle of the dip. This took the form of an upright junction, and was continued up to the surface by pipes, and covered with a stone. It was possible by this means to stir up the deposit in the bottom of the trap and free the stoppage when one occurred, provided that the position of the inspection eye was known. I am afraid that our rum-hard ancestors were too sensitive in most cases to allow the stone cover to be seen, and after it had been covered up for some time no one knew its position.

The Public Health Act, 1875, and the late Sir Robert Rawlinson about the same date, assisted to bring the interceptor into general use, and with its use came improvements in its construction; it was found that stoppages occurred, and with a view to preventing this the inlet was made higher than the outlet in order, by means of the siphonic action, to induce an additional scour through the trap. The rodding eye was also fixed so that the portion of the drain between the interceptor and the sewer might be rodded. Some rodding eyes were turned up vertically and sealed with thin glass, which could be broken from the surface when the interceptor was choked and the manhole full of sewage. Another cover to the vertical rodding eye was a dead weight with a rubber sealing, the weight being attached to a chain which terminated just under the manhole cover; this, of course, enabled the weight to be lifted when the manhole was full. Both these contrivances were designed because the interceptors were so often blocked, and their utility depends on the failure of the interceptor in one very important point—viz., its ability to keep unstopped.

I should like to call attention to another form of interceptor—viz., Sykes' patent. It consists of what is practically the running syphon, with the addition of three screw-stoppered arms, and is built in the middle of the manhole or inspection chamber. In the event of it becoming blocked, the arm nearest the sewer is opened first, and from this opening the trap can be cleared, any back water then in the drain can at once escape down the sewer. The arm on the house side of the trap can, of course, be used for rodding the house drain.

It seems to me a pity that this interceptor is not more used where interceptors are necessary. I have suggested from time to time that if an ordinary interceptor is used it should be immediately above the manhole. Should it become blocked the drain will fill up more quickly, and it is quite easy to unscrew an interceptor from a manhole below it, whereas it is practically impossible to get a manhole above it until all the accumulated sewage has been baled or pumped out.

There are, so far as I am aware, two principal reasons put forth for the use of the interceptor—the chief one being to exclude sewer air from drains, the other to keep out rats.

I have contended for many years, but, of course, it was only the contention of an engineer, and was not at that time backed by bacteriologists—that drain air was more impure than sewer air. My chief reasons for saying this were that only a small proportion of the soil from each discharge of the water-closet was washed into the sewer, and that between each use of the drain a large quantity of soil was always lying in the drain uncovered by water, and consequently giving off more smell than that in the sewers, where the soil is submerged in water, and also the decomposing contents of the interceptor have more effect on the drain than the sewer.

In 1893 the Royal Sanitary Institute conducted a series of experiments (vol. xiv., page 237) with open channel pipes of various sizes and at varying gradients. As I do not wish to bother you with a multitude of figures, I will merely give the average of their results. This was that, with a 2-gallon flush, only 30 per cent of the solid found its way through the interceptor into the sewer. There are other reasons for the superiority of sewer air; sewers are flushed periodically, and, in my borough, cleansed. By this I mean that all sewers 3 ft. high and over are swept out, including side walls, by sewermen who go through them; and all the pipe sewers are brushed out, not by the ridiculous thing supplied with a bundle of sewer rods, but by brushes specially made for me in which the brush is about 18 in. long, and of a diameter to suit the pipe. . . .

The report of the Departmental Committee gives the quantity of solid material which remains in the interceptor as varying from 40 to 79 per cent. This report gives another reason for the less pure state of the drain air—viz., that it is caused by the splashing which occurs in drains to a greater extent than it does in sewers. This opinion is also held by Dr. Andrewes, who reported to the Local Government Board in 1906-7 (page 185) and 1907-8 (page 266) on sewer and drain air, and I am of opinion that it is a very important factor in the case. At all events, the Departmental Committee's report disposes entirely of the question of the sewer air being more harmful than drain air. It therefore appears to me that the only claim remaining for the use of the interceptor is to exclude rats from the house drain. Now I cannot see what harm rats do in a drain; if the drain is so defective that the rats can work their way out, I think that rats are rather a blessing than otherwise, as they will show the necessity for relaying the drain. But if the drain is properly jointed in cement the rats can do no possible harm, and perhaps a little good, by acting as scavengers.

The following are some of the disadvantages, in my opinion, of the interceptor:—

DISADVANTAGES OF INTERCEPTORS.

Their Liability to Blocking.—In 6,492 examined by the Departmental Committee 23 per cent were blocked, or showed signs that they had previously been blocked (par. 24 of the report). I know this has been stated in some of the recent papers and speeches to be greater than the proportion found in the experience of other people. Unfortunately, I have no statistics on the matter, but I have no reason to doubt its accuracy with regard to all interceptors. The number of times interceptors become blocked and clear themselves by the weight of water accumulated in the drain behind them would, I think, astonish us if we had a record of it.

The Necessity for a Fresh-air Inlet.—These are usually fitted with a mica flap to prevent them being foul-air outlets. The mica flap is, in about nine cases out of ten, broken or jambed either open or shut: if the former, it is probably acting as a foul-air outlet; if the latter, there is no ventilation in the drain. It has been suggested that the fresh-air inlet should be carried up high, but then the balance of air in the drain would be equal and the air would be stagnant.

Interceptors as a Source of Foul Smell.—Each interceptor contains from 4 to 10 pints of sewage, which is standing stagnant for a considerable time during each day, and for about eight or nine hours during each night. This is a great deal longer than the time it takes sewage to travel from my borough to the London County Council outfall at Crossness, a distance of about 11 miles, which I calculate is covered in five and a-half hours.

The Interceptor Prevents the Ventilation of the Sewer through the Drains.—I have left this till the last of my reasons for the abolition of the interceptor although I consider it the most important, and now that sewer air has been shown to be less harmful than drain air, I cannot see one reason to urge against the use of the ventilator on the house drain for sewer ventilation. Once I was met with the argument that the sewers were the property of the council and the drains of the individual. This, surely, is absurd. The council does not own the sewers. They only act as the trustees or agents of the individuals, and any money they have to spend on the ventilation of the sewers comes out of the pockets of the ratepayers.

In concluding, I should like to state that in Lewisham our death-rate last year was 11·4 per 1,000—the second lowest in London; and we have held this record for about thirty years to my knowledge, notwithstanding the fact that prior to June, 1901, when the London County Council's by-law making the use of the interceptor compulsory in London came into operation, only about 1 per cent of the drains were intercepted from the sewers, as my late chief and I persistently opposed their use.

Mr. H. Johnson (Wimbledon), at the close of Mr. Van Putten's remarks, said that so far as he was personally concerned he did not wish to deal with the Departmental Committee's report from the bacteriological [illegible] point of view, but having regard to evidence given by Prof. Kenwood in a case heard on the previous Saturday, he thought it would not be long [illegible] would be seriously combated.* In his own district the number of stoppages [illegible] 1·2 per cent., and if that were possible in one district it could be done elsewhere. His view was that the inquiry should not have been held to consider the abolition of the intercepting trap, but to investigate the causes of the abuse of the apparatus and how they could be remedied. He attached no importance to the death-rate in regard to whether the trap was a [illegible] stoppages being only one factor in hundreds that affected the health of a community.

Mr. R. Read (Surveyor to the Corporation), dealing with Mr. van Putten's reference to the late Sir Robert Rawlinson, said he knew that he (Sir Robert), if not opposed to, was very doubtful about the trap, and tried to get an official investigation into it, though without success. The report of the Departmental Committee supported the opinions which he formed between 1879 and 1882 that the trap was useless, did not fulfil the claims made for it, and was a filthy and dangerous obstruction, and the only logical conclusion was the withdrawal of the by-laws compelling its insertion. In the absence of the trap both drains and sewers would be cleaner. The trap was no remedy for a defective or broken drain, and a person could be quite as easily poisoned by his own sewage as by that of other people. A great point was made of the liability of the contents of water-closet traps to evaporate during the absence of householders, but there would then be no one in the house to poison, and surely, in the case of houses let in flats, someone would be left to take care of the property. In the absence of the intercepting trap the ventilation of sewers and drains became simple, and could be easily adjusted and proportioned so that road surface ventilators would always act as inlets, and the soil pipe vent shafts always act as outlets by the combined action of the wind and the flow of sewage. To insure this the inlets at the road level must be small and placed only at the summits of the sewer gradients, because the air current inside the sewers always followed the sewage flow down the gradient, no matter what alternations occurred in the shafts exposed to the wind above the roofs.

Mr. G. Bertram Hayward, Surveyor to the Acton Urban District Council, suggested that if the present [illegible] the question of abolishing or [illegible] the common types of traps in use, instead of the discontinuance of intercepting sewer gases from house drains, there would doubtless be no divided opinion on the subject. A number of statements had recently been brought forward proving that many interceptors have been found choked, but few, if any, had been [illegible] as to the cause of stoppage. This lack of particulars was important, as [illegible] deals, and the results of [illegible] intercepting trap [illegible] ventilation, the case would [illegible] and the [illegible] health bulwark. It was true that experiments had given information, but he ventured to suggest that, owing to different specific gravity and composition, none of the substitutes for human excrement used had given a true example of what takes place in practice. In no case in his experience had a stoppage been found where the trouble could not have been prevented without abolishing sewer-gas interception. Recently it had been stated that a number of blockages had occurred owing to pressure of gas in public sewers forcing out the sweeping eye cap. Another cause of obstruction equally common was improper setting of the trap, or a projection of cement on the invert of the joint between the trap and the pipe. He had found obstructive joints that could only be detected by smashing the traps. As a remedy he suggested that the ordinary trap should be provided with a longer spigot in which there was an inspection eye for cleaning and inspecting the joint at the time of fixing. [illegible] Mr. [illegible] Putten against the intercepting trap, he had only to point to the [illegible]

* In this case [illegible] which had reference to the death of a child in South London, Prof. Kenwood said that there was defective sewer [illegible] and that there was communication between the [illegible] and the sewer. The sewage might find its way into the well, rendering the water [illegible] Ed., Surveyor.

of sewage in the trap; surely in a well-ventilated drain that was preferable to the smells from thousands of gallons of sewage? Other advocates of the "back to the house" movement dealt kindly with the rat, which they described as harmless, useful in scavenging (presumably clean?) sewers, and generally with all the virtues of a drawing-room pet, notwithstanding that rats were known carriers of infection and feeders on filth, who could force their way out of reasonably sound drains when it suited their purpose. In conclusion, he suggested that the present opposition to intercepting sewer gas from house drains, as in the past, was mainly due to those local authorities who wished the public to ventilate their sewers. Sanitary authorities existed for specific purposes and with specific obligations; if their sewers could not be kept free of gas by natural ventilation, then some means of vacuum exhaust should be adopted, preferably with an attachment for cremating foul gases.

Mr. W. Firth (Shoreditch) observed that, with two or three exceptions, none of the witnesses examined by the committee were familiar with domestic sanitation. His own opinion was that people should not be compelled to breathe the air from the sewers.

Mr. W. A. Portman (Tottenham) said that, although there was a general condemnation of the intercepting trap, so far as his judgment went, that portion of the committee's report which gave local authorities option in the matter in framing their by-laws was a very wise one. As to fresh-air inlets, he had always found these, without exception, to be foul-air outlets.

Mr. J. S. E. Clements maintained that if it were properly constructed the intercepting trap was a regulator of public health, and he hoped that it would be a long time before its use was abandoned.

Mr. A. Duck (Woolwich) thought the report left no room for doubt that the trap must go, and that it was incumbent upon them to dismiss it from practice. The liability to blocking had been incontestably proved.

Mr. West (Walthamstow) said that if, as had been urged, the gases from sewers and drains were productive of infectious disease, it was clear that they ought to have had the evidence of the districts which were untrapped. Provincial towns which were untrapped had been shown to be as free from infectious disease as places in which the intercepting trap had been adopted, and the evidence on all hands was that no damage had been done to the people by the disuse of the trap.

Mr. Hampton expressed the view that local circumstances had such an important bearing on the matter that no hard-and-fast rule that public authorities adopted would meet with any general acceptance. The exclusion of rats from the house drains was only a small part of the question, a simple arrangement being sufficient to deal with that part of the problem. Flushes of hot water which came from most houses alone had the effect of keeping out rats, but if the presence of the intercepting trap were suggested as the remedy for this trouble, he did not think a good case had been made out for the trap. The pattern of trap, concluded the speaker, undoubtedly had much to do with the frequency or otherwise of stoppages.

Mr. P. A. Knapett (Lewisham) said he had never seen a property that had required the use of an interceptor. In his district they called the rats "assistant sanitary inspectors" on account of the useful scavenging work which they performed. He had never, however, seen one pass through an interceptor.

The President (Mr. A. J. Martin), in closing the discussion, said he had taken the trouble to look up the word "trap" in the dictionary, and had found that it meant "a snare." (Laughter.) He did not say they were that, but his feeling was that they ought to regard them with a certain amount of suspicion. He looked upon the trap as something in the nature of a charm which, because it was too heavy to hang round their necks, they put on their house drains. (Laughter.) It was important that house drains and sewers should be self-cleansing, but could anyone assert that a contrivance which held back fæcal matter for a whole night conduced to the self-cleansing properties of a sewer or drain? It seemed a weak argument that advocates of the trap should drag in the rat. He had no objection himself to rats in a drain, but bad construction was another thing. He had been dismayed to hear some of their enthusiastic friends asking, now that they had the committee's report, what steps they proposed to take to get people to take out the existing traps. Such a thing was absurd, and

there was certainly nothing in the report to warrant anything of the kind being done. The committee did not say the trap was an evil, but simply a thing which was of no very great use on the whole, and, possibly, better dispensed with. It would be a hardship on a man who wanted to trap off his house to be compelled to omit the apparatus. In a matter such as that he did not think they ought to base any great importance on an investigation which covered so little ground. The report presented to them the evidence of forty engineers and others on the subject, but he insisted that what was required was evidence from people in all parts of the country, and he had suggested that that institute, in conjunction, say, with the Royal Sanitary Institute, should take steps to obtain the opinions of every surveyor and chief sanitary inspector with regard to the question, and issue them in a single volume.

Mr. VAN PUTTEN, in the course of his reply said that the greater number of complaints which were received in Lewisham as to stopped drains were caused by interceptors. It had been said that natural ventilation was non-existent and that ventilation followed the flow. He knew that view was held by Mr. Read, but he differed from it; it was sometimes with and sometimes against the flow.

Mr. READ: In a big sewer?

Mr. VAN PUTTEN: Yes. If interceptors had to be used, why not put the manhole below it—in his opinion the proper position—in order to facilitate clearing out when stoppages occurred?

A vote of thanks was unanimously accorded to Mr. van Putten for his paper, and the proceedings terminated.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

A RECRUITING CAMPAIGN: CIRCULAR TO SURVEYORS.

The following circular has been issued to members of the Institution of Municipal and County Engineers.

DEAR SIR, I am instructed by the council to ask your kind assistance in bringing the claims of the Institution of Municipal and County Engineers before the members of your technical staff, or such of them as may not be connected with the institution. The institution was founded in 1873, and its several grades or classes of membership make the institution open to all engaged upon the technical work of municipal engineering, that is to say, the class of full member is open to all occupying leading positions of staff responsibility; the class of associate member is open to all who fill positions of minor staff responsibility; and the class of student is open to all those filling the junior positions either as pupils, improvers, or other subordinate rank in the offices of municipal and county engineers and surveyors.

Full particulars as to the regulations governing admission to these classes may be found in the by-laws printed on the back of Form "A" application to form sent herewith.

The council would be much obliged if you could assist them in reaching and influencing the members of your technical staff with a view to their enlistment on the roll of the institution, and to this end I am enclosing a form of inquiry which the council trust you may be good enough to fill up in order that a personal communication may be forwarded to those members of your staff who are not yet connected with the institution.

I should add that the aim of the council is to incorporate all eligible persons serving either as chiefs or as engineering assistants upon the roll of this institution, believing that thereby will the professional and personal interests of the members and their usefulness to the authorities they serve, and the offices they fill, be best promoted.

May I respectfully bespeak your personal consideration and your friendly interest and co-operation in this effort to bring before the notice of your technical staff the claims of the institution and the benefits which it is capable of conferring upon those within its ranks?—I am, yours faithfully,

THOMAS COLE,
Secretary.

November 11, 1912.

TOWN PLANNING COMPETITION.

Premiums are offered by the Institution of Municipal and County Engineers for laying out a town as a seaside pleasure resort, with a present residential population of 50,000, and with additional accommodation for 100,000 visitors. Premiums are as follows: To members and associate members of the institution—A first premium of ten guineas, a second premium of seven guineas, a third premium of five guineas; to students of the institution—a first premium of five guineas, a second premium of three guineas.

The conditions of the competition, we are informed by Mr. Thomas Cole, secretary of the institution, are as follows:—

The coast line to be the segment of a circle on a chord 5 miles long, having a centre versed sine above the chord line of 1,800 ft.; the chord line to lay east and west, and the depth of the town from the chord line to have a parallel width of 1½ miles; beach and sea bed has a gradient of 1 in 50; rise and fall of tide is 12 ft., giving 600 ft. horizontal distance between high and low water; the sea wall protecting the front to be set out at a distance of 300 ft. above high-water mark; a low cliff 20 ft. high above parade level exists on its north edge, and the ground on which the town is to be built rises at a regular uniform gradient of 1 in 50; the width of the parade and its adjuncts are left to the discretion of the competitors; at the western extremity of the site is an estuary 200 acres in extent, to be used as a yacht basin and harbour, the centre line through the estuary to form the western boundary of the town; railways to run under the town in shallow subways. Stations to be placed as follows: One, a mile from the sea on the eastern boundary; one, half a mile from the sea near the centre of the town; one, a mile from the sea on the western boundary, with sidings to the quays.

The drawings to be submitted are to comprise—(*a*) A plan showing the whole area as proposed to be laid out by the competitor to a scale of 12 in. to the mile; (*b*) A plan on a double elephant sheet of the centre of the town in more detail to a scale double that of the plan A; (*c*) a double elephant sheet of details of works or features proposed to be introduced; (*d*) a bird's-eye view of the town or a portion of the same as proposed to be laid out, as seen from the sea front. Necessary adjuncts as sewers, tramways, markets, baths, destructor, &c., to be shown.

Competitors in the preparation of their drawings are to bear in mind the possibility of these being reproduced by photography to a smaller scale. Printing and figures should therefore be bold, and scales should be drawn on each sheet. The drawings, except the perspective (*d*), are to be entirely the work of the competitor, and the institution are to have the right to reproduce any of the drawings in their journal or annual volume. The drawings are to be delivered on or before July 10th next, at an address (to be given in a future notice) in the town in which the annual meeting is to be held. Competitors are to mark their drawings with a *nom de plume* or mark, and the word "member" if he is a member or associate member, or "student" if he is a student, and to accompany them with a sealed envelope showing on the outside the mark or *nom de plume* of the competitor, with his name and address in the envelope. The names of the assessors will be announced before the date given for the delivery of the drawings.

EAST MIDLAND DISTRICT COMMITTEE.

The first meeting of the East Midland District Committee of the Institution of Municipal and County Engineers was held on Saturday afternoon last in the Shire Hall, Nottingham.

Mr. E. G. Mawbey, borough engineer and surveyor of Leicester, chairman of the district, was in the chair. Mr. E. Purnell Hooley, the district representative of the council, also being present with nine others, including the hon. secretary, Mr. R. A. MacBrair, Lincoln.

A general discussion took place as to the best means to be taken to promote the interests of the institution in the district. It was decided to approach the various members with regard to holding meetings in their districts, and to make endeavours to hold a meeting in Newark next February, Mr. Hooley's good offices being accepted in the matter. It was proposed to hold an annual district meeting in September or October next, and the names of several towns were suggested to the hon. secretary as likely places for the gathering.

Artificial Stone. A correspondent asks for the name of the makers of a stone composition called "Fluate."

The Concrete Institute.

MR. E. P. WELLS' PRESIDENTIAL ADDRESS.

Mr. E. P. Wells presided on the 14th inst. at the twenty-seventh ordinary general meeting of the Concrete Institute, held in the lecture hall, Denison House, Westminster, S.W., and in the course of the proceedings delivered the following

PRESIDENTIAL ADDRESS.

It affords me very much pleasure, in addressing you for the first time as president of the Concrete Institute, to congratulate you upon the various subjects that have been taken up by the committees during the past year, and also upon the satisfactory state of the institute's membership, which I am pleased to see, is gradually increasing, and it is the hope of the council that before another two or three years are passed the membership will be doubled.

The committees of the institute have a great many subjects at the present time under consideration. The Science Committee, it will be recollected, drafted a Standard Notation for Calculations for Reinforced Concrete, which was subsequently adopted by the Joint Committee on Reinforced Concrete appointed by the Royal Institute of British Architects in their second report, and by the London County Council in their proposed regulations covering the erection of buildings in reinforced concrete in London, while text-books which have been published in London since that date have also followed its recommendations. This, I think, will be felt as a great feather in the cap of this institute.

You are all aware that the scope of the institute has been enlarged—and not before it was wanted—to include structural engineering. The Science Committee has undertaken to compile a Standard Notation for Calculations in Structural Engineering generally. Further effort in the direction of standardisation is being made by the same committee in drafting a standard specification for reinforced concrete work, which at the present time is very badly needed, and also a report on the standardisation of attachments or joints in reinforced concrete. Other subjects of some importance are under investigation—viz., reinforced concrete piles, chemical tests for steel used in reinforced concrete, the adhesion of friction between the concrete and the steel, and the effect of sewage, oils, and fats on concrete. In respect to the last named, it will have been seen that papers are to be given this session on the same subject. These papers will be duly considered by the committee in drafting their report, and it will be in the recollection of many of you that a paper by Mr. Sydney H. Chambers was given in the 1910-11 session on "The Effects of Sewage and Sewage Gases on Portland Cement Concrete," which, you may remember, was also very fully discussed at the time; the full report of the meeting is to be found in the "Proceedings" of that year. This report will also be taken into due account by the committee.

Other committees of this institute have also been very hard at work on other branches of the subject on which standardisation may be advantageously brought to bear; and with regard to this, the institute conducts a Joint Committee on Loads on Highway Bridges upon which the Institution of Municipal and County Engineers and the Institution of Municipal Engineers have representatives. The Joint Committee is now engaged in drafting a report, and no doubt when their work is finished it will prove of distinct service, not only to the Government, but to the municipal authorities throughout the country.

The Tests Standing Committee have the following subjects under consideration, and you will note from the number of the subjects that a great amount of work will be entailed upon this committee in gathering the information which in time will be presented to the members:—

(1) The effect upon steel of the presence of sulphur in aggregate.

(2) The grading of aggregates.

(3) The expansion and deterioration of concrete due to changes of atmospheric temperature.

(4) The effect of the use of calcium chloride on the surface of concrete as affecting reinforcing metal.

(5) The erratic results obtained by the Vicat needle in ascertaining the initial set of cement.

The Reinforced Concrete Practice Standing Committee are investigating:—

(1) Methods of treating the surface of concrete.

(2) Cracks due to the expansion and contraction of reinforced concrete.

A special Investigation Sub-Committee has been formed to investigate failures and accidents in connection with reinforced concrete construction, and also the restrictions placed by the Local Government Board upon the granting of loans to local authorities for the purpose of undertaking work in that material.

The committee which was appointed to consider the widened scope of the Concrete Institute, and whose report in favour of the course of including within its purview the whole field of structural engineering which was adopted by the council, has not been wound up, but will continue to meet as an Improvements Committee.

It will be seen from the programme for next session that the policy is already taking shape by the inclusion of a few papers on subjects not having immediate connection with concrete. The result has been that a greater number of general meetings will be held this session than last, and it is thought that a more interesting programme will be furnished. It may be mentioned that last session only nine general meetings were held, whereas for this year thirteen general meetings and six educational lectures have been arranged. It was decided, on the recommendation of the Improvements Committee, to have such a course of educational lectures annually, and also to hold an examination in structural engineering once a year to test the scientific or technical attainments of applicants for studentship. The first examination will in all probability be held next year, and it is in the right direction as regards increasing the status of members of the institute, because the qualifications for membership have been tightened up, and in due time it is probable an examination will be held for the admission of members, although it is hoped it will never be insisted upon as absolutely necessary to admit an engineer to membership, because there have been and no doubt will be engineers who for various reasons will not or cannot submit themselves for examination, yet who are well qualified and would be worthy members of the institute. At the present time the institute is open to persons who are connected with the manufacture or commercial development of materials and methods of instruction included in the field of structural engineering. Such members are of much value to the institute, and I feel sure it would not be the wish of any one who has the interest of the institute at heart to exclude such persons, although, if the policy of developing the structural engineering side is continued, it may be necessary to give such persons a special classification.

The Concrete Institute has now on the recommendation of its committee the sub-title reading "An Institution for Structural Engineers, Architects," &c. The word "architects" is included because they have to design structures from the engineering standpoint; but also they have to study the artistic side of construction, or the æsthetic treatment of structural materials. That is an aspect which the Concrete Institute has kept in mind, and which it is desirable should continue to receive consideration; but I think it would be as well if the words "Institution of Structural Engineers" were added permanently to the main title of the institute, though this is a matter that will probably come up later on. There are great possibilities in such a development, as there are evidently fine opportunities for such an institution, and, considering that all the users of concrete must necessarily be connected with the theory and design of structures in some form or another, it is only a natural course to pursue on our part.

The work of the institute is now growing very rapidly, and compared with what is being done by other institutions, the subscription is very small indeed. The council, I think, have wisely adopted the decision to require an entrance fee when the membership reaches 1,000, which it is hoped will very soon be the case.

At the present time the council have an insufficiency of funds to enable them to proceed in the direction of experimenting upon the subject of rein-

forced concrete, and until some method is adopted of increasing the revenue this question of experimenting will have to be deferred. The only way that it seems possible to obtain the necessary funds will be to increase the subscription of the home members, but with regard to foreign members they might remain the same as at present. If this were done and the revenue doubled without any large increase of establishment charges, then the council would be able to undertake experiments which would be for the good of all those interested in concrete and structural engineering.

I propose in this my first presidential address to deal almost wholly with the practical side of reinforced concrete construction, as I consider that the more often attention is called to this most important part of the work the better it is for all concerned—for the engineer, the architect, the proprietor, and also the contractor.

PORTLAND CEMENT.

With regard to the first and the principal constituent in concrete—namely, Portland cement—it is strange, at this present day, how many engineers and architects still adhere to the old specification of coarse grinding, consequently requiring aëration of the cement. It has been my lot only this week to come across a specification where it was stated the cement had to be spread on a floor for twenty-one days before being used. Those of us who are well acquainted with the present-day cement, and also its fine grinding, know how deleterious this is when great crushing strength is required. I think I have said, on more than one occasion at this institute, that if cement is to be kept up to its full strength it is absolutely necessary that when it is received on the site of the works it should be stored in airtight wooden bins; and if this is done cement may be kept for many years and be just as good after the lapse of time as it was when freshly made, whereas if the cement be stored in sacks, and even a very small amount of moist air plays upon them, then the cement is rapidly hydrated and cakes in the sack. If, as is often the case, this cement be rubbed through a sieve, it becomes almost absolutely useless for purposes of concrete making—by that I mean good concrete.

I have in my mind's eye a case I had to advise upon. I bought cement in the month of October. The whole winter was a bad one, and he had very little opportunity of using the cement. It was stored in a shed through which the wind could blow freely, and he was rather astonished when the spring came and the cement was found to be solid and set. It was sent to the manufacturers, and when the matter was investigated the true cause of the mischief was found out.

I have myself on many occasions experimented with cement that has been so hydrated, and it is astonishing the enormous reduction in the strength, so much so that it becomes almost useless for making concrete.

Any of you who chooses to make the experiment can do so, and you will find that with the concrete made from an over-hydrated cement the amount of strength obtained will be very little indeed, and that its setting action will be so slow that it will practically take days before it shows much sign of hardening. The only use of such a cement is to mix with an over-calcined cement that is too quick setting; by this means the setting action can be retarded.

AGGREGATES.

Passing from cement, one is led on to the careful choice in all aggregates, the proper grading of the same, and also, what is of more importance, the seeing that everything is absolutely clean and the water pure.

I know it has been said that dirt is of some good in increasing the strength of cement concrete, but the only case that I can find where, over any period, a dirty aggregate increased the strength of the concrete was due to the fact that it had been mixed with a very over-calcined cement. It slowed down its setting action, and by this means did good, but if the test had been carried over a lengthy period, it would have been proved how failacious is the advantage to concrete of dirt in any form.

With regard to aggregates consisting of gravels that are dredged either from the river or from the bed of the ocean, it is very seldom that the mixture is perfect, and sand to coarse material is obtained. There is only one gravel that I know where one can see that the proportion is about correct, and that is obtained from the Thames and along the East Coast there is at the present time a great excess of sand, and under any circumstances I would not in any way recommend that this aggregate should be used without separation of the larger particles from the finer and subsequent crushing of the coarse material.

The difference in the strength of concrete made with an excess of sand is very marked where the proportion of cement is not great—that is to say, 6 to 1 and 7 to 1 concrete, with an excess of sand, show very great falling off in strength, whereas with richer mixtures and an excess of sand, though there is a falling off in the early stages of hardening, after a few years the concrete will almost come up in strength to a concrete made in the correct proportions. Of course, it is well known that for all water work a large proportion of sand is required so as to get a perfectly dense mixture, but in no case must this be overdone.

In concrete for water work it is not necessary to add anything to make it watertight. If concrete be properly made it will be absolutely impervious to moisture, and if it be found necessary to reduce the labour some of these compounds of hydrated lime are, no doubt, of utility in decreasing porosity, but, at the same time, concrete so made is not improved in strength.

Before leaving the subject of aggregates I wish to call particular attention, as I have done here on more than one occasion, to the use of Fletton bricks for concrete. I have found lately that wherever Fletton bricks have been used disruption has taken place in the concrete, and I think this is due to the presence of lime in the bricks. Fletton bricks that are dangerous to use are those with purple markings, and great care should be exercised by all those who propose to use brick aggregate for concrete work to eliminate absolutely Fletton bricks in any form whatever. In this I am borne out by several who have been unfortunate enough to use the bricks, the result being that the concrete has failed.

I was called in only a few months ago to a special floor that had been put down for testing bowls, when it was found that about a month after the floor had been laid it was becoming uneven in places. On examination it was found that in every case where the floor had risen Fletton bricks in the aggregate were the cause of the mischief.

MAKING OF CONCRETE.

It is always advisable in the making of concrete that it should be got into the work as quickly as possible, especially in the summer; with low temperatures it is not of such great importance, as the cold slows the setting action and also its hardening. In frosty weather the drier the concrete and the more ramming, so long as there is no chance of displacing any of the reinforcing, the better for the concrete, as it will set very much more rapidly than if there is an excess of moisture.

With regard to reinforced work it is far better that the concrete should have a slight excess of water than a deficiency. Certain experiences that I have had lately have shown that where steel has been put into concrete that was too dry, the air and moisture had got through the porous concrete to the steel and caused rapid corrosion.

In one case the bottom layer of concrete had been put in and allowed to set, the steel was placed on the dry concrete, and other dry concrete was placed on top. When this work was broken up it was found that the rods in the concrete were quite loose, could be turned round by hand, and the adhesion between the two layers of concrete was anything but good. Now, had the concrete been made wet, there would have been no separation between the steel and the concrete, it would not have been possible to twist the steel rods round in the concrete, neither would moisture have passed through the concrete to the steel and caused oxydisation after the alkaline salts had disappeared by age owing to the presence of air and moisture.

Excess of moisture, as we all know, decreases the crushing strength of the concrete; but at the same time in nearly all structures there is generally such an excess of concrete in the compression member, especially where T-headed beams are used, that it is better to have the steel perfectly protected with a slightly weaker concrete than to have imperfect protection with a stronger concrete, as then the steel protected corrosion will be almost bound to take place, with consequent disruption of the concrete.

Excessive ramming in concrete is not at all necessary where it is made wet. It is far better to employ very light ramming and use that five pounds of

concrete are brought to the surface of the shuttering boards by means of steel slices or trowels. If this be done there will be very little danger of air finding its way through into the steel reinforcing, but a coarse aggregate first put in with an insufficiency of sand is almost always certain to have some porous parts through which the air and sulphur, especially in a London atmosphere, can attack the steel.

EXPERIMENTAL CUBES.

It may be well here to call attention to what I consider to be a most important point in reinforced concrete construction namely, that as the concrete is being put into the work test cubes should be made both for ascertaining the strength of the concrete *in situ* and exposed to the ordinary atmospheric conditions, and also to ascertain in the laboratory the strength of a series of cubes made at the same time and kept under laboratory conditions. One set of cubes should be kept on the works exposed to the varying atmospheric conditions, and the other at the laboratory at the normal temperature, say, of 60 deg. Fahr.

Some years ago I made an experiment to see whether cold had any effect on concrete, and if so, to what extent. I found that in the month of December, when the cubes were taken from about 60 deg. Fahr. and placed on a roof where the temperature fell to below freezing-point, a most alarming decrease took place in the crushing resistance of the concrete, and this remained so until such time as the weather became warmer, when the crushing resistance went up and was practically the same as shown by cubes made to the same gauging, but kept under normal conditions.

This clearly shows that if a building is constructed in cold weather the crushing resistance of the concrete cubes kept on the works will be low, but if it be found that the other set of test cubes, kept under laboratory conditions, shows a rapid increase in the strength, then it is only fair to assume that the concrete that has been exposed to the cold air will, with favourable conditions, increase in strength and attain the same strength as the laboratory experiments.

The reason I am calling particular attention to this point is that if a building is constructed in the winter and the test loads are applied up to 50 per cent in excess while the weather is cold, there may possibly be an excessive amount of deflection, owing to the fact that the strength of the concrete in compression is low, whereas if the experiment were held over until the warmer weather, when the compressive strength of the concrete was largely increased, then the deflection would be practically nothing—of course, assuming that the work in the first instance had been properly designed.

If the work is properly designed, and if the supervision has been strict and the work has been carried out according to the drawings, it is fair entirely to dispense with the testing of the structure so long as the experimental cubes show that the concrete has attained the strength required by the engineer or architect.

It is rather foolish to test a structure when one knows by experience that the crushing resistance, owing to the cold, is low. It would be far better to wait until the weather had become warmer and the concrete had parted with a lot of its moisture, when it would have become much harder. On the contrary, if it is found that the laboratory tests are low, say, for the sake of example, one month after being made, then I should strongly recommend testing the structure to ascertain whether there were anything seriously at fault. Having those conditions of a low laboratory test and a much lower or otherwise the structure not exhibiting any serious deflection, then the work may be passed; but still it is advisable in all cases to watch the crushing experiments, as upon these depends almost entirely the strength of the structure. A good crushing resistance means that the concrete is strong in tension, strong in adhesion, and strong in shear, and, such being so, there is very little danger of the structure failing owing to the deficiency of steel.

TESTING.

The testing of floors and other work is, as a rule, carried out on much too small a scale. Testing should be spread over an area that will at least take in always two sets of secondary beams as well as two spans of main beams completely. By this method of testing the beams always have their full load and the adjoining beams become indicated, which gives the most severe form of test, unless, of course, continuous deflections be carried out.

My experience has taught me that where concrete is good, that is to say, mixtures of 5 to 1 and richer, with the ordinary normal loading for which the structure was designed, unless most delicate instruments be used there will be no deflection recorded, whereas when weak concretes are used—namely, 6 to 1 and under—then the deflection at times becomes very great.

In all cases, in making deflection tests, they should be made not only at the centre of the span, but also at the walls, as very often it is found that a large amount of the so-called deflection is due entirely to the squeezing of the brickwork, owing to the fact that the reaction has not been spread over a sufficient area of brickwork. In no case ought the load on the brickwork to exceed 8 tons per square foot, by this means a good distribution is obtained and the brick walls are strengthened thereby.

CAUSES OF FAILURE.

In a great many works that I have seen where failures have taken place, the failures have been very largely attributable to shuttering and strutting. I have in mind cases of beams deflecting 2 in. or 3 in. after the concrete has been filled into the mould, this being due entirely to the strutting sinking into the soft ground underneath. In several cases this has caused what appeared like shear cracks at each abutment, though the work afterwards stood the test load satisfactorily. Still, such cracks made the beam look unsightly, and there could not have been the same adhesion between the concrete and steel, owing to this settlement, as if the boxes had remained perfectly true and level during the whole time the concrete was being put in and until the same were struck.

I know of one case of a failure taking place entirely owing to the strutting sinking into the ground, the sinking taking place over more than a week. The concrete, therefore, never had the least chance of getting a fair adhesion to the steel, but was constantly being drawn away from it by this settlement of the strutting, so much so that when the strutting was removed the whole structure came down with a run.

It is always advisable, if there is any doubt at all about the ground, to have the latter tested beforehand, and it is far better to increase the sole-plates to double the size required, so as to prevent any possible chance of settlement, than to have an insufficient area, with consequent settlement and trouble taking place.

Not only does the settlement cause a reverse camber of the beam, but it also gives a fall in the floors the wrong way, and it needs extra expense all round to make good such defective work.

All these are points that are easily obviated by the simple means of closely watching the work as it proceeds, and not allowing any concrete to be put in until the engineer or his representative is satisfied that the strutting is of such a nature that settlement is not likely to take place.

Strutting should always remain up as long as possible after the concrete has been placed in position; in fact, if it were not for the exigencies of trade, and also the rapidity with which building works of the present day have to be erected, I should personally like to see all strutting remain up for very much longer periods than is generally allowed, because the harder concrete can get before removal and any weight can get thrown upon it, the better it is for the structure as a whole. Unfortunately, in the present day the question of expense has to be very largely considered, and to allow strutting to remain up as long as one would like it would increase in a great many cases the cost of the work, and I am afraid it would become almost prohibitive. Of course, in cold weather strutting must be left up for periods 50 per cent longer than is allowed in the summer time, and a great many of the failures in this country, and more especially in America, are mainly traceable to the removal of the shuttering and strutting at too early a period in the life of the concrete. The concrete at the time of striking was weak, but had an extra fortnight or more been allowed for the hardening, then the works that have failed would no doubt have stood up.

DANGER OF GYPSUM.

Before finishing with concrete making I would like to refer to water to be used therein. In this country, as a rule, water is almost invariably obtained from what is called a domestic source—namely, water supplied by large public companies who are extremely careful in what is sold to the public. Such being so, it is very rarely in England that one has to use water that does not come from the public supply; but there

are cases where it is advisable carefully to examine the same before it is used. There are some places where the water is highly charged with gypsum compounds, and such being the case, it behoves one to see that there is no likelihood of failure taking place owing to an excess of this compound.

In the South of France, in Algeria, and in a great many districts waters are highly charged with gypsum, and so bad is this in places that concrete is absolutely dissolved and disrupted in less than two or three years. Whenever there is any doubt as to the quality of the water to be employed an analysis should be made beforehand, and so prevent what might lead to a disaster.

STEELWORK.

One of the great defects with regard to reinforced concrete is constantly raised by those who have not had much to do with the subject and often by those who are largely connected with it—namely, the difficulty of getting steelwork placed in the position designed by the engineer. It is a difficult matter always to get the work placed in the designed position, owing to the carelessness of the British workman, whose idea seems to be to get the material into position as quickly as possible, no matter whether it be right or wrong, and in a great many cases if he has an opportunity of leaving the steel out he will do so. The only way to get over this difficulty is not to allow any concrete to be filled or poured in until the steelwork had been passed by the engineer or his representative. If this be done there will be very little danger to be apprehended, because if the steel is in the correct position, if the concrete is proved to be as good, as borne out by the *in situ* tests and by the laboratory tests, and if the strutting has not given way, then one may fairly assume that the work has been well carried out and will sustain all the loads for which it is designed, and that there will be no deflection, or else of such a slight nature that it is not worth troubling about. If, however, the steel be badly placed, the concrete be poor, and the strutting has failed, then there is no knowing what is going to be the result.

In a great many years of practical experience I have come to this conclusion, that even if there is a large deficiency of steel in the structure both in tension and in compression, and the concrete is of an excellent quality, there is hardly any chance of failure taking place, but if the steel is up to and even in excess of the requirements asked for, and by any chance the concrete be poor, then if an excessive load be placed upon the structure, there is nothing to prevent it failing. As I have stated before, a rich concrete is strong in crushing, tension, adhesion and shear, whereas with poor concrete exactly the reverse is the case.

A series of experiments that I carried out some years ago of some beams gave for thirty-three days test a factor of safety of 5¼ to 1; in three years the factor was over 9 to 1. The whole of this was due entirely to a very good concrete which was absolutely homogeneous throughout, and when the beams broke they failed only at the centre, the only place where cracks developed. There was no sign of shear and the diameters of the rods where the failure took place were, to all intents and purposes, the same diameters as when they were put in. These experiments, I think, simply show an enormous increase in the lever arm, due to the rich concrete; in fact, in the case I now mention the lever arm was practically the total depth from the axis of the tension members to the outside of the compression member of the beam. But even this will not account wholly for the enormous load that the beams carried, as the tests produced extraordinary stresses both in the steel and also in the concrete itself.

EDUCATION OF WORKMEN.

A great deal has been done by the London County Council School of Building in educating clerks of the works and others as to the methods in which the practical part of reinforced concrete construction should be carried out. They ought to go a little lower and take in hand the men who are connected with the carrying out of the work because until such time as they themselves understand, to even a very slight extent, what is required of them, so long will they be careless in doing the work they have to do.

The foremen employed must be instructed to keep a sharp lookout on all their men and not to allow laxity in any shape or form. If the men know that the foreman is up to all their so-called tricks of the trade, then they will take good care that the work is carried out in an efficient manner, but if by any chance the foreman is careless his workmen will be the same; and it will, I think, very often be found that where anything serious takes place it is not only the men, but the foremen, and even the clerk of the works on the job, who are answerable for this state of affairs.

Any foreman who persistently makes mistakes in the carrying out of the work, after the same has been pointed out to him, should be dismissed and not allowed to undertake any work of the kind in the future. It is only by making examples of men who do bad work that one can expect an improvement to take place in the industry in this country. Works executed abroad, as a rule, are carried out by men who seem to take a great interest in their work. Even the ordinary labourer knows what he has to do and does it, whereas in this country there are so many instances of scamping, not only in reinforced work, but also in other branches of structural engineering, that it is only strict supervision in the past that practically made our work some of the best in the world, though I have very clear remembrances before me of seeing wooden rivets and other such things being used, and I daresay there are many in this room who have seen likewise. We do not hear of wood being put in for steel in reinforced concrete—that is to say, by the designer—but many accidents have proved that wood has been put in and has been the cause of the mischief.

ELECTROLYSIS.

A point that was investigated by the Science Committee some time ago was one which it is advisable, I think, for me to call attention to, and that is, electrolysis. I have watched one work where this mischief occurred, and only about a couple of months ago I made a further examination, and found that the mischief was still increasing. It is a moot point with some as to whether there is any electrolytic action or not, but personally I have very little doubt upon the subject, so that it behoves all designers and contractors to see that there is no possible chance of electric currents finding their way into the steel reinforcing, because, should they do so, I do not think there is any doubt whatever that it will mean the eventual disruption of the concrete. It only requires the exercise of care to put a stop to this and to be perfectly certain that all cables throughout the reinforced concrete work are properly insulated, and that there are no stray currents wandering about the work.

MATHEMATICS *v.* COMMON SENSE.

I think a great many of my hearers will agree with me in regard to the calculations of reinforced concrete work that a great deal too much mathematics has been imported into the subject, and that common sense has had to take a back seat.

If we were dealing with two materials, both of which were absolutely constant—that is to say, the concrete constant within a month after it was made in strength as the steel is immediately after it is rolled—then it would be possible to go in for mathematical formulæ of a high order; but where you have a material—*i.e.*, concrete—the strength of which, if all portions are good, is increasing day by day, and in some cases attaining a strength of three, four, or more times that which it was originally calculated for, how is it possible in these ways to formulate any formulæ which are even moderately correct? It is far better to use more common sense and simplify or formulate empirical rules which you know are absolutely safe in their application. It is no good trying to extract the square root of two—it is useless. I have seen cases where the stresses have been worked out to five places of decimals, and it could all have been done by mental arithmetic, and the result would have been so close that it was really not worth while troubling about.

I see cases constantly where rods are put into work varied in diameter to 32nds of an inch. That is not at all necessary. It wastes time on the work, and in a great many cases a wrong rod goes into the wrong place. It is far better to adhere in all cases to commercial sizes, never advancing beyond 16ths of an inch, and, if possible, advancing only by ⅛ths, as by that means the size of the rod is clear to the naked eye, and does not require a caliper to be put upon it to find out whether it is 21-32nds or 22-32nds of an inch. Such reinforcements as these simply show how designers lack common sense and bring the work into discredit. Exactly the same thing takes place with calculations submitted for approval. A mass of figures will be carried out into millions where the whole lot can be simplified by reduction

... or hundreds, and the elimination of anything beyond two places of decimals. The simpler calculations are made, the less liability there is of errors creeping in, and if an error does creep in then, it is much easier to discover: but where a whole foolscap page of figures is used to arrive at a result, it means in a great many cases simply courting disaster, as well as being also a waste of time and expense with a view to possibly saving a pennyworth of steel.

I have always been a great enemy to the complicated calculations, as I do not think they are at all necessary. It only brings to mind the largest building that has even been constructed in London. I am now speaking of as long ago as about five-and-twenty years. In an arch rib there was a deficiency in the centre of the span of, I think, ¼ in. in a large sectional area of steel. To make up this deficiency in compression a bar 2 in. by ¼ in. was riveted on, and this only for a length of 2 ft. or 3 ft., thus making mathematics simply an absurdity, whereas no common-sense engineer would for the sake of ¼ in. in 100 sq. in. ever think of doing anything so absurd.

The same applies to reinforced concrete. It is far better to work in all cases to commercial sizes of rods, even if there be a slight deficiency in sectional area, than to put in multiples of rods of all diameter so as to make up a given sectional area. This entails an enormous amount of work, not only upon the designer, but also upon the foreman who has to take charge of the work, and upon everybody connected therewith, and it is of no practical value whatever. Therefore I should like to see in all rules made for reinforced concrete that common sense should enter more largely into the formulæ that are given to the world, and not a mass of mathematics provided, which the authors know perfectly well are even then empirical, because one material is a constant and the other is an inconstant.

INVESTIGATION OF FAILURES.

The committees of the Concrete Institute have been seriously considering for a long time past the question of failures, and there is no doubt that if one could get at the whole facts of the cases with regard to failures they would be most instructive. As a rule, every work that fails has been kept in the background, for fear that the contractor or somebody in connection therewith would suffer either from the commercial point of view or the professional. It will be found, I think, as a rule, that the causes of failure are ones that can easily be allocated with the exercise of a little common sense and supervision. It is, as a rule, due to great carelessness on the part of foremen and workmen employed that the failures take place. Therefore it is advisable in all cases that the principal causes of failures should be known, in order that specifications may be made so rigid that there is little likelihood of these mishaps. It is the fear of failure that debars to a certain extent reinforced concrete from being used by many clients, and therefore it should be the object of all concerned with this matter, from a professional as well as from a commercial standpoint, to see that such care be exercised in the whole of the work, both as to designing, checking and construction that no one, for one single instant, should have any doubt but that reinforced concrete is for certain classes of work the best that can be employed.

It is no good for instance if a failure takes place ... to send it privately to a bad aggregate, to keep the same a secret, because it means that others possibly in the same neighbourhood go on constructing work therewith and with the possible chance that failure will also occur, whereas had the fact of the failure been generally known there is not much likelihood that a second disaster in the same locality would occur from the same cause. So that I make a contention against [illegible] to-night and to all who may read the evidence [illegible] whenever a failure in reinforced concrete takes place they will at once communicate with the Concrete Institute and let them have the facts of the case, not necessarily for publication, but to enable the institute so to word their suggested specification as to guard against a possible accident taking place in the future.

It is only by failure that we are enlightened. All through life it is the same way, and we only learn and remember our alphabet at school by making mistakes and being punished for such mistakes so that we understand. So it is in a minor degree with the subject I am speaking to you about to-night: the elucidation of a failure may be the means in the long run of saving an enormous amount of money.

[illegible] I have trespassed on your time more than I intended, but I trust that the matter of this address is one that we all have at heart; and if it is the means of causing work generally throughout the country to be carried out in a better manner than a lot has been done in the past, then it will be of some avail.

VOTE OF THANKS.

Mr. H. Percy Boulnois, M.Inst.C.E., chairman of council of the Royal Sanitary Institute, vice-president of the Concrete Institute, in proposing a vote of thanks to the president, said that in dealing with reinforced concrete work all knew how absolutely important it was that every man should be doing his best in putting in the concrete, and should not shirk his work, otherwise disaster would follow. Materials could be standardised, but, unfortunately, one could not standardise men, and the personal element of the men came into the work enormously. The best design might be ruined by bad workmanship.

Mr. C. S. Meik, M.Inst.C.E., vice-president of the institute, who seconded the vote of thanks, expressed the opinion that, unless one could get good workmanship, one could not get good work in reinforced concrete. For all such work the men should be specially trained, and one should make sure that there was not a man among them who had been accustomed to make concrete as it used to be made. The old-fashioned method of making concrete was, of course, quite out of place when dealing with materials like reinforced concrete, and the labourer who had been used to the old style could not be made to do good work in the new style. He emphasised the necessity of making test cubes when doing important work. Such cubes made as the work was going on were of great value afterwards should anything happen to the work. If a failure took place, for instance, during testing, it could be found out by reference to the cubes made on that particular day whether the failure was due to the cement or to bad workmanship, and the engineer's mind would be relieved to a great extent when it was found the cement was not at fault.

Mr. E. Fiander Etchells, F.Phys.Soc., M.Math.A., A.M.I.Mech.E., in supporting the vote of thanks, said the institute might congratulate itself on the fact that its standard notation for calculation in reinforced concrete had been adopted both in schools and in books, as well as by official authorities and technical institutions to the exclusion of all counter proposals, and if the same success followed the application of those principles to the formulæ of structural engineering generally, then the Concrete Institute would have done something to benefit the next generation. The president had referred to the sub-title of the institute —namely, "An Institution for Structural Engineers, Architects, &c." He would like it to be more than that he would like it to be truer to the facts and make it "*The* Institution for Structural Engineers and Architects," because it was the institution *par excellence* for them. There was no other institution in this country which combined architects and engineers in one corporate body, though there might be in Austria and in Germany. In doing that, he suggested that the David of the Concrete Institute was not in any way challenging the Goliath of the Institution of Civil Engineers, for the civil engineers had a far wider aim than structural engineering only; they claimed practically the whole of civil engineering. Structural engineering was just a branch, and the man who thought that civil engineering was synonymous with structural engineering was a man who held a view of civil engineering which was far too narrow for the council of the Institution of Civil Engineers.

Twenty-nine new members were elected, and three new students were admitted during the meeting reported above, bringing the total membership of the institute up to 938.

Public Slipper Baths. — The borough engineer of Chelmsford, Mr. P. T. Harrison, would be glad to hear of other towns with a population of 20,000 to 30,000 in which public slipper baths have been erected.

Trackless Trolley System at Leeds.—Mr. J. B. Hamilton, general manager of the Leeds tramways, stated last week that the trackless system had proved eminently satisfactory, both from the point of view of the public and the corporation, and proof that the latter were satisfied was to be found in the fact that this year application was being made to Parliament for powers to extend the system over several miles of road.

"CAMARCO" ON THE BATH ROAD.

At the invitation of the Canadian Mineral Rubber Company, Limited, of 32 Victoria-street, Westminster we inspected a day or two ago a section of the Bath Road near Reading, which has been made up with their material "Camarco," and have pleasure in testifying to the excellence of the paving. The road was laid by the Berkshire County Council during the first week of July, 1912, and has therefore been under traffic for more than four months. It is scarcely necessary to say, moreover, that traffic on the Bath Road is by no means light.

Laying Top Coat of "Camarco" Coated Slag.

The "Camarco" paving which we saw appeared to be in perfect condition. It showed the uniform smoothness typical of the natural asphalts, but was neither too hard nor too slippery. There seems to be plenty of grip to the pavement for horses' hoofs, yet the surface is ideally smooth and resilient to the fast travelling motor car. The road looks as if it will be good for a life of four or five years with little or no maintenance, and we are informed that the super. yard cost of the work was by no means excessive.

The method employed in making up this area was machine mixing the aggregate and the bitumen; laying and spreading on the road to the required thickness, and consolidating by a steam roller. The machine employed was the well-known Acme rotary mixer, supplied by Durable Roads, Limited, and the coating of the metal was done expeditiously and uniformly. The aggregate employed was slag of three sizes, viz., 2½-in., 1½-in., and 1-in.

When the coated metal was consolidated, a coating coat of pure "Camarco" was brushed on "painted" over, and ¼-in. granite chippings were then spread and rolled in, in the usual manner.

"Camarco" is based upon gilsonite, among the purest of natural bitumens. It is highly elastic, and also very adhesive, has no elements soluble in water, and has no volatile constituents. Moreover, it maintains its excellent binding qualities without deterioration, both throughout the hottest summer and the coldest winter possible in the United Kingdom.

The points we specially noted in the "Camarco" paving we are describing are— (1) The successful alliance of a cheap road metal and a high-class natural bitumen, and (2) a method of road making which can, with ordinary precautions, be carried out during autumn and winter without undue risk. We have no hesitation in recommending an inspection of the paving, and we understand that the proprietors of "Camarco" will welcome any inquiries as to the exact site of their Berkshire road and as to any further details of the construction.

"Camarco" is comparatively new to this country, but, under the name of "Pioneer," it has been known to surveyors for upwards of fifteen years in Canada and the United States, and, we understand, has a record for lasting qualities second to none. Among many places where it has been successfully used are the parks in Chicago, and we observe in a recent number of our contemporary *The Motor* that Mr. Rees-Jeffreys, secretary of the Road Board, speaks in the highest terms of these paving roads.

Finished "Camarco" Road.

Messrs. Tuke & Bell, Limited.—We understand that, in consequence of the increase of the business of these well-known sewage specialists, it has become necessary to introduce further capital, and the most convenient way of effecting this is by a reconstruction of the present company, and a transference of its assets and liabilities to a new and larger organisation, formed for the purpose, and to bear the same name. The new company will have a nominal capital of £20,000, instead of the £3,000 which is the nominal capital of the present company. The reconstruction involves the liquidation of the present company, but the proceeding is merely formal and the accounts of the company will be paid, as usual, in the ordinary course of business at the offices, 69 Leadenhall-street, London, E.C.

Bridge Building.—Students, young engineers, and surveyors will find much useful information in "Preliminary Studies in Bridge Building," by Reginald Ryves, Assoc.M.Inst.C.E. (London: St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. nett.) The book is described as the "first of a series of small volumes, each complete in itself, dealing with the design of ordinary highway bridges of moderate span." Though highway bridges alone are considered in the matter contained in this volume is largely applicable to railway bridges, aqueducts, and similar engineering undertakings. The five primary types of bridges are described, and the conditions determining the best site for each of the three types of streams are discussed in detail; while, in connection with wandering streams various modes of designing abutments or approach spans are dealt with. Improvements of fords and the effect of eccentric loading of vehicles on the girder loads are among the numerous other items touched on. *Scotsman.*

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. Frank Nicholson, of Dornoch, has selected the following books in respect of the premium for October, which was awarded to him:—

"Principles of Reinforced Concrete Construction," by Turneaure and Maurer (Chapman).

"Town Planning," by Inigo Triggs (Methuen).

These have been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:—

285. Building Construction.—Explain, with sketches where necessary, the meaning of the following terms: (*a*) Larrying, (*b*) pugging, (*c*) gib and cotter joint, (*d*) lead soakers. ("Pupil.")

286. Hydraulics.—A hemispherical cistern is 20 ft. in diameter, and it is full of water. How long will it take to lower the depth of the water 5 ft. if the water escapes through a 3-in. diameter sharp-edged hole in the bottom of the cistern? The coefficient of discharge for the hole is 0·60. (H. V. O., *West Bromwich.*)

287. Street Gulley.—Will some reader kindly supply a sketch of some form of street gulley, the grid of which is on the face of the kerb and not in the channel of the roadway? ("Anxious.")

288. Mechanics.—Explain clearly the distinction between a vector, a scalar, and a vector quantity. ("Beginner.")

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

283. Strength of Materials.—What is meant by the following terms: (*a*) Modulus of elasticity, (*b*) elastic limit, (*c*) permanent set, (*d*) plastic elongation, (*e*) ultimate elongation, (*f*) contraction of area? ("Inquirer.")

The modulus of elasticity, or Young's modulus, of a material, is the ratio of the stress per unit area to the strain per unit length, when the material is deformed under the action of a direct tensile or compressive force.

In some materials, as wrought iron or steel, the modulus is a constant quantity for stresses which are caused by what may be termed working loads; in cast iron this is nearly, but not quite, true, but in a material such as concrete it varies considerably. In the latter case the actual stress at which the modulus is calculated should be specified, though for calculations in connection with reinforced concrete design a modulus is assumed which is a fair average for the range of stress acting.

Perhaps the best method of defining the terms is to consider a specimen of a material such as wrought iron or steel when tested to destruction by tension, and assume that means are available for registering the stresses and extensions at any instant.

As the load on the specimen is gradually increased, the extensions will increase proportionally, so that the ratio stress/strain will be constant for this period of loading.

At a point which can only be determined by the most accurate observations, the strains commence to increase faster, proportionally, than the stresses.

The stress at the point is known as the "elastic limit," and for all lesser stresses the ratio stress/strain is constant.

As the load is further increased a sudden and perceptible give or yield takes place almost immediately, the stress at that point being known as the "yield point."

If the load is removed at any time before the yield point is reached the bar will regain its original length, but after the yield point has been passed removal of the load shows a permanent lengthening of the bar, this being called "permanent set."

On further loading, elongation continues, the strains increasing at an accelerating rate with greater stresses. This is a "plastic elongation," and depends somewhat on the rate of loading, as the whole extension does not occur immediately on the addition of more load, a slow creeping or plastic flow following for some time without further additional load.

This state of plastic elongation becomes more and more marked, till eventually, near the maximum load, the material becomes almost perfectly plastic, and will extend greatly for a slight increase of load. This extension becomes confined to one portion of the bar, which draws out into a waist, and fracture occurs.

The "ultimate elongation" is the increase in length after fracture, and as it is measured as a percentage of the original length, that length should be stated, owing to the elongation not being uniform over different portions of the bar.

As the volume of the bar remains practically constant, there is a reduction in area, which is chiefly localised at the waist. The contraction of area is usually expressed as a percentage of the original area, which should be specified.

The ultimate breaking stress is always reckoned by dividing the maximum load by the original area, though owing to contraction of area the actual maximum stress is greater.

As an example, a wrought iron specimen, 8-in. long, 1-in. diameter, which broke at a stress of 24 tons per sq.-in., might be expected to have an elastic limit and yield point at about 16 tons per sq.-in., an ultimate elongation of 20 per cent. and contraction of area of 40 per cent. The modulus of elasticity is about 12,500 tons per sq.-in. (H. E. L., *Islington.*)

(*a*) By Hooke's Law, stress varies as strain, *i.e.*, $\frac{\text{stress}}{\text{strain}}$ = a constant. This constant is usually denoted by E, and is called the modulus or co-efficient of elasticity; or E is the stress required to produce unit strain in a bar of unit cross-section area.

But strain is measured by $\frac{\text{increase in length}}{\text{original length}}$

$\therefore$ Unit strain $= \frac{\text{length}}{\text{length}}$ — *i.e.*, the length of the bar is doubled to produce unit strain.

$\therefore$ E is the stress which will be induced in *elastically* straining a bar of unit cross-section area to double its length.

For good steel, E = 30,000,000 lb. per square inch.

(*b* and *c*) When an increasing straining action is applied to a material such as steel elongation or strain is produced. Up to a certain point, if the load be removed the strain disappears; the material is acting elastically; beyond this point, if the load be removed the strain remains, and a *permanent set* is said to have been produced.

(*c*) The greatest load which a material can stand without permanent set is termed the elastic limit of that material.

(*d*) Plastic elongation is the elongation produced during the plastic stage or beyond the elastic limit, and bears no direct relation to the stress, but is much greater than the elastic elongation for a given *increase* in load.

(*e*) The ultimate elongation of a material is the total increase in length of a given specimen when stressed to breaking.

(*f*) When a specimen is tested in tension, the elongation is accompanied by contraction in cross-

sectional area, because the volume remains constant. This is negligible within the elastic stage, but is considerable beyond the elastic limit. The contraction is uniform throughout the whole length up to the "yield point," when the specimen forms a "neck" over a short portion of its length, and at breaking the diameter at the fracture may be only one-half of the original diameter. (H. V. O., *West Bromwich.*)

284. Wood Paving. What are the comparative advantages and disadvantages of soft and hard wood for street paving? ("Suburban.")

It is exceedingly difficult to arrive at any comparative merits and demerits of hard and soft woods for street paving, as unless the various types of wood are laid under exactly similar conditions entirely erroneous conclusions may be arrived at. Various circumstances contribute to the satisfactory condition —or otherwise— of a street paving. Such circumstances are: Sufficient foundation, as after all the strength of a road is the strength of its foundation; careful selection of materials; gradient; care in laying; due attention given to repairs; situation of the street; systematic cleansing; the amount of traffic. All these factors being taken into account, and having found two sections of hard and soft wood paving in use under exactly similar conditions, it is then fair to make a comparison between the two types.

As soft wood is mentioned in the question first, let us take it first. Soft wood is taken to include red and white deal, pitch-pine and spruce. Many other woods are classed as soft woods, but these are the chief, and red deal is the more commonly used. To take the advantages first. First cost is lower, being about 12s. per square yard laid; it wears evenly, the spreading of the fibres where one block butts on another filling any depression at the joint; the grit used to give foothold in wet weather is more easily pressed into the wood without damage to the fibre, and so is not merely swept into the gutters by the traffic. The disadvantages are: Soft wood is more pervious than hard wood, and consequently is less sanitary than hard wood. This objection, however, is lessened, if not completely disposed of, by treating the blocks under pressure with creosote or other waterproofing material. The life of soft wood is shorter than hard wood —on the average about eight years. The annual maintenance is higher, being from 1s. to 1s. 6d. per square yard. Cost of cleaning is also higher, owing to the greater tendency of mud and fæcal matter to adhere to the surface, annual cost of cleaning per square yard being about 3d.

Hard woods, for the purpose of street paving, usually refer to the Australian woods karri and jarrah. Other varieties have been used and termed hard woods, but the two mentioned above are the most important. The advantages of hard woods are: The life is longer than soft woods, being about fourteen years; the wood is practically impervious to moisture, so being more sanitary and more suitable for roads where the centre is liable to be used as a cab-rank; there not being such a demand for hard woods of the type used for paving as there is for deals, there is more likelihood of obtaining sound heart wood, and so a sounder material; the annual cost of maintenance is lower than for soft woods, being from 10d. to 1s. 3d. per square yard; cost of cleansing is also lower, owing to the harder skin, and is from 2d. per square yard per annum. The disadvantages of hard woods are: The first cost is higher, being from 15s. to 17s. 6d. per square yard laid; owing to the hardness of the wood the edges of the blocks are apt to break off under the action of the traffic, and the grain not spreading, after the nature of soft woods, the surface of the paving becomes ribbed, and presents an appearance like corduroy, a surface of this nature being most unsatisfactory, especially for fast-moving traffic; the surface also tends to become more slippery.

The question may be summarised thus —

Advantages: —

Hard wood: Longer life, more sanitary, less upkeep, less for scavenging.

Soft wood: Low first cost, wears more evenly, less slippery.

Disadvantages: —

Hard wood: Higher first cost, wears less evenly, more slippery.

Soft wood: Shorter life, less sanitary, more upkeep, more for scavenging.

("E.C.I.R.P.")

The advantages of hard woods such as oak, blackbutt and jarrah, for street paving, are their long life under heavy wear of traffic, about fifteen to twenty years, which is 25 per cent longer than soft woods under the same conditions. It does not always require creosoting.

The disadvantages, however, being that they shrink, and large cracks are formed in summer weather, unless well watered, or by the seaside where the action of the salt air keeps them moist.

Hard wood wears very unevenly, for it is impossible to get all the blocks of the same density, or evenly graded, for the wood taken from the top of a tree is less dense than that at the bottom, and after about eight years of hard wear the surface becomes very corrugated, and holes 2 to 3 ft. in diameter are formed.

Soft woods, as red pine and yellow deal, well seasoned and creosoted, form a very good paving.

Creosoting lengthens the life of the wood, and also for sanitary purposes it sterilises urine, and prevents damp soaking into the fibres.

The chief advantages of soft wood as compared with hard are due to the fact that it is silent and less slippery.

It also wears more uniformly, and has proved to be the cheapest form of road surface if the prime cost and upkeep is taken for over a period of twenty-five years.

It is for these reasons that soft wood is now generally used, and it is found to be more satisfactory than hard wood, although its life is slightly less.

It has, however, the disadvantage of swelling, but this can be easily allowed for by inserting a compressive joint of 1½ in. of clay at the junction with the kerb. (G. W. H., *Kingstanding-Thornes.*)

Surveyors' Institution Junior Meetings. A paper, entitled "Report Writing," which was read on Monday evening last by Mr. E. L. Rice at a junior meeting of the Surveyors' Institution, has been awarded the Professional's Prize.

Australian Hardwoods. Sir G. H. Reid, High Commissioner for Australia, will preside at the opening meeting of the Colonial Section of the Royal Society of Arts next Tuesday afternoon, when an illustrated paper on "The Hardwood Timbers of New South Wales" will be read by Prof. W. H. Warren Dean of Faculty of Science Sydney University. Tea chair will be taken at 4.30.

London County Council Tramways.—A scheme for the reconstruction of the London County Council tramways from Highbury Station to City-road, *viâ* St. Paul's-road, Canonbury-road, New North-road and Eagle-road, at an estimated expenditure of £62,750, has been submitted to the Highways Committee. Another scheme to be considered is that of constructing a tramway from Yorkroad to East-hill, Wandsworth, *viâ* Highstreet and East-hill, at a cost of £26,480.

Cost of Municipal Services.—The Local Government Committee of the London County Council have prepared a report on the cost of administering public services. This shows that the cost in London is 63s. per head of the population, whereas in Birmingham it is only 45s. In Sheffield the figure falls as low as 38s., in Bristol it is 48s., and in Leeds 48s. It appears, however, that while the total nett cost of general municipal services per head of population is highest in London, the total cost per £ of assessable value is lowest.

SEA-COAST EROSION.—For a very complete and inexpensive library on the cause, prevention and repair of coast erosion the following three works are recommended: "Coast Erosion and Foreshore Protection," by John S. Owens, M.D., Assoc.M.Inst.C.E., F.R.G.S., and Gerald O. Case (price 7s. 6d., post free 7s. 10d.), with numerous illustrations and diagrams; "Sea-Coast Erosion and Remedial Works," by R. C. Allanson-Winn, M.Inst.C.E.I. (price 1s., post free 1s. 1d.); and "Erosion of the Coast and its Prevention," by F. W. S. Stanton, Assoc.M.Inst.C.E., F.S.I. (price 3s., post free 3s. 2d.), with numerous maps and other illustrations. The publishers are the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

INTERCEPTING TRAPS IN HOUSE DRAINS.

To the Editor of The Surveyor.

Sir,—I had the privilege of attending the recent meeting of the Royal Sanitary Institute, and listening to the able address of Mr. H. Percy Boulnois on the report of the Departmental Committee of the Local Government Board on "Intercepting Traps in House Drains," as well as to the discussion thereon, and, although disappointed confess I was not surprised that the result of the evening's conference shed no new light on the subject, nor in any degree further advanced the solution of this long and much debated problem. I say advisedly I was not surprised at the unsuccessful result, because it was hardly to be expected that such an important and complex subject could be finally thrashed out in a couple of hours. It has been occupying the serious attention of sanitarians for the past quarter of a century, and, as Mr. Boulnois stated in his address, has occupied the Departmental Committee for four years in pursuing investigations and inquiries, and publishing their report thereon without, alas! any definite or conclusive result. Consequently I at least of those present left the meeting in a frame of mind which recalls a quotation from the "Rubáiyát" of Omar Khayyám ". . . and heard a great argument about it and about, but evermore came out by the same door as in I went."

The discussion might not inaptly be compared to "tug of war" competitions of two hours' duration, in heats of ten minutes each, excepting that at the meeting cited none of the competitors secured the award of the umpire. It is therefore not surprising that the chairman, Sir Maurice Fitzmaurice, adjourned the discussion to a subsequent evening. I do not claim the ability to decide this momentous question as to the retention or abolition of the intercepting trap, nor would it be possible to do so within such limitations as are here afforded—the solution of this enigma may, with complete confidence in their abilities, be left to the municipal and county engineers and surveyors, and other allied professional gentlemen, to whose province it essentially belongs, owing to their long-continued great experience in all matters appertaining to the sewerage of towns and districts which they officially control; nevertheless, in common with other sanitary engineers, I take a vivid interest in this most important question, but would, at the same time submit that the burning question to be decided at the out-set and before all other issues are debated is the absolutely safe severance and disconnection of the water-closet apparatus from the house drain. In the "Minute" on the intercepting trap in the issue of your journal of the 15th inst. you properly state that—"The wastes from sinks, baths, &c., are already disconnected from the drains at the gullies," and call attention to "the necessity of some means being adopted of effectively disconnecting water-closets from drains without having recourse to an appliance which would perpetuate the defects of the intercepting trap," and you "commend this proposition to the inventive genius of sanitary engineers and manufacturers of sanitary appliances." Without any further preamble, I will at once say that the required pattern of water-closet has already been successfully introduced by Messrs. George Jennings, Limited, and is known as "The Closet of the Century," with syphonic discharge, wherewith complete disconnection from the soil pipe or drain is secured, with continuous fresh air circulation between the traps. This apparatus has gained the Silver Medal and highest award of the Royal Sanitary Institute, and has been installed in many of the most important buildings in all parts of the world. To occupy valuable space in your paper in describing this water-closet apparatus in detail would be an undue liberty, and I will merely add that the apparatus can be seen and tested in the museum of the Royal Sanitary Institute, or at the showrooms of above-mentioned firm. By some persons it may be considered that the sole object of this letter is to advertise my firm's productions, and although I admit there are some grounds for such contention, I am content to leave the judgment on our actions in this matter to those higher minds who recognise and appreciate that a manufacturer may be able to confer lasting public benefits even and when advocating his own wares.—Yours, &c.,

Walter Jennings, Director.

BITUMINOUS MATERIALS.

To the Editor of The Surveyor.

Sir,—In common with many of your readers, I have been much interested in the correspondence which has now for some time past been appearing in your columns on the subject of bitumen. Before the public can follow any discussions of this kind, in which owing no doubt partly to the approaching International Road Congress they appear to be daily more and more interested, it is necessary that they should have fixed in their mind the exact meaning to be attached to all such words as "asphalt," "bitumen," "bituminous," &c. When two distinct meanings are confounded under one or more words (and such must be the case where our knowledge is progressive, and therefore imperfect), erroneous inferences will be drawn, and what is true in one sense of the word will be affirmed as true in both. Hence the necessity for appropriating to each term a clear and distinct meaning.

It has occurred to me that you would be adding another to your many services to all who are interested in modern road construction if you would open your columns to a discussion on the definition of the words above mentioned; and with this end in view I now venture to offer a small contribution by way of opening the question.

Bitumen.—Prévost Hubbard, the distinguished head of the Division of Roads and Pavements in the Institute of Industrial Research, Washington, U.S.A., adopts the following definition of this term:* "Bitumens may be described as consisting of a mixture of native or pyrogenetic hydrocarbons, and their derivatives, which may be gaseous, liquid, a viscous liquid or solid, but, if solid, melting more or less readily upon the application of heat, and soluble in chloroform carbon-bisulphide and similar solvents." It will be seen from the above definition that the word "bitumen" covers a very wide field, and therefore requires some qualifying addition when we are making reference to some particular substance. Happily, the road engineer is concerned only with a limited number of the substances which come under the general head of bitumens. Bitumens are either native or artificial. The former occur in Nature, and are the result of natural processes; the latter, as the term "artificial" implies, are obtained by distillation or other chemical processes. Bitumens also are found in mineral substances (such as bituminous coal), from which they may be educed by destructive distillation. Such bitumens, of course, come under the head of artificial.

Asphalte.—So far as my memory serves me, a correct definition of this term appeared not long ago in your Students' column "Limestone impregnated with natural bitumen." This is in substantial agreement with M. Léon Malo, an eminent French authority, who defines asphalte as "calcareous rock impregnated naturally with bitumen." Of all forms of bituminous material this is, perhaps, the most familiar to the citizens of London, being laid in the form of monolithic pavement in many of our main streets.

Asphalt, Asphaltum.—These two words are synonymous, and are used indifferently in U.S.A. to denote the solid form of natural bitumen. It will be noted that the word "asphalt" is spelt without a final "e." An example of asphalt or asphaltum familiar to us all is that obtained from the Trinidad Lake, which may be seen, also in the monolithic form of pavement, on the Thames Embankment, where it is employed as a matrix for graded sand. The use of the word "asphalt" is, I suggest, unnecessary, and likely to lead to confusion, and I venture to propose that in future only the two forms, "asphalte" (with an "e") and "asphal-

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS' TOWN PLANNING COMPETITION.

To the Editor of THE SURVEYOR.

SIR,—The council of the Institution of Municipal and County Engineers is to be congratulated on [illegible] a Town Planning Competition [illegible] early. The conditions cannot be criticised [illegible] have received the approval of the council. The premiums offered for [illegible] the dignity of the institution demands, for premiums [illegible] last annual meeting, are likely to deter rather than [illegible] the drafting of plans.

The premiums [illegible] or part of the [illegible] Mr. Lloyd George's offer to the electors in making demands altogether disproportionate to the increased benefits offered. The council has the failings of the Dutch, who "offer too little and ask far too much." Hardly one of the competitions promoted during the past few years, even for a building estate of 200 or 300 acres, has offered less than £50 for a first premium, and [illegible] £100. For schemes for laying out the Blackley estate for the Manchester Corporation, premiums of £150, £100 and £50 were offered. Douglas, for laying out pleasure grounds and a park, offered as premium of £200 and two of £100. Schemes for less populations and plans than [illegible] 100 times greater—*e.g.*, the Australian capital provided premiums of £1,750, £750 and £500; for the Dusseldorf extensions £1,000 and £375 were offered; and for laying out a portion of Buenos Ayres, £1,060, £640 and £450. No one expects the latter or, in view of the latter, but if they do not want their competition to end in a fiasco, they must more liberally increase the premiums and [illegible] their conditions. One [illegible] or sets of plans asked for, two of the larger scale plan for the centre of the city, and the bird's-eye view—are quite unnecessary, and for such a competition should not be required. A perspective for a small villa will cost 3 guineas, and there is no perspective draughtsman worthy of the name who would make a bird's-eye view of a town of 50,000 inhabitants for the largest of the premiums offered by the institution. Most architectural competitions at the present day distinctly debar perspectives and colour, and here we have a competition for engineers asking for fancy pictures for a £10 premium!

Then, again, the description offered is most vague. Surely a sketch or block plan might have been prepared showing the main features of the district, and the levels given. We are told the town has already a population of 50,000, and accommodation for 100,000 visitors, but nothing is said as to whether the existing town is to be replanned, which seems somewhat absurd, or if the existing streets and buildings are to be ignored, which is equally absurd, or for what prospective population it is necessary to provide.

The low cliff is said to be 20 ft. above the Parade on the north edge of the site, but no level is given for the Parade, and the north edge may mean the whole 5 miles of its length or a short portion only. Again, who could plot or locate the estuary of 200 acres from the description given?

It is to be hoped that amended conditions with sketch plan, and increased premiums will be given, for unless this is done I am sure the institution cannot expect to get the more able of its members to compete; and while the result may provide amusement for our architectural friends, it can only bring ridicule on the profession of the municipal engineer.—Yours, &c.,

SURVEY.

November 19, 1912.

MODERN ROAD CONSTRUCTION.

To the Editor of THE SURVEYOR.

SIR,—Referring to your comments and the article upon "Road Efficiency," reproduced in your issue of the 15th inst., may I be allowed a small space in your valuable paper to ask both councillor and surveyor who they consider is to blame for the present state of things, as it is one thing to find fault, but quite another to amend it?

Eight years ago I thought out the problem on what I considered practical lines, and four years afterwards introduced the "Jonesway" system, with a view of saving what is now considered "money wasted," but the system was thought too elaborate and expensive at £3,000 per mile. Since then I have introduced the "Jonesway" armour at a considerably less cost, yet this is considered too expensive, though experimental lengths of other methods have been tried at an average cost of £2,652 per mile.

Is it not time we heard something as to which is the best and cheapest for uniformity in road construction?

Engineers admit that the armour placed at the point or seat of attrition will last twenty years, and extend the line of foundations and surface, while others do not consider it expensive in the long run; it is the initial outlay! Figures shown in the Local Taxation Returns expose the highest in loans and cost of maintenance on record; the interest upon loans would exceed the total loan required a century ago before canals and railways were introduced to relieve the roads of the bulk of traffic, which makes one consider whether the saving in time at the increased cost of modern transit compensates the community.

If it was necessary years ago to relieve the roads of traffic which appears to be coming back to the roads, is it not essential to regulate it by means of a central track for the heavy and fast traffic if it is beneficial to other users of the road?—Yours, &c.,

THOMAS JONES.

Hampton-in-Arden.
November 19, 1912.

MIXING CEMENT WITH "BITUMEN."

To the Editor of THE SURVEYOR.

SIR,—As I cannot say it would be found by Mr. W. J. Howard-Smith in the patent specification he mentions, I however can assure him there is no need to pay 8d. to learn if it is "a good thing to mix cement with 'bitumen' (*i.e.*, pitch and tar)," as the mixing of pitch, sand, &c., is not a new process, and the manufacture of materials of this class has

been carried on for many years. The sand, or whatever is used in the pitch, is found necessary for the several purposes these mixtures are used, for a pitch is useless alone. It has no body or toughness, and is, of course, very brittle, and has a low melting point.

The compositions in some cases are intended to take the place of a natural bitumen, such as Trinidad, but the natural product, even at a higher price, is always to be preferred to the artificial. It can only therefore be said to be a "good thing" to employ a filling material with pitch from a manufacturer's point of view, and when mixtures of sand, pitch and artificially produced petroleum residuums—often referred to as "bitumen"—are preferred to natural products obtained from sources where genuine bitumen is known to occur, it may be taken for granted that it is due to want of knowledge and experience or some other particular reason.—Yours, &c.,

A. E. H. Dussek.

Canal Bank,
Deptford, London, S.E.
November 19, 1912.

MUNICIPAL ENGINEERS AND THE PETROL TAX.

To the Editor of The Surveyor.

Sir,—The following communication has been sent to the Road Board by the Institution of Municipal Engineers.—Yours, &c.,

B. Wyand,
Secretary, Institution of Municipal Engineers.

39 Victoria-street, S.W.
November 15, 1912.

[Copy of letter referred to.]

Sir,—Under the provision of the Finance (1909-10) Act, 1910, medical practitioners are granted certain remissions in respect to (a) the duty on motor spirit, (b) the licence on motor cars, in the case of motor-cars "used by them for the purposes of their profession."

There are in this country some hundreds of engineers and surveyors to local authorities who have charge of a very large mileage of highways, and who have, upon quite a moderate salary, to find their own means of locomotion. Many of these are practically compelled to provide and maintain a motor vehicle of some kind or another, and the expense of annual licence and of petrol for running purposes presses heavily upon their income.

The council of the institution have had this matter under consideration, and they feel that it is one which might receive the attention of your board, with a view to obtaining a concession for municipal engineers similar to that granted to the medical profession.—I am, Sir,

Your obedient Servant,
B. Wyand,
Secretary, Institution of Municipal Engineers.

November 14, 1912.

THE CROMPTON PAVEMENT.

To the Editor of The Surveyor.

Sir,—Bearing in mind George Herbert's quotation at the head of the columns, and having no desire to take up your space with a personal controversy with Mr. W. J. Howard-Smith, I would like to point out that his correspondence related at the outset to criticism of Colonel Crompton's pavement, and was headed accordingly, and those which I have not deviated.

It is now quite evident, not only from the flippant manner in which Mr. Howard-Smith originally criticised Colonel Crompton's pavement, but also from his subsequent letters on the subject, that his knowledge of bitumen is limited to the so-called "British" variety, and after his forty years' experience with this material no doubt it is difficult for him to throw off the trammels of the past and realise that Colonel Crompton has adopted more advanced ideas than his own.

In some remarks which I made in *The Car Illustrated* in 1910 I mentioned that the Road Board was then in its infancy, and, like most other infants, the first word I am here taught to speak was "tar." As, however, the Road Board is now growing up and using words of two and three syllables, such as asphalt and bitumen, doubtless it will soon be able to expound to road engineers the real meaning of these apparently still much misunderstood words.—Yours, &c.,

Cecil Nathan.

3 London Wall-buildings,
London, E.C.
November 18, 1912.

WHAT IS A GARDEN CITY?

To the Editor of The Surveyor.

Sir,—My attention has just been called to a letter on the above subject from Mr. A. J. Price, of Lytham, which appeared in your issue of the 15th inst., and from which I gather that he is under the impression that Mr. Culpin is the secretary of First Garden City, Limited, Letchworth.

I am, and have been for over six years, secretary of this company. I think some mistake has occurred, but am quite sure Mr. Price must be under some misapprehension, as Mr. Culpin is the last man in the world to suggest such a thing. Possibly confusion has been caused by the fact that Mr. Culpin is the secretary of the Garden Cities and Town Planning Association, which is a propagandist body whose objects are to preach the gospel of town planning, garden cities, garden suburbs, garden villages, and so forth.

First Garden City, Limited, is a commercial company, whose sole object is the development of an estate of 4,500 acres at Letchworth as a garden city.—Yours, &c.,

Harold Craske, Secretary,
First Garden City, Limited.

Letchworth, Herts.
November 19, 1912.

To the Editor of The Surveyor.

Sir,—Mr. Price has not in any way dealt with the points I made in my last letter, so I do not intend wearying your readers with any further reply to him. Apparently he is of opinion that he knows more about what the garden city is and what is the garden city movement than those who are connected with it; so we will leave it at that.

He mixed up the leaders, and now he mixes me up with the secretary of First Garden City, Limited. I thought by this time it was pretty well known that the Garden Cities and Town Planning Association, although the founder of the movement and responsible for the propaganda, is not responsible for the actual work of development, and that the secretary of the company responsible for the great work which is being done at Letchworth is Mr. Harold Craske, whose address is at Letchworth.—Yours, &c.,

Ewart G. Culpin, Secretary,
Garden Cities and Town Planning Association.

3 Gray's Inn-place,
Gray's Inn,
London, W.C.
November 20, 1912.

THE ROAD CONGRESS EXHIBITION.

To the Editor of The Surveyor.

Sir,—In your list of firms who are exhibiting at the exhibition of road materials in connection with the Road Congress next June we note that you have entitled us The Canadian Rubber Company, Limited. We trust that you will be kind enough to publish this letter as a correction to the above title. Our proper title is as we sign ourselves below.

We are particularly anxious to emphasise the term "mineral rubber," as our bitumen "Camarco" is noted for its great elasticity as well as its other rubber-like qualities, and yet is a pure natural bitumen. Another thing that we notice is that we, with other non-tar firms are classed under the heading of "Tarmacadams, &c." This might give an inquirer a wrong opinion of the origin of "Camarco."—Yours, &c.,

The Canadian Mineral Rubber Company, Ltd.

[The announcement referred to in the foregoing appeared in last week's issue, and was printed as received from the exhibition authorities. While we are therefore not responsible for the errors the statement contained, we have pleasure in inserting the necessary correction. Ed. The Surveyor.]

Municipal and County Club.—The Lord Mayor, Sir David Burnett, and the Sheriffs of the City of London will be the guests of the evening at a banquet to be given by the Municipal and County Club at the Whitehall Rooms, on Monday, December 16th. Sir Wm. Purdie Treloar, Baronet, vice-president of the club, will preside.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Ashby Woulds U.D.C. (November 15th. Major J. Stewart). £3,000 for the water supply of the Ashby Woulds district under the provisions of the Public Health Act 1875. Mr. W. A. Musson, clerk to the Swadlincote and Ashby-de-la-Zouch Joint Water Committee, stated that they wanted the board's consent to the water supply. The price for 1,000 gallons was 9d., and there was no limitation as to the maximum or minimum supply. The existing mains were laid by the Hartshorne and Seals Rural District Council in 1900 from their area to Moira Village. The remainder of the pipes were laid by the Ashby Woulds Urban District Council. The supply was from a reservoir at Woodville, and that council paid £7 10s. per annum for wear and tear of the mains inside their area, and £12 per annum for those outside. They had the option of purchasing. Mr. N. J. Rowley, surveyor and inspector to the urban district council, gave evidence.

Basford R.D.C. (November 8th. Mr. W. O. E. Meade-King). £570 for the Bradmore and £754 for the Bunny water supplies.—Mr. S. Maylan, engineer to the council, explained that the scheme originated from the request made by Dr. Cordeux, of Bunny Hall, for a supply of the Nottingham Corporation water. He asked for a continuation of the mains from Rempstone, and also for a contribution of £900 towards the cost of the scheme. Eventually he increased the offer to £1,000. Mr. W. Stone, on the representation of Bunny council was withdrawn. Negotiations were opened with the corporation, and their terms were accepted. The original estimate of £1,000 had now had been increased to £1,804, on account of the increased price of iron pipes. Mr. Maylan explained that 7in. pipes in the Bradmore district would be used instead of 6in. pipes. Dr. Cordeux pounds was to be paid by Dr. Cordeux, leaving a balance of £1,004 to be borrowed. The rate per £ for repaying the estimate Bradmore £754 and Bunny £7 10s. proposed to make the loans repayable in thirty years. The estimated population of the district was 199 and Bunny 211 [illegible] consumption 15 gallons per head.

Hazel Grove (Cheshire) U.D.C. (November 1st. Mr. F. H. [illegible]) for the making of new streets. The scheme was prepared by the surveyor, Mr. G. S. Doncaster, who was complimented on the [illegible] plans were prepared.

Newquay U.D.C. (November 19th. Mr. Edward Leonard). £110 for the [illegible] improvement at Stonecastle Corner. [illegible] contractor's tools [illegible] the clerk, Mr. [illegible] stated that the council adopted the Private Street Works Act in 1910 almost entirely with the object of [illegible] for sixteen years, and the council had endeavoured from time to time to get it put in order, but without success. The surveyor, Mr. John Ennor, gave details of how it was proposed to [illegible] he said were at present in a very bad state.

Ossett T.C. (November 5th. Mr. E. Leonard). —£590 for the erection of a fire-engine house and [illegible] keeper's house in Illingworth-street; £1,169 for the purchase of land [illegible] £163 for street improvements in Southdale-road; and £2,100 for expenditure in excess of borrowing power in the erection of the town hall.—The town clerk, Mr. T. W. Wilson, represented the corporation, and, dealing first with the application for borrowing powers for the proposed erection of a fire brigade station and the purchase of a fire engine, said that during the last few years there had been a large [illegible] warehouse fires in Ossett, and they [illegible] because they had no fire engine. The borough surveyor, Mr. H. Holmes, gave evidence in support of the application. Respecting the application for sanction to borrow £2,100 for expenditure in excess of borrowing powers in the erection of the town hall, there was no opposition.

Penistone (Yorks) U.D.C. (November 6th. Mr. E. Leonard). £500 [illegible] public hall and public offices on land adjoining Shrewsbury-road.—The proposed building it was stated will have an area of 1,000 yds., with a frontage to Shrewsbury-road of just over 82 ft. The public hall will be 40 ft. wide [illegible] ft. long, and will seat 150 persons.

Pontefract T.C. (November 5th. Mr. Montague Clifton).—£5,600 for the erection of public baths.—It was stated that Mr. J. G. Lyon, one of the three Freemen of the borough, had offered to defray the cost of [illegible] £5,000, making the total cost £10,200. The baths are to be placed on the Headlands estate, [illegible] destructor, and corporation stables have already been erected. The baths will displace baths which are altogether disproportionate to the needs of the borough.

Rotherham T.C. (November 14th. Major J. Stewart). £5,000 for works [illegible] powers. The town clerk stated that [illegible] the council proposed [illegible] in future all footpaths, either those made by the local authority or new streets made by private owners under the provisions of the Public Health Act, to be flagged. In 1910 a loan of £5,000 was obtained, being the first instalment in connection with the carrying out of the footpath scheme. In making the present application the Highways Committee had been moved by the necessity of actively carrying out what he might term the conversion, because for one thing they found that the present form of causeway had got into [illegible] and was [illegible] the [illegible] of the population.

Scarborough T.C. and Scalby U.D.C. (November 13th. Major J. Stewart). The Scarborough Corporation sought a loan of £400, and the Scalby Council an [illegible] £200 [illegible] Burniston-road at a dangerous corner near Scarborough. The total cost will be £1,200, and the Road Board have made a grant of £600.—It was stated that the Scarborough Corporation were proposing to incorporate [illegible] of Scalby into the borough of Scarborough. Alternatively the Scarborough Corporation asked for £600 if the Scalby Council's application was refused. There was no opposition to further applications by the Scarborough Corporation for £600 for erecting seventeen additional bathing bungalows in the North Bay, £250 for erecting an open [illegible] North Bay, [illegible] the present [illegible] and £200 for a [illegible] existing [illegible] Esplanade, [illegible] Road, [illegible] Peasholm Park.

Stoke-on-Trent T.C. (November 19th. Mr. M. K. North).—£11,000 for storm-water drainage at Burslem [illegible] £1,100 for the [illegible] of [illegible] Street. Mr. L. B. [illegible] said that in the Park district of Burslem a large building estate had developed during the past few years. Complaints had been received in times of storm of the flooding of cellars of houses in the district owing to the existing sewer not being of sufficient capacity to take away the sewage and the storm water. Mr. A. Burton, borough surveyor, produced plans, and explained that £241 had already been spent on "unemployment [illegible] during the coal strike. Mr. Lee said the site for the new fire station was centrally situated. The land was [illegible] purposes.

APPLICATIONS FOR LOANS.

Bromsgrove R.D.C. £1,650 [illegible] necessary.

Cambridge T.C.—£1,868 for the provision of a recreation ground.

Chippenham T.C. £1,000 [illegible] street improvements.

Coleraine U.D.C.—£3,000 for the erection of workmen's dwellings.

Doncaster T.C.—£28,895 for the erection of 124 workmen's dwellings.

East Ham T.C.—£3,883 for the provision of a recreation ground.

Felixtowe U.D.C.—£4,052 for electricity extensions.

Oundle R.D.C. £1,000 [illegible] water supply scheme.

Panteg U.D.C.—£2,000 for an additional housing scheme.

Wakefield T.C.—£14,134 for street works.

LOANS SANCTIONED.

Ashton-under-Lyne T.C. £3,000 [illegible] existing sewer.

Beds C.C. £5,306 for a new [illegible] at Leagrave.

Blyth U.D.C.—£13,598 for an elementary school.

Bristol T.C.—£400 for a public convenience.

Bromley T.C.—£915 for artificial stone paving and road widening.

Hants C.C.—£39,348 in respect of the joint asylum at Park Prewitt.

Maldens and Coombe U.D.C.—£1,627 for additional pumping machinery. The board pointed out that the council should take steps to prevent, as far as possible, subsoil and surface water from entering the sewers, and should also take into immediate consideration the question of the extension of the sewage disposal works and the provision of a refuse destructor. The surveyor, Mr. H. Jeffes, has been instructed to prepare a draft specification of the pumping machinery required.

Nuneaton T.C.—£10,000 for the completion of the Griff water supply.

Quorn U.D.C.—£524 for a village hall.

Rushden U.D.C.—£2,500 for the provision of a recreation ground.

Sunderland R.D.C.—£5,283 for a diphtheria ward at the hospital.

3 **Oldbury.** For road widening purposes (Mr. R. H. Bicknell)	900

Wakefield Water Supply.—The Corporation of Wakefield, acting on the advice of Mr. C. Clemesha Smith, the waterworks engineer, have decided to lay an 18in. main, between 6 and 7 miles in length, from the city to Waindyke, in order to improve the supply to Castleford Whitwood, Featherstone, and the surrounding districts. Application is to be made to the Local Government Board for power to borrow £20,000.

ROYAL COMMISSION ON SEWAGE DISPOSAL.

PROPOSED CENTRAL AUTHORITY AND NEW RIVERS BOARDS.

The Eighth Report of the Royal Commission on Sewage Disposal, which was issued on Wednesday, deals with the standards of purity to be applied to sewage and to sewage effluents discharging into streams and rivers, and the tests which should be used in regard to them. The commissioners repeat a previous recommendation that the River Pollution Prevention Act of 1876 should be altered so as to allow local circumstances to be taken into account. The recommendations of the report, which are based upon the presumptive alteration of the Act, call furthermore for the formation by Parliament of a central authority and of subsidiary rivers boards, adequately equipped with expert officers and organised to secure the economical and efficient discharge of the duties of local authorities and others in regard to pollution, and to protect the public health and the amenities of rivers. The commissioners conclude that the most trustworthy chemical index of recent sewage pollution of a river is afforded by the figure indicating the amount of ammonia present. But this constituent does not indicate the character of the pollution, for the determination of which another test is required, and the amount of the dissolved oxygen taken up in five days has been found by the commissioners to furnish the most trustworthy chemical index of the actual state of a stream. They recommend that this amount should be adopted as a standard.

In fixing any special standard, the commissioners state, the dilution afforded by the stream is the chief factor to be considered. If the dilution is very low it may be necessary for the Central Authority, either on their own initiative or on application by the Rivers Board, to prescribe a specially stringent standard, which should also remain in force for a period of not less than ten years. If the dilution is very great the standard may, with the approval of the Central Authority, be relaxed or suspended altogether. "Our experience," the report continues, "leads us to think that, as a general rule, if the dilution, while not falling below 150 volumes, does not exceed 300, the dissolved oxygen absorption test may be omitted, and the standard for suspended solids fixed at 6 parts per 100,000. To comply with this test no treatment beyond chemical precipitation would ordinarily be needed. If the dilution, while not falling below 300 volumes, does not exceed 500, the standard for suspended solids may be further relaxed to 15 parts per 100,000. For this purpose tank treatment without chemicals would generally suffice if the tanks were properly worked and regularly cleansed. These relaxed standards should be subject to revision at periods to be fixed by the Central Authority, and the periods should be shorter than those prescribed for the general or for the more stringent standards."

St. Paul's Bridge Scheme. The London County Council have informed the City Corporation that they have decided to seek powers next session to construct tramways from Southwark-street over the proposed new St. Paul's Bridge to a point near the most western end of Cheapside, and also to construct a shallow underground subway.

Town Planning Schemes. A memorandum issued by the Local Government Board relative to the operation of the Housing and Town Planning Act (1909) mentions that twenty local authorities have been granted authority by the board for the preparation of town planning schemes. Three of these schemes, two by Birmingham Corporation, affecting different areas in the city, and one by Rochdale, have been prepared and submitted for approval. Among the other local authorities that are preparing schemes are Bournemouth, Chesterfield, Halifax, Hanwell, Liverpool, Newcastle-on-Tyne, Sheffield, Southport, Stoke-on-Trent, and Walthamstow. Applications for authority to prepare schemes have been received from twelve other authorities, and 124 local authorities have proposals for schemes under consideration. The memorandum goes on to state that in many cases landowners are adopting better methods of developing estates without the formalities of town planning schemes, and that the Act has had a good influence, quite apart from the actual preparation of schemes under it.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works, at which particulars appear below:—Buildings.—Blackpool £10,000, Durham, £10,118, George £7,630; housing and town planning.—Chester-le-Street, Dumfries, Falmouth; roads and materials.—Hornscastle £2,643; sewerage and sewage disposal.—Barnard Castle, Ellesmere £7,000, Hitchin £14,000, Lichfield £9,000; water, gas and electricity.—Pontardawe, Worcester £7,000; miscellaneous.—Southport. Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Blackpool T.C.—It is intended to spend about £10,000 upon the improvement of the public baths during the ensuing winter.

Cornwall C.C.—An estimate of £10,000 has been approved for the sanatorium treatment of consumptives.

Dartmouth T.C.—The borough surveyor, Mr. W. G. Lane, and the medical officer of health, have been requested to consult with a committee with respect to the provision of an isolation hospital.

Durham C.C.—A scheme is to be prepared for Easington Colliery, at an estimated cost of £10,118.

Cockle U.D.C.—A scheme for a town hall, instead of municipal offices, as previously decided, was passed on Wednesday last. The estimated cost is £7,630.

Lynn T.C.—The question of increased public bath accommodation has been referred to the consideration of a committee.

Norwich T.C.—The Education Committee has accepted the tender of Messrs. T. Gill & Son, at £3,964 for the erection of a school at Winsum View.

Peterhead T.C.—The tender of Messrs. John McAdam & Son, Aberdeen, at £6,936 has been accepted for the construction of the golf road reserve at Formaty Hill.

Rowley U.D.C.—The Education Committee have instructed the architects to prepare plans for a technical school, at an estimated cost of £1,000.

Sandwich T.C.—Extensions are to be carried out at the Guildhall, at a cost of £1,926.

Sunderland R.D.C.—A tuberculosis pavilion is to be provided at the sanatorium hospital, at a cost of £1,100.

Surrey C.C.—The council have decided that they cannot take any action at present, or in the immediate future, to improve Richmond Bridge.

HOUSING AND TOWN PLANNING.

Ashbourne R.D.C.—A letter has been received from the Local Government Board agreeing that the cost of maintenance of the proposed six dwellings to be erected for the working classes at Parwich should be charged on the parish and not on the whole county.

Banbury T.C.—The tender of Messrs. Bosworth & Lowe, of Nottingham, at £6,572, has been accepted for the erection of forty houses.

Battle (Sussex) U.D.C.—The scheme for the erection of working-class dwellings has received the sanction of the Local Government Board, and the tender of Messrs. Banks & Gearing, of Hastings, has been accepted for six cottages.

Cambridge T.C.—With respect to the cottages proposed to be built by the corporation the original cost was estimated at £1,603. Some delay took place, owing to local circumstances, and then further delay with the Local Government Board, who required certain modifications, and particularly the enlargement of bedrooms. The corporation have now received tenders amounting to £1,724 10s. for two blocks, one containing six cottages and the other with twelve single-room tenements for old people.

Chester-le-Street U.D.C.—As the result of a communication from the Local Government Board, a committee has been appointed to consider the question of the provision of working-class dwellings.

Coleraine U.D.C.—A scheme for the erection of workmen's dwellings at Short's Hill at an estimated cost of £3,000, has been agreed to.

Dumfries T.C.—Approval has been given to the carrying out of a scheme of housing which will mean the clearing away of a large amount of slum property along King-street between Queensberry-square and Loreburn-street. The cost of the scheme is estimated at £8,000.

Falmouth T.C.—The surveyor, Mr. J. S. Walton, has received instructions to prepare plans for twenty-two workmen's dwellings.

Glasgow T.C.—A plan has been submitted to the Special Committee on Cottages for the Working Classes of ground at Riddrie belonging to the corporation, on which it is suggested cottages suitable for the working classes might be erected. It is proposed that the cottages should consist of four and five apartments, with baths and other modern conveniences, and that the rent of each cottage should not exceed £18 per annum.

Paignton U.D.C.—The surveyor, Mr. C. O. Baines, has received instructions to take the necessary steps for the preparation of a town planning scheme. He told the council that the estimated cost was £200, including maps, notices, and the salary of an assistant for the work. The borough surveyor of Bridlington, Mr. Ernest Matthews, had intimated to him that the cost to his council was £120, exclusive of the assistance rendered by his permanent staff.

Penzance T.C.—A scheme has been approved for the erection of forty houses upon a site near Alverton.

Selby U.D.C.—A site has been agreed upon for the erection of about 100 cottages.

Tullamore U.D.C.—Thirty-eight cottages are to be erected, at a cost of £4,793.

PARKS AND OPEN SPACES.

Eastbourne T.C.—It has been decided to seek Parliamentary powers for the purchase of the Devonshire Park of 11 acres. The property, for which the sum of £110,665 is asked, includes a theatre, a floral hall of 2,000 seating capacity, pavilion, baths, public-house, and eight shops. The Duke of Devonshire promises to give the town £10,000 of his share of the purchase money on the condition of having two representatives on the managing board, and a further gift of the interest on a further £12,000 on the further condition that the proceeds of 1d. rate are devoted to music.

ROADS AND MATERIALS.

Belford R.D.C.—A grant of £200 has been made to the Road Board towards the work of improvement of road surfaces in the district during the year 1912-13. One half is payable on requisition, and the remainder when the work is satisfactorily completed.

Bowland (Yorks) R.D.C.—A new road is to be constructed at Bashall Eaves, at an estimated cost of £310.

Bromley R.D.C.—Poverest-lane is to be widened, at a cost of £330.

Dumbarton C.C.—The widening of the Loch Lomond-road is to be proceeded with by the Western District Committee, provided the money which represents the committee's quota can be borrowed over a period of years.

Frinton-on-Sea U.D.C.—The surveyor, Mr. E. M. Bate, has received instructions to prepare particulars and obtain tenders for tar-paving the footpaths on the north side of Hadleigh-road.

Greenock T.C.—An experiment is now being made in Nicolson-street with Ferromac. Last week, on the invitation of Roadite, Limited, a company of surveyors from various districts inspected the work in progress, and had the operations explained by Mr. Cowan, the representative for Scotland.

Hampton U.D.C.—It has been decided, at the request of the Middlesex County Automobile Club, to support an application to the Middlesex County Council for by-laws to be made by the county council for regulating the use of locomotives with a number of trailing wagons attached on public highways and for preventing obstruction.—With regard to an inquiry from the Hornsey Borough Council as to making a contribution towards the costs incurred in the event of an adverse decision in a prospective claim against an omnibus company for extraordinary traffic on a certain road in Hornsey, it has been decided that the council is not prepared to promise assistance.

Haywards Heath U.D.C. The tender of the Haywards Heath Gas Company for the supply of tar, at 2s. 6d. per Imperial barrel, has been accepted.

Horncastle U.D.C. The granite setts in West-street and Bridge-place, at a cost of £263.

Kingston (Surrey) T.C. Wood paving, estimated to cost £217, is to be laid in front of the municipal offices.—The Road Board and the county council are to be asked to furnish full particulars of the proposal to form a by-pass road avoiding the borough in connection with the suggested arterial road.—Mr. R. H. Clucas, the borough surveyor, has been authorised to comply with the request of the Automobile Association and Motor Union for an indication on a map, for a series of town maps they are preparing, of a secondary route for motor cars through Kingston alternative to the main roads.

Maldens and Coombe U.D.C.—For making up and macadamising about 525 ft. of roadway in Beckenham-lane, the tender of Messrs. J. Mowlem & Co., Westminster, has been accepted, at £608 (surveyor's estimate, £570); and for paving the footways with artificial stone slabs, and maintenance, the tender of Messrs. J. Wainwright & Co., Limited, of Shepton Mallet, was accepted, at £133 (surveyor's estimate, £140). The Local Government Board have sanctioned a loan of £617 for the foregoing, to be repaid within five years.—Last week the council passed resolutions relative to the proposed making up of part of Duke's-avenue, at an estimated cost of 13s. per ft., part of Park-view (12s. 11d. per ft.), part of George-road (12s. 9d. per ft.), part of Queen's-road (12s. 7d. per ft.), and part of Coombe-gardens.

Southend T.C.—It is proposed to spend an additional £200 upon the improvement of Sutton-road, and thus obtain a 60-ft. road from the Prittlewell Station past Utton's brickfields.—The borough surveyor, Mr. E. J. Elford, has prepared a sketch plan embodying a proposal in connection with the third section of the Western Esplanade widening to take in a greater width of foreshore immediately adjacent to the pier. The Highways Committee are considering the subject, with a view to submitting a scheme to the council.

Surrey C.C. Included in the grants for improvements to main and district roads are George-street, Richmond, cost £22,278, grant £4,652; road over and approaches to the railway bridge in Haydon's-road, Wimbledon, cost £3,400, grant £1,133; Kingston-road, Merton, cost £1,850, grant £340.—The Highways Committee reported that in pursuance of the resolution of the council of January last, the county surveyor, Mr. A. Dryland, had employed the necessary assistance and made a survey for a new road to form a loop on the Portsmouth-road between Beverley Brook Bridge and the village of Esher. Plans and sections have been prepared showing the route which, after numerous trial surveys and consultations with the Traffic Branch of the Board of Trade and with the local authorities, appears to be the most desirable for the purpose of the main scheme, which has been to find an alternative route for an entirely new road between the above-mentioned points, so as to afford better access and egress to London from the south-west. The committee had given instructions for the scheme to be forwarded to the Road Board for their consideration.

Thames Ditton U.D.C.—It has been agreed to send a representative to a joint conference with Surbiton and Malden and Coombe on the proposal to urge the Road Board to allocate a proportion of the cost of constructing the proposed new arterial road.

Wanstead U.D.C. The council have accepted the tenders of Messrs. W. & C. Francis at £1,174 and £147, for making up Woodbine-terrace and Southernhay-road, and Messrs. G. J. Anderson at £129 for making up Manor-road.

SEWERAGE AND SEWAGE DISPOSAL.

Barnard Castle U.D.C.—The council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, [illegible] to prepare plans for the [illegible] the existing [illegible] and to provide additional [illegible] and an [illegible].

Ellesmere U.D.C. A provisional application has been received for a loan of £7,000.

Hitchin U.D.C. The council have approved of a scheme of new outfall sewer and sewage disposal works prepared for them by Mr. E. J. Silcock, M.Inst.C.E., Westminster and Leeds. The estimated cost of the works is £14,000, and application is to be made to the Local Government Board at once for sanction to borrow the necessary money.

Lichfield U.D.C.—The tender of Messrs. Edwards & Co., of Doncaster, at £9,000, has been accepted for works of sewerage.

Linlithgow T.C.—A representative of Mr. F. Wallis Stoddart, Bristol, recently visited the sewage works with the view of advising the council as to certain proposed improvements. Mr. Walker, the engineer referred to, has since embodied his opinions in a report to the local authority. The council, having considered the report, have decided to carry out the alterations and improvements as recommended.

Linthwaite U.D.C.—At a meeting last week a circular was read from the town clerk of Ossett with reference to the expenditure caused by the crude trade effluents delivered into the sewers by manufacturers. A resolution was adopted urging upon the President of the Local Government Board the necessity of next year amending the law as recommended by the Royal Commission on Sewage Disposal, "so as to secure effectual preliminary treatment of the refuse, or the payment of a reasonable charge to the local authority."

Swadlincote U.D.C.—Included in the produce of the sewage farm are about 300 tons of "some of the best mangolds ever grown in England," according to the description of the chairman of the council, Mr. H. M. Howard. The price is 15s. per ton.

WATER, GAS, AND ELECTRICITY.

Coleford U.D.C.—It has been agreed to consider the question of providing a water supply.

Dromore U.D.C.—Application is to be made to the Board of Trade for a Provisional Order to enable the council to produce and distribute electricity for all public and private purposes. It was stated that the present system of public lighting was costing the council £150 a year, representing £3,000 capital. The engineers, Messrs. Millar, Wilson & Pegg, have prepared two schemes, estimated to cost £3,200 and £3,600, and it was argued that by adopting either the council might count on a profit of, roughly, £300 a year after payment of working expenses.

Dufftown T.C.—Waterworks are to be constructed, at a cost of £200.

Felixstowe U.D.C.—The tender of the "D.P." Battery Company, Limited, of Bakewell, Derbyshire, has been accepted for additional battery, duplicate booster and arrangements for balancing at £1,116, subject to the Local Government Board sanctioning the necessary loan.—The tender of the Felixstowe Gas Light Company has been accepted for lighting the whole of the district by gas, excluding the radius of 150 yds. from the back of the Promenade, for a seven-years' contract from January 1, 1913, at the price of £611 per annum.

Hove T.C.—By a majority of one vote, the council decided at their meeting last week to give notice to the Hove Electric Lighting Company of their intention to exercise their right of purchasing the undertaking.

Maldens and Coombe U.D.C.—The lighting contract with the Kingston Gas Company has been renewed for a period of three years at £3 7s. 6d. per lamp per annum.

Neath R.D.C. The report of the electric lighting department states that the position is highly satisfactory, and that the revenue for the past year was £5,000. The cost at present is only 1½ per unit, the lowest on record.

Pontardawe U.D.C.—With a view to the probable construction of an impounding reservoir on the upper reaches of the Pawe river, a number of trial holes are being sunk and water gauges placed upon the neighbouring land.

Stafford T.C.—The extensions and alterations at the Milford pumping station have been completed. The new pumping plant, which cost £1,000, gives an increased yield of water, and effects a saving of £200 a year in fuel. The extensions, which have been carried out under the direction of the borough engineer, Mr. W. Plant, have not necessitated the borrowing of money.

Tanderagee U.D.C. The Duke of Manchester has offered the necessary land for a reservoir in order to expedite the scheme for a water supply for the district,

which is estimated to cost £3,220. The offer has been accepted, and the council have reaffirmed a resolution expressing their willingness to combine with the rural council in promoting the scheme.

Tetbury U.D.C.—A scheme for the extension of the water supply, to cost £2,250, is under consideration.

Torquay T.C.—Work is to proceed in connection with the construction of the first section of the new water mains from the reservoirs on Dartmoor.

Whitwood U.D.C.—The tender of the Leeds Meter Company, at 6d. per yard has been accepted for the cleaning of water mains.

Wolverhampton T.C.—The cleansing of the old reservoir at Tettenhall has been satisfactorily carried out, and an examination of the structure has revealed the fact that extensive repairs will have to be undertaken. The paving of the floor is weak and in very bad condition, and the structure generally is not watertight, but it is not intended to carry out any strengthening and waterproofing before next spring.

Worcester T.C.—Subject to a loan being obtained, it has been decided to carry out the extension of Hylton-road boiler-house and the installation of additional machinery at the electricity works, at a cost of £7,000.

MISCELLANEOUS.

Aberavon T.C. The proposal to borrow £13,770 for the purpose of providing an athletic ground and shelter on the beach has been vetoed by the Local Government Board. In their letter of refusal the board state it was understood that the main object of the scheme was to provide an enclosed area to enable games of football, cycle-racing, and pony-trotting to be witnessed by the public, presumably on a charge of admission. It appeared to the board to be very doubtful whether such a scheme or work of the character proposed could be held to be within the powers of the town council. The proposal also to provide shop-stalls in the beach shelter would seem to be beyond the statutory power of the town council.

Chertsey R.D.C.—On the recommendation of the surveyor, Mr. H. Bowes, the wages of council workmen generally have been raised in Byfleet by 2s. to a standard of £1 a week. In Chobham parish certain increases were made of 1s., and at Thorpe one increase of 2s. was granted.

East Grinstead U.D.C.—The surveyor, Mr. W. E. Woollam, has received instructions to carry out the work of making roads, and constructing the fencing at the new cemetery.

Southport T.C.—The Corporation tramways have been run at a loss, and in a special report Mr. C. W. Mallins, tramways manager to the Liverpool Corporation, suggests the construction of tramways along the promenade for 5¾ miles, and that these might ultimately be linked up with the Liverpool tramways on the south and carried north across the Ribble to join the Blackpool trams. This would shorten the distance between Southport and Blackpool by 24 miles, and between Liverpool and Blackpool by 11 miles.

Stockton T.C.—It has been decided to purchase one of Dennis Brothers' motor fire engines at the price of £690, complete with all accessories.

Motor-Omnibus Traffic.—A conference representing all the local and road authorities in the Greater London area is to be held at the City of London Guildhall on December 17th, with a view to combined action on the subject of motor-omnibus traffic.

Mechanical Haulage.—A paper on this subject will be read by Mr. George Symon, surveyor to the Blaydon Urban District Council, at a meeting of the Institution of Municipal Engineers to be held at Newcastle-on-Tyne to-morrow (Saturday) at 3 o'clock.

British Fire-Prevention Committee.—Recent elections to the council of this body include Sir Aston Webb and Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., chief engineer to the London County Council. The executive, as re-elected, includes, among others, Mr Edwin O. Sachs, F.R.S.E.D., as chairman, Mr. Horace S. Folker, F.A.I., as hon. treasurer, Mr. Ellis Marsland as general hon. secretary, Mr. J. W. Restler, M.INST.C.E. of the Metropolitan Water Boards, and Mr. Max Clarke, F.R.I.B.A. The British Fire-Prevention Committee was formally founded on November 20, 1897, the day of the Cripplegate fire, and has therefore just completed its fifteenth year.

PERSONAL.

Mr. H. P. Maybury, county surveyor of Kent, has been granted an increase of salary from £1,000 to £1,500 per annum.

Mr. F. Grove, assistant county surveyor of Surrey, has had his salary increased to £300, rising by annual increments of £20 to £400.

Mr. W. Fairley, engineer to the Richmond Main Sewerage Board, has had his salary increased by £100 as from 25th December next.

Mr. D. J. Bowe, surveyor to the Clacton Urban District Council, is to have his salary raised £30 per annum as from January next.

Mr. John Dymock, of West Kilbride, has been appointed burgh surveyor and sanitary inspector of Millport in place of Mr. Robert Adam, resigned.

Mr. C. Brown, borough surveyor of Wells (Somerset), is seriously indisposed, we regret to state, and his son has been deputed to carry on the work of the department.

Mr. G. W. Hilditch, ASSOC.M.INST.C.E., has been appointed draughtsman in the borough surveyor's office, Hertford, for the preparation of plans for a sewage disposal scheme.

Mr. W. H. Pearce, ASSOC.M.INST.C.E., chief assistant to Mr. F. Roberts, ASSOC.M.INST.C.E., borough engineer and surveyor, Worthing, has been appointed surveyor to the Urban District Council of Swanage.

Mr. C. D. White, surveyor to the Newton Abbot Urban District Council, with the clerk and sanitary inspector, will represent the council at the town planning conference to be held at Exeter on the 26th and 27th inst.

Messrs. O. Catlin, Holborn, G. B. Chilvers, engineer and surveyor, Oundle, Northants, R. D. Craig, Metropolitan County Board, Adelaide, and S. Wilkinson, Surbiton, have been elected members of the Royal Sanitary Institute.

Mr. John D. Watson, M.INST.C.E., engineer to the Tame and Rea District Drainage Board, who has been engaged to advise the Metropolitan Sewerage Commission of New York on the disposal of the sewage of that city, left for America on Thursday of last week.

Mr. Munro, burgh surveyor of Nairn, who has resigned, has been presented with a purse of sovereigns from the town council, "in estimation," as Provost Macrae put it in handing the gift to the recipient, "of your worth as a public servant, and of our satisfaction with your work."

Mr. H. H. Hodgson, surveyor and sanitary inspector to the Leeds Rural District Council, and assistant overseer for Roundhay, has been recommended for a superannuation allowance of £279 as a consequence of being deprived of office by the extension of the boundaries of Leeds.

Mr. Julian C. Rogers, formerly secretary to and now an honorary member of the Surveyors' Institution, was last week presented with the Gold Medal of that body for the paper entitled "An Evening in the Institution Library," which he read at a meeting held on January 22nd last. The leading points of Mr. Rogers' contribution, we may recall, were presented in our issue of February 2nd.

Mr. A. Hamer, borough surveyor of Bishop's Castle, died recently, we regret to state, at the age of seventy-six. He was appointed surveyor to the Highway Board in 1864, and borough surveyor in 1885, and had thus completed forty-eight years' service. Mr. Hamer had given notice of his retirement, and Mr. B. P. Chadwick, of Bridgnorth, has been appointed to the vacant positions of borough surveyor and inspector of nuisances.

Mr. H. Percy Boulnois is to be credited, in connection with the debates he recently initiated at the Sanitary Institute, not only with the unqualified success which attended the important discussions, but with an instance of mental and physical energy which must be accounted a feat. On the occasion of the adjourned debate he spent an arduous day in Exeter, travelled to London, took part in the coursing of the hare he had started at Buckingham Palace-road, and before seeking a well-earned rest dealt with accumulated correspondence. Considering that he had only recently recovered from a passing illness, this is surely a day's record which would tax the vitality of many a younger man.

FOR OTHER ADVERTISEMENTS
See End of Paper.

KEYNSHAM RURAL DISTRICT COUNCIL.
APPOINTMENT OF HIGHWAY SURVEYOR.

The above Council invite applications for the appointment of Surveyor of Highways for their District (about 10 miles by 7, embracing 14 parishes), at a salary of £175 per annum. Duties to commence early in the New Year, probably about the end of January.

The person appointed will be required to carry out all the duties appertaining to the office of a Surveyor of Highways, including the keeping of all necessary books and accounts, and be capable of making estimates and plans, to devote his whole time to the duties of the office, and to provide a horse or other suitable means of locomotion.

Preference will be given to Candidates between the ages of 25 and 40 years, with experience as aforesaid.

Applications, stating age, experience, and qualifications, and accompanied by copies of not more than three recent testimonials, endorsed "Surveyor, &c.," to be delivered to me not later than Saturday morning the 7th December, 1912.

Selection of Candidates will take place on the 10th December, 1912, and appointment on the 17th December, 1912.

The Appointment will be subject to the approval of the Somerset County Council.

Canvassing Members of the Council, directly or indirectly, will disqualify.

FRANK G. WHITTUCK,
Clerk to the Council

Keynsham, Bristol.

ESSEX COUNTY COUNCIL.
HIGHWAYS COMMITTEE.

RECONSTRUCTION OF BURNT MILL BRIDGE.

Tenders are invited from Contractors for the execution of the necessary work involved in the reconstruction of the above bridge which crosses the Stort Navigation near Burnt Mill Station, G.E. Railway.

The work consists for the most part of the erection of abutments in brickwork and concrete, the floor being formed in steel decking.

Drawings may be seen and Bills of Quantities obtained on Saturday, November 23rd, 1912, upon application to the County Surveyor of Essex at Chelmsford.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, sealed and endorsed "Burnt Mill Bridge," are to be delivered to this Office not later than the first post on Monday, December 2nd 1912.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford,
November 20, 1912.

ESSEX COUNTY COUNCIL.
HIGHWAYS COMMITTEE.

RECONSTRUCTION OF HIGH ONGAR BRIDGE.

Tenders are invited from Contractors licensed to execute Ferro-concrete work on the Hennebique system for the erection of a New Bridge over the River Roding in the Parish of High Ongar.

Drawings may be seen and specifications obtained on and after Saturday, November 23rd, 1912 upon application to the County Surveyor of Essex at Chelmsford.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, sealed and endorsed "High Ongar Bridge," are to be delivered to this Office not later than the first post on Monday, December 2nd, 1912.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford.
November 20th, 1912.

HAMPTON URBAN DISTRICT COUNCIL.
AIR COMPRESSING MACHINERY.

The above Council are prepared to receive Tenders for the supply and erection at their Sewage Disposal Works of a duplicate set of Condensing Steam Engine Air Compressors and other subsidiary works in connection therewith.

Plan, General Conditions, Specification, Form of Tender, and further particulars may be obtained of the undersigned at the Offices of the Council, where Tenders, duly filled up, must be delivered, sealed and endorsed "Tender for Air Compressors, &c," not later than 4 p.m. on Tuesday, the 10th day of December, 1912.

Dated this 19th day of November, 1912.

(By order)
SIDNEY H. CHAMBERS,
Surveyor.

Public Offices,
Hampton, Middlesex.

WOMBWELL URBAN DISTRICT COUNCIL.
ROAD MATERIALS, &c.

The Council invite Tenders for the Supply during the twelve months ending December 31st, 1913, of the following Materials, *viz.*:—800 tons Granite, 400 tons Whinstone, 500 tons Blue Rock Limestone, 1,000 tons Tarred Dross, 1,500 tons Lump Slag and Rejections, 400 tons Basalt, 200 tons Dross Chippings, 100 tons Limestone Asphalt, 30 tons English Cement, and various quantities of Setts, Kerbing, Channelling, Flags, and Stoneware Pipes.

Further particulars and forms of tender may be obtained from Mr. W. Quest, Surveyor to the Council, Town Hall, Wombwell.

Tenders must be delivered to the undersigned, sealed and marked "Tender for Road Materials, &c.," not later than Monday, the 2nd day of December, 1912.

PERCY MILNES WALKER, Solicitor,
Clerk to the Council.

Town Hall, Wombwell.
November 20th, 1912.

COUNTY BOROUGH OF WEST HAM.
TO CONTRACTORS.

The Council hereby invite Tenders for the Erection of Fire Brigade Station and Firemen's Dwellings, Silvertown.

Plans and Specification may be seen, and Form of Tender, Bills of Quantities and further particulars obtained, at the office of Mr. John G. Morley, Borough Engineer, Town Hall, West Ham, E., upon payment of £1, which will be returned upon receipt of a *bonâ-fide* Tender.

NOTE.—No Tender will be considered unless the same is delivered at the Office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post, not later than 4 o'clock p.m. on Tuesday, 10th December, 1912.

The Council do not bind themselves to accept the lowest or any Tender. The Contractor will be required to enter into a bond, with one surety, for the due performance of the Contract, and no work will be ordered under the Contract until such bond has been duly executed.

The Contractor whose Tender is accepted, and with whom a Contract is entered into, will be required to pay the whole of his workmen such rate of wages, and observe such hours of labour as are recognised by the Workmen's Trade Unions, and shall not assign, nor under-let, or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By Order of the Council,
FRED. E. HILLEARY,
Town Clerk.

Town Hall, West Ham, E.
November 22nd, 1912.

CIVIL ENGINEER (A.M.I.C.E.) requires Temporary Berth. Expert knowledge on Modern Methods of Sewerage and Sewage Disposal. 11 years' experience in and upon Works. Experienced in Quantities, Setting-out Works, Theodolite, and Level, &c. Box No. 1,202, c/o of THE SURVEYOR, 21 Bride-lane, Fleet-street, E.C.

Progress in Developing and Conserving Water Supply for Municipal and Domestic Purposes.*

By ALLEN HAZEN, New York

In many parts of the United States water is available for all required public water supplies, without special effort being made for its collection and conservation. This is especially true of cities located on rivers of considerable size and upon the Great Lakes. In these cases it has often proved necessary to prepare the water for use by purifying it, but from the broad standpoint of securing water, no serious difficulty has been presented.

In other parts of the country water is obtained for supply from relatively small streams by building reservoirs in which flood flows are stored and made available for use in dry periods. Many of the largest cities in the country, including New York, Boston, Baltimore, San Francisco and Denver, are supplied in this manner. This general method is especially used in hilly country, and often has the advantage that the water may be supplied by gravity, thereby saving the cost of pumping. This advantage is so considerable that storage reservoirs are often used even where rivers are at hand which could furnish a sufficient quantity of water. There are also certain sanitary advantages growing out of the use of stored upland water which have frequently been of importance in determining the selection of these sources.

WATER SUPPLY POSSIBILITIES IN THE UNITED STATES.

The water supply resources of this country are very great indeed. No one knows or can know exactly how great they are. They differ with climate and topography. They are relatively less in the arid and sub-arid regions of the west and on the Southern Pacific coast. In this great area the whole available water supply will be developed and used, either for water supply or for irrigation, at a date that in the history of the country is not remote. Through the middle states there are occasionally cities located near the head waters of streams where there is or will be difficulty in securing water in large quantities without transporting it for longer distances than have been considered feasible up to the present time. With these exceptions the water resources of the country are so great in comparison with the requirements of domestic use that they may be considered practically unlimited. . . .

In a strip of land, 400 miles long and 50 miles wide, extending from Boston to Washington, are located many of the largest cities of the United States. In this region more water has been developed for public water supplies than in any other corresponding area in the world. The amount is larger than in densely populated European areas, because our per capita consumptions are several times higher; but with this done, the water resources available to this region have not been exhausted. It is true that in the immediate neighbourhood of Boston and New York the most available supplies have been developed and utilised, and it is necessary to go somewhat further for additional water; but if there were demand for more water and a market to sell it at remunerative prices, physical resources are available so that an enormously greater quantity could be supplied. Without attempting a close estimate, it may be said that at least ten times the amount now supplied could be furnished, and probably a much greater quantity. . . .

That which applies to this small area of greatest density of population applies in even greater measure to most of that part of the United States east of the arid region.

CONFLICT OF INTEREST BETWEEN CITIES.

It frequently happens that a source of water supply that is selected by one city is also physically well adapted to use by another. Each city desires to secure the control of that source or sources which can be most economically and advantageously used for its own purposes, and many conflicts have grown out of this condition. Until recently the city or company or individual that was first upon the ground and acquired sufficient property to control the situation, or secured the legislative authority to take the same by the exercise of eminent domain, held it to the exclusion of all others. In recent years a number of states where cities are near each other have established methods by which rights in new sources of supply could be acquired only after procedure intended to prevent cities, corporations or individuals from acquiring more than their fair share of water, and to protect the assumed natural right of each municipality to have for its own use the source or sources of supply most convenient and natural to it, as far as the same is not inconsistent with the like rights of its neighbours, and in case of conflict, to make as fair a division as possible. . . .

COMMUNITY OF INTEREST IN WATER SUPPLY.

Another problem similar to the last, but differing in its manifestation, is presented, where two or more cities are so situated that they can be more economically served by natural resources by one system of works than by independent systems. Cases of this kind are numerous in the older and more densely populated parts of the country, where it is frequently necessary to transport water for much greater distances than the average distances between adjoining municipalities.

The cost of transportation is often an important part of the whole cost of the water, and this cost is reduced by using one or two large lines, as compared with several smaller ones.

To secure this and other economies of combined action, water districts have been formed comprising several, or a considerable number of municipalities. In other cases water companies have supplied groups of communities. In some cases the whole water business has been consolidated under one management. In other cases the management of the distribution systems has remained local, and water has been supplied at wholesale to the local works, which have preserved their independence by acting as retailers only.

In most cases water suitable for a water supply, and land suitable for developing it, are also available for other uses. As the water resources are enormously greater than the needs of domestic supply, it naturally follows that most of the water and most of the property, from a physical standpoint, available for developing it are not in actual use for furnishing water supply, and generally the water and the properties are taken up and used for other purposes. This is not only a natural result, but it is the best arrangement considered from the standpoint of the development of the whole country. If all the water and all the land that might possibly be some time used for water supply were reserved from other uses, it would result in an unwarrantable tying up of the resources of the country, and would work great injustice.

Some of the uses to which such water and property may be put are not incompatible with their use for public water supply. Without attempting a complete statement, an example of such double use may be given. Public parks upon the gathering ground of a water supply system are not objectionable, and where large parks are desired and areas are also to be reserved for water supply purposes, it is in the interests of conservation of the resources of the country to use the same areas for both purposes as far as possible. . . .

If one follows up representative rivers in a hilly country, especially the smaller rivers in New England, or other densely populated portions of the east, a succession of dam and reservoir sites is frequently presented which, from a physical standpoint, might be utilised for storing and making available the flood flows of the streams. These reservoir sites are commonly the most productive and valuable lands; and they frequently afford the best sites for towns and cities. Hundreds of New England towns are located on ground which, under other conditions, might have been the floors of reservoirs; and the sites for the high dams that might have formed such reservoirs are occupied by mill dams of only moderate height. Railroads frequently follow the streams. To utilise such possible sources involves buying all property, removing the villages, buying out the mills and moving

* Extracts from a paper submitted to the Eighth International Congress of Applied Chemistry.

the railroads above the flow lines of the proposed reservoirs.

When a great city is looking for a water supply to serve the added needs of the growth of a generation, it can afford to buy out villages that are not too large and to re-locate railroads, and to do the other things that may be necessary to utilise a supply in such a location. This is a matter of degree. There are limits beyond which even the largest and richest cities may not go. Some of the best reservoir sites are occupied by thriving towns and cities, and are seats of industry to such an extent that they can never be used for water supply purposes. Other natural sites are remote from development and the lines of progress, and can be secured. It is often a question of buying out and utilising a naturally economical but now otherwise occupied site near at hand, or carrying the water from a more remote site which can be obtained with less disturbance to existing conditions. . . .

ANTICIPATING THE FUTURE.

One of the most interesting and difficult questions presented is as to how far a city really ought to anticipate the future in acquiring land and rights. If it were said our city has 100,000 inhabitants, and in a century will have 1,000,000, and we shall then require so many gallons of water per capita, and it will take such and such areas to supply this water, and we propose to buy them now, the result might easily be burdening the present generation unduly with interest charges on bonds issued to pay for remote and even speculative requirements, for it is quite possible that the increase in population may not be as great as assumed, and it is equally possible and probable that the habits of the people who live in another century will be different from ours. It may be that more will be required or it may be that less will suffice. It is only necessary to mention the shower bath and the swimming pool to suggest the great uncertainty of the remote future.

Then there is the certainty that there will be great developments in the whole business of water supply, and the possibility that sources will be opened up not now considered available. If there were a magnificent source of supply near at hand which could be obtained at small expense, prudence would dictate the advisability of securing it. This condition may still exist in a few cases. Far more commonly, to secure a liberal supply for a century would involve the expenditure of great sums of money to procure land and rights which would not be justified by the reasonable prospects of the case, and which ought not to be lightly undertaken. What then will happen? The properties controlling the sources will fall into other hands, and be put to such uses as they are fit. Water power is developed, the land is cultivated, railroads are built, and the property becomes valuable. Many sources of supply otherwise excellent are used for other purposes to the point which for ever effectively prevents their use for water supply. Towns and even cities are located in valleys which would otherwise form ideal reservoir sites. They cannot be moved with increasing demand for water. Instead, other and more remote sources of water supply must be found and developed, and the saving in land and rights may more than compensate for the added length of conduit.

If the water resources of our country were more limited, so that, for instance, all the water that could be produced was likely to be required for domestic and municipal purposes within a limited length of time, then it would seem desirable and necessary to study the water resources more thoroughly and to make outline projects for future requirements, and to make a greater effort to reserve the properties for water supply purposes. With conditions as they are, it may be questioned if this is feasible except in a few exceptional cases.

STATE LINES IN WATER SUPPLY.

The business of procuring, storing, distributing and selling water is . . . done by municipal and other corporations having State charters and subject to State laws. There are cases, including one very notable one, where the most economical and advantageous supply for a city is in another state, but one state does not have authority to build waterworks in another state, nor to authorise its municipalities to do so. There are instances of private corporations that have secured water in one state and sold it in another, but in many important cases the State line has been regarded as an insurmountable barrier. For this reason a supply partly on either side of a state line is usually considered not to be available for municipal use at the present time. . . .

There is no logical reason why any city in this country should not have the privilege and all the rights that are necessary to develop a water supply wherever in its neighbourhood it can be most economically and advantageously done. If existing laws do not permit this, as they apparently do not, the sooner this matter can be corrected the better it will be. The Constitution of the United States prohibits the States from imposing duties on exports. It does not seem to prevent a state from prohibiting the export of a commodity. One state has done this with water, and has amended its constitution to this end. Probably the idea of this change in the law was that ultimately all the water resources of the state would be required by its own citizens, and that it was wise to prevent the diversion of any of the water into another state. . . .

If water supplies are developed and used, and all the water drawn from them that can be drawn during this century, there will be just as much water available in the centuries that follow as if not a drop had been utilised in this. If, instead of prohibiting the sale of water outside the state, provision were made for controlling it, or so that the rights would revert after a long period, water could be sold and profits realised on its sale through a period of years which might be very long, and still there would be absolutely no reduction in the amount of water ultimately available to the citizens of the state.

On the other hand, developing supplies for use outside the state would tend to insure retaining the properties on which they rest for water supply purposes, while if they are not so used some of them are certain to be used for other purposes, and will cease to be available for water supply before the time when they might be required for use in the state in which they are situated, and so far as this is the case the prohibition of present use means permanent loss of these sources of water supply.

COMPENSATION.

Compensation is calculated upon the theory that when the right to divert water is obtained, the diversion of the water begins at once, and is complete. In order to secure a valid right for the diversion of water from a particular source, it is customary and apparently necessary in most cases to secure the full right to the whole source. This practically results in the recovery by the riparian owners of damages for the diversion of all the water, and as only a fraction of the water is needed at first, the balance flows down the stream as before, and the owners continue to enjoy a large part of that which they have been paid for. Of course, conditions vary greatly. There are cases where diversion is comparatively complete from the start, but they are exceptions.

It frequently happens that the area from which water is to be taken is large, and that flood flows from it are very great, and flow to the sea without advantage to anyone. In fact, these flood flows are frequently destructive and do positive harm instead of good on their way. Taking a source for water supply frequently means building a large impounding reservoir and holding back these flood flows to fill the reservoir. It is sometimes possible to so manage the business that only flood flows will be taken for water supply, and that the moderate flows of the stream will remain undiminished. In England this procedure has been established by law, and is called compensation in kind. That is to say, the law provides that when a stream is taken for water supply, the storage provided shall be sufficient to not only furnish the water taken for domestic supply, but also to maintain flows of the stream which are regulated by procedure so that riparian rights below will be no less valuable than they were before.

In a number of cases arrangements of this kind have been carried out in America voluntarily. Such arrangement may be mutually advantageous because it relieves the water undertaking of heavy water damages, and at the same time, if properly carried out, insures the power owners against loss of power, and, in fact, practically may even give them more power than they had before. Legal recognition is needed to enable this most useful procedure to be carried out fully and with the best results.

Irish Roads.—The total sum allocated by the Road Board to Ireland up to March last was £203,528.

TRACKLESS TROLLEYS AND ROAD MAINTENANCE.

In the House of Commons on Monday consideration was given to the report on the Light Railways Bill, as amended in Standing Committee.

Mr. J. M. Robertson (Parliamentary Secretary, Board of Trade), on behalf of the Government, moved the omission of Clause 2, which empowers the Light Railway Commissioners to authorise trackless trolley systems. He said the clause as amended in committee cast a heavy liability on the promoters of trackless trolley systems in regard to the roads, and it was regarded by the roadway interest as being an evil so great that they would rather have no provision made for trackless trolley systems at all. They said they would rather have the existing procedure under which they had to come to Parliament for powers. As the clause had been originally framed for the purpose of facilitating trackless trolley schemes, the Government considered that it was not reasonable to persist with the amended clause when those whom it was anticipated would benefit by it did not attach any value to it. The effect of the omission of the clause would be that the law in relation to trackless trolley systems would remain as it was now. It seemed to the Government it was preferable that questions of road maintenance should be dealt with in a general comprehensive and systematic manner rather than in such a piecemeal fashion as was the case in this measure. The amendment would leave trackless trolleys out of the Bill.

The retention of the clause was supported by several speakers, on the ground that under its terms the owners of trackless trolleys would be required to contribute, as do tramways, to the upkeep of the roads; other members objected to this new form of locomotion being singled out with this object, while heavy motor waggons and so forth escaped contribution.

Mr. Joynson-Hicks approved of the action of the Government, holding that the House should be set free to deal with the whole question at the first opportunity.

Mr. C. T. Needham (South-West Manchester) agreed that this question of the maintenance of the roads was one which ought to be dealt with in a large measure, and not in detail by reasons in such a Bill as the present. He had a letter from the tramways department of the Manchester Corporation, supporting this view of the question.

Mr. Robertson stated that the Municipal Tramways Association also took the view that the question of road maintenance should be dealt with [illegible] systematic manner than was possible in a Bill [illegible] this sort.

Mr. P. W. Raffan (Keighley) asked that an assurance that the question of the promotion of the schemes would be borne in mind, and that some inquiry at least would be made into it. It was extremely hard that the promoters of traction schemes should have to come to Parliament year after year at a great expense, when a much more expeditious and less expensive plan could be devised.

Mr. Robertson promised that this aspect of the question should be borne in mind.

On a division the proposal to take out the clause was carried by 317 votes to 134.

The consideration stage of the Bill was completed, and the Bill was then read a third time.

True Economy. Finding that to employ a contractor to do the work would be far too costly, the villagers of Ashley, in Staffordshire, headed by the vicar, the Rev. J. Richards, are occupying themselves in their spare time in constructing a system of sewerage. Mr. Richards expects that a 1d. rate in Ashley yields only £12, and that it would have taken thirty years to have paid off the money if they had employed a contractor. As it was the work would soon be finished.

Roads Improvement Association Activities.—At the next council meeting of the Roads Improvement Association a private exhibition of a film depicting London traffic conditions will be given by the British and Colonial Kinematograph Company. The Roads Improvement Association is considering the possibilities of the cinematograph for (1) educating the general public how to avoid common traffic dangers, (2) demonstrating to the authorities cases of needless traffic congestion or danger, and (3) generally promoting the association's propaganda.

UNITED STATES OFFICE OF PUBLIC ROADS.

THE LABORATORY APPARATUS.

The following is a list of the testing apparatus and accessories which form the equipment of a laboratory of the United States Office of Public Roads. It is not to be assumed that the list is exhaustive as regards the equipment used by that office, but it includes all the apparatus necessary for the carrying out of tests of a well-known character.

Testing Machines: A four-cylinder Deval abrasion or attrition machine—An impact testing machine for toughness tests—A Dorry hardness testing machine—A cementing-value impact testing machine.

Apparatus for Preparing Specimens: A briquette machine and mould, for cementing value tests—A diamond core drill—A diamond saw. Two grinding laps—A small disc grinder—A small jaw crusher—Two ball mills—A large drying oven—A desiccator for cooling briquettes.

Sieves: Two 15-in. sieves 0.6-in. mesh and No. 40 mesh. A set of sieves including sizes from 1½ in. by ¾ inches down to ¾ inch; also ¾ in., and sizes 10, 20, by tens to 80, and 100 and 200.

Scales: Platform scales (500 lb. to ¼ lb.). Scales (5 kilograms to ½ gram). Chemical balance (100 grams to 100th gram.

Thermometers: A room thermometer. An oven thermometer.

Measures: A cubic foot measure. A ½ cubic foot measure. Vessels graduated to 100, 500 and 1,000 cubic centimetres. A 200 cubic centimetre beaker for specific gravity test.

Other Vessels: A dozen 3-quart pans for holding rock samples before and after the abrasion test. A dozen pint jars.

Tools: A 50-lb. anvil. A 10-lb. sledge hammer. A 3-lb. double-face stone hammer. A 1½-lb. single-face tool hammer. A 6-in. scoop.

Materials, &c.—A barrel of quartz sand, between No. 30 and No. 40 sieves. A 50-lb. bale of waste. A galvanised iron waste can. Oil can and motor oil. Six sink scrubbing brushes. 100 sample box (17 in. square when empty). 500 blank labels.

New Reinforced Concrete Loading Pier at Southend-on-Sea.—Construction work has commenced for the new loading pier which the Corporation of Southend-on-Sea has decided to erect under the superintendence of Mr. Ernest J. Elford, M.Inst.C.E., the borough engineer. The total length of the pier will be 600 ft., and it has been designed for a working load of 5 cwt. per square foot. The whole of the work will be executed on the "Piketty system" of reinforced concrete. Mr. T. W. Pedrette, Enfield, N., is the contractor. The contract is for £11,000. The borough engineer selected and recommended the adoption of the "Piketty system" after receiving designs, in open competition, from [illegible] firms of ferro-concrete specialists.

Modern Survey Work.—A lecture on surveying was given by Mr. F. H. Wrench, Assoc.M.Inst.C.E., at the last meeting of the Sheffield Society of Architects and Surveyors. Mr. Wrench described some of the instruments used and the methods adopted in surveying, and he dealt with the exploration survey made by travellers in an unmapped country, topographical surveys, those surveys made for boundary and jurisdiction purposes, and those made for engineering or constructional purposes. In order to get over difficulties in the art of sketching, photography had been introduced in many classes of work, and this had proved most valuable. The plan table was hardly ever used in this country, probably because the ordnance survey had done much of the work for which this instrument was most useful. But with this instrument remarkably rapid surveying was done. For rough work the student could easily make his own plane table. A method practically unknown in England, very useful to explorers, was the photo-theodolite, with which some excellent work had been done in Canada, among the Rockies. The best results with the camera were only obtainable in treeless districts, where an extensive panoramic view could be secured. Mr. Wrench exhibited a number of surveying instruments, and he also showed samples of survey work carried out in most of the principal countries of the world. Thanks to Mr. Wrench were carried, on the motion of Mr. A. F. Watson, seconded by Mr. T. Winder.

SOME RECENT PUBLICATIONS.*

Common-sense Homes.—A Practical Book for Everybody upon the Essential Equipment and Treatment of the Home. By Spencer Sells, member of the Society of Engineers and the Institution of Municipal Engineers. Price 5s. nett. London: Cassell & Co., Limited.

The author aptly quotes a dictum that "The national well-being depends very much upon the standard of comfort in the home." Hence his imposing-looking volume of 168 demy-quarto pages, introduced by a coloured frontispiece of a room fitted with a type of Devon fire and studded with twenty diagrammatic illustrations and thirty-two plates, all admirable specimens of draughtsmanship and reproduction respectively. The letterpress, written in non-technical language, is divided into seven sections: Structure; Water supply; Drains and drainage; Dust, dirt, refuse; Light and air; Warming; and Lighting. It evidences throughout sound common-sense and practical knowledge, and we commend it cordially to every householder. If that usually happy-go-lucky individual could be persuaded to assimilate some of the simple principles here set forth as to methods and fitments, he would be helped materially to maintain the "standard of comfort" of his home at a higher level than that usually set for him by the casual plumber.

A DIARY FOR CITY MEN.

"The City Diary" (W. H. & L. Collingridge, price 1s.) celebrates its jubilee with the new volume for 1913. To the City man it cannot fail to be of daily usefulness, as it not only has ample space for the insertion of daily records, but it contains a large amount of information respecting the City of London, and is a reliable guide to all its institutions. It gives lists alphabetically arranged, according to wards, of the members of the corporation and its officers; of the City churches, with the names of clergy, lecturers and vestry clerks; and of the City Livery Companies, with the names of the clerks and the situation of the halls. Details concerning the London County Council, the City Union, and other governing bodies are supplied, and an exhaustive table of social organisations, forming a singularly practical companion for every citizen. The diary portion, with three days to a page, is interleaved with blotting-paper of excellent quality, and cash columns are ruled on the several pages. It is certainly a good shillingsworth.

To the railway engineer or contractor whose work is likely to take him into Spanish-speaking countries the "Dictionary of Railway Terms," compiled by Andrés J. R. V. García, and published by Constable & Co., Limited, at the price of 12s. 6d. nett, will be particularly welcome. The work is exclusively devoted to interpreting words and terms that concern railway enterprises, special terms which are used in Cuba, Mexico and South America, and which differ from those used in Spain, being included, and the exhaustive character of the dictionary will readily be understood when it is stated that the two sections (Spanish-English and English-Spanish) cover some 250 demy 8vo. pages, each page containing between fifty and sixty entries.

The current number of the *Electrical Review* celebrates the fortieth anniversary of that widely-read publication. A feature of the issue is an article by Sir Wm. H. Preece, K.C.B., F.R.S., for a short time the editor. Sir William cannot be accused of exaggeration when he says that the file of the *Electrical Review* is a history of the life of the electrical industry, and we join in his congratulations to the editors and proprietors on the position they have so well maintained, and hope that at some future day we may be able to complement them on the jubilee of their achievement.

On the first line of the sixth paragraph of the review of the Municipal Tramways Association Interim Committee's report on rail corrugation, in last week's issue, the sentence should have read "It is a puzzle and at the perplexity upon the subject . . ." Another error occurred in the seventh line of the second column, the word "scarcely" appearing in place of "merely."

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EASTERN DISTRICT.

Chairman—Mr. Alfred Fidler, M.Inst.C.E., Northampton.

An Eastern District meeting is to be held at Lyons' Victoria Mansions Restaurant, Victoria-street, Westminster, on Saturday, December 7th.

Programme.

5 p.m.—Meeting of the Eastern District Executive Committee at the offices of the institution, 11 Victoria-street, Westminster, S.W. Note. The members of this committee were elected at the Grays meeting, and have been so notified.

6 p.m.—Dinner at Lyons' Victoria Mansions Restaurant (Victoria-street, Westminster). Tickets 2s. 6d. each.

7 p.m.—Discussion on the report of the Departmental Committee of the Local Government Board in reference to Intercepting Traps on House Drains, to be opened by Mr. H. P. Boulnois, M.Inst.C.E.

8 p.m.—Music and conversation.

8.30 p.m.—Suggestions and discussion in regard to the work of the institution, with special reference to the Eastern District.

Notices.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than Monday, December 2nd, and remittances for dinner tickets should also be sent by this date. Members are requested to make a special effort to attend this meeting, and, if convenient, the dinner, as the hon. district secretary has had to agree to take a certain number of tickets for the latter. A cordial invitation is given to members of the institution outside the Eastern District to attend the dinner and discussion.

Ernest J. Elford, M.Inst.C.E.,
Hon. District Secretary.

Borough Engineer,
Southend-on-Sea.

SOUTH-EASTERN DISTRICT.

A meeting of members of the above district will take place at Sidcup at 2.30 p.m. on Wednesday, January 8th, when the road sections will be inspected.

Mr. Maybury has kindly consented to supply the revised cost of the trial lengths up to December 31st; the meeting will be followed by a dinner at Frascati's Restaurant, Oxford-street, at 6.30 p.m.

A meeting of the institution will be held at Caxton Hall, Westminster, on Friday, December 6th, at 8 p.m., to discuss a paper to be read by Mr. H. T. Wakelam on "Tramway Rail Corrugation."

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

JOINT SOUTHERN AND SOUTH-EASTERN DISTRICT MEETING.

A Joint Southern and South-Eastern District meeting will be held in the council chamber, No. 4 Southampton-row, London, W.C., on Wednesday, November 27th, at 8 o'clock, when a paper, "The Effect of Recent Decisions upon the Arbitration Clause," by Mr. W. Valentine Ball, M.A., barrister-at-law, author of "The Law Affecting Engineers," joint editor of "Emden's Building Contracts," 4th edition, will be read.

The subject of Mr. Valentine Ball's paper is of wide importance to engineers and others engaged in municipal work, and it is hoped that each member will, where possible, bring to the meeting his town clerk, chairmen of committees, and others interested in the

matter. The discussion will be an open one, and an advance copy of the paper may be had upon application.

The building, No 4 Southampton-row, is almost opposite the Holborn Station of the Great Northern and Piccadilly Tube, and within a minute of the British Museum Station of the Central London Railway. Omnibuses from all parts practically pass the door.

ARTHUR PALMER,
J. WOOLFORD BROOK,
Joint Hon. District Secretaries.

JOINT WESTERN AND SOUTH-WESTERN DISTRICT MEETING.

A Joint Western and South-Western District Meeting will be held at Gloucester and Exeter on Friday and Saturday, November 29th and 30th.

PROGRAMME.

Gloucester Meeting, Friday, November 29th.

3 p.m.—Meet at the New Inn, Gloucester.
Business meeting of the Western District.
Short address by the president.

4 p.m.—Discussion of Mr. A. Winter Gray's paper, "Superannuation and Security of Tenure," which will be taken as read.

5 p.m.—Adjourn for tea.

6 p.m.—Informal meeting, at which Mr. Latham will preside.

Exeter Meeting, Saturday, November 30th.

3 p.m.—Meet at the Bude Hotel, Exeter.
Business meeting of the South-Western District.
Short address by the president.

4 p.m.—Discussion of Mr. A. Winter Gray's paper, "Superannuation and Security of Tenure," which will be taken as read.

Discussion on the question of "Working-Class Housing," when two or three short papers will be presented. Members are requested to contribute what information they can on the question, in order that it may be fully discussed, with a useful interchange of views and experience.

6 p.m.—Adjourn for tea.

7 p.m.—Social evening, with musical programme, at the Bude Hotel, to which members and their friends are invited.

Members are requested to make every effort to attend on at least one of the above days. As stated, Mr. Latham will be present on both days, and would be glad to meet as many members as possible.

JOHN BROOK,
C. OWEN BAINES,
Joint Hon. District Secretaries.

November 11, 1912.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

INSTITUTION OF WATER ENGINEERS.

President—Mr. J. S. PICKERING, M.INST.C.E., borough surveyor and water engineer, Cheltenham.

WINTER GENERAL MEETING.

The seventeenth Winter General Meeting of the Institution of Water Engineers will be held at the apartments of the Geological Society, Burlington House, W., on Saturday, December 14th. The proceedings will commence at 10.30 a.m., or as soon as the business of the special general meeting called for 10 o'clock, is completed. The usual informal dinner will be held on Friday evening.

The following papers have been promised for reading and discussion:

(1) "Some Recent Examples of Pollution of Public Water Supplies," by J. C. Thresh, D.SC., M.D., &c.

(2) "The Valuation of Water Undertakings on Transfer to Local Authorities," by E. J. Silcock, M.INST.C.E., F.S.I.

(3) "Recent Advances in the Science of Water Purification," by Adolph Kemna, D.SC.

Advance copies of these papers will, it is hoped, be available for the use of those wishing to take part in the discussions, but as only a limited number will be printed early application should be made.

PROGRAMME.

10.30 a.m.—The minutes of the seventeenth ordinary general meeting and of the special general meeting will be read and submitted for confirmation; ballots will be taken for council for the year 1913-14, and for new members; reading of papers and discussions thereon.

The meeting will be adjourned for luncheon or otherwise as circumstances may require.

PERCY GRIFFITH,
Secretary.

20 Victoria-street, S.W.

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, DONCASTER.

A sessional meeting of the Royal Sanitary Institute will be held to-morrow (Saturday), in the Mansion House, Doncaster, at 11 a.m., when a discussion will take place on "Town Planning in Relation to the Development of the South Yorkshire Coalfield," to be opened by Dr. A. B. Dunne, medical officer of health, Doncaster Rural District Council.

Among those whom it is hoped will take part in the discussion are Messrs. R. A. MacBrair, M.INST.C.E., city engineer and surveyor, Lincoln; R. G. Whitley, surveyor, Bentley Urban District Council; C. F. Wike, M.INST.C.E., city engineer and surveyor, Sheffield; and John W. Wilson, surveyor, Bolton-upon-Dearne Urban District Council.

The chair will be taken by Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute.

The members will be entertained at lunch by the Corporation of Doncaster, and later in the day will proceed on a visit to the Woodlands Model Colliery Village.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. JOHN D. WATSON, M.INST.C.E., F.R.SAN.I.

ANNUAL GENERAL MEETING AND DINNER.

The eleventh annual general meeting and dinner of the Association of Managers of Sewage Disposal Works will take place on Thursday, December 12th, at the Holborn Restaurant, London.

PROGRAMME.

11 a.m.—Council meeting.

2 p.m.—Annual general meeting, chairman's annual report, balance-sheet, reading of papers; discussion.

6.30 p.m.—Reception.

7 p.m.—Annual dinner.

Appointments Summaries. Such advertisements may, in cases of emergency, be telephoned* (**No. 1359 Holborn**), *subject to later confirmation by letter.*

EAST SUSSEX COUNTY COUNCIL.

APPOINTMENT OF DISTRICT SURVEYOR OF MAIN ROADS.

The Roads and Bridges Committee of this Council are prepared to receive Applications for the Office of District Surveyor of Main Roads for the No. 1 or West District, comprising at present about 94 miles of main road.

The District Surveyor, who will be under the direction and control of the County Surveyor, will be required to devote his whole time to his duties and to reside in such part as may be fixed by the Committee, and will receive an annual salary of £160, rising by yearly increments of £5 to £200 per annum, payable quarterly, exclusive of such travelling expenses as may be allowed by the Committee.

Canvassing for the office will be considered a disqualification.

Candidates must be between the ages of 25 and 35 years, and have had practical experience in the maintenance and improvement of roads. Preference will be given to those who are Members or Associate Members of the Institute of Municipal and County Engineers.

Applications for the appointment, accompanied by copies of not more than three recent testimonials, marked on the outside "District Surveyor," to be sent in on or before Tuesday, the 3rd December, 1912, addressed to the Clerk of the County Council, County Hall, Lewes, from whom further particulars can be obtained on application by letter.

F. MERRIFIELD,
Clerk of the County Council.

November 12, 1912.

COUNTY BOROUGH OF BIRKENHEAD.

The Corporation of Birkenhead are prepared to receive applications for the post of an Architectural Assistant in the Borough Engineer and Surveyor's Department, at a salary of £170, rising by annual increments of £5 to £185.

Preference will be given to candidates who have had some previous experience in connection with school buildings.

Applications, in candidate's own handwriting, stating age (which must not exceed 35 years) and experience, accompanied by copies of not more than three recent testimonials, sealed and endorsed "Architectural Assistant," must be delivered at the Office of Mr. Chas. Brownridge, M.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Birkenhead, not later than 12 noon on Wednesday, the 4th December, 1912.

Canvassing will be deemed a disqualification.

THE RURAL DISTRICT COUNCIL OF DONCASTER

invite applications from competent Architects and Surveyors for the appointment of Town Planning Assistant in the Surveyor's Department. Candidates must be quick and accurate Surveyors, Levellers, and good Draughtsmen.

Salary £12 per calendar month.

Applications, to be on foolscap paper in candidate's own handwriting, stating age, qualifications, previous experience, and present employment, together with copies of not more than three recent testimonials, should be sent in on or before Thursday, the 28th inst., addressed to

H. M. MARSHALL,
Clerk to the Council.

Union Offices,
High-street, Doncaster.
November 19, 1912.

BOX 1,196.—The vacancy advertised in THE SURVEYOR, November 1st (p. 619), has now been filled.

TENDERS WANTED.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

SUPPLY OF TOOLS.

Tenders are invited for the Supply and Delivery of Tools for use on Main Roads throughout the County during the year ending 31st March, 1914.

Conditions and Form of Tender may be obtained on and after November 20th from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester.

Tenders are to be delivered to me on or before Saturday, 21st December, 1912, in sealed envelopes, endorsed "Tender for Tools."

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

The County Council invite Tenders for the Hire of Steam Rollers for use on the Main Roads throughout the County during the year ending 31st March, 1914.

Conditions and Form of Tender may be obtained on application from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after November 20th.

Sealed Tenders, marked "Tender for Hire of Steam Rollers," are to be delivered to me on or before Monday, the 9th December, 1912.

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

TAR.

Tenders are invited for the Supply of Refined Tar for surface treatment of the Main Roads during the year ending March 31st, 1914.

Specification, Form of Tender, General Conditions and Schedule of Stations to which the Tar is to be delivered, may be obtained on and after November 20th from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on deposit of One Guinea, which will be returned on receipt of a *bonâ-fide* Tender.

Tenders, endorsed "Tar," to be delivered to me on or before Monday, the 9th December, 1912.

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

TO STONE CONTRACTORS.

Tenders are invited for the Supply of Stone for the Repair of the Main Roads during the year ending March 31st, 1914.

The following Stones are required:

Columnar Basalt.
Clee Hill Basalt.
Welsh Granite.
Coverack or similar Syenite.
Quartzite.
Tarred Macadam, &c.

Form of Tender and Schedule of approximate Quantities required, and Stations to which the Stone is to be delivered, may be obtained on application to the County Surveyor, The Castle, Winchester, on and after November 20th.

Sealed Tenders, endorsed "Road Stone," to be delivered to me on or before Monday, December 9th, 1912.

H. BARBER.
Clerk of the County Council.

The Castle, Winchester.
November 11, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

SURFACE TARRING MACHINES.

Tenders are invited for the Supply and Delivery of Surface Tarring Machines.

Conditions and Forms of Tender may be obtained on and after November 20th from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester.

Tenders are to be delivered to me on or before Saturday, 21st December, 1912, in sealed envelopes, endorsed "Tender for Tarring Machines."

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

WILTS COUNTY COUNCIL.

MAIN ROADS UNDER DIRECT MANAGEMENT.

ROAD METAL.

The Roads and Bridges Committee of the County Council invite Tenders from Quarry Proprietors, Stone Merchants, and others for the Supply of Road Metal for a period of one year commencing 1st day of April next.

The Material required will consist of Granites, Basalts, Flints, Limestones, Gravel, &c., particulars of which are set out in Specifications. Schedules of approximate Quantities and Forms of Tender to be obtained of the County Surveyor, Trowbridge. The bulk of the Material will be required to be delivered at railway stations or wharves, except in the case of local material.

Sealed Tenders, to be addressed to the Clerk of the County Council, County Offices, Trowbridge, must be delivered on or before the 10th day of December, 1912.

All Tenders to be endorsed "Tenders for Road Metal."

No pledge is given that the lowest or any Tender will necessarily be accepted.

(By order)

J. GEORGE POWELL,
County Surveyor.

County Surveyor's Office,
Trowbridge.
November 20, 1912.

Specifications, Schedules of approximate Quantities and Form of Tender can, on application, be obtained from the County Surveyor.

Sealed Tenders, addressed to the Clerk of the Council, and endorsed "Tender for Steam Rolling," must be delivered on or before the 10th day of December, 1912.

No pledge is given that the lowest or any Tender will necessarily be accepted.

(By order)

J. GEORGE POWELL,
County Surveyor.

County Surveyor's Office,
Trowbridge.
November 20, 1912.

WILTS COUNTY COUNCIL.

MAIN ROADS UNDER DIRECT MANAGEMENT.

TOOLS FOR ROADWORK.

The Roads and Bridges Committee of the County Council invite Tenders for Tools for work on 316 miles of Main Road, for a period of one year, commencing on the 1st day of April next.

Specification and Form of Tender can, on application, be obtained from the County Surveyor.

Sealed Tenders, addressed to the Clerk of the Council, and endorsed "Tender for Tools," must be delivered on or before the 10th day of December, 1912.

No pledge is given that the lowest or any Tender will necessarily be accepted.

(By order)

J. GEORGE POWELL,
County Surveyor.

County Surveyor's Office,
Trowbridge.
November 20, 1912.

CITY OF NOTTINGHAM.

The Works and Ways Committee are prepared to receive Tenders for the Supply of the undermentioned Stores and Materials, the Contracts to commence on the 1st January next, and to terminate on the 31st December, 1913:—

(A) Cement.
(B) Blue Lias Lime.
(C) Red Bricks.
(D) Blue Bricks.
(E) Timber.
(F) Earthenware Pipes, &c.
(G) Earthenware Pipes, &c. (Patent Joints).
(H) Iron Castings, Iron Gulleys, &c.
(I) Yorkshire Flags, Kerb, &c.
(J) Granite Setts, Kerb, and Broken Granite.
(K) Ironstone Slag, Chippings, &c.
(L) River Gravel.
(M) Coal.
(N) Picks, Shovels, Scoops, &c.
(O) Ironmongery.
(P) Scavenging and other Brushes.
(Q) Disinfectants.
(R) Refined Tar.
(S) Pitch.
(T) Creosote Oil.

Forms of Tender may be obtained on applying to Mr. Arthur Brown, M.Inst.C.E., City Engineer, Guildhall, Nottingham, on payment of a deposit of 5s. each, which will be returned on receipt of a *bonâ-fide* Tender, in accordance with the Specification, providing such Tender is not withdrawn, and is delivered by the time stated below.

Patterns and Samples may be inspected at the Eastcroft Depot, London-road, Nottingham.

The Committee will not consider any Tender except on the authorised Form of Tender, which must be delivered to the undersigned, in the official envelope provided, on or before Thursday, 5th December, 1912.

The lowest or any Tender will not necessarily be accepted, and Tenders will only be accepted from persons who conform to the conditions as regards paying the local standard rate of wages, &c., and to the working rules of the Nottingham District applicable to the various trades.

(By order)

W. J. BOARD,
Town Clerk.

Guildhall, Nottingham.
November 12, 1912

BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The Beckenham Urban District Council invite Tenders for the Making Up of Overbury-avenue, 600 yds. in length, and Hampden-road, 280 yds. in length. The Works include about 500 cub. yds. Hard-core, 1,130 cub. yds. Flints, 1 110 lin. yds. New 6-in. by 12-in. Granite Kerb, 1,750 lin. yds. of Second-hand Setts, 280 sq. yds. Blue Brick Paving, and the Laying of 2 700 sq. yds. of Red Brick Paving.

Plans and Sections may be seen, and Bills of Quantities, Specifications and Forms of Tender obtained, on application to Mr. John A. Angell, Surveyor, on the production of a receipt from the Collector (who attends his Office daily from 9 a.m. to 5 p.m.) for a deposit of £2 which will be returned on the receipt of a *bonâ-fide* Tender.

A clause will be inserted in the Contract providing that the Contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the Town where the work is executed, and (2) to the extent of 75 per cent at least of the staff required in the execution of such works give preference to, and engage such competent workmen of the class required as may be *bonâ-fide* residents in the Parish of Beckenham and may offer themselves for employment.

Payment under the Contract will not be made until six months after the completion of the Works.

Tenders, duly sealed and endorsed "Tenders for Street Works," to reach undersigned not later than 4 p.m. Monday, December 9th, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

F. STEVENS,
Clerk to the Council.

NANTWICH RURAL DISTRICT COUNCIL.
WILLASTON AND WISTASTON SEWERAGE AND SEWAGE DISPOSAL WORKS.

The above Council invite Tenders from Builders and Contractors for the Construction of Sewage Disposal Works, comprising Detritus, Settling, Storm-water and Stand-by Tanks, and Filter-beds and Humus Tanks, together with the Laying of about 700 lin. yds. of 12-in. and 5,126 lin. yds. of 9-in. Sewers, and the Construction of 57 Manholes and other appurtenant works.

Plans may be seen, and Specifications, Quantities and Forms of Tender obtained, at the office of the Engineer to the Council, Mr. Charles E. Davenport, A.M.INST.C.E., 152 Hospital-street, Nantwich, on deposit of Two Guineas, which sum will be returned on receipt of a *bonâ-fide* Tender and the return to the Engineer of all documents received from him.

The Council do not undertake to accept the lowest or any Tender.

Sealed Tenders, endorsed "Willaston, &c., Sewerage," must be sent in to me not later than 4 o'clock in the afternoon of Saturday, the 14th day of December, 1912.

(By order)

H. G. ATKINSON,
Clerk to the Council.

Rural District Council Offices,
Nantwich.
November 12, 1912.

BRIDGWATER RURAL DISTRICT COUNCIL.

Tenders are invited for the Supply of Stone for the Roads within the above District. The Contracts will be for one year, from 1st April, 1913, to 31st March, 1914.

Printed Forms of Tender, containing full particulars and conditions of Contract, will be supplied on application to the undersigned, or the Council's Surveyor, Mr. W. A. Collins, 56A Eastover, Bridgwater.

Sealed Tenders, endorsed "Highway Tenders," to be addressed to the undersigned, postage paid, on or before Friday, the 6th day of December, 1912, and samples of Stone to be delivered at the Surveyor's Offices on or before such date.

The Council do not bind themselves to accept the lowest or any Tender.

T. M. REED,
Clerk to the above Council.

Bridgwater.
November 1912.

PARISH OF LAMBETH.
BOARD OF GUARDIANS.
ELECTRIC LIFTS.

The Guardians of the Poor of the Parish of Lambeth hereby invite Tenders for the Supply and Installation of three Electric Lifts and Dismantling and Removal of existing Lifts at their Renfrew-road Workhouse, Lower Kennington-lane, S.E., and their Infirmary, Brook-street, Kennington, S.E.

Tenders, which must be endorsed "Tender for Lifts," must be sent to the undersigned, or placed in the box provided for their reception in the Office of the Clerk to the Guardians, by the tenderers or their representatives, should they so desire, on or before Tuesday, the 10th December, 1912, and will be opened in the Board-room at noon on the following day, when all persons tendering, or their authorised agents, should be in attendance. Specification and Form of Tender may be obtained from the undersigned upon payment of £2 in respect thereof, which will be returned to each person sending a *bonâ-fide* Tender. The Guardians do not pledge themselves to accept the lowest or any Tender.

(By order of the Guardians)

JAMES L. GOLDSPINK,
Clerk.

Guardians' Offices,
Brook-street,
Kennington-road, S.E.
November 19, 1912.

BOROUGH OF EALING.
TO ROAD CONTRACTORS AND MANUFACTURERS OF ROAD MATERIALS.

The Town Council of this Borough is prepared to receive Tenders from Manufacturers of Patent or other Road Materials for the Supplying and Laying of such Materials in the Carriageways of certain Roads.

The Contractors, in their Tenders, are to state the price per super. yard for the Laying of some 10,000 to 12,000 super. yards, and also to specify the type of paving quoted for, their guarantee, and the term of years for which they are prepared to enter into a Contract to maintain such paving when laid.

Sealed Tenders, endorsed "Tender for Road Paving," must be delivered at my Office not later than 9.30 a.m. on Tuesday, the 3rd day of December, 1912.

The tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligation arising from his Tender, even though he may not have signed a formal Contract.

Dated this 15th day of November, 1912.

(By order of the Council)

GEO. E. BRYDGES,
Town Clerk.

Town Clerk's Office,
Town Hall,
Ealing, W.

HORSHAM URBAN DISTRICT COUNCIL.
TENDERS FOR ROAD MATERIALS.

The above-named Council invite Tenders for the Supply of the following Road Materials:—

600 tons of Broken Hard Stone, 1½-in. gauge;

to be delivered free at Horsham Railway Station not later than the 31st of January, 1913, in such quantities and at such times as shall be directed in writing by the Council's Surveyor. The weights to be as taken in the trucks at Horsham Station by the said Surveyor.

Sealed Tenders, endorsed "Tender for Road Materials," quoting a price per ton, and accompanied by a small sample of the Stone quoted for, to be delivered to the undersigned not later than 12 noon on Wednesday, the 27th of November instant.

Forms of Tender are not supplied; and the Council do not bind themselves to accept the lowest or any Tender.

(By order of the Council)

S. MITCHELL,
Clerk.

Council Offices, Horsham.
November 19, 1912.

KENT COUNTY COUNCIL.

BROKEN ROAD STONE AND TARRED MACADAM.

The Bridges and Roads Committee of the County Council invite Tenders for the Supply of the undermentioned Materials, to be delivered between the 1st of April, 1913, and the 31st of March, 1914, as follows:—

60,000 tons (more or less) of Broken Road Stone, such as:—

(1) Rhenish Basalt.
(2) Guernsey, Jersey or Alderney Granites.
(3) Clee Hill Basalt.
(4) Leicestershire Granites.
(5) Penlee, St. Keverne or other Cornish Granites.
(6) Northumberland Whinstone.
(7) Penmaenmawr or other North Wales Granites.
(8) Quartzite.
(9) Norway Granite.
(10) Quenast or Lessines.
(11) Or other equally durable Material.

Tenders are also invited for Tarred Macadam, and special forms for the supply of this material will be furnished upon application.

Also the following Local Materials:—

7,500 yards (more or less) of Surface-picked or Grubbed Flints.
3,000 yards of Kent Rag.

Specification and Forms of Tender can be obtained upon application to the County Surveyor, Maidstone.

Sealed Tenders, endorsed "Tender for Road Metalling," must be sent to the undersigned (upon the prescribed form) not later than 12 noon on Wednesday, the 11th day of December next.

The Committee reserve the right to apportion the order as they may feel disposed, and will favourably consider offers of small consignments.

The lowest or any Tender will not necessarily be accepted.

W. B. PROSSER,
Clerk to the Council.

Minutes of Proceedings.

Royal Commission on Sewage Disposal: Eighth Report.

Renewed interest will be aroused in the doings of the Royal Commission by the issue of a further report, not only on account of the contents of the report itself, but by reason of the intimation conveyed therein that their next publication will be the *final* report. From this we gather that the labours of the Commission are shortly coming to an end, and if this occurs soon they will have completed their work without having the satisfaction of seeing their recommendations put into full effect by the establishment of rivers boards with a central controlling authority. On the other hand, it is only fair to admit that, in several directions, the Local Government Board have altered their requirements in accordance with the recommendations of the Royal Commission, and in this sense their labours have had some direct practical results. In May next the Royal Commission on Sewage Disposal will have been in existence for fifteen years, and for some time past very little interest has been evinced in their doings. In this connection it is not out of place to note that in the document by which the Commissioners were originally appointed they were requested to report their opinion upon the matters submitted for their consideration *with a little delay as possible*. It is obvious that it was not anticipated at that time that the Commission would be in existence for so long a period as fifteen years.

For some time past it has been generally accepted as an axiom that it is impracticable to fix a standard of purity for sewage effluents, as local circumstances must be taken into consideration. In the Rivers Pollution Prevention Act of 1876 the sewage effluent alone was considered, and local circumstances were not taken into account, and the present report, in dealing with the question of standards, commences with a reiteration of the recommendation contained in the fifth report to the effect that the law should be altered so as to allow local circumstances to be taken into account, and so that local authorities should not be required to purify their sewage more highly than is necessary to obviate the risk of actual nuisance arising from its discharge. In the final conclusions of the present report it is recommended that an effluent, in order to comply with the general standard, must not contain, as discharged, more than 3 parts per 100,000 of suspended matter, and, with its suspended matter included, must not take up at 60 deg. Fahr. more than 2 parts per 100,000 of dissolved oxygen in five days. From this it will be observed that the general standard affects the amount of suspended matter and the capacity of the effluent to take up dissolved oxygen in five days. In any special standards that may be fixed the chief factor to be considered will be the amount of dilution afforded by the stream into which the effluent is discharged. As a matter of fact, however, the introduction of the test for dissolved oxygen taken up in five days into the prescribed general standard was also due to the great importance of the degree of dilution afforded by a river as a factor in determining the selection of a standard. In comparing the relative advantages of this test with the much more speedy and more easily worked test for oxygen absorbed in four hours from permanganate, the Commissioners point out that the dissolved oxygen absorption test reflects more accurately the observed conditions of the streams, it represents more naturally the actual process which takes place in the stream, and laboratory experiments have shown that it is the more delicate test of the two. Further, it is, in essence, a bacteriological test. In addition, emphasis is laid upon the statement made in the fifth report that, whatever be the standard adopted, under no circumstances must compliance with that standard be held to justify the use for drinking purposes of streams receiving those effluents without subsequent treatment by the waterworks authority. The observations on the administrations of standards contain a repetition of the recommendation made in the fifth report, with one or two modifications suggested by further consideration of the subject. It is recommended that definite periods should be fixed in which standards once prescribed should not be altered. Further, in considering the needs of a watershed, the rivers board having jurisdiction over each area will naturally have to proceed by degrees, and might consider it desirable to deal with pollutions occurring in the upper reaches of the river before attacking the problems presented by discharges occurring lower down. The Commissioners, however, believe this to be unnecessary and, in many cases, undesirable in practice. They think that the rivers board might be well advised to turn their attention first to securing compliance with the standard by the larger towns whose works are as yet inefficient. It is suggested that the standards should not apply to storm-water sewage, which should be dealt with upon the lines recommended in the fifth report, the adoption of which would, it is considered, prevent the occurrence of nuisance.

The report is well worthy of careful study in detail. The whole subject has, in our opinion, been dealt with in a thoroughly practical manner, and we believe that the recommendations will be received with approval by all reasonable persons. In the first place, the Commissioners have fixed a definite normal standard for sewage effluents under ordinary circumstances, and have made provision for the arrangement of special standards in cases where exceptional local circumstances obtain. This will be welcomed by all municipal engineers, district surveyors and others who have the management of sewage disposal works in their hands, and who, in the past, have had no definite general standard to guide them. Secondly, local circumstances generally, and the degree of dilution afforded by the stream or river into which the sewage effluent is discharged in particular, are to be taken into account in fixing the standard which

is to be attained in any particular case. Special consideration of local needs and local possibilities will alone determine what will protect sufficiently the amenities of the river without incurring needless expense, and local authorities will not be required to purify their sewage more highly than is necessary to obviate the risk of actual nuisance arising from its discharge. Thirdly, the establishment of rivers boards will ensure the consideration of the needs of each watershed area as a whole, and some discrimination in the degree of purity required in the effluents at different points along the main watercourse. This should prevent such an anomalous state of affairs as exists to-day in, for example, the Thames Valley, where a uniformly high degree of purity is apparently required in the sewage effluents discharged (*a*) at Erith into tidal water and below the discharge from the London sewers, (*b*) at Kingston, above tidal water, but below the Water Board's intakes, and (*c*) at Staines, above the Water Board's intakes.

In view of the anticipations that next year's Parliamentary Session is to be a less strenuous one than the present, is it too much to hope that the Government will see its way to introduce and place upon the Statute-book a measure embodying the recommendations of the Royal Commission on Sewage Disposal, and thus bring its long labours into practical effect?

* * *

Rivers Pollution.

While our own Royal Commission on Sewage Disposal has just issued its eighth report dealing with the standards of purity to be applied to sewage and to sewage effluents discharging into streams and rivers, and the tests which should be used in regard to them, a somewhat similar report has recently been made by a committee of the United States National Association for Preventing the Pollution of Rivers and Waterways appointed for that purpose. This report was presented by Mr. George C. Whipple, one of the members of the committee, at a conference on the pollution of lakes and waterways held at Cleveland, Ohio, in October last, and deals with standards of purity for rivers and waterways, and we are indebted to our contemporary *Engineering Record* for the text of this report, which we print on another page. A comparison of the two reports makes very interesting reading, and it will be noticed that the Royal Commission go further than the American Committee in fixing a definite test as an index of the actual state of a stream or the amount of dissolved oxygen taken up in five days. In both cases, however, the degree of dilution afforded by the stream or waterway is taken as a factor to be considered in fixing any definite standard, and where a higher degree of dilution has caused a relaxation of the standard, the Royal Commission recommend that such relaxed standards should be subject to revision at periods to be fixed by the proposed central authority, and these periods should be shorter than those prescribed for the general or for the more stringent standards. The formation by Parliament of a central authority and of subsidiary rivers boards, as previously recommended by the Royal Commission, would provide the means for putting these standards of purity into practice, and thereby preserve the reasonable purity of our streams and rivers. These rivers boards must, however, have full control of the water supplies in their respective areas, as it will frequently be necessary to come to a decision as to whether the purity of the sewage effluent should be increased in order to reduce the work which would otherwise be placed upon a water purification plant at some place lower down the watershed, or whether it might not be cheaper in the end to abandon the use of the water for drinking purposes rather than attempt to reduce the pollution to the required extent.

The protection of water supplies is becoming a matter of urgency in other countries as well as in our own and in America. A very stringent law has recently been drafted in Prussia, in which it is proposed to make the person or persons who pollute a river responsible for the injuries they may cause thereby. Existing rights to underground water supplies are also to be restricted in cases where the extraction of water in one place deprives a neighbour of his water or even reduces it, or where it affects the use of the water, or lowers the water level of another owner. On the top of this it is even proposed among the penalties that where a town violates the law, the head of the community may be committed to prison! In Germany, as in the United States of America, the difficulties are rendered greater by the fact that a number of the rivers are not confined to one State, but pass through several on their course to the sea, and it is suggested that any laws that may be established should deal with the country as a whole, and not be promulgated separately by the various States. In this country, fortunately, this complication does not arise, and all we need is prompt action on the part of the Government to put into force the recommendations of the Royal Commission on Sewage Disposal.

Cornish Roads: Important Proposals.

At a recent meeting of the Highways Committee of the County Council of Cornwall a comprehensive scheme for the reorganisation of the road system of the county was submitted by Mr. A. E. Brookes, county surveyor. Mr. Brookes recommended a classification which would create a system of main roads consisting only of the more important highways and their connecting links, the roads needed to complete the system being "mained" where necessary. Roads now classed as "main roads," but not belonging to this system, would be dismained, and two classes of secondary roads created, A and B, with county subsidies of £30 and £20 a mile respectively. The increase in county expenditure, about £3,600 a year, would be in part a relief of local rates, and in part an expenditure for the sake of greater efficiency. The scheme, in the form in which it was submitted, was not accepted by the committee, but Mr. Brookes was instructed to prepare a scheme without secondary roads, which will be discussed at a meeting to be held early next January. We do not know whether both schemes will be taken into consideration, or the new one only, but it is clear that the matter of highway organisation in Cornwall is being taken up in a manner which is bound to have good results. To enable our readers to "place" Cornwall, they may be reminded that the county is considerably larger than Wiltshire in area, a little smaller than Essex, about 95 per cent of Suffolk. The population is about that of Monmouth, considerably more than Berkshire, Hertfordshire, or Cumberland, but less than that of Suffolk. In rateable value it ranks near Wiltshire, a little more than Cambridge, and a little less than Monmouth. As regards climate by far the most important factor is its position relative to the Atlantic and to the Gulf Stream, while in latitude it lies, roughly, about midway between Northumberland and South Central France, or, to take wider limits, midway between Sutherlandshire and the Pyrenees.

* * *

A Donegal Appointment.

A striking example of the familiar process known as putting the cart before the horse is afforded by the proceedings of the Donegal County Council in appointing a surveyor for the southern division of the county. Their choice fell upon a gentleman whose name was duly submitted to the Local Government Board, and that authority has now written to the council pointing out that it was clear from the information furnished that the candidate had not been regularly trained as a civil

engineer, and was not qualified for the appointment. They therefore requested the council to make a fresh appointment. It is at this point where the action of the council showed a curious inversion of the common-sense procedure by which people are ordinarily guided in these things. It was moved, seconded, and ultimately carried that a committee should be appointed to go into the qualifications of the gentleman whom they had appointed to the office. In other words, the council apparently consider it the proper thing to do after they have appointed an officer that which it was manifestly their duty to do before they had expressed their confidence in him by their votes. We know nothing about this particular case except what has appeared in the Irish newspapers, but we notice that one speaker made the significant statement that "when this appointment was before the council they had a fully qualified candidate before them, but they preferred to appoint a gentleman who made no pretence to being qualified for the post." Whether this is a correct view of the matter or not we have no means of knowing, but it is obvious from the attendant circumstances that the council have placed themselves in an anomalous if not a ridiculous position, from which they will have some difficulty in extricating themselves with anything like credit or satisfaction.

* * *

Motor v. Team Haulage.

To the general question whether motor or team haulage is better adapted for municipal engineering work there can never, of course, be an answer. The varying conditions of work, the widely divergent character of different districts, and the difference in the quantities of material to be dealt with are a few only of the factors which render it impossible to make general statements on the subject. The value of the argument from experience in considering any given case is therefore of more than usual importance, and those who have to advise for or against the adoption of motor haulage in their own districts can evidently derive the greatest assistance from careful statistics of the results achieved in practice in a similar district and under identical circumstances. Herein lies the chief value of the paper by Mr. George Symon, the surveyor to the Blaydon Urban District Council, which was read on Saturday last before the Institution of Municipal Engineers at Newcastle. Mr. Symon is careful to state that he would not venture to give advice of a general character, but his paper (which will be found elsewhere) contains the fullest particulars of his own experience. A perusal of this paper shows that the circumstances prevailing in the Blaydon district are peculiar, and this must be borne in mind when considering Mr. Symon's conclusions. It has there been found that steam haulage is not only cheaper than team labour, but also that it is less damaging to the roads for a given quantity of material carried. One of Mr. Symon's conclusions, however, may be taken generally, and that is that mechanical haulage will show to greater advantage in proportion as distances are increased or gradients become steeper.

* *

Doncaster and Town Planning.

The very special character of the circumstances and requirements of the Doncaster rural district in regard to town planning and the provision of housing accommodation was emphasised at the meeting of the Royal Sanitary Institute held at Doncaster on Saturday last. The sinking of no fewer than thirteen new collieries in the vicinity of the town raises many difficult and urgent questions in regard to the housing of the workers. In connection with some of these new enterprises the owners of the collieries have acquired sites upon which model villages can be laid out. This is all to the good; but, inasmuch as the population to be provided for in the near future will not fall far short of 120,000, it is evident that the problem is not capable of solution by private benevolence or the interest of the jerry builder. This would appear to be a case for the application of the Town Planning Act, but, as was pointed out by one of the speakers, the procedure under that statute is very cumbersome. If an immediate start were made, it would be two years before a scheme could be finally approved, and by that time much mischief would have been done. Mr. H. Percy Boulnois, M.Inst.C.E., who presided at the meeting, said that it was evident that the time was more than ripe for dealing with the area, and this opinion was reflected in a resolution which was subsequently passed urging an application to the Local Government Board with a view to special measures being taken to facilitate the immediate operation of the Town Planning Act in the Doncaster rural district. The circumstances certainly seem to be such as to call for special treatment, and it will be interesting to see what view the board will take of the suggestion contained in the resolution referred to.

The Survey of India.

Considering the great importance of the work done and the rapid progress made, it would be difficult to name any undertaking of greater value to the empire, in proportion to the sums expended, than is that carried out by the Survey of India. The topographical surveys now in progress, some of them in wild, undeveloped countries, provide the engineer with information on which he can base an opinion as to the nature and scope of the works which he may be called upon to carry out in order to develop the resources of these regions, and provide as well the materials needed for the preparation of preliminary estimates of cost. To those who are concerned with problems of irrigation, water-supply, and communications by road and rail, the work of the department is equally valuable as regards both the work of the public works officer and that of the municipal or district board engineer. The survey department has encountered the difficulties inseparable from the formation and working of an organisation composed of so many and such diverse elements, that there can be no doubt that it is of great service to Indian progress, bringing out as it does some of the best elements of native zeal and competence, and linking Englishmen and a score of native races in a great common task. Some notes on the report for 1910-1911, which will be found on another page, will doubtless be of interest to our readers generally, and especially to those who are working near the outposts of empire.

* * *

Fair Play?

In the interests of all concerned we are always glad to give publicity to cases of hard or unfair treatment being accorded to surveyors. The latest instance of the kind has occurred at a place (for the present at any rate it must remain nameless) which has had no fewer than six surveyors in eight years! This fact alone is sufficient to raise grave suspicions as to the conditions under which the surveyor's work has to be done, and inquiry shows that these suspicions are abundantly justified. The salary has been £120 per annum, without allowance for office or travelling, and the surveyor has been responsible for the maintenance of over 150 miles of roads at an annual cost of £7 per mile. This would appear to be a sufficiently difficult task in itself, but, coupled with excessive and ignorant interference by individual members of the local authority, it is not surprising that a succession of surveyors have with one consent abandoned the attempt as hopeless. Parsimony in highway maintenance and administration is never a wise policy, and it is particularly foolish under present-day traffic conditions. If this note should by any chance be brought to the attention of the authority referred to, we hope that they will mend their ways and highways!

Intercepting Traps in House Drains.

ROYAL SANITARY INSTITUTE DISCUSSION OF DEPARTMENTAL COMMITTEE'S REPORT.

(*Conclusion.*)

The discussion on the report of the Departmental Committee of the Local Government Board, opened by Mr. H. Percy Boulnois, M.Inst.C.E., at a meeting of the Royal Sanitary Institute on the 12th inst., was brought to a conclusion on the 19th inst., Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E., chief engineer to the London County Council, again presiding.

Mr. H. C. H. Shenton (Westminster) said it seemed to him that the report they had been discussing was based upon evidence which was really overwhelming in proving that the trap was open to objection, and it almost seemed a waste of time to go on discussing the merits or defects of the trap in face of the evidence collected. He urged at a former meeting on the same subject that the speakers should try and apply the findings of the report, for it seemed they would certainly have to be applied, and he thought there would be considerable profit in discussing the matter from that point of view that night. The intercepting trap was stated in the report to be objectionable and unnecessary, and as long as the fittings and gullies were properly trapped there was little risk of drain and sewer air getting into the house. They would see that every sink or bath waste pipe, and everything except the water-closet, was trapped twice—at the gully as well as inside the house. The water-closet had only one trap, and he suggested that if the interceptor on the main drain was taken away the water-closet certainly ought to have more than one trap. There were plenty of instances of traps becoming unsealed, particularly in the case of houses that had been left empty for some time, or in the case of a closet in a house which was not used, and he suggested that it would be a serious thing to have sewers ventilated in that manner. It was a point, he thought, that ought to be considered.

Mr. C. H. Cooper, borough engineer of Wimbledon, said the crux of the whole question appeared to him to rest on the matter of sewer air—at least the whole report was based on that. The arguments in the report were based on the investigations of the bacteriologist, and whether they could rely on the bacteriologist or not was a question that seemed to him to be very much governed by chemistry, a science which they had had with them longer than bacteriology. He remembered very well a sewer case fought nearly thirty years ago in which the discharge from a bone-boiling works formed a very important point. This discharge smelt most abominably. It was analysed by the late Dr. Tidy, who gave his analysis, and in the course of cross examination he was asked whether he could show any difference between the analysis of that liquor and that of beef tea, and he said he could not. They had in paragraph 76 of the report the result of the bacteriological analysis of sewer air. It said: "This is established not only in the case of good sewers and those which are well ventilated, but also in the case of bad sewers and those containing more or less stagnant sewage with large deposit, and those in which ventilation is small or absent; indeed, in this latter kind of sewage the number of sewer-air microbes would appear to be a minimum." Then it went on to say that those which might be pathogenic were very rarely present in sewer air. That was to say, in a sewer that contained stagnant sewage and a lot of sediment they found a minimum number of bacteria. Was that evidence any use whatever to base a report like that on? They all knew the effect on themselves of going down these badly ventilated sewers, and he had a rather sad case among his own staff some eleven years ago. A young man in the drawing office happened to sprain his wrist, and, being unable to do his usual work, went out with two assistants to examine a sewer in which there was a good deal of stagnant sewage. The result was that all three were affected. The young man he had referred to ceased work the third day after that was on May 24, 1901—and on June 15th he died of septicæmia. They could get any number of these cases, although the report said it was not so. Take his own sludge works—time after time they had men engaged in sludge pressing who had to give up, although they would not give up until the very last. The report had referred very rightly to the death-rates in Germany; if anything, these showed, he thought, a larger decrease perhaps than in this country. He had not been able to work out the death-rates here, but in this country, taking the period when intercepting traps came in—1871—they got a decrease of 23 per cent subsequently. But in considering Germany they must remember that the German in years gone by was not living under such favourable circumstances as the people in England. When, in the seventies, he was serving his time, it was quite impossible to get the German clerks in the city to pull the plug of the water-closet after use, whereas English people, who were more accustomed to sanitation, always did so. There was no doubt that prior to 1870 or 1880 their sanitation was much better than that of other countries, so that in comparing the German death-rate prior to 1870 with the English death-rate they must remember that fact and expect to find that the rate in England was lower. It seemed to him a great fault in the report was that of making light of the danger of sewer air. To found the argument on bacteriology and chemistry that sewer air was not dangerous was, he thought, altogether wrong, and they did not want the statistics confined to a small number of people, but as large an area as possible in order to arrive at the truth of the question. As regarded stoppages in intercepting traps, the trap was like any other device which required attention, and if it were not attended to it got out of order. He had prepared a diagram which showed a form of back drainage which had been in use at Wimbledon for many years. It ventilated not only the main sewer *viâ* the back drain, but the manholes were so arranged that they could get a rod down in the back drain for cleansing purposes. There was a great deal of opposition to it for a time, and one large builder kicked very much against it. About three years afterwards, however, he admitted to him (Mr. Cooper) that the drainage of those houses was costing him less than that of any other houses he possessed, and that he had never had to make an opening in it. That was a case where intercepting traps were applied to every house, although they were only small houses. Mr. Johnson, their sanitary inspector, who was present that evening, would tell them how the drains had worked since they had been in.

Mr. H. Johnson (Wimbledon) said the portion of the report which he would like to deal with particularly was in regard to stoppage in the intercepting traps. Appendix II. of the report dealt with Wimbledon. As the credit of designing the system of sewers in that borough lay with Mr. Cooper, he was quite unprejudiced, but as inspector for the past sixteen years he could give accurate figures as to what had been found. If in Wimbledon the percentage of stopped traps was only 1·5, why in other districts should there be figures of 15·8, 25·3 and 24·1? Where such a condition of things had been discovered he maintained it was the duty of the authorities to institute an inquiry as to why such should be the case. If a percentage as low as 1·5 had been found in Willesden, the probability was that the committee would never have been heard of. The questions of the ventilation of sewers and the interception of house drains were very closely connected, and one could not speak of one without the other, but he did say emphatically that it was not necessary in order to ventilate public sewers that it should be done through the soil pipes of the house drains. The Wimbledon system showed that it was quite possible to design an effective scheme and ventilate the sewers by means of ventilating pipes put up by the local authority. Some speakers had said that the drains and sewerage system were all one, and that it was no hardship on the owner of private property if he ventilated the public sewer, but the owner of private property was able to see whether his drainage was perfect, and if it were not he could remedy it, whereas if the public sewer were not, he was unable to remedy it, and they all knew there were "sewers" and "sewers." In the report it was said that the fresh-air inlet was open to abuse. That might be so if the intercepting trap was of bad design, if there was misuse, or if

there was bad workmanship. They recognised in Wimbledon that the mica flap would always be out of order, and consequently they never fixed one. A 4-in. pipe was brought up as near to the ground surface as possible, protected by an iron grating, and the outlet shaft was as high as possible, and their experience had been that so long as there was movement of air there was little foul air in the drain. With a population of 30,000 not 10 per cent of the houses had baths; they had simply a water-closet and sink, but the number of complaints of foul air coming from the fresh-air inlet were extremely few. In regard to stoppages, he had had occasion to examine the drains of 1,303 houses in the same neighbourhood. He not only examined the manhole, but the houses where there was an access cap and a manhole at the back, and in slightly more instances they found the stoppages were between the back manhole and the front. If they had examined the front manhole a little later in all probability they would have found the obstruction there, and the intercepting trap would have been blamed for what was really not its fault. It had been borne out by other inspectors who had since examined the back manholes that they had found as many stoppages in the back manholes where there was no intercepting trap as in the front where the intercepting trap was, and the great majority of the stoppages were undoubtedly caused by misuse. If for the misuse of a sanitary appliance they were going to scrap it, then all drains would have to be scrapped. Did anyone suggest that because they found a stoppage in a drain they should scrap it? On their surface-water sewers there was no intercepting trap, and these were the only ones in regard to which they received complaints. He, like Mr. Cooper, had been struck with paragraph 76 of the report, which, if taken to its logical conclusion, meant that the more they ventilated sewers the worse they became from the bacteriological point of view. He was satisfied that sewer gas did have a harmful effect on human beings. For many years his father suffered from tonsilities and septic quinsies, at intervals of two or three months. He knew there was a sewer under his house because he had been foolish enough to allow one to be constructed there. A specialist whom he consulted told him the origin of his illness was drain or sewer air, but, believing that the sewer was perfectly airtight, he could not accept the explanation until he was persuaded to have the sewer tested by smoke, with the result that it was discovered that, almost under his desk, there was a badly-made joint. That having been put right, his father had never suffered since. It might be a coincidence, but it was no use telling his father that sewer gas was not harmful. He did not think the committee were justified in coming to the conclusion they had on the question of stoppages; if they had taken a larger number of towns a different conclusion would have been arrived at. The option given to local authorities in the matter of by-laws was, however, one excellent feature of the report and would, he considered, have good results.

Mr. W. Jennings (Lambeth) said he was sensible of the honour of being permitted to say a few words on that most interesting and abstruse subject which had occupied the minds of sanitarians for the past quarter of a century, and the earnest deliberations of a Royal Commission for four years. He had, by the chairman's permission, ten minutes at most to compress his remarks, which could obviously be greatly extended without exhausting the subject. He recognised that many eminent sanitarians had already expounded their views, and he did not purpose traversing the same ground, although he was deeply interested in the questions for and against the intercepting trap. He left the discussion on that, and passed on to a still more important subject—*viz.*, the disconnection of sanitary fittings from house drains. Competent authorities were practically agreed that the danger lurked in the smaller private drains rather than in the larger public sewers, yet while great importance and attention had hitherto been paid to the disconnection of the private from the public drain, little or none had been given to the disconnection of water-closets from soil pipes or house drains, and most illogically, while it was deemed imperative to doubly trap, disconnect and ventilate the waste pipes of baths, lavatories and sinks, the most important sanitary appliance, and the most frequent source of danger—*viz.*, the water-closet—was not disconnected at all. In hotels and mansions it was the present-day custom to find installed side by side lavatories, baths and closets fixed under the conditions he had named, and he submitted that it was the duty of sanitarians to make secure the first line of defence, and render the house impregnable to any incursion from the house drains, before considering the outworks, as they might term the public sewer, which, although of great, was admittedly of secondary, importance. In olden days an Englishman's house was his castle, and, according to the imperial lexicon or dictionary, a castle was a fortress, or a house fortified for defence against an enemy; and it behoved all sanitary engineers first of all to fortify the dwellings of the inhabitants of the kingdom against the incursion and ravages of the enemy—*viz.*, drain air. Without desiring to appear in the *rôle* of a pessimist, he would briefly refer to the awful epidemic of cholera which had broken out among the Turkish forces. God forbid that the disease should ever land on these shores; but it was the duty of all of them to be prepared for such an eventuality and to take such steps as would enable them to overcome and defeat such a visitation should it unfortunately arise. He hoped his remarks might engender further consideration of that vital subject.

Mr. Edward Willis, engineer and surveyor to the Chiswick Urban District Council, said a considerable amount had been said that evening as to Willesden being the cause of this enquiry, and no doubt it would be much maligned in consequence, but he believed they had done very great service in bringing together so much evidence, which was undoubtedly useful, although many present might differ from it. What was the *raison d'être* of these discussions? Surely they did not expect to bring better evidence than a Departmental Committee with unlimited funds at its disposal had brought forward? Then were they entirely to ignore the findings of the committee? He held no brief for Willesden, although he had had the pleasure of serving in the locality for many years. He was not at all connected with the evidence that had been given before the committee, but prior to the enquiry he had studied the question of the intercepting trap, primarily because he considered that the shape was wrong, and as a building surveyor in the neighbourhood of Willesden for some years he had the opportunity of examining a number of houses and testing intercepting traps with actual excreta under ordinary conditions. They were in drains which had been properly tested and properly laid, and in the course of his experience he found a number of these traps he could not give the exact percentage because at the time he did not know anything about an enquiry—choked, primarily with paper and rags, and only on one or two occasions was it due to the stopper falling into the trap itself. He had had an experience of finding the cement had got into the traps, simply because the manhole covers were not put on at the time the drain was laid in many districts, and in some cases the actual position of affairs was that the flow had only 2½in. to pass over the trap. When he tested with a 2-gallon flush he had never succeeded in removing the excreta and paper, and when he tried a 3-gallon flush, it was only occasionally that that was possible, and after several flushings, but in every case where he tested with a pail of water or a pail of slops the excreta and the paper were entirely cleared. That brought them to a very important point in regard to the means adopted for flushing closets, whether interceptors remained or not, and, in his opinion, there was room for great improvement in the present methods. He had two experiences with regard to rats getting through the traps, in one of which he had a witness, while in the other case he was the only person in the manhole. In the latter case he had sent his assistant to arrange for the drains to be flushed, and he saw the rat come right through the trap, and the same thing occurred a second time, when he had a witness present. Therefore, he was afraid they must disabuse their minds of the idea that the intercepting trap was a perfect bar against rats, and they had to contend with a most serious problem, especially when they had traps beneath a closet on the ground floor. He thought that in a large number of cases intercepting traps would be done away with after this report, and his personal opinion was that for many reasons that would be a benefit. He admitted there were reasons which would lead one to the opposite opinion, but he thought the maximum opinion was in favour of removal of the trap. If they removed the trap they must give some additional bar against rats, and that point had been dealt with by Mr. Jennings. In the future, if those traps were done away with, they would have to provide a double trap to every water-closet in a house, which they practically got now in the case of valve closets. It

did not think they should pass lightly over the evidence which had been given before the Departmental Committee. The witnesses had no axes to grind; they were asked to give impartial evidence, and their status in the profession was sufficient to carry great weight, and not only on the question of intercepting traps, but in regard to sanitation generally and sewerage construction the evidence would be most useful. The evidence in connection with the discharged gases from flowing sewage was, he thought, particularly useful. It clearly pointed to the fact that splashing was the primary cause, not only in drains, but in sewers, of the discharge of offensive gases. He could not agree with one of the witnesses who said that sewer gas was not to be feared if it gave off no odour—that did not agree with an experience he had had with an assistant in going through a 580-ft. length of 3-ft. sewer. They both found their lights beginning to burn dimly when they were about a quarter of the way through, and his assistant wanted to stop and rest, but he (the speaker) managed to push him on in front and succeeded in getting out at the other end. The sewer was perfectly inoffensive and perfectly clean, except for a slight flocculent accumulation on the sides, but it was a proof that there were dangerous gases in it, and he thought therefore that particular clause in the report should be taken *cum grano salis*.

Mr. W. D. Scott Moncrieff (Westminster) said he did not think it was possible for those who were advocating getting rid of the trap to ignore such arguments as had been given that evening by Mr. Cooper and his inspector, Mr. Johnson. His recollection went back to the construction of one of the first disconnecting traps in Scotland, by Dr. Ferguson in Glasgow forty years ago. The idea of disconnecting was so clear in the minds of sanitarians at that time that it was taken up as a matter of course and in the belief that sewer gas was dangerous. It was quite clear that if there was no danger in the air that escaped from sewers there was little to be said against getting rid of the trap, which, in its very nature, had certain obvious mechanical disadvantages. But he thought that was a large order. On the evidence presented they were asked to believe that sewer gas for all practical purposes was a negligible quantity as regarded public health. It was generally recognised that the ventilation of sewers themselves was still an unsolved problem, but until the evidence was available the disconnection of the sewer from the house was accepted as an absolutely solved problem, and it seemed to be a very dangerous proceeding to fly in the face of what they had at present and take the very serious step of making great alterations on evidence which might very likely be upset before many years had passed. Since its establishment the Royal Sanitary Institute had committed itself to this system of disconnection, and if they adopted the views of the committee it might happen that discoveries might be made later on—through no fault of the bacteriologists or chemists, but simply from the state of knowledge of the time—and some other terrible creature with a long name found. The disconnecting trap would then have to be put back until some disinfectant had been discovered to deal with the creature. (Laughter.) What Mr. Cooper had said with regard to the difficulty of analysing the actual pathogenic conditions connected with a particular smell was well known, and Dr. Rideal, in one of his text-books, had said that they might take an exceedingly small quantity of perfectly fresh broth or similar substance, put it into sterilised water, and, with a suitable organism, produce a most offensive smell. One might fairly challenge the medical men who had signed the report from the bacteriological point of view, or had suggested the view by the evidence they gave—not to take a person who was accustomed to sewers, but a delicate person susceptible to sore throat, and subject them to a whiff of sewer gas and see what they would say. There were a vast number of people in the country who were not strong, and in many situations there were sleep inclines, as in London. Under certain conditions of the atmosphere they would have a passage of very foul gas from the ventilating pipes very near the level of the houses in which nine-tenths of the people were sleeping. Putting one gas against another, he thought there was little to choose between them, but, speaking for himself, he would prefer not to have the gases at the level of the part of the house where he happened to sleep, and at a time when the vital forces were naturally lower and less able to stand them. It had always appeared to him curious that certain experiments made some years ago by an Italian bacteriologist had been ignored when dealing with this aspect of sanitation. This Italian bacteriologist made experiments on animals which were immune by inoculation from enteric fever, and he discovered that the immunity was destroyed by their being exposed persistently to the presence of sewer air. If an immune animal could be rendered liable to enteric fever, how liable might a large number of the more delicate proportion of the population of London be to the intrusion of these gases was a question to be considered. As had been said, it was a large order to accept the view that there was no danger.

Dr. C. Porter (Marylebone) commented on the fact that of the three medical officers who spoke at the opening discussion two were in favour of the intercepting trap, Dr. Butler being against it. He agreed with Dr. Butler, and, like him, had been brought up, so far as the intercepting trap was concerned, in the orthodox faith; but before he heard of the report he was strengthened in the doubts he entertained with regard to the trap, as the result of his work in the Midlands, and more especially in Leeds. Leeds was looked upon as an entirely trapless city, but as a matter of fact traps were insisted upon under the by-laws, and when he was there he brought pressure to bear on the owners to instal them, and had also to listen to the complaints of inspectors and others in regard to traps. He need not say what was stated in the report with regard to the health conditions of houses in Leeds which were without traps. Living in Leeds, one had a tendency to become heterodox, and some time ago he told Dr. Parkes that he saw no necessity for the committee, because he did not think anyone believed in the trap. Dr. Parkes replied that a great number of people believed in the trap, and that he himself did, and, of course, he (the speaker) rapidly changed the subject. At the previous meeting Dr. Parkes drew a terrible picture of the typhoid bacillus finding its way through the soil pipe and down the drawing-room chimney; but he still believed in the accuracy of his own conclusion that the trap was really no protection at all, that it was an apparatus difficult to choose and to lay, that it was so constructed that it was difficult to flush, and that it would act as an obstruction to anything going from the drain to the sewer. Dr. Boobbyer said he believed in the intercepting trap, because in the far-famed Nottingham Park the water-closets sometimes dried up, and Dr. Parkes' reason for being in favour of it was that Mr. Patten Barber in his experiments used artificial fæcal matter which contained clay, in addition to what he said about the typhoid bacillus. Neither of those gentlemen gave one valid reason in favour of the trap, and he very much preferred to stick to the logic of the report which Mr. Boulnois had so ably summarised.

Mr. A. A. G. Malet (Local Government Board) said he was probably not letting out any secret when he said that two of the members of the Departmental Committee were brought up in the orthodox style. They were told that the report they had issued was not orthodox, but he could only say that they followed what they thought were the conclusions shown by the evidence before them. Their report was certainly not written either to bolster up or pull down the intercepting trap, and he was surprised to hear some speakers claiming the report as something written precisely on their side or against the other side. The committee had absolutely no intention of taking up a position of that kind; they had no wish to show any preference either one way or the other. Speaking personally, it seemed to him that one of the most important points in the whole report was that if the evidence was true, sewer air was less dangerous than drain air. He did not wish to say that sewer air was not dangerous at all; he only said it was less dangerous than drain air. If that was accepted it followed that a combination of sewer air and drain air could not be worse than drain air alone, and that practically meant that in ordinary circles the need for an intercepting trap was not a vital necessity. Then they came to certain circles where an intercepting trap might be necessary, and in such cases it should be left to local conditions to decide whether a trap should be placed or whether it should not. One gentleman who had recently spoken had welcomed that recommendation, and he (Mr. Malet) ventured to say that it was quite a natural conclusion to come to. If they accepted the fact that sewer air was less dangerous than drain air, then the fact to which one gentleman had referred, that traps might evaporate and air emanations get into the house in conse-

quence, did not appear to be very important, because if the trap ventilated a series of flats they would still get emanations from the drain into the house, and if sewer gas was not so dangerous as drain gas, and the trap was taken away, they got both sewer air and drain air in, and that did not make it any worse than getting only drain air in. The vital point of the whole thing was whether sewer air was less dangerous than drain air. What they found in the course of their investigations was that if there was any undue pressure in a drain it was only the weakest trap that went; there might be twenty traps in a drain, but in case of undue pressure it was only the weakest trap that would go; the others remained in quite satisfactorily. If that were the case it was hardly worth while thinking what should be done when the trap was taken away, but it seemed to him that a weak trap might be put on the drain—they might take the lowest connection from the closet and might insert between the ordinary house fitting trap and the connection from the sewer pipe a puff pipe, and if they had undue pressure the weak trap would go, and the emanations would go through the puff pipe into the open air, or wherever they liked to take it. It would be less dangerous than going into the house. No one wanted sewer air or drain air in their house; it was a thing to be avoided by all possible means. A lot of evidence went to show that sewer air was chiefly dangerous from the point of smell. In their report they drew particular attention to the question of smell, and they said that every means should be taken by the local authority to see that no smells should occur, and that no sewer air or drain air should get into a house, and they suggested in one place that cast-iron pipes should be used. The two most important points were those relating to smells and splashing. It was an important object in life to keep their drains tight, and to see that smells should go somewhere where they would do the least possible harm, and they could not be too careful in considering where these upcast shafts should be taken to. They should be taken to places where the least possible nuisance and inconvenience was caused. As to splashing, they knew it was an accepted fact that splashing was dangerous in foul air, both in regard to the germs and the organisms that were given off. They knew that in the case of a sprinkler going round a sewage filter, if the sewage were at all septic or foul, the greater the spray the greater the smell. Personally he had been rather impressed by the evidence they got from Germany, where all pipes were taken up inside the houses owing to climatic conditions, and where they were told that only one town—Cologne—ever had intercepting traps, and there they had become such a nuisance that they had been taken out. They also learned that whenever they laid earthenware or stone pipes they always made the joints with some bituminous compound, and not with cement, a point which might be worth considering.

Mr. F. Osborne Smith remarked that the report was somewhat perplexing and deserved careful consideration. It was certain that they must reconsider their present accepted ideas with respect to drainage. This, of course, did not necessarily mean that they were to accept the evidence and conclusions deduced therefrom without question. Personally, he took exception to several points—the removal, for instance, of the fresh-air inlet to overcome one of the disadvantages of the interceptor. That, he considered, would be fatal in several ways. Let them, as an example, take a house with one soil pipe, a ground floor and upstairs water-closet, and a mica flap fresh-air inlet; the top water-closet was flushed, and the air was driven in front. Where could it go? Obviously it must go somewhere, and it went through the ground floor closet trap, and drove the water of the trap in front of it. How much more would that happen without an inlet. Of course, the flap was acting well. This had happened several times in his own experience. Another point in the report was the sealing down of the lower portion of the drain so that a stoppage might become evident sooner than it did under the present arrangement. If they assumed that a stoppage had occurred in the trap, how was it to be removed without flooding the brick chamber? One of the advantages claimed for this sealing was that it prevented the flooding and consequent removal, which was objectionable. It was known that the interceptor frequently became stopped. Why was this? Some people said it was because dirt, &c., entered through the fresh-air inlet, but if this was so the inlet was obviously in the wrong position. Others argued that it retained legitimate solids in such quantities that they stopped it. In that case two facts were noted—either there was an insufficient flush of water to clear it, or the velocity was so small that there was no force to carry the solids through. That could be increased in various ways. The quantity of water might be increased, although this was sometimes difficult. Reducing the size of the trap would increase the velocity through the trap, and the gradient of the drain might be increased, which would also increase the velocity. Most of the traps which were found to be stopped would, he thought, also be found to be larger than was requisite for the amount of matter that was to pass through them, and the drain was laid with too little fall. Interceptors and drains in the past had generally been of too large a size, and until recently it had been considered essential to have 6-in. drains and interceptors for all main house drains. These were the cause of half the trouble. The interceptor was said to contain decomposing sewage which was responsible for the smell in sewers. Where did this decomposing sewage come from? It did not come from the water-closet, because clean water was used to flush it out of the closet apparatus. It came from the gullies which received the waste from scullery sinks and baths. These gullies were seldom cleaned out, and rarely flushed, and it was well known how offensive they became. If the waste pipes were examined it would be found that they were lined with a filthy slime, which was quite as offensive as the soil pipe, if not more so, and yet they had abolished the traps at the feet of the soil pipes long ago, and retained those at the feet of the waste pipes, which were literally young cesspools. The interceptors which were at the feet of soil pipes were really clean compared with the present gullies, many of which were actually selected because they retained the filth. Waste pipes had long since been made with pipes and joints similar to those used for soil pipes, except in size. Why not treat them as soil pipes—they were quite as foul—and remove the cesspools at their feet? They would then have the full value of their discharge to flush drains, there would be fewer traps to become broken and defective by frost or other causes, and they could retain one trap—the interceptor—to protect them and their houses from the foul air of other people's drains; it was quite enough that they should deal with their own. All sewers were not as clean as they should be, and it was unfair to judge all sewers by those which were clean. Some sewers were as sweet as could be desired, while others—well, the least said about them the better. It would be interesting to know if all the advocates of the trap had sewers beyond reproach. He was afraid not. He did not desire to mention names, but he knew of some which were practically half full of silt. Were they to ventilate those elongated cesspools through their house drains? He hoped not. The report stated that in some cases the trap would be necessary. In that case, why not take the bull by the horns and see that they got an efficient trap, and then they would rarely hear of stopped traps. The practice of ventilating drains by flushing them with foul air from other people's drains did not appeal to him. There was plenty of fresh air, and it should be passed through the drains to sweeten them and dilute the foul air which might be in them. To do this the fresh-air inlet must be at a low level, and not above the roof. In the event of the fresh-air inlet acting as an outlet at intervals, it would generally be of short duration. As a matter of fact, the poor fresh-air inlet was frequently the scapegoat of the scullery gully, which he had referred to, and which was frequently adjacent to it in the front areas of town houses.

Mr. A. J. Martin (Westminster) observed that, in matters of this nature, he liked to make sure of his premises, and what he was talking about, and he had taken the simple precaution of looking up the word "trap" in the dictionary, with the result that he read, "a trap is a snare." (Laughter.) He did not suggest that every intercepting trap was a delusion and a snare, but he feared a good many of them had something of that about them. He listened to the interesting discussion the previous week, but he confessed he was disappointed, because he had hoped to gather from the supporters of the intercepting trap some real arguments in favour of it. The best he heard was that made use of by Dr. Boobbyer, who stated that the trap was useful because it pandered to the prejudice of an ignorant public. Dr. Boobbyer did not say so in so many words, but it was manifestly the idea in his mind. In the days before they had the benefit of the Insurance Act a prudent man who wished to

protect himself against evil went to a wise woman, who gave him a charm to hang round his neck. It appeared to him that the intercepting trap was very much in the nature of a charm. Although it was too large to wear round one's neck, they stuck it on to the house drain. He was not sure whether in many cases it would not do as much good to put it into the garden and grow geraniums in it. In laying a sewer the point the engineer aimed at was that it should be self-cleansing; that the liquids and solids should pass through it instead of lodging in it; and also that it should be self-cleansing as regarded the air it contained. They took care to lay their sewers and house drains up to the standard, and then put in a contrivance which held back a large quantity of decomposing solid matter, and brought about stagnation in the drain and sewer. What he was impressed with most in the discussion was the awful straits to which the advocates of the trap were reduced in their efforts to justify its existence. The case of the rat seemed to be the weakest that could be placed before an intelligent audience. If anything could be weaker, perhaps, it was the elaborate description given by Dr. Parkes of the pilgrimage of the adventurous typhoid organism from the soil pipe and down the drain, and up the next soil pipe, and then by some mysterious means down the throat of the inhabitant of the neighbouring house. He allowed that this was possible, but it was a remote possibility, and when persons were driven to such an argument they must surely have a very bad case. They had listened to an eloquent disquisition that evening on the danger of sewer air getting into a dwelling-house if the intercepting trap was left out, but who in his senses was going to put a ventilating pipe into a place where the gas could get into the house? Looking at the subject as a whole, there did not seem to be a doubt that the objections to the trap were real, while the advantages were problematical, and it seemed to him, therefore, that a very heavy blow had been dealt at the idea that the trap was a necessity in every case. The supporters of the trap claimed that the objections to it were due to wrongful construction, and so on, and they pointed to defective drains and sewers as necessitating the continuance of the trap. But if they assumed advantages for a properly fixed trap they must also be fair and assume perfect drains. It had been urged that, as the report of the Departmental Committee alleged that the trap was no good, they should consider what steps they should take to get people to do away with it; but he would ask if such a course would not reflect seriously on the sanity of their profession. They would, it appeared to him, absolutely stultify themselves if they were now to put up a contrivance which down to a few days ago they were compelled to put in. The report contained nothing to justify such a step; it simply pointed out that there was a good deal to be said on both sides, and the logical outcome seemed to be that they should give local option to householders to say whether they would have traps or dispense with them. Valuable as the report was, he did not think they ought to apply the far-reaching conclusions on so small a foundation of fact. He accepted the investigations absolutely so far as they went, but he did not think it was altogether safe to rely on the [illegible] and class of investigations of sewer air. They ought also to have regard to results, and they ought to have evidence from more than the forty or fifty gentlemen who had been before the committee. There was a large body of experience in the country, and this might easily be collected. He would like to suggest whether it might not be well for the council of the Royal Sanitary Institute to join perhaps with other bodies in addressing inquiries to local authorities, putting certain definite questions on the subject, and then arrange for the answers to be summarised.

Mr. A. P. J. Cotterill (Westminster) said that [illegible] intercepting trap he could not help feeling that there [illegible] the expression used by one speaker that sewers were "sewers," and he thought it was because of that that they found it [illegible] some sewers [illegible] the need of the trap. [illegible] would point to the fact that the trap [illegible] fixed it, and there was no reason why it should. The percentage of blockages in Willesden had been given, it being added that in no case was there evidence of the stoppage until the traps were exposed to view. But where was the sewage going? With regard to [illegible] he was bound to say that in the majority of cases these were placed in the wrong position, and his opinion was that they ought always to be at the top end of the drain, so that the fresh air would be drawn in by the partial vacuum caused by the receding sewage. Any retention of sewage in a trap was not the fault of the trap, but of the people who fixed it, and there was no reason why the trap should contain sewage. If they did away with the intercepting trap they would not do away with the bad [illegible] a large [illegible] there not carried too far. Years ago there were people who absolutely refused, as long as they possibly could, to have a connection made between their drains and the sewer on the ground that it was more dangerous than having a cesspool on their premises. That objection had ceased as a result of the improved condition of the sewers, and it was when they so improved the sewers generally that they would find householders prepared to dispense with the trap. He thought progress could be made in the direction of the improvement of house fittings. Drains were things which the ordinary householder preferred to think as little about as possible, and how many of them had a regular inspection of their intercepting trap? Even local authorities themselves, except in one or two instances, did not pay any regular attention to the house trap, and yet it was very important that that should be done. The stoppages mentioned in the course of the discussion were all such as could have been prevented, the accumulation of cement in the drains being one thing which could be avoided. For his own part, he abominated the fresh-air inlet, and he would do without it as often as he could. In his opinion there was no need to carry currents of fresh air through the drains. In their report the committee stated that the more fresh air was brought into a drain or sewer the larger the number of microbes they brought into existence—in other words, they were creating the very nuisance they were trying to abolish. A clear vent was undoubtedly necessary, and his view was that was all that was required. In the present state of public opinion, to say nothing of the present state of the law, even with this very strong report in their hands, none of them would be justified in asking for the abolition of the intercepting trap, but he thought its omission might be permissive in cases where by-laws were being revised. It might be desirable on old systems of sewers, but people should not be tied down to its retention in new systems.

Mr. T. A. Gorinot (Marylebone), who stated that he had had a somewhat extensive experience in the building trade, said that when he started out his first impressions were that there was no necessity for traps at all. He constructed drains on that principle, but when he eventually settled down to a particular branch of the trade he became impressed with their absolute necessity. If they did not have intercepting traps, why have any traps at all? It was said that the trap was an obstruction to the drain; but did they mean to tell him that without the trap there would be no obstruction of the drain? When he was working as a boy he found more drains without traps stopped up than those which had them. He would prefer the air generated by the drain of a single house to the accumulated air of a whole town. As regarded the fresh air inlet, if they had a certain amount of decomposition going on it was better to have the introduction of fresh air and proper ventilation of the drainage than have the air of an elongated cesspool introduced to a house. No one, it was suggested, would be stupid enough to put up a ventilating shaft where people could breathe the air from it, but in London it was impossible to erect such shafts at any reasonable distance from windows. If the intercepting trap was an evil, he looked upon it as a necessary one.

Mr. W. Firth (Shoreditch) said that, although it seemed to be assumed opponents of the trap were in the majority, he thought it would be found to be otherwise if a poll were taken. In spite of misrepresentations and of the pressure brought to bear on them, the committee had not been able to recommend the abolition of the trap. The alleged disadvantages of the trap were set out on page 3, paragraph 9 of the report, but he thought that was only begging the question. A proper trap did not cause stoppages any more than any other because it was an intercepting trap, and there was no reason why it should. The percentage of blockages in Willesden had been given, it being added that in no case was there evidence of the stoppage until the traps were exposed to view. But where was the sewage going? With regard to fresh-air inlets, he was bound to say that in the majority of cases these were placed in the wrong position, and his opinion was that they ought always to be at the top end of the drain, so that the fresh air would be drawn in by the partial vacuum caused by the receding sewage. Any retention of sewage in a trap was not the fault of the trap, but of the people who fixed it, and there was no reason why the trap should contain sewage. If they did away with the intercepting trap they would not do away with the bad [illegible] a large [illegible] there not

being sufficient water to sewer the excreta through the pipe. They had been going wrong for many years. The ordinary wash-down closet made a big stir, but half the water went out before the excreta, and two-thirds of the water was through the intercepting trap before the excreta reached it. With the old-fashioned valve closet, however, there was a large body of water, which carried the excreta right through the trap and into the sewer.

Mr. P. Dodd, borough engineer and surveyor of Wandsworth, in a written communication, said he was one of those who had held the opinion that from an engineering point of view the intercepting trap was not a necessity, but he had always been led to believe that from a public health aspect it was and is an absolute necessity and ought to be retained, because, among other reasons, the trap was a seal against disease germs passing from an infected sewer or house drain to the non-infected drain of a neighbouring house. Moreover, it prevented the foul air of the sewers from escaping to the house drains. But, according to the report of the Departmental Committee of the Local Government Board, the use of the intercepting trap was not a necessity on bacteriological or epidemiological grounds, and, again, it stated that it was a well-known fact that soluble gases could be taken into solution on one side of a column of water and given off on the other. If these conclusions were correct, the theory of the trap being a seal against disease germs travelling from one house drain to another was wrong, moreover, the trap was not apparently a barrier against sewer gas passing from the sewer to the house drain, because when the water in the trap had absorbed all the sewer gas it could possibly hold the surplus gas passed through the water trap as if there were no barrier to prevent it from doing so. Under those conditions we had foul sewer and drain air on both sides of the trap. The question was no doubt one of serious public health importance, and it seemed that before taking any drastic measures further investigation would be needed. In the borough of Wandsworth they had at least 50,000 traps fixed on house drains, and it would not only be inexpedient but unreasonable to ask the owners to remove the traps which they had been compelled to provide under the existing by-laws. Seeing that the report states that the offensiveness of sewer air was sometimes pronounced, it was obvious that the real point was to get rid of the foul air both in the sewers and house drains. When we had impure air to deal with in any large crowded public buildings or in some of the badly constructed dwelling-houses, the remedy invariably suggested was the supply of fresh air. The same remedy should be made to apply equally to the more or less foul and contaminated air conveyed by the sewers and drains to the immediate vicinity of our dwelling-houses. The report states that "It is obviously important that public health authorities should make every effort to secure that both sewers and house drains are so designed and constructed that the opportunities of their contributing smell to the atmosphere shall be reduced in every possible way." It seemed that the best way, not only to reduce but to abolish the smell, was, if possible, to prevent the sewage from becoming septic, and at the same time to cause the drains and sewers to be filled with fresh air. If the intercepting trap was to be retained, then the best type should be adopted, standardised and approved by the Local Government Board. He had an opportunity that morning of inspecting and seeing the working of a little automatic apparatus which he believed would immediately be placed on the market, and which he thought would revolutionise our present system of house drainage. It was an automatic self-cleansing trap, drain-flusher and fresh-air distributor combined. It was claimed that the trap would not only be always clean, but the apparatus would flush and ventilate the house drain and sewer, and would meet the objections of those who were against the abolition and those who were against the retention of the intercepting trap. Furthermore, it was claimed that the apparatus was a solution of this much-vexed question.

Mr. H. Percy Boulnois said that if he attempted to reply to the discussion it would mean keeping them there for another hour. He did not think they were any nearer a conclusion than before, but the discussion had been useful. If the trap was to go—and he thought it would—what precautions were they to take beyond those they had already taken? First of all, their sewers must be reconstructed of proper size, with proper self-cleansing gradients and with sufficient ventilation. The drains must be connected at a proper level with the sewer in order to prevent splashing—a most important matter. Then they would have to be very carefully laid in order to guard against leakage, and the soil pipes carefully constructed and connected with the drain; all sinks, baths, rain-water pipes and wastes must be disconnected and trapped and—he agreed with both Mr. Jennings and Mr. Shenton—the water-closets double sealed. Then, again, if the trap was to be done away with, he thought that iron pipes would come into almost general use; he believed in them most thoroughly. It was only a question of 25 or 30 per cent. greater initial outlay, and there was a sense of security about them to make him happier to live in a house in which they were fixed. But what he did hope was that they would get an improved flush, for all the experiments which had been carried out showed that half the difficulties arose owing to the ridiculous 2-gallon flush. It was a retrograde step of the water companies and of the Metropolitan Water Board to insist on that, because the only result was that people flushed the water-closet two or three times, and used 6 or 8 gallons of water instead of 4 gallons, which should be the flush—or three at the least. Two gallons were absolutely insufficient. The Royal Sanitary Institute could, of course, investigate further, but was it worth it? They had a committee which, without fear or favour, had investigated the matter for four years. They had examined a number of witnesses, but he regretted they did not examine more sanitary inspectors. They only examined two. Several sanitary inspectors had taken part in that discussion, and had been very practical in what they said, and, indeed, almost more practical than anyone else who had spoken. Now that the committee had done all that work, what further work could they do, and what was the use of pressing it further? Mr. Martin had suggested that they should send a circular to all the surveyors in the country; but what would be the result? One half would condemn the trap and the other half would say they would not do without it. He thought they must accept it that the trap, although not absolutely condemned, had been found in places to have caused trouble; therefore the by-laws in future must be permissive, the Local Government Board would have to withdraw their prescription, and it must be left to the responsible officers of a town to deal with the place on its merits and act accordingly. If the trap was done away with they must obtain additional security. Personally he was brought up in the belief that the trap was a means of protection against the common enemy the public sewer. The object was to keep their neighbour at arm's length, because if there was any truth in the germ theory it was felt that germs might pass into drains and poison people. He did not think Dr. Parkes was to be laughed at on account of his opinions. The whole of Dr. Porter's speech was a cynical derision of the whole thing, but he (Mr. Boulnois) thought there was a great deal in what he said, and he thought the idea would still lurk in his mind, notwithstanding the statement in the report that sewer air was almost the purest that one could breathe, and that the microbes were really obtained from the air itself. They must remember that they had been struggling with sanitation for the past forty or fifty years, and the proof of the pudding was in the eating. No one could deny that people were healthier than they were, and suffered less from zymotic disease, and that that was undoubtedly largely due to the improvements in drainage.

Votes of thanks to Mr. Boulnois for his paper, and to Sir Maurice Fitzmaurice for presiding, were passed, and the proceedings then terminated.

SOME COMMENT ON THE REPORT OF THE DEPARTMENTAL COMMITTEE.

By R. Harris Reeves.

The following comments are made by the author, not as destructive criticism, but with a view to bringing into light for discussion some of the vital points dealt with in the report, as illustrating his view that it does not satisfactorily correlate the experiences of the engineer, chemist, bacteriologist, meteorologist and sanitating engineer:

The usefulness or otherwise of the report of the Departmental Committee of the Local Government Board on the Intercepting Trap in House Drain-

hinges, not on the trap, but on its use in obtaining good or bad sewer ventilation.

What the majority of medical men, health committees of councils, and the general public wanted was some sound solution of the sewer emanation difficulty. To deal with the question on the lines adopted in the report is simply putting the sanitary clock back, as it were, a quarter of a century. Had this committee gone through and examined the work done twenty years ago within 1 mile of their office, and investigated the work and experiments carried out at that time, as well as those of recent date, there would have been no necessity for this report to be issued.

By the publication of this report a very curious state of affairs has been brought to light. Not a single person or firm trading or dealing commercially with the subject has been called. This, to me, is most astonishing, as the President of the Local Government Board owes his position solely to the help of the commercial classes, and in this report he has entirely ignored their existence and their ability to throw any light on the subject.

One point which seems to have been entirely overlooked is the difficulty that local authorities will have to encounter through its recommendations and conclusions. For instance, persons may take the views of this committee, and in erecting a large house omit to provide an intercepting trap. The neighbours on each side of the building already have traps and inspection chambers fixed to their house drains. Then the one house drain without the trap would allow the sewer air to go through the drain and up the soil pipe, where it would, at certain times, be freely discharged in large volumes. Now a discharge of sewer emanations from a soil pipe entering the next building would in all probability cause sickness and even death to the inmates. This being proved, the council would be liable for the damage, the primary source of the evil being the sewer constructed by that council or local authority.

The local authorities having no intercepting traps to the house drains have no limits to their obligations in protecting householders from sewage pollution.

Any experts proving by analysis or photography that impurities came through the untrapped drain from the sewer would undoubtedly win the case in a court of law for their clients.

The Government itself spends money very freely on science, but when there is an opportunity of applying such knowledge commercially and to the benefit of the public, they invariably give it the cold shoulder.

The views of the various expert witnesses make interesting reading for students of sanitation, but the whole production shows a complete lack of business acumen.

From a common-sense point of view is it correct to allow emanations from sewage and putrid matter to collect in sewers, and then to find their way through drains and soil pipes to the tops of houses to disperse, when they can be dealt with effectually in the sewer? Prior to the Local Government Board Model By-laws a very large amount of work was done by way of experiments and appliances to prevent sewer air contaminating the air of dwellings, especially the air of bed-rooms where people were sleeping. But on the introduction of the trap by such an authority as the Local Government Board these improvements were abandoned.

It is only by comparing the zymotic sickness and death rate at that time with that at the present when sewer gas entering a house is almost an impossibility, through the efficient seals provided and enforced by the medical officers to the various councils—that we can judge the value of the intercepting trap from a public health point of view.

The death-rate in London from zymotic disease in 1853 was per 1,000, but in 1881 it reached 13·657, being an excess of 2·599 over that of the previous year.

The expenditure of the Asylums Board when these cases were treated was, in 1880, £252,000, but in 1881 it reached £502,600, or an excess of £250,000.

In 1881 the death-rate from small-pox was 223 per 1,000,000 of inhabitants.

In 1882, 224 per 1,000,000.

In 1883 the rate per million from small-pox was practically the same, and large sums were required to provide hospitals and staff to cope with the cases. At that time the source of the disease was considered in all probability to be the foul air from the sewers entering bed-rooms through untrapped drains. The then Main Drainage Committee, on the advice of Mr. Dibdin, their chemist, chemically treated the whole of the main sewers under the control of the board, with a view of preventing the discharge of sewer gas from the sewage in transit. The cost of this work was £110,000. It was a rough but effectual experiment, and the effect was a cessation of the outbreak, and the following year the hospitals were empty of cases. As a proof of how little the staff had to do, an application was made and granted to allow a band to play on the ships and hospitals to relieve the monotony of the staff.

In 1886 (when the sewage was treated) the death-rate from small-pox was 1 per 1,000,000.

In 1887, 2 per 1,000,000.

In 1888, 2 per 1,000,000.

Thus, by taking the whole facts, it will be seen that it cost four times the amount of money to cure the disease as compared with the cost of preventing it.

On going through papers dealing with the subject, I came across one with reference to the ventilation of the main intercepting sewer of the Water of Leith Purification and Sewerage Commissioners.

In this paper, which was read before the Incorporated Association of Municipal and County Engineers, is ample proof that Edinburgh was the first city to deal largely with the question of sewer ventilation on the lines of attacking the evil in the sewer itself. The principles then adopted have been proved to be correct by this report of the Departmental Committee, although no notice has been taken of the work.

Taking the medical and bacteriological side of the question, Sir Henry Littlejohn, I believe, had experiments made by Edinburgh University experts to prove that the air in sewers was sufficiently purified to warrant the Edinburgh Council paying for the work done, and that they were working on correct lines in this matter. Unfortunately, these tests were never published. But, to my mind, they were more thorough and advanced than any mentioned in the recent Local Government Board report.

The late Mr. Cooper, burgh engineer of Edinburgh, and others associated with him, did not believe in the value of shafts. That they were correct is borne out by Mr. Mawbey's evidence and observations in Leicester. He says (page 43 of the report):—

"Thus, in 1,042 observations on 30 sewer ventilating shafts (6 in. by 4 in.), each observation lasting 15 minutes, the anemometers recorded 619 down currents and 1,002 up currents. Many shafts, therefore, acted both as air inlets and air outlets during each observation, while some never acted as outlets. Similarly, with 20 shafts of larger size, in a total of 575 observations, the instruments recorded 449 down currents and 547 up currents."

The bacteriological experiments, as recorded in this report, by the various pathologists and medical men, are undoubtedly correct. But, to my mind, they appear to be so confusing in their application that they do not help us one step further to obtain perfect ventilation in a sewer.

We find that pathogenic germs are the lowest form of vegetable life. Taking a common-sense view of the facts, we know that increased vegetation is produced by a manure which is most suitable for its cultivation. For instance, nitrate of soda is an excellent manure. But if you plant a vegetable in this alone will it mature? The same law and facts apply to the growth of pathogenic germs under the influence of sewer emanations. In this report it is stated that bacteriologists found more germs or bacteria in the outer air than they did in the sewers on which their experiments were carried out. Taking the outer air as the earth, and the sewer air as the manure, my point is that the bacteria would neither grow in the sewer air (manure) nor in the pure outer air (earth). But by adding a certain proportion of the manure to the outer air the cultivation of the bacteria would be greatly increased, thus accounting for the fact that more were found in the outer air than in the sewer.

On page 35, paragraphs 104 and 103 of the report details are given of some experiments carried out on animals to ascertain the injuriousness or otherwise of sewer air. It was sought to ascertain whether animals became more susceptible to certain pathogenic germs with which they were experimentally inoculated if put to breathe in surroundings defiled by putrid gases. It was found that microbes were much more virulent with animals which had been exposed to putrid gases than with control animals not so exposed. The total number of animals subjected to the putrid effluvia was 179, and of these 143, or 80 per cent, died after inoculation; while of 133 control animals similarly inoculated, only 3, or 2¼ per cent, died. M. Depépine's

experiments do not show the results of inoculating the animals after breathing the sewer air. Rats, from their nature, could withstand the effects of breathing this sewer air. But can these animals, without inoculation, be compared with human beings so exposed?

The value of the Bristol evidence can be determined by the following facts: A cutting from the *Daily Express* of May 8, 1912, showed that small-pox was prevalent in Bristol. Small-pox epidemics have been known to have been stamped out by preventing the public from inhaling emanations from sewers. As for diphtheria and throat troubles, the medical officer of Bristol some years ago established a special laboratory for bacteriologically testing the throats of infected patients as the cases occurred. He also provided his fellow medical men in the city with swabs for this purpose. The results were published in the "Proceedings" of the Society of Medical Officers of Health, and showed conclusively that these cases were due to the non-ventilation of sewers, if compared with the results at other places where ventilation existed. As to Mr. Steele's report on the pneumatic action of the sewer—although he does not seem to have grasped the question in that light—I should like particularly to refer to the evidence published in my work. "Sewer Ventilation and Sewage Treatment," pages 7 to 33, particularly to the remarks *re* the chimney shaft on page 23. As this was written some twenty years before Mr. Steele's observations, I think I may say that by comparing the two you will find that the committee was a long way behind what was done at that date, and that when the Water of Leith Commissioners first decided to ventilate their sewers (on the principles they adopted) they had better evidence than is contained in the Local Government Board report.

The weakest point in the report, from a public health point of view, is that no attempt was made by analysis to show how much or how little the heavier gases constituting sewer air were found in the sewers or drains. Yet authorities describe the action of two of these gases on the public health as follows:

CARBONIC ACID.

"When so far diluted with air as to admit of being received into the lungs, carbonic acid operates as a narcotic poison, producing drowsiness, entire loss of muscular power, rapidly followed by insensibility and coma. When the gas is respired in the lowest poisonous proportion, the symptoms come on very gradually, and the transition from life to death is usually very tranquil."

SULPHURETTED HYDROGEN.

"The gas has a peculiarly nauseous odour, resembling that of rotten eggs and so diffusible that a single cubic inch escaping into the atmosphere of a large room is soon perceptible by its smell in every part. When respired it proves fatal; and it is very deleterious, even though largely diluted with atmospheric air. Nausea, giddiness, headache, and a peculiar faintness, with loss of appetite, are the usual symptoms produced when an atmosphere even slightly contaminated by sulphuretted hydrogen has been breathed for any length of time." These facts are entirely overlooked in the report.

The statement that 25 per cent of the traps examined were found to be blocked I should take *cum grano salis*. The incorrectness of this could be well verified by the Association of Sanitary Inspectors.

The following evidence shows conclusively the value of the intercepting trap, as well as that of the work of sanitation, in keeping the public clear from sewage contamination, especially in our dwellings, where women, as a rule, spend the greater part of their time

GOVERNMENT WANTS MORE FOR ITS ANNUITIES.

People nowadays live longer than they used to, and it is proposed, in consequence, that the cost of government life annuities should be increased.

Mr. J. Blakey, actuary to the National Debt Commissioners, has prepared a report on the mortality of the 19,367 persons who purchased Government annuities between the years 1·75 and 1·04. According to the experience of 1890-75 the number of annuitants who ought to have died within five years was:—

Men.	Women.
632	1,134

The actual number of deaths, however, was

Men.	Women.
618	1,027

It will be seen that about 10 per cent of the women refused to die within the actuary's allotted time. A woman who buys an annuity at 60 may now be expected to live until the age of 82·61 instead of 67·67, the old estimate.

Annuitants who survive in defiance of actuarial tables get the better of the bargain with the Government, and Mr. Blakey recommends that both men and women shall pay more.

Under his new scale, a man of forty would pay £1,783 instead of £1,687 for a £100 annuity, and a woman of forty would pay £1,917 instead of £1,867.

Possibly these annuities will again increase as improvements continue to be made in obtaining a pure atmosphere in our dwellings and streets.

The following particulars of some tests recently carried out on the sewers of a large metropolitan borough will show what can be done to remove sewer emanations effectually:—

MANHOLE No. 1.

1st test.	Velocity of air current,	400 ft.	per minute.
2nd "	" "	406 "	"
3rd "	" "	386 "	"
Average	" "	401 "	"

Volume of fresh air passed into sewer by this ventilator per day, 192,960 cub. ft.

Volume of oxygen passed into sewer by this ventilator per day, 38,592 cub. ft.

Weight of oxygen passed into sewer by this ventilator per day, 1 ton, 15 cwt., 44 lb.

MANHOLE No. 2.

1st test.	Velocity of air current,	360 ft.	per minute.
2nd "	" "	360 "	"
3rd "	" "	400 "	"
Average	" "	373 "	"

Volume of fresh air passed into sewer by this ventilator per day, 178,560 cub. ft.

Volume of oxygen passed into sewer by this ventilator per day, 35,712 cub. ft.

Weight of oxygen passed into sewer by this ventilator per day, 1 ton, 12 cwt., 84 lb.

MANHOLE No. 3.

1st test	Velocity of air current,	320 ft.	per minute.
2nd "	" "	300 "	"
3rd "	" "	367 "	"

Volume of fresh air passed into sewer by this ventilator per day, 158,400 cub. ft.

Volume of oxygen passed into sewer by this ventilator per day, 31,680 cub. ft.

Weight of oxygen passed into sewer by this ventilator per day, 1 ton, 5 cwt., 100 lb.

I would state that the atmosphere at the time of the tests was a still one, so that the gratings were not acted on in any way by the wind pressure. I think these results conclusively show that the correct way to get rid of emanations from sewage is by ventilating down to the sewer through the open gratings; not up from the sewer through vents, as is the usual practice. The amount of additional oxygen obtained from the atmosphere in this way, as compared with the full cost of working the apparatus at 2d. per day, I think is a point worth the due consideration of all municipal authorities and their officials.

Sewerage Works Fatality.—On Thursday of last week two workmen were buried in a deep trench in the village of Old Colwyn, North Wales. The main sewer was being reconstructed when the upper portion of the trench collapsed. Mr. William Jones, the surveyor to the Colwyn Bay Urban District Council, two of his staff, four doctors, and some others were quickly at work, and, hearing the faint cries of the entombed men, they laboured heroically to remove the heavy mass of soil in time to save life. An elderly man named John Lloyd was first pulled out, and between his gasps he was heard to say, "Never mind me, boy. Look after the other man." He died while the rescue work was still going on. After arduous labour the second man, Morris Edwards, was reached and taken by the doctors to the cottage hospital in a serious condition.

Talbot Car's Fine Performance.—The Invincible Talbot celebrated the conclusion of the Olympia Show lately by an attack upon the records at Brooklands. The car, which was a 25-horse power, with the ordinary standard engine, catalogued and supplied by Messrs. Clement Talbot, Limited, first of all put up the terrific speed of 113·28 miles per hour. The flying kilometre was done at 112·81, and the mile at 111·73 miles per hour, while the fastest lap (about 3 miles) was completed at 109·43 miles per hour. The character of the Talbot performance can be gathered from the fact that the previous record for 4-in. engines was beaten by no less than 26 miles per hour, and, with one exception, the 25-horse power Talbot secured the record of being the fastest car that has ever travelled on the Brooklands track. A little item of interest to every motorist was that at the conclusion of the trial the Palmer tyres, with which the car was fitted, showed not a mark testimony to the wonderful springing of the Talbot and the value of the Derihon shock absorbers. The car was fitted with the Stewart-Talbot carburettor and Bosch ignition

Standards of Purity for Rivers and Waterways.

AMERICAN COMMITTEE'S REPORT.

[In December, 1911, Mr. George C. Whipple, Mr. George Wisner, Dr. A. J. McLaughlin, Dr. Edward Bartow, and Mr. Harry W. Clark were appointed as members of a committee of the United States National Association for Preventing the Pollution of Rivers and Waterways charged with the duty of making a tentative report on the feasibility of establishing standards of purity for waterways applicable to different conditions. The report of the committee, presented by Mr. Whipple at a conference held at Cleveland, Ohio, last month, is reproduced herewith.]

This committee finds that, on account of the increasing population of the country, it is and always will be physically impossible to maintain waterways in their original and natural condition of purity. A reasonable degree of cleanliness should nevertheless be demanded.

The discharge of raw sewage into streams and harbours should not be universally prohibited by law. The method of disposal of sewage by dilution is recognised as sound in principle and safe in practice if carried on with proper restrictions.

For each waterway at any given point there is a limit to the amount of permissible discharge of waste matter, depending upon the use that is made of the river and the character of the territory through which it flows. No universal standard of purity can be wisely established or maintained. When the extent of the pollution is such as to affect the public health in any way by any reasonable use of the river, the sanitary aspect of the situation should control and the degree of pollution should be regulated accordingly. The courts must decide what is "reasonable" use. When the extent of the pollution is such as to cause sensible offence to public decency in the course of any reasonable use of the river, this aspect of the situation may properly control. When the extent of the pollution is such as to cause material injury to fish or shellfish industries, or to the ice industry, this element may control. When the extent of the pollution is such as to cause the silting up of the channels of navigable streams, this element may control.

Even when the demands of public health, offence to decency and interference with navigation are such as to place a limit to the pollution of the stream, the economic aspects of the case should be considered in regulating the amount of permissible discharge of waste matter, the fundamental principle being that the results accomplished shall be reasonably commensurate with the cost of prevention of the pollution.

While no universal standard of purity applicable to all rivers and waterways can be established, it is believed to be feasible to establish and maintain appropriate standards of a general nature for waters that fall within certain particular groupings. The committee has this matter under advisement, but is not prepared to report upon it in detail at this time.

DISCHARGE OF SEWAGE.

Inasmuch as the safety of public water supplies is the most important element in the problem of stream pollution at the present time, the following general principles should govern the discharge of sewage and waste matters into rivers and waterways:—

Streams from which water supplies are taken without purification should not receive any fæcal matter, sewage, sewage effluent or wastes that will render the water a menace to health, or otherwise impair its natural quality.

Streams from which water supplies are taken and used after purification should not receive fæcal matter, sewage, sewage effluent or waste matters in such quantities that the contamination of the water at any waterworks intake would put an unreasonable burden upon the purification works, or in quantities sufficient to produce the conditions referred to in the next paragraph.

Streams not used for water supply may receive sewage, wherever used, in such quantities that it will not sensibly offend decency in the reasonable public use of the stream, or cause interference with navigation or with valuable fish industries or the ice industry. When this cannot be done the sewage or waste should receive such treatment before discharge as to bring the effluent within this rule, due regard being given to the relative cost of the processes required and the benefits to be derived.

Large lakes from which water is used for a public water supply without filtration should not receive any fæcal matter, sewage or sewage effluent within a distance of several miles from the intake, depending upon local conditions as to currents, and suitable provision should be made for disinfecting the water supply.

Large lakes from which water is used for public water supply after filtration should not receive fæcal matter, sewage, sewage effluents, or other waste matters in such amounts or at such places that the water reaching the intake would be contaminated to the extent that an unreasonable load would be placed upon the filter, or in quantities sufficient to produce the conditions referred to in the next paragraph.

Lakes not used for water supply, harbours and tidal estuaries may receive sewage if discharged in such a manner as to be quickly and thoroughly diluted, so that its entrance will not sensibly offend decency in the reasonable use of the water, or interfere with navigation. Where this cannot be done sewage should receive such treatment before discharge as to bring the effluent within this rule, due regard being given to the relative cost of the processes required and the benefits to be derived.

The data for deciding what is a reasonable burden to place upon a water-filtration plant have not yet been secured. It is recognised that water-filtration plants are not infallible, and that for this reason the work that they are called upon to do must not be too great. Until this fundamental question is settled it will not be possible to formulate reasonable standards of purity for streams necessarily used both for sewage disposal and for water supply. Often greater economy can be secured by abandoning water supplies from polluted streams than by attempting to reduce the pollution to the required extent.

While recognising that the pollution of many rivers and waterways is inevitable, and that absolute prevention of pollution is impossible, it is deemed imperatively necessary that some control over the discharge of waste matter into rivers and waterways be maintained. The committee heartily endorses, therefore, the movement that is being made to keep the pollution of streams within reasonable bounds.

The committee recommends the adoption by the association of these fundamental propositions, believing that they will serve as a basis for the establishment of more detailed standards later, and will be helpful to those who at the present time are engaged in formulating policies in regard to this matter. The committee also request that it be allowed to continue its work for another year.

Greenock and Port Glasgow Electricity Scheme.—Approval has been given by Greenock Corporation to a proposal to apply to the Secretary for Scotland to authorise the borrowing of £60,000 for the purposes of this undertaking, to meet the estimated expenditure within the area scheduled in the Port Glasgow Provisional Order. The engineer estimated the total cost of the Port Glasgow scheme at about £21,529.

Northampton Polytechnic Institute.—The Northampton Polytechnic Institute, Clerkenwell, announces a number of changes in and extensions of their equipment. In the mechanical engineering department a new steam plant has been laid down, while in other departments other important additions have also been made. The artistic crafts department, which had a very successful session last winter, is being continued on the same lines. The half-time trade courses in technical chemistry inaugurated last session are being further developed. In these classes the students, all of whom are engaged in commercial workshops, are in attendance from 9 a.m. to 1 p.m. and spend the afternoons in their employers' workshops. The experiment appears to meet the needs of the particular trades concerned, and if it continues to be as successful as in the past year it will probably be extended to other trades.

Mechanical Haulage.*

By GEORGE SYMON, Engineer and Surveyor to the Blaydon (Durham) Urban District Council.

As the papers to be read bearing directly upon our duties are not at the present moment too numerous, I venture to introduce a few remarks on the subject of "Mechanical Haulage" which may be of interest to some of our members.

One of the heaviest items of expenditure in connection with our work is the cost of conveying materials; this is especially so in the case of road and street work, and also in connection with such items as new sewage disposal works, &c.

During the summer of 1905 the Urban District Council of Blaydon, after numerous inquiries by me and some exhaustive reports thereon, decided to purchase a steam motor, and proceeded to do so, the results of which I now propose to describe to you. I will first, however, give a brief description of our district and the reasons for this somewhat unusual departure from the ordinary routine.

The Blaydon District has an area of 9,314 acres and a population of 31,148. Its rateable value is for poor-rate £110,074 and general district rate £90,183. It consists practically of a ridge forming the watershed between the rivers Tyne and Derwent, extending from their point of confluence at Derwenthaugh westward some 8 miles to the county boundary. In altitude it ranges from practically sea level up to 850 ft. above ordnance datum. There are 30 miles of main roads and 37½ miles of district roads, besides streets and public footpaths. The traffic on the majority of the roads is heavy; that on the main roads [illegible] like everywhere else, is tending to increase.

There are several villages spread over the district, the chief centres of population being Blaydon, Winlaton and Chopwell, the distance between the first and last mentioned being about 6 miles by road.

On the council coming into existence in the year 1895 they found a legacy of neglect awaiting them, which neglect and its effects they and their successive surveyors have ever since been endeavouring to overtake. This applies with peculiar emphasis to the state of the roads, which were in a truly deplorable condition.

The district being a coal-bearing one throughout, and there being thus no igneous or other rocks suitable for use as road metal to be found, or at least not in reasonably get-at-able positions, practically the whole of the metal required for the construction of the roads (they had to be constructed, as the existing roads consisted practically of long, narrow spaces, having little or no metal upon them) had to be brought by rail or by water, and many of the roads being a considerable distance from railway depots, the cost of carting was heavy, as much as 4s. per ton being paid for that item alone; hence the reason for searching around for some possibly cheaper mode of conveyance than that of team labour.

The fact that the council were then also being pressed by the county council to proceed with several somewhat extensive schemes of sewerage and of sewage disposal, which would necessitate the carriage of large quantities of heavy materials for long distances, also assisted in bringing about the purchase of the motor.

The motor that they ultimately decided—after many inquiries and comparisons—to purchase was a steam cart, by Mann's Patent Steam Cart and Wagon Company, of Leeds. There were several other very good types of vehicles examined and discussed, each of which had their good and suitable points, and, of course, also their drawbacks, and among the reasons which influenced the decision arrived at are the following—viz.:—

(1) It is a cart as distinguished from a rolley.

(2) It is made to tip.

(3) It can be turned completely in a circle of 36 ft. outside diameter—or by manœuvring on a road 20 ft. in width.

(4) The lowest part of its body is 11 in. clear of the road under it.

(5) Its extreme length is 14 ft.

(6) Its extreme height is 8 ft.

(7) Its extreme width is 6 ft. 7 in.

BLAYDON URBAN DISTRICT COUNCIL.

STATEMENT SHOWING EXPENSES OF THE STEAM CART.

Purchase of the Cart was £475 15s. 10d. each.

Year Jan. to Dec.	Renewals.	Maintenance	Raising steam.	Travelling.	Hired work.	Insurance	Wages	Total expenditure	Receipts.	Difference or gross gain.	Net gain (+) or loss (−)*

Average	7 3 10½	100 2 10½	15 7 4½	19 7 0	19 8	1 10 0	121 14 10½	266 5 10½	378 19 5	112 13 6½	39 3 6½ +

* A total gain of £77 3s. 7d. has been realised in the 7 years, or an average of £11 0s. 6d. per year, the cart having been in use for a period of 7 years.

N.B.—The cost of water has been omitted in the above, the water used being paid for at the rate of 1s. per 1,000 gallons, which would be approximately one-half per cent.

(8) Its extreme weight in working order is 4 tons 19 cwt.; this includes steam up on a full boiler.

	cwt.
Then water tanks (100 gallons) ...	9
Fuel (chiefly coke) about	3
	12 cwt.

[illegible] load of 5 tons 11 cwt. without a load.

(9) It has a range of action of 6 miles.

(10) The diameter of travelling wheels is—back 3 ft. 11 in., front 2 ft. 9 in.

(11) The width of travelling wheels is—back 10 in., front 5½ in.

(12) It was constructed so as to comply with the Highways, Locomotive and other Acts, and Local Government Board Regulations in force at that time.

(13) It can carry a load of 5 tons on a gradient of 1 in 7.

(14) It could also pull a trailer carrying 2½ tons in addition when on fairly level roads.

(15) It can travel 5 miles per hour on high gear.

(16) It can travel 2½ miles per hour on low gear.

(17) It can travel either backwards or forwards on either gear.

(18) The fly-wheel can be used for transmitting power by means of a belt, its diameter being 2 ft. 6 in. by 4½ in. width of face, the number of revolutions per minute being 200 to 300.

It must not be inferred from all this that it has no faults; on the contrary, it has several drawbacks, which I need not mention here and now.

It has been found that it not only conveys materials cheaper than could be done by team labour, but that less damage is done to the roads by its use than if the same materials were to be carried thereon by ordinary team labour.

* Paper read at a Northern District meeting of the Institution of Municipal Engineers held at Newcastle-on-Tyne on Saturday last.

We find that there is little if any difference in cost as between the motor and ordinary team labour when the distance traversed does not exceed 1 mile. In travelling long distances or up steep hills the motor shows a distinct advantage.

If the council had purchased two or more motors the results would have been more beneficial to the ratepayers so long as there was sufficient and constant employment for them, as we have had two men constantly with one motor, whereas three men could have managed two, or four men three motors, as the existing extra man is only to assist in filling, &c., and his presence with the motor is not now required by law.

Besides all this the steam motor could be worked all night as well as all day in an emergency, seeing that it does not get tired. Nevertheless, it had to be re-tyred in the year 1909, with the result that on that year's working we had a loss of £25 13s. 7½d. That was the only year during which no profit was made.

Being anxious to know the exact financial results of this venture, I had a set of forms prepared upon which to keep careful daily, monthly and yearly records as to time spent upon and cost of lighting up, travelling to work, and actually at work, as well as quantities and cost of fuel, oil, &c., used.

After a close observation of this kind for six years I find that there has been a nett gain during that time of £235 1s. 3½d., as per the foregoing tabular statement, which gives fairly full particulars as to mileage and the various items of expenditure.

The figures given in respect of earnings are arrived at by taking as a basis the cost of carrying the same material by team labour on piecework, which again is based on the nett value of labour of one horse, cart and man at 1s. per hour. The sum of £77 15s. 7d. is deducted from the earnings annually, that being the payment necessary to liquidate the original cost of the cart plus 3½ per cent interest, spread over a term of seven and a-half years, being the assumed period of life of the cart. The amount allowed is thus equal to 13½ per cent per annum for depreciation. (The first half-year's instalment was paid immediately upon arrival of the cart, which explains the apparent discrepancy between the seven and a-half years stated in this paragraph and seven years in the tabular statement.)

In conclusion, I could not venture to give advice respecting steam *v.* team haulage, but would remark for the benefit of anyone thinking seriously of the matter: –

(1) See that the boiler tube plates are properly stayed.

(2) That the various parts and fittings of the whole are get-at-able without pulling the machine to pieces. This refers especially to the mountings, which have apparently been designed from a diametrically opposite point of view.

(3) That sufficient spare seat seats are available for two men.

(4) Do not hesitate to pay for a competent mechanical engineer and boilermaker to see your machine properly built, as otherwise you may possibly find later that there are other jerry things besides jerry-building possible in your new wine into old bottles.

Sewerage Schemes in South Africa. The Town Council of Port Elizabeth has been authorised to borrow £200,000 and the Town Council of East London £210,000 for sewerage and drainage works.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in The Surveyor and Municipal and County Engineer, is intended as the first in a series of volumes which together will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back than the selection of the site, and considers the most important and neglected factors in design, such as the necessity for considering a bridge as a part of a road system, and the relation of bridges to the water-ways. The bridge engineer is apt to forget this primary purpose of a bridge, and to treat it as a piece of work on a river or stream. Mr. Byrne, in a refreshingly original manner, has emphasised the necessity for taking natural and economic conditions into consideration, and has dealt with a very broad problem in a way which should be helpful to the best method of getting the river and the traffic across one another.

* Preliminary Studies in Bridge Design. By Austin T. Byrne, New York.

THE SURVEY OF INDIA.

SURVEYOR-GENERAL'S REPORT FOR YEAR 1910-11.

The general report on the operations of the Survey of India during the survey year 1910-11 has been issued. This report was prepared under the direction of Colonel S. G. Burrard, C.S.I., R.E., F.R.S., who, on October 24th, succeeded the Honourable Colonel F. B. Longe, C.B., R.E., as Surveyor-General of India. As stated in the preface, it is "intended to be general and concise. More detailed descriptions and discussions of results will be found in the volume 'Records of the Survey of India, 1910-11.'"

The report is in four parts. Part I., "Administration," records a few facts relating to the transference and amalgamation of offices, and includes a table headed "Disposition of Officers." From this table the *personnel* of each survey party or office staff can be found, and the locality in which the party worked or where the office was situated. The names of imperial and provincial officers and of upper subordinates are given, and the number in each party or office of lower subordinates.

Part IV. contains short references to work done for other Government departments, including, it may be noted, a survey on the 2-in. scale of the Periyar catchment for irrigation purposes, this area being in the State of Travancore; and the preparation of the maps of Dr. Stein's explorations in Chinese Turkestan and Western China (1906-8) on a scale of 4 miles to the inch.

The bulk of the report is contained in Parts II. and III. and the related index maps. Three of these show by different colours and hatchings the areas surveyed during the year and previously. In separate index maps, the areas for which maps were prepared before October, 1910, the areas for which sheets have been published in 1910-11; in some cases the areas triangulated in advance are shown, and, in the case of the 1,000,000th scale, the sheets published, under publication, and in hand.

Part II. relates to "Survey Work in the Field," including topographical, forest and trigonometrical surveys, tidal operations, levelling operations, and magnetic surveys.

The brief descriptions of the areas in which the different parties were working form a series of word sketches of considerable interest, not only for those engineers and surveyors who possess the topographical instinct, but also for the general reader whose knowledge of Indian topography is based on the one hand upon broad and general descriptions of large areas, and on the other hand upon detailed accounts of single spots or very small areas. The ground covered by a single survey party during the year amounted in many cases to an area of 5,000 or 6,000 square miles.

The forest surveys were in every case carried out by the topographical party working in the district in which the forest lies. These surveys were for the most part on the 2-in. scale, some on the 1-in., and forest boundaries on the 4-in. In the Eastern circle twelve forest reserves fell within the area under survey by No. 10 party.

The classes of maps published by the office are: The map of India on the scales of 1 in. to the mile and 1 in to the miles, geographical maps on the 1,000,000th scale (about 15 miles to 1 in.); small scale geographical maps and special maps. "The joint duty of the office is to reproduce and print the 1-in. and ½-in. maps of India, prepared by the field parties and circle offices from the topographical surveys now in progress." Of the 1-in. maps, 115 were reproduced and printed during the year, and 111 sheets were received from the circle offices. Next in importance ranks the preparation of the map of India on the 1,000,000th scale, and the general small-scale maps.

A new "Railway, Road and Canal Map of India," 32 miles to 1 in., has been prepared and published, and a general map on the same scale is being prepared but has been delayed by the necessity to include Tibet and other North-Eastern areas. A railway administration map has also been issued, and this will be revised and published annually. No fewer than 150,000 copies of a railway map for the Coronation Durbar were printed.

The cost of the department for the financial year ended March 31 1911 was about £223,000.

Artificial Stone.—A correspondent asks for the name of the makers of a stone composition called 'Flinite."

INTERCEPTING TRAPS IN HOUSE DRAINS.

To the Editor of THE SURVEYOR.

SIR,—It has been said that the intercepting trap must go. In my humble judgment the intercepting trap must not go until an equally efficient means has been devised for preventing the free discharge of sewer air into the atmosphere within smelling distance of the habitations of human beings. So long as foul odours are known to have their origin in the common sewer, so long will not medical men or the public be persuaded that no risk to health is incurred by inhaling them, and if it were possible so to convince them, there would still exist the *nuisance* which would have to be abated. That the intercepting trap does possess the important advantage I have mentioned I suppose no one will question, and if that advantage were not attended with some disadvantage no objection to the intercepting trap would be raised. There can be no doubt that the intercepting trap adds something to the liability of drains to become blocked, and there can be as little doubt that drains also become blocked in innumerable instances from causes which are in no way connected with the trap, and it would therefore be as reasonable to argue that drains should therefore be abolished as that the intercepting trap should.

From all that has been said upon the subject, the entire objection to the intercepting trap may be summed up in the added liability to cause stoppage in the house drains, for I suppose it can hardly be treated as a serious objection that fæcal matter remains in the trap blissfully unobserved by anyone until the next flush or two come to displace it, or the suggestion that foul odours would not emanate from sewers if there were no intercepting traps. It follows then that, if the trap does possess some advantage, its abolition can only be justified by greater disadvantages incident to its use, and the impracticability of either removing those disadvantages, or of so reducing them that their advantages cannot outweigh them. Whether that *is* impracticable is a question which, I take it, has been amply answered by Mr. de Courcy Meade when he tells us that, from his observations in the city of Manchester, the stoppages in intercepting traps occur with an average frequency in each drain of about once in every 160 years. I do not suggest that that infrequency is the case in every town, but I do venture to affirm that it proves that frequent stoppages are not necessarily incident to the interceptor, and that if properly constructed and laid, similar results may be obtained anywhere. Would any sane person, assuming the intercepting trap has any permanent advantage, however small, which I suppose hardly any engineer would dispute, dream of sacrificing it to avoid having to clear a choked syphon or drain once in 160 years. Surely, then, if the interceptor is a useful appliance, the sensible course is to see that conditions are insisted upon that will give results such as Mr. Meade has shown are perfectly practicable.

But *cannot* the function of the intercepting trap be equally performed, and yet the trap abolished, at any rate in the form and situation usually adopted? If every waste discharge from the interior of a house were passed to a trapped gully or other opening outside the dwelling, the interceptor could be dispensed with without the risk of sewer air circulating about the house. As everyone knows, the common practice is to convey the waste liquids in the manner mentioned, with one exception, that of the soil pipe. It therefore only remains to provide a syphon trap at the bottom of the soil pipes and the problem is solved. Such a position for the interceptor would, owing to the velocity of the flow at that point, render the risk of blockage a perfectly negligible one, and if it were not, a cast-iron syphon, with side access plate in a small chamber, would make the cleansing of it quite easy. Such an arrangement would prevent the circulation of air in the drains, and have the advantage of giving the quietus to the superstition that the free circulation of air in sewers and drains is either necessary or desirable, a superstition that has been severely, if not mortally, wounded by the Departmental Committee's report. The arrangement suggested should satisfy those who object to the interceptor, unless, indeed, the agitation against it arises which I do not suppose—from a desire to relieve local authorities from the responsibility of ventilating the public sewers, and imposing that work upon private individuals, a shirking of responsibility which I think would be reprehensible.—Yours, &c.,

T. CAINE

Worcester.
November 26, 1912.

FIRE PROTECTION IN LONDON.

To the Editor of THE SURVEYOR.

SIR,—The coroner in summing-up at the Kensington fire inquest on Thursday, 21st inst., is reported to have spoken as follows: "The calamity made one wonder how many other buildings in London were in the same condition as they were told Messrs. Barker's premises were; how the many negotiations were going on, and how many buildings were waiting before the necessary alterations were to be made."

I wish to take the earliest opportunity of publicly replying to these questions. There are upwards of 50,000 buildings in the Metropolis at the present moment to which the London Building Act Amendment Act of 1905 has not yet been applied.

Although this Amendment Act has been in force now for upwards of seven years, the superintending architect of the London County Council, giving evidence before the House of Commons Committee on the London County Council General Powers Bill (1912) in June last, stated that only 2,330 buildings had been scheduled for action at that date, and that the Building Act Committee of the London County Council had only considered 1,203 of those cases. Of these 1,203 cases only 527 had at that date been satisfactorily equipped by the provision of suitable means of escape, and the balance were in what might be termed a state of negotiation.

That so few buildings (527) should have been put in order out of approximately 50,000 cases in the long period of seven years is a matter of gravest import, but the balance should not in any way be attributed to the superintending architect nor his officers, but specifically to the London County Council in its corporate capacity, which does not give its Building Act department either the necessary means, the necessary staff, or the necessary encouragement to carry out the requirements of the Building Act Amendment Act energetically and promptly.

It is not for me to go into the reason why the County Council should apparently have been so adverse to allowing its officers to carry out their obvious duties, but the fact remains that indirectly the responsibility for lives lost in such buildings as the Barker establishment must fall on the shoulders of the authorities rather than the building owners, who, owing to the council's known apathy, practically consider the Amendment Act of 1905 a dead letter. Thus the short reply to the coroner's question is that quite an enormous number of buildings in the Metropolis are in the same condition as the one which was under review at the inquest—that but very few negotiations are going on as to remedying this state of affairs, and that quite 50,000 buildings are waiting for the necessary alterations to be made.

It is to be hoped that the Barker fire will awaken the London County Council to its duties in this particular matter. With the necessary staff and facilities, and with the diligence which the county council occasionally applies to other departments of its work, the outstanding 50,000 buildings should be put in proper order within the next five years.—Yours, &c.,

EDWIN O. SACHS.

British Fire Prevention Committee's Offices,

BITUMINOUS MATERIALS.

To the Editor of THE SURVEYOR.

SIR,—I venture heartily to endorse Mr. John Hutchinson's admirable suggestion that your journal should be the medium for defining once and for all time the exact meaning of such words as asphalt

and bitumen. I may say that my article, entitled "What is Asphalt," which appeared in your issue of March 9th last (pages 404-406) was written in an earnest endeavour to that end.

Upon one point, however, in Mr. Hutchinson's letter I would at once like to join issue with him, and that is that asphalt and asphaltum are not synonymous terms, the former being recognised throughout the world as the natural material, and the latter as the residuum obtained from distillation of asphaltic or semi-asphaltic base petroleums. I therefore, as my contribution, contend that it is absolutely necessary that all the materials to-day known under the generic name of asphalt should be divided into three separate classes, as follows:—

(1) Pure natural asphalts or solid bitumens.

(2) Natural rock asphaltes, or calcareous rock impregnated with bitumen.

(3) Asphaltums, or residuums obtained from the distillation of asphaltic or semi-asphaltic base petroleums.

In an article upon this subject, which I wrote at the request of Lord Montagu—who, by the way, has since become the president of our Association of Bituminous Paving Material Manufacturers—and which appeared in *The Car Illustrated* of January 4, 1911, I then quoted the definition of asphalt. This, under the heading of "Bitumen," appears in Ure's Dictionary, and, in view of this discussion, may now be of interest. It reads as follows:—

"It is a very remarkable fact in the history of the useful arts that asphalt, which was so generally employed as a solid and durable cement in the earliest constructions upon record, as in the walls of Babylon, should for so many thousand years have fallen wellnigh into disuse among civilised nations. For there is certainly no class of mineral substances so well fitted as the bituminous by their plasticity, fusibility, tenacity, adhesiveness to surfaces, unpenetrability by water, and unchangeableness in the atmosphere, to enter into the composition of terraces, pavements, roofs, and every kind of hydraulic work. Bitumen, combined with calcareous earth, forms a compact, semi-elastic solid, which is not liable to suffer injury by the greatest alternations of frost and thaw, which often disintegrate, in a few years, the hardest stone, nor can it be ground to dust and worn away by the attrition of the feet of men and animals, as sandstone flags and even blocks of granite are."—Yours, &c.,

CECIL NATHAN.

3 London Wall Buildings, E.C
November 25, 1912.

[Another letter on this subject—from Mr. A. E. H. Dussek—is unavoidably held over until next week.—ED. THE SURVEYOR.]

WHAT IS A GARDEN CITY?

To the Editor of THE SURVEYOR.

SIR,—Mr. Culpin has a weakness for startling fresh hares, but I fail to see why the fact that I confused him with Mr. Craske (for which I offer both gentlemen an apology) should enable him to dispose of my letter by saying that I "have not in any way dealt with the points in his last letter." Like the ladies, who, when asked for a reason, only reply, "because it isn't," he says, "without wasting a column I say it is not so." Contradiction is not argument, and I must respectfully decline to accept his statements in the absence of any support of them in the way of proof or argument.

Mr. Craske's letter only increases one's surprise that Mr. Culpin should have disputed my statement about the speculative character of most "garden city" schemes. Mr. Craske states that the "First Garden City, Limited, is a commercial company, whose sole object is the development of an estate of 4,000 acres at Letchworth as a garden city." There is no pretence of philanthropy or disinterestedness about this, though I am afraid Mr. Culpin will be shocked at such a statement, and will probably in your next issue tell Mr. Craske that he has misrepresented, or does not understand, the objects of the garden city company.

I think your readers may be left to choose between the preacher (Mr. Culpin) and the practician (Mr. Craske), for while the propagandist talks grandiloquently of philanthropy and sociology, the practical man is content to rely on the commonplace method of the development of the estate of town for which he is responsible.—Yours, &c.,

Lytham. V. J. PEET.
November 26, 1912.

THE MANCHESTER APPOINTMENT.

To the Editor of THE SURVEYOR.

SIR,—Your interesting comment in THE SURVEYOR of the 15th inst., congratulating the Manchester City Council on their action of limiting candidates for the post of deputy city surveyor to either associates or members of the Institution of Civil Engineers, has raised this question in my mind (and probably in others that, having passed the examination of the Institution of Municipal and County Engineers, what is the value attached to being an associate or member of that body? If such a qualification is not deemed sufficient for the post of deputy surveyor to any borough, I think that the sooner the junior members of the profession realise that fact the better, and I hope, Sir, that you will, with your usual fairness, give this matter due publicity.—Yours, &c.,

ASSOCIATE.

November 21, 1912.

[Our correspondent is not quite accurate in his reference to our comment on the Manchester appointment (p. 663). We congratulated the Manchester City Corporation on widening the appeal of their advertisement, not on limiting it—a distinction with a difference. We should still more warmly have welcomed an extension that would have provided, as a qualification for candidature, membership of the Institution of Municipal and County Engineers.—ED. THE SURVEYOR.]

TOWN PLANNING IN URUGUAY.

As an outcome of the urban planning competition held some months ago, the Government has given its approval to a very extensive and ambitious project for practically transforming the city of Montevideo says the *Times* in its *South American Supplement* of Tuesday. The main feature is the construction of a number of direct and diagonal wide avenues running between various parts of the city, the port, and the principal suburbs. Along these, sites are reserved for a new Government Palace, a Palace of Justice, a National Museum and Library, a Municipal Hall and Municipal Theatre, a new General Post Office, and various other edifices of a public character.

The Government does not propose to undertake these constructions all at once. Its intention is to commence with the new Government Palace, and with two broad avenues connecting that with the new Legislative Palace already partially built and with the port. The site selected for the Government Palace is completely on the outskirts of the city, and to provide it the Government has already decreed the expropriation of twenty "blocks" of land (each block consisting of about 11,000 sq. yds.). Only one-fourth or one-fifth of this space will be actually occupied, the plan being to resell the remainder (sites in which being allowed the preference) at an increased value, as a source of revenue, and, with the same object, to impose a "higher value" tax on all the adjacent properties. The same system will be followed in the expropriations necessary for building the avenues. This measure is causing some alarm among owners of land, and creating a feeling of complete instability of tenure from one day to another. If the entire plan is carried out on the same system, there is hardly a property in the whole city that will not fall under expropriation. This, however, is scarcely likely to happen, for the project is far too costly—the city does not yet boast 350,000 inhabitants, and its population does not increase rapidly—to be carried out in its entirety.

Sewage Disposal in the United Kingdom (By Henry Lemmoin-Cannon, P.A.S.I. Price 7s. 6d. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.) . . . gives a concise but comprehensive outline of the present position with regard to the question of sewage disposal. The main portions of the book are worthy of present-day interest, as it contains a great deal of information on practical work for students, engineers and surveyors.—*Glasgow Herald*.

Birmingham Sewerage.—The Birmingham Public Works Committee, who gave long consideration to the system of sewering best adapted to the extended city, reported on the way best open to the adoption of a combined system, and advise the retention of the existing separate systems in the outer districts. In regard to the former, they point out that the necessary widening of the River Rea would alone would cost £200,000. The matter is to be further considered by the committee.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

286. Hydraulics.—A hemispherical cistern is 20 ft. in diameter, and it is full of water. How long will it take to lower the depth of the water 5 ft. if the water escapes through a 3-in. diameter sharp-edged hole in the bottom of the cistern? The coefficient of discharge for the hole is 0·60. (H. V. O., *West Bromwich.*)

287. Street Gulley.—Will some reader kindly supply a sketch of some form of street gulley, the grid of which is in the face of the kerb and not in the channel of the roadway? ("Anxious.")

288. Mechanics.—Explain clearly the distinction between a vector, a scalar, and a rotor quantity. ("Beginner.")

289. Strength of Materials.—Compare the resistances to bending of a wrought-iron I beam, flanges 6 in. by 1 in., web 8 in. by ⅜ in., when upright, and when laid on its side, thus ⊢.

290. Design of Struts.—Explain why the resistance of a long strut depends largely on the stiffness of the material than on its strength. ("Designer.")

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

285. Building Construction.—Explain, with sketches where necessary, the meaning of the following terms: (*a*) Larrying, (*b*) pugging, (*c*) gib and cotter joint, (*d*) lead soakers. ("Pupil.")

(a) Larrying.—Larrying is the use of very soft semi-liquid mortar, laid on the work and rushed up in the vertical joints by sliding the bricks along. It is very often adopted in thick walls, after face

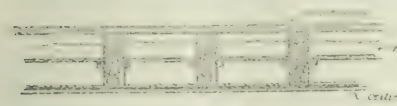

Fig. 1.

bricks have been laid, and then consists in spreading soft mortar in a thick layer over the bed, and putting each brick down some distance from its

Fig. 2.

ultimate position, and pushing it into that position thus filling up the joints between the bricks.

(*b*) *Pugging.*—The object of pugging is to reduce the transmission of sound. Fig. 1 shows part section through sound-proof floor with pugging.

(*c*) *Gib and Cotter Joint.*—See Figs. 2 and 3.

(*d*) *Lead Soakers.*—A lead soaker is a sheet of lead placed over any part which cannot easily be protected from the weather otherwise. Where ridges stop against the roof plane, as in the case of dormers, a soaker is provided, and in every instance where

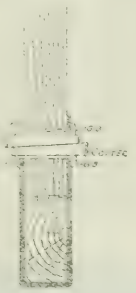

Fig. 3.

[illegible] slate about against brickwork, &c. (H. E. M., *Waltham-on-Thames.*)

L. B. (*Ware*) sends the following sketches (Figs. 4 and 5), showing the use of the gib and cotter in the

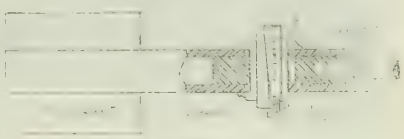

Fig. 4.

joint between the tie rod and shoe in an iron roof truss. The "clearance" allows the joint to be tightened up.

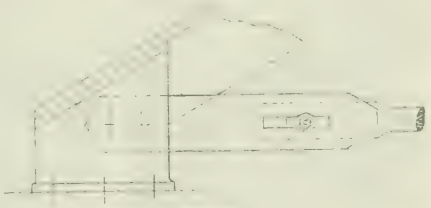

Fig. 5.

The gibs and cotters are of cast-iron, and the straps of wrought-iron.

Bridge Building.—Students, young engineers, and surveyors will find much useful information in "Preliminary Studies in Bridge Building," by Reginald Ryves, Assoc.M.Inst.C.E. (London: St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. nett.) The book is described as the "first of a series of small volumes, each complete in itself, dealing with the design of ordinary highway bridges of moderate span." Though highway bridges alone are referred to, the matter contained in this volume is largely applicable to railway bridges, aqueducts, and similar engineering undertakings. The five primary types of bridges are described, and the conditions determining the best site for each of the three types of streams are discussed in detail; while, in connection with wandering streams various modes of designing abutments or approach spans are dealt with. Improvements of fords and the effect of eccentric loading of vehicles on the girder loads are among the numerous other items touched on. *Scotsman.*

THE UPKEEP OF ROADS AND HEAVY MOTOR TRAFFIC.

DARWEN CORPORATION'S WEIGHBRIDGE.

Although the Heavy Motor Act has now been in force about seven years, it has not been generally taken full advantage of the enactments. The Act distinctly places the limit which shall be carried on each axle as 8 tons, and to provide a machine specially for such a test has been left to the Darwen Town Council, who placed with Messrs. W. and T. Avery, Limited, Birmingham, an order for the design and manufacture of a machine which has been fixed in the Market-square at Darwen. The illustration and description should be of interest to surveyors and contractors, as well as to the heavy motor user.

The weighbridge shown is so constructed and arranged that when a car is upon it the load can be immediately ascertained upon either of the axles, or upon the two axles combined. The apparatus can be used with equal facility for ordinary wagons or carts, as, although the two platforms are quite distinct when weighing the separate axles, when combined for weighing ordinary traffic the two platforms are practically one, as there is no dead plate intervening. The combination of three separate pillars and steelyards is somewhat special, and in this case most useful, as the readings can be taken on either platform separately and simultaneously upon two separate steelyards, or a combined load upon the two platforms can be ascertained upon a third steelyard.

It is well to point out that with this arrangement the weighman has no hand lever to manipulate, the steelyards always being in gear, and no loose weights form any part, as the steelyards are graduated to their full capacity by 7-lb. divisions. Avery's patent steel-notched protection bar is fitted to each steelyard to prevent [illegible] poising nib of the sliding poise coming to grief on notches when dropped in.

Each separate weighing platform is made entirely of iron and steel of improved design, which entirely prevents all torsional stress, and allows the platform to swing in the direction of the traffic, preventing undue shock and wear to the knife-edges and bearings, and prolonging the life and accuracy of the weighbridge. The underwork of each platform is carried in a strong cast-iron framing, with joggle joints, machined and bolted together, which prevents any shifting under stress, with consequent variation in weighing. The girders, verges and levers are the result of many years' experience and [illegible] the best material, [illegible] necessary to avoid any variations in the weighings. The verges are interchangeable, as are also the knife-edges, the latter being of special high grade steel, [illegible] recesses in the levers, and secured by means of wrought-iron shanks and nuts. This interchangeability is a matter of great importance in machines of this character, as it enables the weighbridges to be kept in perfect weighing condition at a minimum cost, and saves delay when replacement is necessary, at the same time ensuring a continuance of accuracy.

The Darwen Corporation are to be congratulated in the possession of such a machine, the work of which in restraining overweighted motor lorries increasing the cost of the country roads will no doubt be watched with great interest by local authorities throughout the country.

MOTOR WAGON BEING DRIVEN ON TO AVERY WEIGHING MACHINE.

TOWN PLANNING IN THE SOUTH YORKSHIRE COALFIELD.

SUGGESTED APPEAL TO THE LOCAL GOVERNMENT BOARD.

Town Planning in its relation to the new coalfield around Doncaster was the subject of discussion at a meeting of the Royal Sanitary Institute held at Doncaster on Saturday last, and presided over by Mr. H. Percy Boulnois, M.INST.C.E., chairman of the council of that body.

Dr. ARTHUR B. DUNNE, medical officer of health of the Doncaster rural and Bentley urban districts, presented a paper, in which he pointed out that in the district around Doncaster thirteen new collieries were in process of being, or were about to be, sunk. Of these, ten are within the area covered by the Rural District Council of Doncaster and the urban district of Bentley. It was estimated that each pit would form the centre of a district of from 10,000 to 12,000 persons, and that in the districts surrounding Doncaster there would [illegible] 120,000

in the near future directly dependent upon mining. As the collieries were situated in sparsely populated rural parishes, and were sometimes quite a distance from any existing village, it would be realised what were the problems involved in housing the people. The Woodlands model village at Brodsworth had not escaped criticism for various reasons, but against this must be set the fact that it had attracted attention, and had stimulated public opinion. Messrs. Barber & Walker had a colliery village, covering an area of 75 acres at Bentley, where 802 houses would eventually be erected. At Edlington, in connection with the Yorkshire Main Colliery Company, a large [illegible] Askern the colliery company had bought an estate, [illegible] Rossington, [illegible] engaged in sinking a new colliery, there was to be [illegible] on the same principle as in their well-known village at Maltby, while at Owston the Bulcroft Colliery Company were erecting a small village. All these villages, though differing one from another in design, yet had this in common—that they were laid out on a definite plan from the beginning, the houses being erected as they were wanted. They would not, however, be capable of housing the new population altogether, and the speculative builder was already in the field providing [illegible] and it was in connection with the activities of the private builder that the necessity of a town plan for a colliery village arose.

Dr. J. R. KAYE, medical officer of health to the West Riding of Yorkshire, said it must be admitted that the proper housing of the very poor seemed practically impossible unless some public burden

were borne. They ought to bear in mind that good housing meant diminishing public expenditure in other directions. In Ireland within recent years something like £559,000 had been advanced by the State. Why could not something be done in England on the same principles?

Mr. F. KIRKBY, chairman of the Bentley Urban District Council, expressed the opinion that in the districts affected the parish councils ought to have power to engage surveyors and nuisance inspectors. They might have a Town Planning Act, and yet have bad and undesirable houses erected unless the buildings were supervised as they were built.

Mr. R. G. WHITLEY, surveyor to the Bentley Urban District Council, said he considered that if the authorities took the subject to heart they would have a town plan during the next twelve months. Twenty thousand more houses would be wanted in the vicinity of Doncaster. But the procedure under the Town Planning Act was too long. It would be two years before they could get a scheme finally approved if they started to-day. He thought the case was one for the intervention of the Government.

Mr. GEORGE PROBERT (Bolton-on-Dearne) declared that the local authorities had not done their duty, and that some of them did not intend to do. The members wanted rousing up when their time of office expired.

The CHAIRMAN (Mr. H. Percy Boulnois) agreed with the last speaker, adding that with one exception there was not a representative of the rural district council present. If there was a will there was a way to get a scheme through. It was evident that the time was more than ripe for dealing with this area. Miners lived gray lives, and it was the duty of the local authority to help them.

The meeting subsequently approved a resolution calling the attention of the council of the Royal Sanitary Institute to the urgent necessity of applying to the President of the Local Government Board in favour of such measures as might facilitate the putting into operation immediately of the Town Planning Act in the Doncaster rural district.

"The Civic Engineer's Who's Who."—The first issue of "The Civic Engineer's Who's Who" (London: St. Bride's Press, Limited, 24 Bride-lane, E.C., 2s. 6d. nett) gives wonderfully complete lists of the engineering officials of England and Wales. For a first issue it is very creditable.—*Glasgow Herald.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

METROPOLITAN DISTRICT MEETING.

A Metropolitan District meeting, held at the offices of the Institution of Municipal and County Engineers, on Wednesday, the 20th inst., at 7.30 p.m., those present being Messrs. J. Patten Barber (district chairman, Islington), O. E. Winter (district representative, Hampstead), H. Percy Boulnois (past-president, Westminster), J. Rush Dixon (Woolwich), W. F. Loveday (Stoke Newington), C. Chambers-Smith (Westminster), P. G. Killick (Finsbury), J. Sutcliffe (Deptford), J. E. Cooke (Islington), J. Gair (Marylebone), F. J. Slater (Camberwell), A. E. Darby (Bethnal Green), G. Sturgess (Chelsea), and Norman Scorgie (district representative and hon. district secretary, Hackney). Mr. Patten Barber occupied the chair.

The minutes of the Metropolitan District meetings held at Caxton Hall, Westminster, on February 9th and March 18th last were read, confirmed and signed.

EXECUTIVE COMMITTEE.

In accordance with the resolution passed on March 18th, the meeting proceeded to the election of an executive committee, consisting of the chairman, secretary and two district representatives as *ex-officio* members, four other members, and two associate members. For the four members the following were nominated—viz.:—Messrs. J. Sutcliffe (Deptford), E. B. B. Newton (Paddington), W. F. Loveday (Stoke Newington), P. Dodd (Wandsworth), H. Heckford (Poplar), J. Rush Dixon (Woolwich), E. J. van Putten (Lewisham), R. J. Angel (Bermondsey), and A. R. Finch (Kensington). It was resolved that the election be by ballot, and Messrs. Killick & Cooke were appointed scrutineers. The scrutineers having presented their report, the chairman declared Messrs. P. Dodd (Wandsworth), E. B. B. Newton (Paddington), J. Rush Dixon (Woolwich), and J. Sutcliffe (Deptford) elected.

Messrs. G. Sturgess (Chelsea) and W. P. Wrack (Poplar), having been nominated as associate members of the committee, and there being no further nominations, the chairman declared them elected.

DRAFT BY-LAWS—OVERHANGING LAMPS, SIGNS, ETC.

The hon. district secretary having read a short report on the draft by-laws forwarded by the London County Council to the several metropolitan borough councils, a general discussion ensued, after which it was resolved to deal with each by-law separately.

During the discussion the feeling was generally expressed that regulations to deal with overhanging lamps, signs, &c., in the Metropolis as a whole were necessary, and that, as the proposed by-laws were based on the conclusions arrived at at the conference held on November 5, 1908, they should, with slight modifications, as hereafter mentioned, be recommended to the borough councils for acceptance as an earnest attempt to deal with a difficult problem.

By-law No. 1.—Approved as drafted.

By-law No. 2.—In the fifth line omit "so" after "any such lamps," and, in the same line, after "fixed or fitted," insert "after such date," the object of these alterations being to bring No. 2 into conformity with By-law No. 1, and make it clear that it is not to operate retrospectively.

By-law No. 3.—Approved as drafted.

By-law No. 4.—Alter as in By-law No. 2 for similar reasons.

By-law No. 5.—Approved as drafted.

By-law No. 6.—Delete; it being considered inexpedient that the county council should have power to dispense with the observance of by-laws which they framed for the better government of the Metropolis.

By-law No. 7.—Approved as drafted.

By-law No. 8.—Approved as drafted.

ADDITIONAL.—It was resolved—"That some limitation should be placed as to the number of signs and structures, and that the following proviso, approved at the conference previously referred to, should be inserted:

"Notwithstanding anything contained in the preceding by-laws, not more than two signs or structures carrying the same shall hereafter be erected on or attached to any one building having a frontage of not more than 20 ft. on any street for the purposes of any one person, firm or company, in actual occupation."

It was resolved that a copy of the above recommendation should be forwarded by the secretary of

the institution to the town clerks of the several metropolitan borough councils, with a request that they should be submitted for the consideration of the council or proper committee, and that a copy be also sent to the borough engineers and surveyors within the metropolitan area.

THE NEXT MEETING.

The hon. district secretary having read communications from several members expressing inability to attend, and pointing out the inconvenience of Wednesday as the day of meeting owing to council and committee work, it was resolved—"That the next district meeting be held on Friday, December 13th, instead of Wednesday, December 18th, as provisionally arranged; that it be of a social as well as business character, and that friends of the members be cordially invited to attend and take part in the proceedings.

The meeting terminated with a vote of thanks to the chairman, who congratulated the members on the complete success of the gathering, and expressed the hope that many more of a similar character would be held in the metropolitan district.

RESISTANCE TO ROLLING.

PROF. CHATLEY'S STUDIES AND EXPERIMENTS.

No reference has so far been made in these pages to an interesting paper on "Resistance to Rolling," which appeared in the June number of the "Journal and Transactions" of the Society of Engineers. This paper was contributed by Mr. Herbert Chatley, B.Sc., Assoc.M.Inst.C.E.I., Professor of Civil Engineering at the Government College of Engineering, Tangshan, China.

The first part of the paper is a mathematical study of the conditions of static balance of a rolling pair, and of the changes which occur in this equilibrium when a torque is applied to the movable body. The author obtains an equation of the fourth degree for the length of surface in contact, and shows that more convenient expressions can be found if we assume that the ordinate to the curve of contact is a cosine or parabolic function of the abscissa. If the cosine form is used, the maximum stress is $\frac{\pi}{2} \times$ mean stress. If the parabolic form is used, the maximum stress is $\frac{3}{2} \times$ mean stress $\left(\frac{W}{bl}\right)$. The formulæ can be simplified by accepting the approximation:—

$$l = 2\sqrt{2VR}$$

where l is the length of the curve of contact, V its camber, and R the radius of the roller.

Though the assumption that the coefficient of depression is constant is probably to some extent incorrect, the author cannot see any practical way of avoiding the resulting error, which does not seem to be serious within the limits usually considered.

When a roller rests upon a plane a small force applied parallel to the plane, or a small tilt of the plane, is usually sufficient to overcome the resistance to rolling. When the plane is tilted, but not enough to cause rolling, there must be a tendency to slide in the direction of the applied force, and this will call out a shear stress due to friction between the two pieces and a slight compressive stress in front of the roller. As the force is increased the resultant of it and the weight becomes more inclined until it passes a point within the surface of contact beyond which the resultant of the stresses in the plane cannot pass. There must be such a point, for an infinitely great stress would be needed at the front edge of the surface of contact if the resultant of the stresses is also to act at this point. The energy required to produce rolling includes the following items:—

(*a*) The continual maintenance of a slight compression in front of the roller.

(*b*) The continual rupture of the cohesive bond developed by the close contact of the two pieces.

(*c*) The difference between the strain energy stored by the vertical compression and that recovered by the resilient return of the material. This difference depends on the time needed for the recovery of the material and the degree of imperfection in its elasticity.

(*d*) A similar difference due to the imperfect or late recovery from the shear strain.

The author concludes that the usual statement that there can be no rolling resistance with mathematically geometrical and elastic materials is incorrect. The resistance is largely due to the continuous maintenance of a lateral compression and shear.

EXPERIMENTAL EVIDENCE.

Prof. Chatley notes that the published experimental work on this subject is surprisingly meagre. He has carried out several series of experiments with a view to the determination of constants and to find the effects produced by changes in the conditions.

The apparatus used included steel fly-wheels provided with axles of various sizes, rolling upon pairs of brass rails. These rails were provided with levelling screws, by means of which varying tilts could be given and measured. The rolling angles were determined, and the mean rolling resistances were also found. With fly-wheels between 16 lb. and 18 lb. in weight, and with weights per unit breadth of contact varying from 39½ lb. to 44 lb., the following were found to be the rolling angles in radians: With a ½-in. axle, 0·0043; with a ¾-in. axle, 0·0038; 1-in. axle, 0·0037; 1¼-in., 0·0035; and 1½-in., 0·0032.

Further experiments were made with simple rollers on inclined planes. On an oak plane, steel rollers of 0·372 in. diameter, weighing 0·07 lb. to 0·11 lb., and 0·035 lb. per unit breadth of contact, gave a rolling angle of 0·0093 radian. On an oak plane, a hard-wood roller, 0·761 in. diameter, weighing 0·04 lb., and 0·013 lb. per unit breadth of contact, had a rolling angle of 0·0070 radian. Other experiments, on a cast-iron plane, with weights of 9 lb. to 12 lb. per unit breadth of contact, gave rolling angles varying from 0·0012 to 0·0024 radian. Greasiness of the surface increased the rolling angle. On pine wood similar experiments gave rolling angles of 0·0061 to 0·0069 radian. It was found that a small flaw in the roller or a particle of grit on the plane increased the rolling angle by 100 per cent, or more. The starting value of the rolling angle is appreciably more than the kinetic, but by an uncertain amount.

This paper forms a useful contribution to the study of the subject, and several of the points raised in it will, no doubt, be discussed by mathematicians and engineers.

CORRESPONDENTS PLEASE NOTE!

There is a man the printer loves, and he is wondrous wise,
When e'er he writes the printer-man he dotteth all his "i's";
And when he's dotted all of them with carefulness and ease,
He punctuates each paragraph and crosses all his "t's."
Upon one side alone he writes, and never rolls his leaves,
And from the man of ink a smile the mark "insert" receives;
And when a proof in duplicate he doth ask—taught wisely he has been—
He doth the second proof stamp for postage have put in;
And thus by taking little pains, at trifling care and cost,
Assures himself his manuscript will not be buried or lost.
So let all those who long to write take pattern by this man;
With jet black ink and paper white, do just the best they can:
And then the printer-man shall know and bless them as his friends,
All through life's journey as they go, until that journey ends.

By The Editor of the *Meriden Express*.

Manhole Covers.—"Inquirer" writes: "Might I ask any of your readers to be good enough to inform me how they deal with the question of 'rocking' manhole covers? Hinged covers have not proved satisfactory, as the hinge usually gives way first, and when placed in certain situations (the centre of the tramway track, for instance), it is imperative that covers without hinges should be used. My experience is that manhole covers, whether round or square, and however well fitted when new, soon begin to 'rock' when subjected to heavy traffic, with the result that the covers have to be renewed while the frame remains good. I shall be greatly indebted to any reader who can inform me of the best means of overcoming this difficulty."

Permanent Building with 2-in. Walls.—Messrs. F. H. Heath, Limited, building specialists, 22 Bridge-street, Manchester, write: "It may be of interest to your readers to know that we have recently had accepted by the Birmingham Corporation plans for the erection of a cinematograph hall in High-street, Erdington, the outside walls of which are to be constructed of reinforced cement slabs 2 in. thick, secured to steel framing. The building is to be about 80 ft. long by 45 ft. wide, and about 18 ft. to eaves. The whole of the steel work will be encased with "Gypo." The building will seat about 800 people. We believe this is the first building with walls 2 in. thick to be accepted as a permanent building under the corporation by-laws. The construction has met with the approval of a number of authorities as being of a permanent and sanitary nature."

Law Notes.

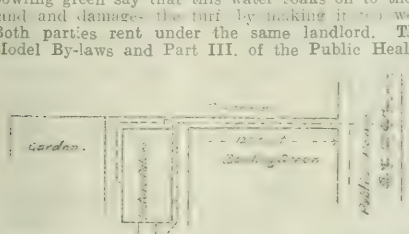
EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries which should be written legibly on foolscap paper, one side only, should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion, correspondents are requested to write initials instead of words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

RAIN WATER FROM ROOF.—"S.A.M." writes: A builds a picture palace according to approved plans, but neglects to lay the drain as shown to carry off the water from the roof to the surface-water drain in the public road. The tenants of the adjoining bowling green say that this water soaks on to their land and damages the turf by making it too wet. Both parties rent under the same landlord. The Model By-laws and Part III. of the Public Health



Acts Amendment Act are in force. There are no foul-water drains, not even a lavatory basin. (1) Have the council power to compel A to lay the drain, seeing that the building is over 100 ft. from the sewer? (2) Upon whom should a notice (if any) be served? and (3) Under what section? I consider it is a matter for private action only. I may add that the subsoil is sand and gravel, and I did not think it necessary to drain the site so as to prevent dampness in the building.

In my opinion the council have not power to compel A to lay the drain.

SEWAGE DISPOSAL WORKS: FLOODING OF SLUDGE-PITS.—"Ultra" writes: About fifteen years ago this council bought a piece of land on which sewage disposal works were constructed, and for a long time now we have had considerable difficulty with regard to the sludge owing to the surface water from the adjoining field flowing on to the sludge-pits, causing the sludge to be always soft and unfit to be lifted with shovel and carted away. The sludge-pits are made up of ballast, about 2 ft. 6 in. in depth, on to which the sludge is discharged and allowed to dry off, but, owing to the conditions stated above, it is only in dry weather that it will stiffen. The land on which the sewage works are constructed was bought from the owner of the field referred to. Can the district council compel him to drain off this surface water so as to prevent it from flowing on to the sludge-pits?

In the absence of any special provision in the conveyance of the site of the sewage works to the council, unless the adjoining owner has done anything on his own land whereby the flow of surface water on to the sludge-pits is greater than would ensue from the operation of natural laws, he is not liable. If he has done anything of the kind he would be liable to the extent to which the drainage is increased by such acts of his beyond what it would have been had the water been allowed to flow as it would have done [illegible]. *Rawlins v. Ingram* [1901] 1 Q.B. [illegible].

WATER SUPPLY.—"G.N." writes: I have been instructed by my council to advise on the water supply of forty-five colliery houses in this (an urban) district, for which there are at present three common taps in the streets abutting, fed by the local water company's mains. As these mains are laid in the streets and within a few feet of the houses, I have reported to the effect that, in my opinion it is not a case in which it could be held that there is not an adequate water supply, as the tenants can, by means of the taps, have as much water from the company's mains as they want by fetching it; but as all the tenants have to come out of their houses, and some have to travel about 30 yds. in order to get to the nearest tap, it seems to be more a matter of inconvenience than of inadequate water supply. The above conditions have obtained probably since the erection of the houses, which are of a good age; but there is a diversity of opinion as to the correctness of my view as expressed in the report, and I will be obliged for your valuable opinion thereon, in view of sec. 62 of the Public Health Act of 1875.

The question when a house is "without a proper supply of water" within the meaning of the section is one which does not appear to have been judicially decided. Presumably it would be a question of fact in each individual case. This section does not (as does sec. 3 of the Public Health [Water] Act, 1878) in terms require the supply to be "within a reasonable distance," but probably a supply not within a reasonable distance would not be a "proper supply" within sec. 62. The Local Government Board have expressed the opinion that in determining what is a reasonable distance regard must be had to the labour involved in carrying the water, and to the injurious results likely to arise if, in order to avoid this labour, the water is stinted. Similar principles would appear to apply to the present case.

WATER SUPPLY: SERVICE PIPES.—"Monte" writes: In the area of a company which has incorporated in its local Acts Waterworks Clauses Acts, 1847 and 1863, alterations and extensions are being made in existing water-service pipes—*i.e.*, the company's water supply is being laid on to additional water-closet cisterns or baths. Can the company—under sec. 19, Waterworks Clauses Act, 1863—compel the owner, where the service pipe has previously been brought in from the next property, to lay in a new and separate service direct from the company's main, the premises in many cases having different owners and separate assessments; or can the owner, where the existing stop tap is an obsolete diaphragm pattern, and in such a position that it controls only a small portion of the service pipe, be compelled, because he is making alterations or extensions, to fix a new stop tap in an approved position? In this area all service pipes and fittings belong to and are laid by the owner.

Under the section referred to a consumer cannot, without the consent of the company, (1) fix a pipe or apparatus to (*a*) a pipe belonging to the company or (*b*) a communication pipe or service pipe belonging to or used by the consumer, or (2) make any alteration in any such communication or service pipe or in any apparatus connected therewith. It is open to the company under this section to refuse their consent to the fixing of new pipes or apparatus to the existing service pipe, so that if the consumer wishes, *e.g.*, to lay on a supply to a water-closet cistern or bath, he would have to lay a new service pipe to the company's main, but he could not connect to the main without their consent, and they might make their consent conditional on his discontinuing the use of the existing service pipe. If, however, the company were to consent to the fixing of new pipes or apparatus to the existing service pipe, they might make such consent conditional upon a new stop-tap being fixed in an approved position.

SURFACE-WATER DRAINS.—"C. D." writes: I forward sketch plan [not reproduced] of surface road water, cellar, and land drains and wells, which are drained through a field. This field is water-logged at bottom, and the owner has asked the urban district council to allow him to connect to that in the main road, as he cannot get fall to connect in his field. The council refuse permission. (1) Can the owner of the field connect in the main road, seeing that their surface road water drains go through his field? (2) Can the owner of the field compel the urban district council to make a new drain in the road? (3) If not, are the urban district council responsible for the drain being kept in proper repair through the field? (4) If the council go into the field to repair the drain are they responsible for surface damage?

(1) Assuming that this is an urban district, the surface-water drain is a "sewer" vested in the urban district council, subject to the county council's right of user. This being so, it would appear that the owner of the field has a right, under sec. 21 of the Public Health Act, 1875, to cause his drains to empty therein on giving notice to the council and complying with their regulations. (2) In my opinion he cannot. (3) Yes. The council are bound, under sec. 15 of the Act of 1875, to keep all sewers vested in them in repair. (4) The council have an implied right of access to repair their sewer. If they do any damage to the land the owner would probably be able to claim compensation under sec. 308 of the above Act.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Cleckheaton U.D.C. (November 21st. Mr. P. M. Crosthwaite).—This was an application for a Provisional Order authorising the construction of new gasworks on a site acquired many years ago at Moorend, and the raising of new capital for that purpose to the extent of £50,000, and also upon an application for sanction to borrow £21,400, the residue of capital expenditure authorised by a Provisional Order of 1888. Already a gasholder is upon the site with a capacity of 500,000 cub. ft., and beyond this the estimated expenditure on the new scheme is £57,150, but during the next few years it is calculated that not more than £40,000 will be called for.—It was stated that the capacity of the present works is 550 000 cub. ft. per day, and it is proposed to put down a new plant—to produce 750,000 cub. ft.—in a form easily and economically capable of extension when required.

Dublin T.C. (November 19th. Mr. P. C. Cowan).—£28,100 for the purpose of extending the electrical cables of the electricity generating station buildings; £2,000 for extending the underground public convenience at Nelson's Pillar; £4,000 for acquiring property in Castle-street for municipal offices; and £2,200 for the extension of the Pig Market.—With respect to the proposed loan for electrical cables, it was explained that the receipts from the department for the year 1911 were sufficient to not only pay all the working expenses of the undertaking, and all the interest upon all moneys borrowed up to this, and the part repayments of the borrowed money, but left an absolute available cash surplus amounting to £11,670. The surplus of the preceding year was £6,458. These two sums have wiped out the debit balance carried over from preceding years, and have left the undertaking with a surplus this financial year of over £4,000. With reference to the loan for municipal offices, it was stated that the present condition of things caused congestion of the official staff and exasperation to the public. It was also stated that, if the condition of the Pig Market was not improved, a threat had been held out that the corporation's licence would be withdrawn.

Youghal U.D.C. (November 19th. Mr. J. F. McCabe).—£2,000 for the erection of workmen's dwellings.—Mr. D. A. Levie, of the firm of Chillingworth & Levie, Cork, engineers of the scheme, said the total cost would be £1,483, including nine houses at £135 each. The dwellings would have a living room and scullery and bedroom on the ground floor, and two bedrooms upstairs.

St. Annes-on-the-Sea U.D.C. (November 20th. Mr. P. M. Crosthwaite and Dr. A. H. MacEwen).—£38,000 for works of sewage disposal.—Some time ago a sewerage scheme was submitted to the Local Government Board, but it was not sanctioned. The engineer, Mr. C. J. Lomax, prepared another scheme, which the council adopted. It was into this scheme that the inquiry was held. Mr. Lomax explained that the scheme, which provided for a resident and visiting population of 98,500, was similar to the one previously submitted, except that the outfall was much further out to sea. Dr. Sargent, the county medical officer of health, attended the inquiry, and although he did not oppose the scheme, he said that the tendency of the times was to prevent crude sewage being turned into the sea, and conditions allowed by the Local Government Board twenty years ago were not now advocated. Mr. T. Loftos, town clerk of Blackpool, opposed the application. He said that the screening system should be adopted. Evidence in support of this view was given by Mr. J. S. Brodie, the borough surveyor of Blackpool, and Dr. Rees Jones, the Blackpool medical officer of health.

Uckfield U.D.C. (November 20th. Mr. A. G. Drury).—£12,200 for the purposes of sewerage and sewage disposal, including the execution of works in the parish of Isfield (which is within the Uckfield rural district).—Mr. W. H. Overton, of the firm of Messrs. Overton & Scott, the engineers for the scheme, gave details of the proposed new works. Mr. Hugh Stott, medical officer of health, said he thought it an excellent scheme under the circumstances. It was absolutely necessary for the Uckfield Urban Council to do something, because of the effluent from the old sewage works.

APPLICATIONS FOR LOANS.

Birmingham T.C.—£40,800 for the widening of Broad-street.

Droitwich T.C.—£1,700 for the provision of working-class dwellings.

Fleetwood U.D.C.—£2,770 for street works.

Greenock T.C.—£60,000 for the Greenock and Port Glasgow electricity scheme.

Hoylake U.D.C.—£1,325 for works of street improvement.

Northampton T.C.—£1,500 for the provision of conveniences and other works at Far Cotton recreation ground.

Oswaldtwistle U.D.C.—£1,040 for a drainage scheme.

Selby U.D.C.—£960 for the purchase of land for workmen's dwellings.

Wakefield T.C.—£20,000 for water mains extensions.

Worcester T.C.—£7,400 in connection with the electricity undertaking.

LOANS SANCTIONED.

Battle U.D.C.—£1,174 for the provision of cottages.

Bray U.D.C.—£10,000 for housing purposes and £1,000 for water mains.

Cambridge T.C.—£8,495 for a duplicate rising main.

Carrickmacross U.D.C.—£4,200 for working-class dwellings.

Finchley U.D.C.—£3,200 for the provision of an open space.

Lees U.D.C.—£480 for street widening.

Maldens and Coombe U.D.C.—£3,000 for Wimbledon and Putney Common extension scheme. The period of repayment is sixty years.

Mansfield T.C.—£300 for the purchase of property for street improvement.

Norwich T.C.—£4,811 for works of sewerage.

Rushden U.D.C.—£12,300 for sewage disposal extension.

Saltburn U.D.C.—£3,290 for the purchase of the brine baths.

Shifnal R.D.C.—£4,350 for the Albrighton sewerage works.

Swansea T.C.—£6,550 for a housing scheme at Cwm and £10,167 for houses at Trewddfya Common.

FORTHCOMING INQUIRIES.

DECEMBER.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Birmingham £4,500, Cardiff, Johnstone £2,500, Shrewsbury (Staffs) £7,191; housing and town planning—Carnarvon £20,000, Coventry £10,500; roads and materials—Bingley £5,000, Cheshire £1,200, Ramsgate, Southampton £2,500; sewerage and sewage disposal—Clones £2,600; Wirksworth £9,300; water, gas and electricity—Grimsby £8,000, Norwich.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Birmingham T.C.—The Public Works Committee have had under consideration the reconstruction of the bridge carrying the London and North-Western Railway line over Witton-road in the vicinity of Witton Railway Station. The estimated cost of constructing a girder bridge to a span of 50 ft. is, together with the necessary street works, £4,500, and the committee recommend that they be authorised to have the work carried out.

Bromley T.C.—A public convenience is to be provided in King's Meadow at a cost of £351.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has received instructions to obtain tenders for the new fire station.

Cheshire C.C.—A new school is to be built at Ashton-on-Mersey, at an estimated cost of £5,000.

Johnstone T.C.—A new public abattoir has been completed at a cost of £2,500.

Llandudno U.D.C.—Improvements are to be carried out at the isolation hospital next year at an estimated cost of £100.

Newcastle-on-Tyne T.C.—A sub-committee has been appointed for the purpose of pushing forward immediately the schemes for the building of new baths at Walker, Benwell, and Heaton; and also for the provision of cottage baths in the poorer parts of the city. The proposal is to take a number of private houses and instal baths therein, the use of which can be had at a cheap rate.

Rhyl U.D.C.—The Local Government Board having refused to grant a proposed loan of £10,000 for the renovation of the Rhyl Pier, the council have decided to abandon the scheme for acquiring the structure.

Shrewsbury T.C.—The scheme for widening English Bridge is to be undertaken, provided one-third of the estimated cost—£12,525—is met from an outside source.

Staffs C.C.—A nurses' home is to be erected at Cheddleton Asylum, at an estimated cost of £7,191.

Swansea T.C.—The Parks Committee have decided to spend £64 at Morfa-stan Park in excavating for a proposed open-air swimming bath.

HOUSING AND TOWN PLANNING.

Carnarvon T.C.—An extensive housing scheme, estimated to involve an outlay of £20,000, is under the consideration of the council.

Coventry T.C.—A proposal is being considered for the erection of fifty industrial dwellings, at an approximate cost of £10,500.

Dundee T.C.—Approval has been given to the carrying out of a scheme of housing which will mean the clearing away of a large amount of slum property along King-street between Queensberry-square and Loreburn-street. The cost of the scheme is estimated at £5,000.

Glasgow T.C.—The city engineer, Mr. A. B. McDonald, has received instructions to prepare a building plan for an area of 20 acres of the ground at Riddrie belonging to the corporation, showing twelve houses to the acre, in terraces of eight on each side, being 240 in all. The houses are to be of the cottage type, and the rents are not to exceed £18 each.

Hailsham R.D.C.—The council have adopted a report from the Housing and Town Planning Special Committee stating that at their meeting with representatives of the Uckfield Rural District Council, it was agreed that application should be made to the Local Government Board for the assistance of one of their expert officers upon the question of a town planning scheme for the parishes of Waldron and Heathfield.

Hemel Hempstead T.C.—It has been decided to purchase for £700 a site for the purpose of a housing scheme.

Honiton T.C.—Inquiries are being made with respect to the availability of a site in Cowley-lane for a housing scheme.

Merthyr Tydfil T.C.—The five houses of concrete that are being erected at Merthyr are expected to be completed next month, the *South Wales Daily News* states. The cost is borne by Mr. Gilbert Harrap, of Farnham, Kent, who has presented the corporation with a cheque for £500. Mr. Harrap is well known in the town by reason of his business connections. Some months ago the corporation discussed the question of building concrete houses, as a further step towards solving the housing problem, but there were divergent opinions among the members as to the utility of concrete for building purposes. Mr. Harrap was favourably impressed with the idea, and in order that the ratepayers should not be burdened with the expense of experimenting with the material, he offered to defray the cost of building the five houses that are now in course of erection. The cottages are expected to cost about £100 each. Nearly 300 houses are owned by the municipality, and the erection of many more is contemplated, but the urgent need is for a small house, to be let at a rental of, say, 10s. a month.

Midhurst R.D.C.—The question of the provision of cottages has been referred to the consideration of the Public Health Committee.

Pebworth R.D.C.—It has been decided to make an offer of £60 for 1½ acres of meadowland for the purpose of a housing scheme.

PARKS AND OPEN SPACES.

Hove T.C.—The borough surveyor, Mr. H. H. Scott, has been instructed to bring up suggestions for providing dressing-room accommodation for footballers in Hove Park.

Liverpool T.C.—Subject to the necessary sanction being obtained, the Parks and Gardens Committee have adopted a scheme prepared by the city surveyor, Mr. T. Shelmerdine, for the conversion, at an estimated cost of £7,000, of land at Rupert-lane Barracks into a public recreation ground

REFUSE COLLECTION AND DISPOSAL.

Middlesbrough T.C.—The borough engineer, Mr. S. E. Burgess, has submitted to the Sanitary Committee a scheme for the provision of a dock for loading refuse in the barge. This provides for the construction of a dock on the western portion of the ferry land, at an estimated cost of £3,500, or, including the cost of the land, £5,500. The loading of the barge will not, he said, be seen from the transporter or from Ferry-road, and the only annoyance, if any, would be in the leading of the refuse from the depot, which would apply to any site. The committee have decided to await the report of the sub-committee appointed to inquire as to sites.

ROADS AND MATERIALS.

Belfast T.C.—It has been decided in constructing the tramway in University-avenue to increase the width of the carriageway by reducing the footpath, so as to leave room for vehicles between the tramway track and the footpath; also to pave the portion between the tramway rails with wood, and complete the portion outside the tramway track with tarmacadam.

Bingley U.D.C.—A number of properties are to be purchased for the widening of Main-street, the nett cost of improving which is estimated to be £12,000. It is also proposed to widen Cottingley Bridge, at an estimated cost of £5,000, half of which would be borne by the county council. These improvements are being carried out with a view to the promotion of a tramways scheme.

Birmingham T.C.—The council on Tuesday last agreed to purchase a strip of land, containing about 1,140 sq. yds., in Broad-street, between Baskerville-place and Easy-row, for the widening of that thorough-

tate, for a sum of £40,000, the purchase to be completed and the money paid in 1920.—The Public Works Committee have been authorised to reconstruct the railway bridge in Witton-road to a width of 50 ft., at an estimated cost of £4,500.

Bodmin R.D.C.—The council on Saturday last received a letter from the county surveyor, Mr. E. A. Brookes, containing details of the expenditure on the main roads in the district, and stating that a cheque for £198 would be sent in final settlement of the contract to March last. Replying to Mr. J. Bate, the clerk, Mr. J. Pethybridge, said the county council had expressed their intention not to pay the insurance contribution of the men employed on the main roads. Mr. Dyer asked why the county council were taking that course, and Mr. J. Knight, surveyor, replied that he understood it was because it was not in the contract. Mr. Dyer: Neither is it in our contract either. Supposing the district councils did not pay the contributions for the men employed on the main roads, what would happen? The clerk said the county council expected the district councils to do their work for them, and they were cutting down the expenditure to the lowest possible point. The surveyor said it was very difficult to carry on the work on the main roads under present conditions. The council decided to accept the cheque sent on account, and asked for a further sum which they considered due to them.

Cheshire C.C.—It has been decided to purchase four tar-spraying machines, at an estimated cost of £300 each.

Dorset C.C.—The Poole Corporation have forwarded plans and estimates for improving High-street and Towngate-street, at an expenditure of £11,834, with a request for a contribution, and the council have referred the matter to a sub-committee.

Edmonton U.D.C.—Private street improvement works are to be carried out, at a cost of £2,224.

Hampshire C.C.—A resolution was carried at the recent meeting requesting the Main Roads and Bridges Committee to consider the question of the housing of the road men employed by them in the rural districts.

Hastings T.C.—Bexhill-road is to be improved, at a cost of £2,764, and £545 is to be spent on tar treating certain roads.

Newhaven R.D.C.—The council are giving consideration to a proposal by the Rottingdean Parish Council requesting the rural council to apply to the Local Government Board for power to raise a loan not exceeding £700 to carry out the scheme recommended by the Rottingdean Sea Defence Committee for the repair and protection of the Rottingdean Gap, such loan to be a special expense on the parish of Rottingdean. If the suggested scheme were carried out it would prove a permanent solution of the difficulty arising in connection with sea erosion at the Gap.

Ramsgate T.C.—Tenders are to be obtained for work in connection with the East Cliff extension, the construction of a sewer, and the provision of a shelter.

Richmond (Surrey) T.C.—The tender of the [illegible] Wood Company, at £286, has been accepted for wood paving works in Kew-road. The same company have just completed other important wood paving contracts in the borough.

Southampton T.C.—The borough engineer, Mr. J. A. Crowther, has received instructions to carry out channelling and kerbing works up to an estimated expenditure of £2,500.

Thames Ditton U.D.C.—The council have received a letter from the Surbiton Council urging that "as the position of the new arterial road is practically settled, it appears that the time has arrived when the three authorities concerned, Surbiton, Esher and the Dittons, and Malden and Coombe should now [illegible] efforts to urge the Road Board to allocate [illegible] special sum for the cost of constructing the new road." They also suggested the holding of a conference of the three authorities and with this the council concurred and appointed representatives.

West Sussex C.C.—Upon the presentation of the report of the Roads and Bridges Committee at the meeting of the council last week a question was asked by Mr. Boxall with reference to the roads. A great many complaints, he said, had been received about the great danger of the loose stone of the roads. It had really become a very serious matter. Alderman Wilberforce replied that he was perfectly aware of these complaints and they were well founded. The explanation was this. Last year, when they tarred the roads they had great difficulty in getting granite chippings which had been used previously with the tar and which had given a sufficient foothold for the horses. They therefore had to substitute pea beach—small round stones—which went very well with the tar and looked very nice; but the round stones were slippery. The county surveyor, Mr. H. W. Bowen, had been approached on the matter, and he hoped next year they would have ample granite chippings. The chairman added that they were taking immediate steps to put down sand and granite chippings.

SEWERAGE AND SEWAGE DISPOSAL.

Clones U.D.C.—Mr. H. J. Weaver, of Gloucester, has prepared a sewerage scheme, estimated to cost £2,600, which is now under the consideration of the council.

Devonport T.C.—The construction of the filter-bed and new reservoir at Crownhill, and the Dousland reservoir, has been completed, at a cost of £39,107—£107 in excess of the estimated price.

Hemel Hempstead R.D.C.—A sewerage scheme for King's Langley has been prepared by Mr. W. H. Radford, the estimated cost being £686.

Llandilo Fawr R.D.C.—The sanitary surveyor, Mr. J. Griffiths, has prepared a sewerage scheme for Brynamman, and an expert is to be asked to draw up a report upon it.

Rothesay T.C.—Mr. J. B. Brodie, of Glasgow, engineer for the proposed sewage scheme, has explained to the council his proposals in detail. He made special reference to the screening chamber which it was proposed to place on the shore at Bogany, and assured the council that from the position of the outfall there would be no possibility of any nuisance that would affect the Craigmore district. At the proposed outlet there was a depth of 35 ft. at high water and 25 ft. at low water. Some questions were put as to an alternative scheme to deal with the sewage by way of purification, but Mr. Brodie stated that there would be no necessity for a process of that kind, and it would only entail an additional burden on the ratepayers.

Rushden U.D.C.—It was stated by the chairman at a meeting held recently that the scheme of the surveyor, Mr. W. B. Madin, for the extension of sewage disposal works had gone through, practically without the alteration of a comma, and he thought that this reflected great credit on the surveyor. The scheme had satisfied the Local Government Board with only the very slightest alterations. It was due to the surveyor that this should be mentioned.

Street U.D.C.—A tender of £66 has been accepted for the purchase of the osiers at the sewage farm.

Wirksworth U.D.C.—A sewerage scheme prepared by Mr. H. A. Johnson, of Bradford, is to be carried out, at an estimated cost of £9,300.

WATER, GAS, AND ELECTRICITY.

Birmingham T.C.—The installation of the new vertical retorts at the Windsor-street gasworks is rapidly approaching completion. There are twenty-two beds of retorts, each bed containing four retorts, and the work is being carried out by the Woodall-Duckham Syndicate Company, Westminster, S.W., at a cost of £60,000.

Goole R.D.C.—A letter of inquiry with respect to the matter having been received from the Local Government Board, the council have appointed a committee to consider the question of a water supply for Swinefleet.

Grimsby T.C.—The Lighting Committee have advised the council to provide new plant at the electricity station, at an estimated cost of £8,000.

Llandudno U.D.C.—The assistant engineer, Mr. W. T. Ward, reports the completion of the works at Dulyn and Melynllyn, the two lakes west of the Conway from which the town gets its water supply. One of the works was the connection of the 12-in. outlet from Dulyn to the town conduit pipes, making available (in addition to the present 9-in. outlet) an additional outlet for water supply purposes. The second section of the works consisted of a new 9-in. connection to Melynllyn, giving an extra foot of depth of water in the lake to draw from. The quantity of water now, therefore, available for water supply purposes from the lakes is double what it was two years ago.

Maryport U.D.C.—A scheme has been approved for the provision of a new retort stack with regenerative furnaces at the gasworks, at an estimated cost of £1,500.

Norwich T.C.—The electric light is to be substituted for gas light for public street lighting in the remainder of the city not at present lighted by electricity, the substitution to be completed by October 1, 1913.

Oystermouth U.D.C.—A conference is to take place with the Swansea Waterworks Committee with reference to a proposed new water supply for Mumbles.

Warrenpoint U.D.C.—A new water supply was inaugurated last week. The water is derived from the Mourne range of mountains, whence it passes into a large reservoir with connecting pipes. The supply is abundant and excellent in quality.

MISCELLANEOUS.

Chester-le-Street R.D.C.—Having regard to the increased cost of living, the council have decided that the wages of the workmen who at present received 24s. a week and under be increased by 1s. 6d. a week, and that men receiving over 24s. have their wages increased by 1s. a week.

West Sussex C.C.—It has been agreed to contribute £1,000 to the proposed scheme for dealing with coast erosion at Lancing.

PERSONAL.

Mr. H. Beeney, surveyor to the Chertsey Rural District Council, has had his salary increased by £50 per annum.

Mr. H. Endsor Inglis, surveyor to the Keynsham Rural District Council, who has resigned, has accepted a position abroad.

Mr. J. E. Hamblin, late of Feltham and Wood Green District Councils, has been appointed surveyor and inspector of nuisances to the Urban District Council of Sexmundham.

Mr. J. H. Bridges, borough engineer of Reading, and Superintendent of the Reading Corporation Tramways, has been appointed a delegate from this association at the International Road Congress to be held in June next.

Mr. James W. Stephens, assistant surveyor to the Feltham Urban District Council, has been appointed surveyor and inspector of nuisances to the North Walsham Urban District Council.

Mr. R. S. Murt, chief engineering assistant in the office of the Cornwall county surveyor, was on Wednesday the 20th inst. presented with a purse of money by the office staff on the occasion of his marriage.

Earl Fortescue, Lord Lieutenant of the County of Devonshire, has consented to accept the office of president of the twenty-fifth congress of the Royal Sanitary Institute to be held at Exeter from July 7 to 12, 1913.

Mr. E. George Mawbey, M.INST.C.E., borough surveyor of Leicester, recently received a gold medal and plaque from the Dutch Government who visited Leicester to inspect the sewerage and land treatment works at Beaumont Leys and the Abbey pumping station.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BRIDGWATER RURAL DISTRICT COUNCIL.
SURVEYOR'S ASSISTANT.

Applications are invited for the post of Junior Assistant in the Engineer and Surveyor's Office. Salary £50 per annum, rising by annual increments of £5 to £60 per annum.

Applications in candidate's own handwriting, stating age and experience, together with copies of three testimonials, to be delivered to the undersigned by December 17th, endorsed "Assistant."

No application will be considered unless candidate has had practical experience, and preference will be given to a Student of the Institution of Municipal and County Engineers.

W. ALFRED COLLINS,
Engineer and Surveyor.

56A, Eastover,
Bridgwater.
November 27, 1912.

SECOND ARCHITECTURAL ASSISTANT required by the Government of Ceylon for the Public Works Department for three years' residential service, in the first instance, with possible extension. Age between 25 and 30 and unmarried. Strict medical examination, and vaccination if necessary.

Salary £300 a year, rising to £350 by annual increments of £25. Free first-class passage out and home again on satisfactory termination of engagement. Half salary on voyage out, full salary from date of arrival in the Colony.

The selected candidate should have had a good sound general and practical knowledge of the work of a Provincial Architect and Quantity Surveyor. He should be neat and accurate in draughtsmanship, taking out of quantities, and in the preparation of estimates.

Application, by letter (no special form required), stating age, giving full particulars of experience, accompanied by copies of testimonials (not originals), with names and addresses of referees of whom inquiries can be made as to capabilities and character, should be sent at once to the Crown Agents for the Colonies, Whitehall Gardens, London, S.W.

Quote M 5711 on left-hand top corner of application.

URBAN DISTRICT COUNCIL OF DENTON.
EXTENSIONS OF SEWAGE DISPOSAL WORKS.

The above Council are prepared to receive Tenders for Alterations to existing Tanks, Construction of New Sludge Tanks, and Erection of Engine and Sludge Pressing House, and other Works in connection therewith.

Plans may be seen, and General Conditions, Specifications, and Forms of Tender may be obtained, on or after the 6th December 1912 at the Office of Mr. John B. Cooke, Engineer of the Council, Town Hall, Denton, near Manchester, upon payment of Three Guineas, which sum will be returned on receipt of a *bonâ-fide* Tender.

Tenders, sealed and endorsed "Sewage Works Extensions, Contract No. 1," or "Sewage Works Extensions, Contract No. 2," as the case may be, must be sent in to me so as to be received by me not later than the 17th December, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

WM. RICHARDS,
Clerk to the Council.

Town Hall,
Denton,
Near Manchester.
November 27, 1912.

URBAN DISTRICT OF FINCHLEY.
FORTIS GREEN-ROAD IMPROVEMENT.

The Council of the above-named District invites applications for the Coating of about 2,000 super. yds. of Carriageway with the undermentioned Materials:—

(A) Bitumen-treated Macadam.
(B) Asphalt on Concrete.
(C) Creosoted Deal Blocks on Concrete.

A minimum guarantee of five years will be required with all Material.

Specifications and Forms of Tender may be obtained from Mr. C. J. Jenkin, M.I.C.E., at the undermentioned address. A deposit of £2 will be required, and will be returned on receipt of a *bonâ-fide* Tender for the whole of the work.

Sealed Tenders, endorsed "Fortis Green-road," to be addressed to the undersigned and delivered not later than the 14th of December, 1912.

The Council does not bind itself to accept the lowest or any Tender.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End, Finchley, N.
November 28, 1912.

PUPIL.—The Borough and Waterworks Engineer of Leamington (A.M.I.C.E.) has a vacancy in his office for a Pupil.—Address, Town Hall.

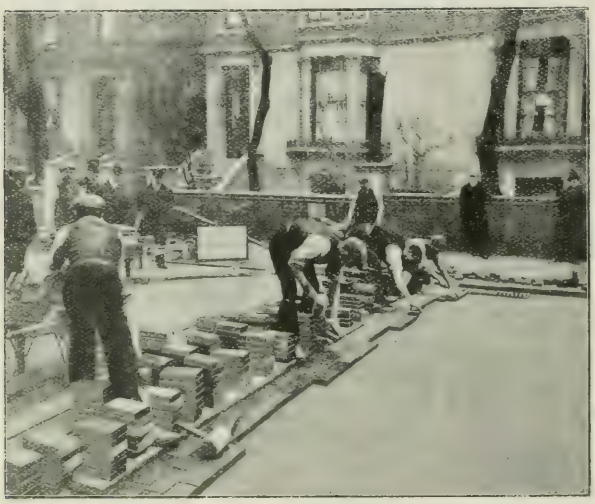
YOUNG ENGINEER wishes lessons in surveying from Practical Surveyor; no coaches.—Apply J. N., 41 Palace-court, W.

THE ROAD MENDER'S WORK IN GREAT BRITAIN.

AN AMERICAN IMPRESSION.

A writer whose skill in literary composition is of no mean order, and whose style distinctly "gets home," has contributed to *Engineering and Contracting* a description of a method of road maintenance the importance of which we have frequently been concerned to urge. While, however, the system is in operation in many parts of the country, the article referred to, the full text of which appears below, has filled us with the desire to see it carried out precisely in the way so vividly described and with exactly the same plant as that referred to. The article runs as follows:—

"The old man-jug or water patrol method of road maintenance is still in use in certain rural parts of England and Scotland. By this plan it was customary to subdivide the highways into sections of about 4 miles each, and place these under the charge of one man (generally an elderly man), whose duty it was to patrol the road, remove all foreign or organic matter, and wherever and whenever necessary make repairs at the very inception of demand for them, the theory being the old-fashioned one of a "stitch in time saves nine." The equipment used by this man has always been a small cart drawn usually by a donkey, the cart containing the usual tools for road repairs, and, in addition, two large jugs of water and a pail. The base of operations for the caretaker is invariably a small and attractive-looking, vine-covered shed, built well on one side of the highway. Under this shed is kept, in a locked portion, the cart and tools, and under an open section is usually a pile of large stone. In dry weather, when nothing else of importance occurs to be done, the caretaker accumulates a supply of ordinary field stone of sufficient toughness to use for surfacing or building roadways. This is usually in England a flint rock, tougher, if anything, than our trap rock. In wet weather the caretaker breaks up the large stone to sizes which will pass as a minimum through a 1½-in. ring. With a supply of this cracked material on hand he is in shape to take to the road and make such repairs as may be necessary at different points. His usual method is to drive down the road with his little cart filled with a certain amount of stone and the tools above mentioned. When he gets to a point which to the eye looks low, he puts some water from one of the jugs in his pail, dashes it on the road at the apparent low spot, and if the water holds and does not run off then he knows that a repair must be made. He then starts in and ravels up the road sufficiently to incorporate the low point and loosen and revamps by hand the macadam, adding a sufficient amount of new material to bring the roadway up to a perfect surface. This is all done by hand, including the hammering, which takes the place of a roller. When he gets entirely through he again tries it out with water, and if the water runs off his job is complete, and he goes on to the next place."



Method of Laying Lithofalt Block Paving

LITHOFALT BLOCK PAVING.

BUCKINGHAM PALACE QUADRANGLE CONTRACT.

We have from time to time had occasion to call attention to the enterprise of the Limmer Asphalte Paving Company, Limited, in connection with various products which they have placed upon the market during the past few years. Among other things, we have to call special attention to the increased use both at home and abroad of this company's well-known Lithofalt paving blocks for carriageways, footways, courtyards, and so forth. The use of these blocks is being increasingly appreciated by engineers and architects who desire a dustless, noiseless, sanitary and antiseptic paving for confined areas, courtyards, carriageway drives, and similar situations, and among the numerous other places in which the blocks have been laid within the last two or three years may be mentioned the approaches to the British Museum, the courtyards to Fleetway House (the new offices of the Amalgamated Press, Limited), Messrs. Maples' extensive premises in Tottenham-court-road, Messrs. Huntley & Palmer's works at Reading, Messrs. J. Lyons & Co.'s up-to-date depot and bakeries at Cadby Hall (Kensington), and the Pure Ice Company's depot (All Hallows-lane, E.C.); another important contract being in connection with the reconstruction of the Great Western Railway Station at Snow-hill, Birmingham. Lithofalt blocks are also specified to be laid in large areas in the courtyards and approaches to the New King's College Hospital at Denmark-hill in South London, an institution which, when completed, is expected to be one of the most up-to-date and finely equipped of its kind in the world.

Without doubt, however, the most striking testimony to the all-round excellence of the system is the statement to hand this week that the Limmer Company have received an order from H.M. Office of Works to pave a portion of the quadrangle at Buckingham Palace with these blocks. Needless to say, it is of the utmost importance that the paving laid in a position of such prominence should be one of the highest possible standard, and it may be safely assumed that the use of Lithofalt blocks was not decided upon by the Government department responsible until their merits and general suitability had been very carefully investigated.

During the past few years the blocks have been supplied and laid to the amount of many thousands of yards in some of the principal metropolitan boroughs and suburban districts, as well as the chief watering places, including Brighton and Folkestone. We also understand that very large quantities have been exported to such distant Colonies as New Zealand, and that the Municipality of Shanghai have for some time past had the blocks under the most rigorous tests, and subjected to wide variations in climatic conditions, and have now specified them for use in the streets of the town.

Town Planning at Finchley.—Mr. Thos. Adams, on behalf of the Local Government Board, recently conducted an inquiry into the application of the Finchley Urban District Council for permission to prepare a town-planning scheme. Mr. C. J. Jenkin, the council's surveyor, in the course of his evidence, stated that the council never knew from day to day what large residences would be marked for demolition by builders who proposed to construct ordinary "gridiron" streets. It was not the intention of the council to oppose the inclusion of working-class dwellings in the development scheme. All classes would be catered for.

Manchester Sewerage.

LOOKING FIFTY YEARS AHEAD.

[The following interesting description we quote from the *Manchester Evening News*. The initial which cloaks the identity of the author suggests that he is the son of a well-known municipal surveyor, and is himself an engineer of wide experience.]

A few days ago I was walking along a completed portion of the new main sewer which the Manchester Corporation are engaged in making—an enterprise on which the health of the population almost absolutely depends, and which is going to cost the ratepayers something like £1,000,000. It was in the neighbourhood of the Irwell at Hulme that I entered the sewer, and I had strolled several hundred yards along the broad, clean, subterranean highway when a rumbling noise overhead compelled an instinctive halt. . . . And then I learnt that we were exactly beneath Chester-road, and that just about 30 ft. above our heads the tramcars were passing along the thoroughfare.

TO PROVIDE FOR 1,400,000 PEOPLE.

This bright brick "tube," which is to carry so much of Manchester's sewage to Davyhulme, is, roughly, 13½ ft. wide and about 8 ft. high—wide enough for a carriage and pair to be driven through it. This is the maximum—in parts it is narrower and lower; but the scheme has been designed by the city surveyor, Mr. de Courcy Meade, on a scale big enough to settle the Manchester sewerage problem for something like the next half century. It is expected to provide for the day when Manchester's population, now about 700,000, has almost doubled itself.

In this matter of sewerage provision, however, so much depends on rainfall, and other such doubtful conditions as the distribution of population, that absolute accuracy cannot be assumed. The existing sewers of Manchester were supposed to be sufficient to take the drainage of a population of 868,000. The population actually contributing to the sewage is only 615,000, but already the sewers are flooded during each heavy rainfall. They were even so flooded before the sewage of a population of only 500,000 was coupled up to them. In times of storm the water rises in the manholes to heights varying from 6 in. to 26 ft. above the tops of the sewers, the sewage backs up into the house drains, and the foundations become saturated with filth.

It is satisfactory, therefore, to have the assurance that the new main drainage system which is now being inaugurated will put an end to all this, and that the complaints which have been received from the Royal Infirmary, the University and other places will be heard no more. Next to the provision of a plentiful and pure water supply, nothing is more essential to the health of a large and congested population than a perfect drainage system, and as this large expenditure—which, by the way, is repayable over a period of only fifty years—will make Manchester one of the best drained cities in the kingdom, it is an expenditure which no one need grudge. It is a fortunate coincidence that the city council should have entrusted the carrying out of this work to the Rivers Committee, whose chairman (Alderman Frowde) and deputy-chairman (Councillor West) happen to be engineers.

THE AMATEUR BRICKLAYER.

The all-important point in hidden structures like sewers is that the material and workmanship should be of the soundest, and so far as a layman can judge from close inspection on the spot this condition is fulfilled to the letter. I saw more than one section of the work, and even participated to the extent of laying—"well and truly," let us hope—one brick of this great structure which is to give Manchester eventually a total length of over 100 miles of main and intercepting sewers.

At various points the miners were at work, here cutting through the firm clay and there carving a way through the red sandstone which is met with at intervals. As they bored and delved their way through the cutting they were followed up, only a few yards behind, by the builders, who, working by candlelight, laid brick on brick four deep, with Portland cement and proper filling to make a perfect job.

Hour after hour, by day and night, the work goes on under the strictest supervision of the workmanship. Then, even when the tunnel is to all appearances finished, along come the officials of the corporation, under a special clause of the contract, to undo here and there a piece of work, merely to make assurance doubly sure. This is done under an agreement which provides that the corporation shall replace everything at their own cost when the work is shown to be satisfactory, while the contractors must make the work good where anything not perfectly sound is disclosed.

It had been my intention to see something of the old sewers as well as of the new, and to this end I had been provided with the necessary rig, but of the five manholes which were opened for investigation near Chorlton-road none proved sweet enough to invite a descent. I saw the narrow and shallow little sewer which was considered good enough for our needs prior to 1885, and also some of the sewers which form part of the existing main drainage system, but as my guide, having explored the best of them, declared it "pretty bad," I considered discretion the better part of valour, and, with a profound admiration of the men who regularly inspect these subterranean passages, gave up the task.

It is a wonderfully interesting scheme this underground network of intercepting sewers and storm overflows, not easy to understand, and still less easy to explain. Briefly, the scheme is arranged so that, while the sewage proper is carried to Davyhulme, the storm waters are carried through more than 200 overflows into the rivers Irwell, Medlock and Irk (or their tributaries), and the Ship Canal. The arrangement of the intercepting passages is such that only the higher flow from the sewers can be carried into the rivers, and it is so exact that the percentage of dilution which is secured can be measured to a nicety. Down at Hulme, where a large new overflow will empty itself into the Irwell just below the normal level of the river, a penstock arrangement—a huge stop valve it might be called—is provided so that the flow can be stopped and the section pumped empty for the purpose of inspection.

A PURER WATERWAY.

When this new scheme of drainage is completed the Ship Canal will be purer than it has ever been. In dry weather over 17,000,000 gallons of water pass through the docks every twenty-four hours, as compared with an average daily flow into Davyhulme of over 36,000,000 gallons. But for the facilities which exist for discharging the storm water into rivers or streams Davyhulme would be literally swept away.

The average amount of mineral matter in the storm water now discharged from six overflows into the Ship Canal is 3,169 grains per gallon, whereas the estimated amount of mineral matter in the storm water to be discharged from the Woden-street overflow is only 18·5 grains per gallon, or little more than already exists in the Irwell itself with no flood at all. Three of the existing storm overflows will be dispensed with, and no sewage is to be admitted into the canal until it has been so diluted with storm water that the combined volume is seven times that of the sewage only.

If all this benefit can be obtained for £1,000,000 spread over fifty years the money will not have been ill-spent. Other towns in the area of the Joint Committee have had to spend proportionately more, the total being over £6,000,000 for a population of 2,782,215, and in many respects Manchester's expenditure in comparison with results is moderate. Even in the disposal of its sewage sludge, by conveyance to sea in its own steamer, Manchester's cost is comparatively low. The site for depositing Manchester's sludge is beyond the North-West Lightship, 7 miles off the Welsh coast—a round trip of 120 miles, which is made about 210 times every year. London sends her sludge vessel on a round trip of 116 miles, and Glasgow's vessel makes a trip of 90 miles, and the respective cost is: Manchester 4·3d., London 6·5d., and Glasgow 2·75d. Apart altogether, however, from the question of expense, it would seem perfectly clear that with its new drainage scheme Manchester will have efficiency, which is everything. Infinite pains have been taken in securing the necessary data and in

regulating the force of the flow all over the city. Many years ago the sudden oncoming of rain so surprised a party of officials in one of the Manchester overflow sewers that every man of them had to run for their lives to the river, and were only rescued with difficulty from the Irwell. There should be no such unexpected incidents for the next half century at any rate. C.

HIGHWAY ADMINISTRATION IN SASKATCHEWAN.

An interesting bulletin has been issued by Mr. A. J. McPherson, chairman of the Board of Highway Commissioners of Saskatchewan.

During the period from 1905 to the present day the Department of Public Works has spent annually on the improvement and maintenance of roads and on the construction of bridges amounts varying from £40,000 to £140,000, and much work has been done in opening up the country and giving settlers ready access to their markets.

When it was decided in 1906 to carry out improvements in definite localities, the plan adopted was to select one of the local residents of known ability to organise the labour and do the work. The results so obtained were naturally unsatisfactory, and in 1907, instead of local men being appointed, the best of the foremen previously employed were appointed as road foremen, to act during the whole season, to go from place to place where improvements were required, to organise the local labour, and see that the work was properly done. The same policy, with slight modifications, was pursued in 1908 and 1909, and, in addition, various publications had been distributed to the foremen and to the local authorities, and a force of skilled inspectors had been kept constantly at work supervising road building and improvement.

In 1910 the local authorities were asked to work out their problems and to apply for what assistance they required in order to do so. The arrangement was to make grants under regulations approved by the Lieutenant-Governor in Council to all municipalities which had completed their organisation under the Rural Municipality Act. The work had to conform to a certain standard, and certain information had to be placed before the Public Works Department. This system has produced good effects, and has given satisfaction where properly worked out.

In a new country such as Saskatchewan many improvements are urgently required which are so large as to be beyond the means of the local authorities. For instance, practically all bridges of 20 ft. span and over, and many small bridges and culverts, have been constructed by the provincial government, and in most cases their maintenance has also devolved on the provincial authorities.

Provision has recently been made for meeting the cost of important improvements of permanent value by spending a sum of £1,000,000 from the provincial treasury, and it is intended to proceed as fast as is consistent with economy and efficiency.

Provision has been made in a Highway Improvement Act for the appointment of a Board of Highway Commissioners, and municipalities will be asked to give further consideration to the classification of roads in order that a complete system of main roads may be built up, constructed with provincial funds, and, in addition, connected roads from one municipality to another. The Highway Commission will investigate methods of improvement that may seem to offer solutions of special difficulties, will distribute information to those interested, will give advice wherever needed, and will send experts if necessary to any place in the province to help in solving the problems of the local authorities.

Titanium Steel Tramrails.—Mr. T. Rowlands, director of Messrs. T. Rowlands & Co., Limited, Sheffield, British agents for the Titanium Alloy Manufacturing Company, writes: "In your issue of 15th inst. you have announced that the Liverpool Corporation are about to place in service 100 tons of the above. An error has been made in stating that these will be the first to be used in this country, as the writer has personally supervised the treatment of steel with titanium alloy and the rails made have now been in service for several months. Besides tramrails, several miles of permanent way rails have been made, and we hope to be in a position to give particulars as to their wearing qualities at an early date."

SOME RECENT PUBLICATIONS.*

Building Construction (Advanced and Honours Courses). By Charles F. Mitchell, M.S.A., &c., assisted by George A. Mitchell, A.R.I.B.A. Price 6s. London: B. T. Batsford.

We presume that it is hardly necessary to introduce our readers to "Mitchell's Building Construction," which is almost, if not quite, the most popular book on the subject. The volume now before us is the seventh edition of the "Advanced and Honours Courses," and is truly a wonderful production at the price. It has again been revised and enlarged, and the chapters on Skeleton-framed Buildings and Reinforced Concrete have been completely rewritten in view of the new London County Council regulations in regard to these classes of work. The book now contains over 900 pages, and innumerable illustrations, and the reader is led step by step through every phase of the science and art of building. Mr. Mitchell is an ideal guide, inasmuch as he not only possesses a great deal more than the necessary knowledge of the subjects with which he deals, but his experience as a teacher enables him to appreciate the student's point of view and to write in an easy and lucid manner, which makes it a pleasure to consult his book. There can be no doubt that, both as regards price and quantity and quality of matter, this is *the* book for the student of building construction.

Reinforced Concrete Construction (Advanced Course). By M. T. Cantell. Price 12s. 6d. nett. London: E. & F. N. Spon.

This treatise forms a continuation of the elementary course by the same author, and, in addition to the text and numerous illustrations, there are thirty-one fully worked examples covering the whole range of reinforced concrete construction. In most cases the examples are accompanied by explanatory diagrams, working drawings, and illustrations of recently constructed works. The reader is thus not only enabled to study the mathematical principles of design, but also to compare the results obtained by calculation with structures which have been recently erected. The subjects dealt with include (among others) Piles, Retaining Walls, Roofs, Water Tanks, Water Towers, Reservoirs, Swimming Baths, and Arches. A list of the symbols used appears at the beginning of the book, thus rendering it an easy matter to follow the mathematical parts of the book. Reinforced concrete construction has now a considerable literature, but there is plenty of room for such a complete and carefully prepared work as that under notice.

Practical Geometry and Graphics for Technical Students. By E. L. Bates and F. Charlesworth. Price 4s. nett. London: B. T. Batsford.

The authors of this book are both experienced teachers, and this fact is reflected in the style and arrangement of the work. They have kept in view the requirements of the practitioner as well as those of the student, and the book will be found to contain not only sufficient to cover the syllabus of the Board of Education "lower stage" examination in the subject, but also a great deal of practical information of value to engineers, architects, surveyors, and craftsmen in following their daily employment. The book is divided into three parts, dealing respectively with Plane Geometry, Graphics, and Descriptive Geometry. These are all subjects which are necessary for the professional equipment of architects, engineers and surveyors. The merit of the present volume is that it treats them definitely from this point of view, and thus it is specially suited to the needs of the technical student or practitioner. Information in regard to examinations is contained in appendices, and the text is elucidated by many clearly drawn diagrams.

Practical Mathematics for Technical Students. By E. L. Bates and F. Charlesworth. Price 3s. nett. London: B. T. Batsford.

This is an elementary text-book designed primarily to meet the requirements of technical students and artisans. The subjects included comprise Arithmetic, Algebra, Geometry, Logarithms, Mensuration, Trigonometry, and an elementary account of the processes of differentiation and integration. It will thus be seen that within the scope of its 500 pages the book contains all the mathematics that the average technical student or practical man requires. The

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

authors have acquired a reputation for lucidity of expression which is fully maintained in this work. Numerous worked examples, exercises and diagrams increase the value of the book, a prominent feature of which is the practical application of the principles discussed to the problems met with daily by engineers, architects, surveyors and draughtsmen. The book is one which will be appreciated by a large number of students for whom the standard works on mathematical subjects are unsuitable.

Early Christian and Byzantine Architecture. By Edith A. Browne. Price 3s. 6d. nett. London: A. & C. Black.

This is the fifth volume of an excellent series of books dealing with the various periods of architecture. The series is intended to constitute a popular history of architecture, and the method pursued in each volume is first to link up the style indicated with the past, then to treat it as a distinct entity, and finally to consider its influence on contemporary and future styles of building. The illustrations in the present volume, which range from the Church of Santa Sophia at Constantinople to the Roman Catholic Cathedral at Westminster, are very well reproduced, while Miss Browne's letterpress affords a delightful introduction of the architecture with which she deals. This volume and the others of the series will prove very helpful to the amateur who seeks to base his appreciation of great buildings upon a knowledge of the principles which go to make up their characteristic style.

Gasworks Directory and Statistics, 1912-13. Price 10s. 6d. nett. London: Hazell, Watson & Viney, Limited.

This is the thirty-fifth annual issue of this useful book. Its contents are divided into four sections, dealing with England and Wales, Scotland, Ireland, and Foreign and Colonial Gasworks respectively. In the case of each gasworks particulars are given as to population served, annual output, price, share capital, offices and officers, and many other matters of interest. As a book of reference for all engaged in the gas industry, it is difficult to imagine how this work could be improved upon.

A reprint from *Applied Science* of an article on "The Evolution of Vertical Lift Bridges," by Mr. Henry Gratton Tyrrell has been issued by the University of Toronto Engineering Society. Mr. Tyrrell, who is a bridge and structural engineer practising at Elvaston, Illinois, is the author of numerous writings on bridge engineering, his work experience in connection with which is at once apparent from a perusal of his latest contribution on the subject.

Specification and agreement writing is essentially a work in which clearness, definiteness and strictest accuracy in all particulars are of the utmost importance, and the reprint which the *Canadian Engineer* (Toronto) has published of a number of articles dealing with the subject will therefore be welcomed by engineers in general. What the lack of attention to details may result in is shown by the articles, and the procedure to be adopted is very clearly set out. The price of the pamphlet is 1s.

Illuminating Engineering Society. A paper, entitled "Modern Methods of Indirect Lighting: Their Advantages and Merits," will be read by Messrs. F. W. Willcox and H. C. Wheat at a meeting of this body to be held on Tuesday, the 3rd prox., at 8 p.m.

Roads Improvement Association.—Mr. Robert Todd occupied the chair at the November meeting of the council of the Roads Improvement Association. A resolution strongly urging the Local Government Board to support the application of the Croydon Corporation for a loan of approximately £20,000 to carry out the relief road scheme was unanimously passed. A small sub-committee was appointed to confer with leading horse owners upon the question of evolving a more up-to-date type of horse-shoe, which, while giving the horse a firm foothold upon the modern hard waterproof road surface, would also minimise the pitching action of the calkin. The lease was signed and various other arrangements settled concerning the association's new premises at 15 Dartmouth-street, Westminster, London, S.W. The association will take possession at Christmas. The Highways Bill of the association is to be brought up to date, and when completed arrangements are to be made to establish Parliamentary Committees in both Houses.

TOWN PLANNING SCHEMES.

QUESTIONS IN PARLIAMENT.

The President of the Local Government Board was asked in the House of Commons on Monday to state the number of local authorities who had applied to the Local Government Board for permission to prepare town-planning schemes, the number of authorities to whom such permission had been granted, and the number of town-planning schemes prepared or adopted by local authorities which had been approved by the Local Government Board; and whether the Local Government Board had issued any sets of general provisions under Clause 55 (1) of the Act of 1909 for carrying out town-planning schemes.

In reply, Mr. John Burns said the number of local authorities who had applied for permission to prepare town-planning schemes was twenty-six. These applications related to thirty-four schemes. The number of local authorities to whom the permission had been granted was fifteen in respect of twenty schemes. Three schemes had been prepared and submitted for approval, but had not yet been finally approved. The answer to the last inquiry was in the negative. The information asked for was contained in a White Paper presented to the House on the 12th inst., except that one application for authority to prepare a scheme had been received since that date.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EASTERN DISTRICT.

Chairman Mr. Alfred Fidler, M.Inst.C.E., Northampton.

An Eastern District meeting is to be held at Lyons' Victoria Mansions Restaurant, Victoria-street, Westminster, on Saturday, December 7th.

Programme.

5 p.m.—Meeting of the Eastern District Executive Committee at the offices of the institution, 11 Victoria-street, Westminster, S.W. Note.—The members of this committee were elected at the Grays meeting, and have been so notified.

6 p.m.—Dinner at Lyons' Victoria Mansions Restaurant (Victoria-street, Westminster). Tickets 2s. 6d. each.

7 p.m.—Discussion on the report of the Departmental Committee of the Local Government Board in reference to Intercepting Traps on House Drains, to be opened by Mr. H. P. Boulnois, M.Inst.C.E.

8 p.m.—Music and conversation.

8.30 p.m.—Suggestions and discussion in regard to the work of the institution, with special reference to the Eastern District.

Notices.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than Monday, December 2nd, and remittances for dinner tickets should also be sent by this date. Members are requested to make a special effort to attend this meeting, and, if convenient, the dinner, as the hon. district secretary has had to agree to take a certain number of tickets for the latter. A cordial invitation is given to members of the institution outside the Eastern District to attend the dinner and discussion.

Ernest J. Elford, M.Inst.C.E.,
Hon. District Secretary.
Borough Engineer,
Southend-on-Sea.

SOUTH-EASTERN DISTRICT.

A meeting of members of the above district will take place at Sidcup at 2.30 p.m. on Wednesday, January 8th, when the road sections will be inspected.

Mr. Maybury has kindly consented to supply the revised cost of the trial lengths up to December 31st;

the meeting will be followed by a dinner at Frascati's Restaurant, Oxford-street, at 6.30 p.m.

A meeting of the institution will be held at Caxton Hall, Westminster, on Friday, December 6th, at 8 p.m., to discuss a paper to be read by Mr. H. T. Wakelam on "Tramway Rail Corrugation."

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

JOINT WESTERN AND SOUTH-WESTERN DISTRICT MEETING.

A Joint Western and South-Western District Meeting will be held at Gloucester and Exeter to-day and to-morrow.

Programme.

Gloucester Meeting, to-day.

3 p.m.—Meet at the New Inn, Gloucester.
Business meeting of the Western District.
Short address by the president.
4 p.m.—Discussion of Mr. A. Winter Gray's paper, "Superannuation and Security of Tenure," which will be taken as read.
5 p.m.—Adjourn for tea.
6 p.m.—Informal meeting, at which Mr. Latham will preside.

Exeter Meeting, to-morrow.

3 p.m.—Meet at the Bude Hotel, Exeter.
Business meeting of the South-Western District.
Short address by the president.
4 p.m.—Discussion of Mr. A. Winter Gray's paper, "Superannuation and Security of Tenure," which will be taken as read.
Discussion on the question of "Working-Class Housing," when two or three short papers will be presented. Members are requested to contribute what information they can on the question, in order that it may be fully discussed, with a useful interchange of views and experience.
6 p.m.—Adjourn for tea.
7 p.m.—Social evening, with musical programme, at the Bude Hotel, to which members and their friends are invited.

John Brook,
C. Owen Baines,
Joint Hon. District Secretaries.

November 11, 1912.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District was held at the Victoria Hotel, Manchester, on November 20th. Mr. A. R. Bleazard, the district chairman, presided, and the proposed social was the first matter dealt with. It was decided, after full discussion, to proceed with the arrangements for a dinner and social evening, commencing at 6 p.m. prompt on December 7th, members to be accompanied by gentlemen friends only, and the charge to be 4s. per head. (Morning dress.)

In order to extend the usefulness of the institution to members residing some distance from headquarters, a scheme of local "correspondents" based on the new list was considered, and the hon. district secretary was requested to write certain members thereon. A draft programme for 1913 was approved.

The principal business dealt with was the discussion on the "Merits of the Intercepting Trap," introduced by Mr. E. Walker (Stretford). Special reference was made to the trap being an obstacle to ventilation, the inlet-outlet nuisance, the question of cost, and the obstruction to the flow of sewage. Mr. Walker dealt at length with the points raised against the intercepting trap, and laid special stress on the conditions of provincial industrial towns being very different to the drainage systems required by London, Birmingham, &c. The usefulness of the separate trap and the relationship between the size of traps and the diameter of inlets to the number of stoppages were also referred to. Mr. Walker afterwards answered several questions, and the discussion became general. The meeting concluded with a hearty vote of thanks to Mr. Walker for his paper.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

SOCIETY OF ENGINEERS.

A meeting of the Society of Engineers will be held at the Institution of Electrical Engineers, Victoria Embankment, W.C. (south end of Savoy-street, near Waterloo Bridge), on Monday, December 2nd, when a paper on "The Deflection of Reinforced Concrete Beams" will be read by Mr. Percy J. Waldram, F.S.I., M.C.I., the following being a synopsis:—

Relation of stiffness to strength—Reinforced concrete weaker than steel or fir—Small deflections not a proof of strength—Deflection of beams under stress—Stress for given deflection—L.C.C. draft regulations—Suggested standard of deflection—Effect of end fixing not yet fully determined—Importance of correct standard of deflection—Calculation of deflection with given loading and unknown stress—Deduction of moment of inertia from moment of resistance—Moment of inertia of rectangular and T beams with single and double reinforcement—The difference between calculated and actual deflection in the Talbot and other tests—Effect of shear members on deflection.

The chair will be taken at 7.30 p.m. precisely.

A. S. E. Ackermann.
17 Victoria-street, Westminster, S.W. *Secretary.*

INSTITUTION OF WATER ENGINEERS.

President—Mr. J. S. Pickering, M.Inst.C.E., borough surveyor and water engineer, Cheltenham.

WINTER GENERAL MEETING.

The seventeenth Winter General Meeting of the Institution of Water Engineers will be held at the apartments of the Geological Society, Burlington House, W., on Saturday, December 14th. The proceedings will commence at 10.30 a.m., or as soon as the business of the special general meeting called for 10 o'clock, is completed. The usual informal dinner will be held on Friday evening.

The following papers have been promised for reading and discussion:—

(1) "Some Recent Examples of Pollution of Public Water Supplies," by J. C. Thresh, D.Sc., M.D., &c.
(2) "The Valuation of Water Undertakings on Transfer to Local Authorities," by E. J. Silcock, M.Inst.C.E., F.S.I.
(3) "Recent Advances in the Science of Water Purification," by Adolph Kemna, D.Sc.

Advance copies of these papers will, it is hoped, be available for the use of those wishing to take part in the discussions, but as only a limited number will be printed early application should be made.

Programme.

10.30 a.m.—The minutes of the seventeenth ordinary general meeting and of the special general meeting will be read and submitted for confirmation; ballots will be taken for council for the year 1913-14, and for new members; reading of papers and discussions thereon.

The meeting will be adjourned for luncheon or otherwise as circumstances may require.

Percy Griffith.
20 Victoria-street, S.W. *Secretary.*

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. John D. Watson, M.Inst.C.E., F.R.San.I.

ANNUAL GENERAL MEETING AND DINNER.

The eleventh annual general meeting and dinner of the Association of Managers of Sewage Disposal Works will take place on Thursday, December 12th, at the Holborn Restaurant, London.

Programme.

11 a.m.—Council meeting.
2 p.m.—Annual general meeting; chairman's annual report; balance-sheet; reading of papers; discussion.
6.30 p.m.—Reception.
7 p.m.—Annual dinner.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—November 30th.—Newquay Urban District Council.—Mr. G. F. Nicholls, clerk.

DEPUTY CITY SURVEYOR.—November 30th.—Corporation of Manchester. £750 per annum.—Mr. Thos. Hudson, town clerk.

ASSISTANT SURVEYOR.—December 2nd. Runcorn Rural District Council.—Mr. G. F. Ashton, clerk, 71 High-street, Runcorn.

BUILDING INSPECTOR.—December 2nd.—Hale Urban District Council. £2 10s. per week.—Mr. J. G. Whyatt, clerk.

CLERK OF WORKS.—December 2nd.—Ipswich Education Committee. £3 5s. per week.—Mr. R. C. Wrinch, architect, 16 Museum-street, Ipswich.

DISTRICT SURVEYOR OF MAIN ROADS.—December 3rd.—East Sussex County Council. £160—£200.—Mr. F. Merrifield, clerk.

CLERK OF WORKS.—December 3rd.—Rhymney Urban District Council. £2 5s. per week.—Mr. L. Reynolds, clerk. Milbourne Chambers, Merthyr Tydfil.

ARCHITECTURAL ASSISTANT.—December 4th.—Corporation of Birkenhead. £170—£185.—Mr. Chas. Brownridge, borough engineer and surveyor.

CLERK OF WORKS.—December 4th.—Corporation of Portsmouth. £3 5s. per week.—Mr. G. H. Etherton, town clerk.

INSPECTOR OF NUISANCES.—December 5th.—Oundle Rural District Council. £90 per annum.—Mr. G. Coombs, clerk, New-street, Oundle.

TEMPORARY SURVEYING ASSISTANT.—December 7th.—Hazel Grove and Bramhall Urban District Council. £2 2s. per week.—Mr. Frederick Pidgeon, clerk.

HIGHWAYS SURVEYOR.—December 7th.—Keynsham Rural District Council. £175 per annum.—Mr. Frank G. Whittuck, clerk.

ROAD FOREMAN.—December 11th.—Tonbridge Urban District Council. 35s. per week.—Mr. W. L. Bradley, engineer and surveyor, The Castle, Tonbridge.

CLERK OF WORKS.—December 11th.—Corporation of Ramsgate. £4 4s. per week.—Mr. A. B. Clarke, town clerk.

BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—December 21st.—Corporation of Ludlow. £200 per annum.—Mr. John H. Williams, town clerk.

INSPECTOR OF NUISANCES.—Abingdon Rural District Council. £110—£120 per annum.—Messrs. B. and E. M. Challenor, clerks.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

WANDSWORTH.—November 30th.—Designs for a public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-street, S.W.

BELFAST.—January 1st.—Designs for 126 houses of two apartments each, and 126 houses of three apartments each, for the corporation. Premiums are offered of £25, £15, and £10.—Mr. R. Meyer, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

HARROGATE.—February 3rd.—Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

DUBLIN.—February 6th.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A. —The Town Clerk.

FOLKESTONE.—No date.—Designs for a band pavilion, cost not to exceed £20,000, for the corporation. Premiums of 100 guineas, 50 guineas and 25 guineas are offered.—The Town Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

GLASGOW.—November 30th.—For the construction of public conveniences, for the corporation.—Mr. J. Lindsay, town clerk.

GUILDFORD.—November 30th.—For the erection of cemetery chapel and lodge, iron fencing and gates, and forming paths, for the Joint Burial Committee.—Messrs. Potter & Crundwell, joint clerks, Farnham.

WEST HAM.—December 2nd.—For the erection of a handicraft centre, for the corporation.—Mr. Fred. E. Hilleary, town clerk.

ESSEX.—December 2nd.—For the erection of a new bridge over the river Roding in ferro-concrete work on the Hennebique system, for the county council.—Mr. Percy J. Sheldon, county surveyor.

ESSEX.—December 2nd.—For the reconstruction of Burnt Hill Bridge, for the county council.—Mr. Percy J. Sheldon, county surveyor.

GLAMORGAN.—December 2nd.—For the erection of a new school, for the county council.—Mr. T. Mansel Franklen, clerk, County Hall, Cardiff.

CULLEN (Banff).—December 2nd.—For the construction of harbour extension works, for the corporation.—Mr. W. C. Paterson, town clerk.

RAMSGATE.—December 2nd—11th.—For the erection of a school, for the corporation.—Mr. A. D. Clarke, town clerk.

MAESTEG.—December 3rd.—For alterations to town hall and market buildings, for the urban district council.—Mr. R. Scale, clerk.

LANCS.—December 3rd.—For the erection of an elementary school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

HYDE.—December 3rd.—For extensions to public baths, for the corporation.—Mr. Thomas Brownson, town clerk.

WOLVERHAMPTON.—December 3rd.—For the erection of a horse repository, for the corporation.—Mr. G. Green, borough engineer.

LLANFAIRFECHAN.—December 3rd.—For constructing public convenience and footbridge, for the urban district council.—Mr. W. H. Ellis, clerk.

BOROUGH OF LUDLOW.

APPOINTMENT OF BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES FOR THE BOROUGH OF LUDLOW.

Notice is hereby given that the Town Council will, on Thursday, the 16th day of January, 1913, appoint a competent and fully qualified person to perform the duties of the above joint offices.

The salary for the joint offices is £200 (allocated as follows: £80 for the Borough Surveyor and £120 for the inspector of nuisances), with office accommodation, including stationery.

The duties will be:—

(*a*) The ordinary duties of a Borough Surveyor.

(*b*) The ordinary duties of an Inspector of Nuisances, as defined by the Sanitary Officers (Outside London) Order, 1910.

(*c*) The duties imposed by the Housing and Town Planning, &c., Act, 1909, and the Orders of the Local Government Board thereunder on an Inspector.

(*d*) The duties of an Inspector under the Petroleum Acts.

The appointment (as to the Inspector of Nuisances) is under the terms of Article IX. of the foregoing Order of the Local Government Board, and is subject to the approval of the Board.

The person appointed will (to comply with the Public Health Acts) be required to give security for the due performance of his duties, which security is fixed at £25. And will be required to give an undertaking not to be concerned in any work that may interfere with his official duties.

And also will be required to agree to give at least one month's notice previous to resigning the office or to forfeit the sum of £5 as liquidated damages.

Applications, with copies of testimonials, endorsed "Borough Surveyor," to be delivered at my office not later than 5 o'clock in the afternoon of Saturday, the 21st day of December next.

The Council does not bind itself to make any appointment.

Personal canvassing of the members of the Council will be considered a disqualification.

JOHN H. WILLIAMS,
Town Clerk.

Town Clerk's Office, Ludlow.
November 23, 1912.

KEYNSHAM RURAL DISTRICT COUNCIL.

APPOINTMENT OF HIGHWAY SURVEYOR.

The above Council invite applications for the appointment of Surveyor of Highways for their District (about 10 miles by 7, embracing 14 parishes), at a salary of £175 per annum. Duties to commence early in the New Year, probably about the end of January.

The person appointed will be required to carry out all the duties appertaining to the office of a Surveyor of Highways, including the keeping of all necessary books and accounts, and be capable of making estimates and plans, to devote his whole time to the duties of the office, and to provide a horse or other suitable means of locomotion.

Preference will be given to Candidates between the ages of 25 and 40 years, with experience as aforesaid.

Applications, stating age, experience, and qualifications, and accompanied by copies of not more than three recent testimonials, endorsed "Surveyor, &c.," to be delivered to me not later than Saturday morning, the 7th December, 1912.

Selection of Candidates will take place on the 10th December, 1912, and appointment on the 17th December, 1912.

The Appointment will be subject to the approval of the Somerset County Council.

Canvassing Members of the Council, directly or indirectly, will disqualify.

FRANK G. WHITTUCK,
Clerk to the Council.

Keynsham, Bristol.

HAZEL GROVE AND BRAMHALL URBAN DISTRICT COUNCIL.

TEMPORARY SURVEYING ASSISTANT.

Wanted, temporary Surveying and Engineering Assistant for Town Planning purposes. Salary £2 2s. per week.

Applicants must be expert Surveyors and Levellers, and neat and expeditious Draughtsmen, and have had such experience as to fit them for Town Planning work.

Applications, stating age, experience and qualifications, with copies of three recent testimonials, to be sent to the Surveyor, Council Offices, Hazel-grove, not later than Saturday, the 7th December next, endorsed "Surveying Assistant."

(By order)
FREDERICK PIDGEON,
Clerk.

Council Offices, Hazel-grove,
Near Stockport.
November 26, 1912.

TENDERS WANTED.

BOROUGH OF GUILDFORD.

The Town Council invite Tenders from responsible persons for the Construction of about 972 yards of 18-in. and 12-in. Surface-water Drain in Woking and Woodlands roads, Guildford, with necessary manholes, gullies and connections.

Plans and sections may be seen, and copies of the Specification, Bill of Quantities and Form of Tender obtained, on application to Mr. C. G. Mason, Assoc.M.Inst.C.E., Borough Engineer and Surveyor, on payment of Two Guineas, which will be returned on the receipt of a *bond-fide* Tender.

Sealed Tenders, endorsed "Tender for Woking-road Drain," must be sent to me before 12 noon on Wednesday, the 18th December, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

A. D. JENKINS,
Town Clerk.

Town Clerk's Office,
Bridge-street,
Guildford.
November 26, 1912.

GODSTONE RURAL DISTRICT COUNCIL.

HIGHWAYS AND BRIDGES DEPARTMENT.

The above-mentioned Council hereby invite Tenders for Tar-washing the Surfaces of certain Highways in their District during the season of 1913.

The area cannot be definitely stated or guaranteed.

Tender forms can be obtained from the undersigned upon the receipt of a stamped and addressed envelope.

Tenders must be sealed, and endorsed on the outside "Tender for Tar-washing," and must be delivered to me not later than Saturday, the 14th day of December, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

GEO. E. CROWTER,
Surveyor of Highways.

High-street,
Godstone,
Surrey.
November 26, 1912

CITY OF LEEDS.

LEEDS CORPORATION ACT, 1908 (SEWERAGE).

SEWAGE DISPOSAL SCHEME AT THORPE STAPLETON.

TO PUBLIC WORKS CONTRACTORS.

CONTRACT No. 41.

For the construction of Main Intercepting Sewers, consisting of the execution of the following work:—

A New Intercepting Outfall Sewer, mainly in Brick and Concrete, ranging in size from 8 ft. 6 in. to 3 ft. 6 in. internal diameter, of a total length of about 4¼ miles, commencing in Meanwood-road, traversing North-street, Skinner-lane, York-road, Pontefract-lane, to the New Sewage Works Site at Thorpe Stapleton; also two new Branch Sewers to be connected with the existing Sewers in Roseville-road and Chapeltown-road respectively, together with all Manholes, Lamp Chambers, Storm Overflow Chambers, Conduits and other Work incidental thereto.

The Sewerage Committee of the Leeds Corporation are prepared to receive applications for Contract Documents from Public Work Contractors who are desirous of submitting Tenders for the above Contract. The latest date on which such applications will be received by the undersigned is December 9th, 1912.

The Tenderers, when notified by the Sewerage Engineer, will be required to deposit with the Corporation the sum of Ten Pounds (£10) to cover the Contract Documents necessary for preparing a Tender can be forwarded or supplied, such sum will be returned when the Council have accepted a Tender, provided that a *bonâ-fide* Tender shall have been sent in, and that the same shall not have been withdrawn.

The Sewerage Committee reserve the right to decline the application of any Tenderers, and do not bind themselves to accept the lowest or any Tender.

Persons tendering must do so at their own cost.

(By order)
GEO. A. HART,
Sewerage Engineer.

26 Great George-street, Leeds.
November 19, 1912.

CITY OF LEEDS.

LEEDS CORPORATION ACT, 1908 (SEWERAGE).

SEWAGE DISPOSAL SCHEME AT THORPE STAPLETON.

TO MAKERS OF CENTRIFUGAL SEWAGE PUMPING MACHINERY.

CONTRACT No. 42.

For the Supply, Delivery and Erection of 6 No. Independent Units of Combined Centrifugal Sewage Pumps direct coupled to 3-Phase Alternating Current Motors and other incidental Work required in the New Pumping Station to be constructed at the Low-level Sewage Works at Knostrop, in the City of Leeds.

The Sewerage Committee of the Leeds Corporation are prepared to receive applications for Contract Documents from Makers of Centrifugal Sewage Pumping Machinery only who are desirous of submitting Tenders for the above Contract. The latest date on which such Applications will be received by Mr. Geo. A. Hart, Sewerage Engineer, 26 Great George-street, Leeds, is December 2nd, 1912.

The maker of the centrifugal sewage pumps will require to take full and complete responsibility for both the pumps and the whole of the electrical equipment required in accordance with the terms of the Conditions of Contract, Specification (both mechanical and electrical), Drawings and Diagrams which have been prepared, and to enter into a formal Agreement with the Corporation accordingly.

The Tenderers, when notified by the Sewerage Engineer, will be required to deposit with the Corporation the sum of Ten Pounds (£10) to cover the Contract Documents necessary for preparing a Tender can be forwarded or supplied. Such sum will be returned when the Council have accepted a Tender, provided that a *bonâ-fide* Tender shall have been sent in, and that the same shall not have been withdrawn.

The Sewerage Committee reserve the right to decline the application of any Tenderer, and do not bind themselves to accept the lowest or any Tender.

Persons tendering must do so at their own cost.

(By order)
ROBERT E. FOX,
Town Clerk.

Pearl Chambers, Leeds.
November 18, 1912.

KENT COUNTY COUNCIL.

(10) Quenast or Lessines.
(11) Or other equally durable Material.

Tenders are also invited for Tarred Macadam, and special forms for the supply of this material will be furnished upon application.

Also the following Local Materials:—

7,500 yards (more or less) of Surface picked or Grubbed Flints.
3,000 yards of Kent Rag.

Specification and Forms of Tender can be obtained upon application to the County Surveyor, Maidstone.

Sealed Tenders, endorsed "Tender for Road Metalling," must be sent to the undersigned (upon the prescribed forms not later than 12 noon on Wednesday, the 11th day of December next.

The Committee reserve the right to apportion the order as they may feel disposed, and will favourably consider offers of small consignments.

The lowest or any Tender will not necessarily be accepted.

W. B. PROSSER,
Clerk to the Council.

Sessions House, Maidstone.
November, 1912.

MERTON URBAN DISTRICT COUNCIL.

SUPPLY OF TAR FOR ROAD SURFACING.

The above Council invite Tenders for the Supply of Tar for Road-surfacing Works in the Parishes of Merton and Morden, such tar to be supplied as and when required during the six months ending 30th September, 1913.

Tender forms can be obtained from the undersigned on or after the 13th December.

Sealed Tenders, endorsed "Tender for Tar," must be delivered at the Council offices before 12 o'clock noon on Friday, the 27th day of December, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

G. JERRAM,
Surveyor to the Council.

Council Offices,
Kingston-road, Merton, S.W.
November 29, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

SUPPLY OF TOOLS.

Tenders are invited for the Supply and Delivery of Tools for use on Main Roads throughout the County during the year ending 31st March, 1914.

Conditions and Form of Tender may be obtained on and after November 20th from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester.

Tenders are to be delivered to me on or before Saturday, 21st December, 1912, in sealed envelopes, endorsed "Tender for Tools."

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

HIRE OF STEAM ROLLERS.

The County Council invite Tenders for the Hire of Steam Rollers for use on the Main Roads throughout the County during the year ending 31st March, 1914.

Conditions and Form of Tender may be obtained on application from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after November 20th.

Sealed Tenders, marked "Tender for Hire of Steam Rollers," are to be delivered to me on or before Monday, the 9th December, 1912.

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

TAR.

Tenders are invited for the Supply of Refined Tar for surface treatment of the Main Roads during the year ending March 31st, 1914.

Specification, Form of Tender, General Conditions and Schedule of Stations to which the Tar is to be delivered, may be obtained on and after November 20th from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on deposit of One Guinea, which will be returned on receipt of a *bona-fide* Tender.

Tenders, endorsed "Tar," to be delivered to me on or before Monday, the 9th December, 1912.

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

COUNTY OF SOUTHAMPTON.

MAIN ROADS.

SURFACE TARRING MACHINES.

Tenders are invited for the Supply and Delivery of Surface Tarring Machines.

Conditions and Form of Tender may be obtained on and after November 20th from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester.

Tenders are to be delivered to me on or before Saturday, 21st December, 1912, in sealed envelopes, endorsed "Tender for Tarring Machines."

H. BARBER,
Clerk of the County Council.

The Castle, Winchester.
November 15, 1912.

WILTS COUNTY COUNCIL.

MAIN ROADS UNDER DIRECT MANAGEMENT.

ROAD METAL.

The Roads and Bridges Committee of the County Council invite Tenders from Quarry Proprietors, Stone Merchants and others for the Supply of Road Metal for a period of one year commencing 1st day of April next.

The Material required will consist of Granites, Basalts, Flints, Limestones, Gravel, &c., particulars of which are set out in Specifications. Schedules of approximate Quantities and Forms of Tender to be obtained of the County Surveyor, Trowbridge. The bulk of the Material will be required to be delivered at railway station or wharves, except in the case of local material.

Sealed Tenders to be addressed to the Clerk of the County Council, County Offices, Trowbridge, must be delivered on or before the 10th day of December, 1912.

All Tenders to be endorsed "Tenders for Road Metal."

No pledge is given that the lowest or any Tender will necessarily be accepted.

(By order)
J. GEORGE POWELL,
County Surveyor.

County Surveyor's Office,
Trowbridge.
November 20, 1912.

WILTS COUNTY COUNCIL.

MAIN ROADS UNDER DIRECT MANAGEMENT.

STEAM ROLLING.

The Roads and Bridges Committee of the County Council invite Tenders for Steam Rolling on 316 miles of Main Road, for a period of one year, commencing on the 1st day of April next.

Specifications, Schedule of approximate Quantities and Form of Tender can, on application, be obtained from the County Surveyor.

Sealed Tenders, addressed to the Clerk of the Council, and endorsed "Tender for Steam Rolling," must be delivered on or before the 10th day of December, 1912.

No pledge is given that the lowest or any Tender will necessarily be accepted.

(By order)
J. GEORGE POWELL,
County Surveyor.

County Surveyor's Office,
Trowbridge.
November 20, 1912.

WILTS COUNTY COUNCIL.

MAIN ROADS UNDER DIRECT MANAGEMENT.

TOOLS FOR ROADWORK.

The Roads and Bridges Committee of the County Council invite Tenders for Tools for work on 316 miles of Main Road, for a period of one year, commencing on the 1st day of April next.

Specification and Form of Tender can, on application, be obtained from the County Surveyor.

Sealed Tenders, addressed to the Clerk of the Council, and endorsed "Tender for Tools," must be delivered on or before the 10th day of December, 1912.

No pledge is given that the lowest or any Tender will necessarily be accepted.

(By order)
J. GEORGE POWELL,
County Surveyor.

County Surveyor's Office,
Trowbridge.
November 20, 1912.

BRIDGWATER RURAL DISTRICT COUNCIL.

Tenders are invited for the Supply of Stone for the Roads within the above District. The Contracts will be for one year, from 1st April, 1913, to 31st March, 1914.

Printed Forms of Tender, containing full particulars and conditions of Contract, will be supplied on application to the undersigned, or the Council's Surveyor, Mr. W. A. Colton, 56A Eastover, Bridgwater.

Sealed Tenders, endorsed "Highway Tenders," to be addressed to the undersigned, postage paid, on or before Friday, the 6th day of December, 1912, and samples of Stone to be delivered at the Surveyor's Offices on or before such date.

The Council do not bind themselves to accept the lowest or any Tender.

T. M. REED,
Clerk to the above Council.

Bridgwater.
November, 1912.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. DECEMBER 6, 1912. No. 1,090.

Minutes of Proceedings.

London Water: Dr. Houston's Annual Report.

Once again Dr. Houston states very clearly, in his sixth annual report to the Metropolitan Water Board, that there are certain matters which need attention in the methods of purification at present in use for the protection of the London water supply. It is perhaps remarkable that the technical Press, in reviewing Dr. Houston's reports, seems to overlook his very serious warnings, and to regard only the optimistic portions, which, while they tell us how the water supply of London may be made reasonably safe, certainly do not tell us that the safety has been secured. If the report is read carefully it will be seen that the most optimistic statements are made in the most guarded manner. Conclusion 39 in the report contains the words :—"I consider that the means now adopted, or in process of adoption, for the purification of the Metropolitan water supply are such as to render the water reasonably, if not absolutely, 'safe' for drinking purposes." If these were the only words in the recommendation they would not be very reassuring. If Dr. Houston were called in to report upon any other water supply in the kingdom but that of London, and said that he could not describe the water as being absolutely safe, it would create a very unfavourable impression ; but Dr. Houston does not even say this. The recommendation quoted above is prefixed by the words "subject to these qualifications." It is necessary to read the preceding report and thirty-eight previous conclusions in order to understand thoroughly what the qualifications referred to are. They do not afford much comfort, and are certainly open to the construction that Dr. Houston does not consider that the means now adopted for the purification of the Metropolitan water supply are such as to render the water reasonably safe at all times. Owing to the fact that the Water Board no longer possess an unrestricted right to draw water from the river during times of drought, when its quality is good, their reservoirs are partially emptied, and when wet weather succeeds the drought and the rivers are full of flood-water of very inferior quality the reservoirs have to be filled quickly, and this polluted water has to be drawn off at once and passed on to filters. These filters cannot possibly purify it properly, and further, owing to the fact that water cannot be run to waste from the filters, such impure water may pass through a sand filter which has just been cleaned and receive practically no purification at all. The water issuing from such a filter cannot be sampled until it has been mixed with the water from other filters, and thus the bacteriologist is quite unable to obtain any real proof as to the quality of the worst water coming from a filter.

The report states that 80 per cent of the London water is derived from sewage-polluted rivers. There are few places which would acquiesce in the use of such a source of supply at all, and seeing that we are here dealing not with a supply of a rural district or small town, but with that of the largest city in the world, it is surely most unnecessary folly to omit any step in the process of purification which is recommended by the bacteriologist and the water authority itself. Dr. Houston has urged for some time past the importance of occasional pretreatment of flood waters taken into the reservoirs. Why the board have neglected to follow this advice is inconceivable. The risk run is extraordinary, and the saving in expense cannot be great, and if great is not justified.

* * *

Capital Expenditure and Road Maintenance.

Several important points were raised by Mr. Thomas Jones in a letter which he contributed to the correspondence columns of our issue of November 22nd. For the present our own comments will be confined to that part of his letter which deals with the relation between capital expenditure and annual maintenance. With respect to methods of construction specially devised to resist wear, a prime difficulty, in most cases, is that the materials do not wear fast enough to remain rough to the extent necessary to provide foothold and wheelhold. If there be a material, and a method of using it, which will present a surface permanently of sufficient roughness without considerable wear, let it be produced, if it can be put down at a reasonable cost. A very considerable range of expedients is, however, put out of court as regards any but a small proportion of the total mileage of roads simply because their first cost is too high. These methods are not good because they are not cheap enough to compete with present methods. In a series of methods of increasing cost the mileage affected becomes rapidly less as we advance from the less costly to the more costly. Take surface tarring. Such tarring as may be done for £25 a mile cannot possibly reduce the cost of maintenance of roads which already cost less than £25 a mile, nor is it likely to reduce the cost of roads which are now maintained for less than some such figure as £40 to £50 a mile. Surface tarring costing £40 a mile per annum is obviously limited as a cost reducer to roads costing some £60 or £70 a mile, probably to roads on which the present cost of maintenance is much higher. If tarring does not save its own cost it is obviously no direct economy, but for the sake of argument we have assumed that it pays for itself with a good deal to spare. Tarring exceeding £50 a mile in annual cost is clearly limited to a small proportion only of country roads as a direct economy.

Turning now to the matter of capital outlay, there are, of course, many roads the cost of maintenance of which may be reduced by a considerable outlay of capital ; but the economic outlay is strictly limited by the present position, in each case, as regards annual maintenance. To be well on the safe side let us assume that the cost of maintenance in every case can be reduced to £20 a year for roads now costing under £60, and to £30 a year for roads costing more than this. Allowing 4 per cent for interest and repayment, a capital of £1,000 cannot be economically spent on roads costing, at present, more than £60 a mile per annum. The economic expenditure of £2,000 capital is limited to roads which now cost £110 a mile. A sum of £2,650 has a range extending only to roads now costing £136 a

year or more per mile. After reading Mr. Jack's annual report on the main roads of Herefordshire, we made some calculations which showed that in such cases as those he described, even if we assume that suitable foundation stuff is very cheap, and that the effect of providing foundations would reduce the annual cost of maintenance very much, the amount of capital which can be spent with direct economy is very small. The problem need not be regarded as insoluble, but it certainly presents special difficulties. Indirect economy is quite another matter. If the better state of the road will lead to a reduced cost of transport, and a reduction of indirect expenses in cleaning vehicles, horses and clothing, the sum which the Road Board may spend economically in such a case is considerably greater than that which limits the financial horizon of the surveyor. The latter can, however, reckon as at least no loss a contribution by the local authority amounting to, say, £500 for every £20 reduction in the future cost of maintenance.

* * *

The Group Names of Rocks: Their Significance in Highway Work.

A bulletin recently issued by the United States Office of Public Roads contains a table showing the results, up to January last, of physical tests of samples of rocks used in road-making. On another page we have summarised portions of this table and quoted several notable passages from the general conclusions as to the behaviour of similar rocks in service. For purposes of comparison the figures giving maximum and minimum values are much affected by differences in the numbers of samples tested, the larger the number tested the greater being the probability of a high maximum and a low minimum being reached. The figures relating to a rock of one kind are therefore more informative than those relating to different rocks under the same test. Thus in each case the maximum and minimum values show a range which applies to a definite number of samples. To obtain a clear idea of the significance of the ranges of values found we should require a column giving in each case the number of quarries, or distinct parts of quarries, from which the rocks came, and in each case a range of values based upon an equal number of tests of each sample, an equal number of samples being taken from each source. If this be not done the divergence between laboratory results and those of service conditions will be greater than that due to natural causes. One might, and perhaps should, go further, and test in each case a number of specimens proportioned to the output of the quarry for road purposes. These considerations are based upon the assumptions that there is some value in generalisation and that a connection between group names and service results is a matter of importance. It is obviously necessary that in addition to its group name the sample tested should in each case be designated by a definite name such as one of the compound names of the mineralogist, or a group name qualified by an adjective. The range of values found for each of the stones so defined would usually be much smaller than that found for the group. This more precise information is, of course, recorded at the laboratories. What we are now concerned with is a matter of generalisation, such as may be of value in the preliminary stages of selecting a road stone. Even then, when he is considering a group as a whole the highway engineer finds the separate statements giving the results under the different tests of more value than any figure of merit obtained by combining these results as separate factors. If, for instance, his climate is a very wet one the wet attrition test is more important than the dry attrition test, and nearly useless unless the wet attrition test has no value except in the absence of a record of dry tests. In any ordinary climate the relative importance of wet and dry tests will be nearly proportionate to the average number of wet and dry days respectively during the year.

The Relative Values of the Groups: British and American Experience.

The conclusions to which the authors of the bulletin arrive with respect to the supreme test of service conditions as compared with the results of laboratory tests are of considerable interest. More importance attaches, however, to their very remarkable conclusions as to the general character of each class of rock, as disclosed by the results of experience on the roads of the United States. It is impossible to say to what extent the notable divergence from results obtained in this country and elsewhere is due to a difference in the proportions of good and bad rocks coming under the class names, or how much of it is due to differences in climate and in traffic conditions. In the case of sandstones, which seem, as a class, to give much poorer results in the United States than they do in this country, a consideration of their behaviour under laboratory tests, on both sides of the Atlantic, suggests that the better service results obtained here are largely due to our climate, which is much more favourable for sandstone roads than are most of the climates of the United States. Even more remarkable is the opinion expressed as regards the value of quartzite, in which case, however, the same differences in climatic conditions may considerably affect the results. With respect to granites and gneisses, the former class, as a surfacing material, is condemned without qualification, and the latter fares little better. If climate comes in here as well as in the case of sandstones and quartzite, the United States has to reckon with a very costly factor in road maintenance generally; and, no doubt, it has a climate far worse than ours in its effects on roads. The divergence in this case is, however, more probably due either to some difference in class fication or to a lack, in the United States, of those valuable stones which in this country come under the general group name of "granite," and the absence of those tough and very durable gneisses such as are found in large quantities in South Africa and India. It must be borne in mind that the conclusions embodied in the bulletin do not relate especially to main roads, and are, indeed, confined to roads on which the traffic is principally horse drawn. Possibly, then, the divergences to which attention has been drawn are due in part to differences in nomenclature and in climate, and in part to the relative poverty of the United States in certain groups of road stones, and possibly in some degree to a superiority in other classes, such as the trap rocks; but when all is said we should be interested to know whether the highway engineers of the States are substantially in accord with the Office of Public Roads in this matter.

* * *

Rural and Urban Housing.

The public interest which is being shown on every hand in regard to the housing of the working classes is reflected in the frequency with which this important question is discussed by meetings of surveyors, architects, municipal engineers, and others whose professional duties give them a practical interest in the matter. The latest meeting at which this subject was under consideration was held by the Institution of Municipal Engineers at Exeter, when communications were presented in regard to both rural and urban housing. The former aspect was dealt with in a paper by Mr. L. Caplen in which he gave a description of the scheme recently completed at Montacute, Somerset, by the Yeovil Rural District Council. This scheme was undertaken in consequence of inquiries which showed that in at least five of the parishes in the district there was either a deficiency in housing accommodation or a considerable number of existing houses were in a condition so insanitary as to be unfit for human habitation. Details of the scheme and drawings of the houses which have been erected will be found in another column; but it is worthy of note that an analysis of the

cost shows that with a rental for each house of 3s. 9d. a week the scheme is entirely self-supporting, the cost per house being approximately £152—an exceedingly satisfactory result. Mr. B. Wyand, the secretary of the institution, presented an interesting note descriptive of a scheme which it is proposed to carry out in the East-end of London. This scheme is partly philanthropic in character, and only a dividend of 4 per cent. upon the capital invested is anticipated. Although each "apartment" will be occupied by a separate family the evils of the one-room tenement will be prevented or at least minimised by the adoption of a number of ingenious devices. For example, the beds will fold back into the walls when not in use, and privacy will be preserved at night by means of collapsible screens. The whole building will be heated by radiators, so that fireplaces and coal will be dispensed with, while for cooking small gas cookers on the slot system will be provided. Further, there will be ample common room accommodation, including crèche, refreshment-room, washhouses, smoking-room, library, reading-room, and kitchen. The average inclusive rent per apartment will be 6s. 6d. per week, the only extra being the cost of the gas used for cooking. This scheme contains many points of novelty and its execution will be watched with great interest.

Quantity Surveyors and Reinforced Concrete.

The subject has raised questions of the position of the quantity surveyor in regard to reinforced concrete work was the subject of a very complete paper read at the last meeting of the Concrete Institute by Mr. John M. Theobald, A.R.I.B.A. A full extract of the paper will be found in another column. Mr. Theobald dealt in detail with each of the three usual forms of contract under which reinforced concrete construction is carried out. The first and most unsatisfactory was the lump sum contract. Here it is clear that, unless a quantity surveyor is employed, when the time for a final settlement arrives the contractor's account for extras must be accepted without means of settlement. In the second form of contract—the measurement one in practice—the bills of quantities (prepared by the contractor) do not form part of the contract, but the contractor undertakes to deposit a copy of the priced bill, it being stipulated that the prices shown are to form the basis for arriving at the value of extra work executed. If a lump sum contract of this kind is entered into, it is evident that errors in the bills of quantities may occur which may tell either in favour of the building owner or the contractor. The third kind of contract discussed by Mr. Theobald is that in which the bills of quantities form part of a lump sum contract. This is a much better arrangement from every point of view. It is fair to both building owner and contractor, provided that the bill of quantities is prepared by a competent surveyor. Finally, there is the lump sum contract, to which the bills of quantities form a schedule, the entire building being executed by the contractor. This would be a perfectly satisfactory method save on the score of extravagance. We forbear in this place from commenting further on the various forms of contract referred to, but we would direct the attention of our readers to Mr. Theobald's paper for a fuller discussion of the matter.

Colonel Jones' Retirement.

The retirement of Lieut.-Colonel Alfred St. Jones, C.B., M.INST.C.E., from the management of the Aldershot Camp Sewage Farms is to be marked by a presentation from his professional *confrères* and other admirers, to be made at the forthcoming annual dinner of the Association of Managers of Sewage Disposal Works. The wide circle of Lieut.-Colonel Jones' friends includes many who are not members of the association, but who would doubtless like to associate themselves with such an interesting function as that which is to take place next week, and to express their goodwill and esteem on his coming retirement by their presence. The secretary of the association, Mr. Charles Ball, of Manchester, will be glad to hear from any gentlemen to whom this intimation may specially appeal. Our readers will probably not need to be reminded that Lieut.-Colonel Jones has a double claim to distinction. His military career was crowned by the conferring of that coveted distinction the Victoria Cross, given in recognition of "a well conceived act gallantly executed." On the civil side he has been consulting engineer to the Borough of Wrexham for sewage disposal, and he is a member of the Institution of Civil Engineers, the Institution of Municipal and County Engineers, the Royal Sanitary Institute, and other professional and learned bodies. Born in 1832, he is relinquishing his work full of years and honour, and we are confident that we may speak on behalf of all our readers wherever they are dwelling when we express the hope that he will have a happy retirement.

* * *

Sludge Disposal.

On another page we give an abstract from a paper read by Mr. W. J. Dibdin, on Monday last, at a meeting of the London section of the Society of Chemical Industry, together with a report of the discussion which followed its presentation. In this paper an account was submitted of the success of the slate-bed treatment of sewage in recent years, and while the author might take exception to the above heading on the plea that his system does not produce sludge in the ordinary sense of the term, we have adopted it because we consider that slate-beds form the most hopeful solution of the sludge problem that has been brought into practical operation up to the present. The most interesting part of the paper is that which gives an estimate of the probable quantity of the humus discharged from slate beds, and describes the utilisation of the humus, after it has been air-dried, for manurial purpose. The experiment made with this material by a well-known firm of horticulturists is a very practical test, and if it can be sold for such purposes, even at a price that will defray the cost of carriage and handling, much will have been attained. Up to the present the amount of humus available has not been sufficient for experiments in its utilisation as a manure on a large scale, but as slate beds are adopted more generally all over the country there will be greater opportunities for making tests of the kind referred to in this paper, and we shall expect to hear more of this method of utilisation in the future.

Reinforced Concrete Tests.

In another column of our present issue will be found an abstract of a paper on "Test Deflections in Reinforced Concrete," which was read on Monday before the Society of Engineers by Mr. Percy J. Waldram, F.S.I. In view of the rapid increase in reinforced concrete construction and the draft regulations which have been devised by the London County Council, the subject of Mr. Waldram's paper is of great immediate interest. The draft regulations received full consideration, and some criticism; their further consideration by those who are directly affected by them is important because they require the approval of the Local Government Board before they come into force, and it is highly desirable that they shall be brought to a high state of efficiency by criticism and amendment before such approval is given. Moreover, it must be borne in mind that although their scope may nominally be limited to London, when once they are confirmed they will certainly be regarded as a standard over a much wider area. Those of our readers who are interested in the matter should obtain a copy of the paper.

The Contour Survey of Bushey, Herts.

By A. J. LAING, A.C.G.I.

Correspondence has lately appeared in THE SURVEYOR on the necessity of having a contour survey made previous to the consideration of a town planning scheme.

The writer, who recently assisted on such a survey executed for the Bushey Urban District Council, proposes to give a brief description of the method employed in carrying out the work.

The Bushey Urban District Council necessarily wished to have the fullest information as to the suitability of their district for town planning, and, in varying with the nature of the country, being less on irregular ground and greater where a more regular formation obtained.

Each line of contour was denoted by a different colour. Three colours were used in succession—viz., red, white and blue—red being reserved for altitudes divisible by three, as 180, 210, &c., thus avoiding confusion in the field book.

For the survey lines were poled out to run as far as possible parallel to the direction of the contours and were then chained, offsets being taken to the arrows.

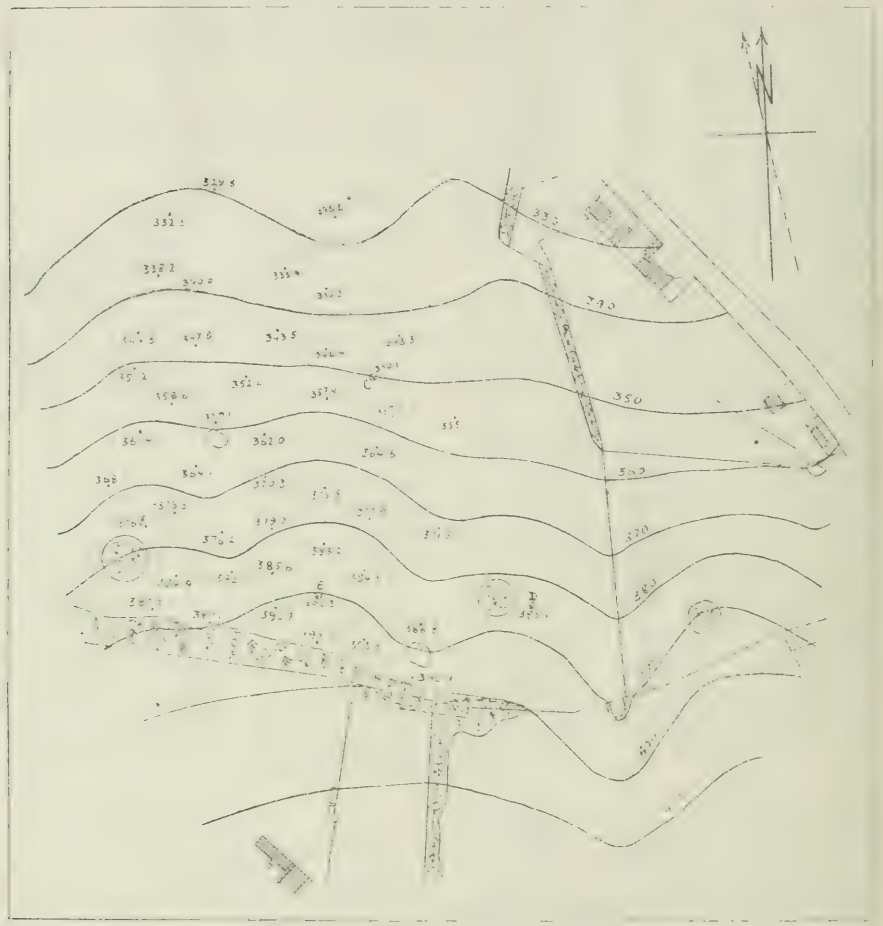

FIG. 1.

preliminary step before going further into the question.

about 3 miles long by 1½ miles wide. The country is

at every 10 ft. variation of altitude.

up from point to point.

driven into the ground to mark the stations on which the instrument was subsequently to be set. These station pegs were placed some 500 to 600 ft. apart and levelled with a dumpy, their position and the direction of the line having been first determined by an examination of the ground ahead. The stations were indicated by letters and referenced by the number of the field given on the ordnance—for example, station A, field 463.

The instrument was then set up over the first peg

on the line great care being taken to see that it reversed truly. The bubble of the vertical circle was frequently tested and, if necessary, adjusted to ensure the correctness of the vertical angles. After having measured the height of the instrument above the peg, the horizontal plates were clamped in the zero position, and the telescope turned in azimuth until the trough compass needle pointed north. The top plate was then released and the telescope directed towards the forward station, on which an arrow was held. Having taken the horizontal angle for bearing, a staff was placed on this station and rocked slightly while the distance and vertical angle were read.

Points in the field were next taken at every change of slope, readings for the distance, bearing and altitude being observed. Two persons were employed at the instrument, one for reading and the other for booking, the order of reading being, (1) the wires (2) the bearing, (3) the vertical angle.

An engineer had charge of the men carrying the staves and directed them over the ground, at the same time making notes of the different points taken, and, where necessary, sketches, and taking such subsidiary measurements as were required. The points were numbered and referenced to their station, and also to the field in which they were taken. The engineer was careful to watch each point as it was read from the instrument, so that, in making his notes the number of all points referred to in his field-book corresponded with those entered in the tacheometer book.

Having taken the necessary number of observations from the station, the tacheometer was transferred to the forward station, where it was again set up. Here the horizontal plates were set to the bearing of the line, the telescope transited and directed towards the back station, readings of the distance and vertical angle being taken as before. The telescope was again transited, the top plate released and brought to zero, and the north checked. If this was found to be correct the next forward station on the line was read and points taken, as already described. To enable the traverse to be plotted, some of the stations were referenced by direct measurements to details shown on the ordnance, and also by bearings to corners of buildings, or to other prominent features.

OFFICE WORK.

The first work undertaken was the reduction of the tacheometer books. For obtaining the altitude of each point, the difference between the readings of the outer wires (called the generating number), the reading of the centre wire (or axial reading), and the vertical angle were used. Multiplying the generating number by $\frac{1}{2}$ (sin. 2 vertical angle), and adding to or subtracting from this the difference between the axial reading and the height of instrument, the difference in level between the point and its station was arrived at.

From the formula generating number $\frac{1}{2}$ cos. vertical angle, the true horizontal distance was calculated. The reduction of the tacheometer books being completed, the plotting was next taken in hand. A line representing the magnetic north was first drawn. Then, having fixed the position of known stations, the traverse was laid down, the angles being plotted by tangents in the usual manner. On the scale of 1/2500 this method was found to be quite satisfactory. In order, however, to further determine the accuracy of the work, a polygon of thirteen sides was checked by co-ordinates, and the error was found to be 6 in. in 1,000 ft., a degree of accuracy equal if not superior to chain measurement.

For plotting the points, a protractor, semi-circular in shape, with the scale marked on its diameter, and zero coinciding with a pinhole at its centre, was used. A needle was fixed at the station and the protractor rotated until the bearing of the point agreed with the north line drawn through the station, when the distance was marked off along the scale and the reduced level written against the point.

In this way all the points taken in the field were plotted on the ordnance sheets, together with the notes and measurements extracted from the engineer's fieldbook. From these points contour lines were

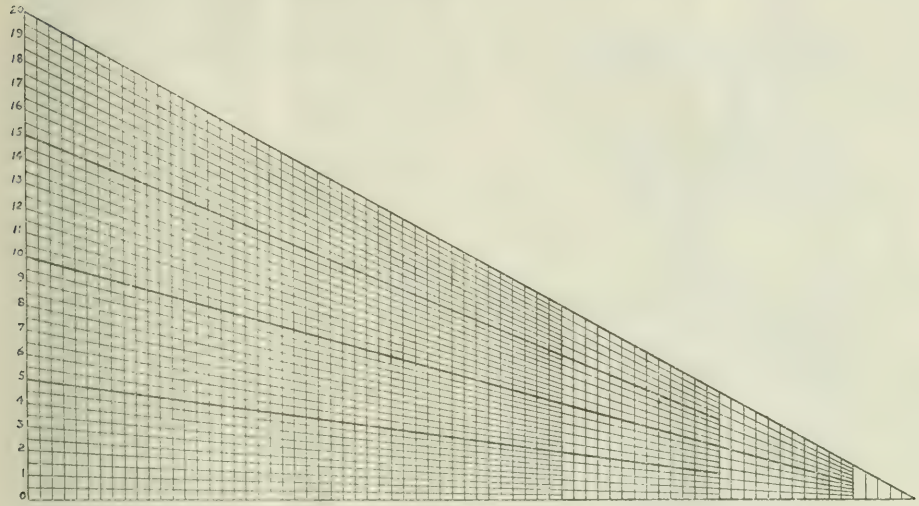

Fig. 2

traced (Fig. 1), the use of a proportional scale (Fig. 2).

The progress of the work proved the tacheometer method to be considerably faster than the dumpy, besides giving a greater amount of useful information.

The diagrams accompanying this article are reproduced by permission of the engineers, Messrs. P. W. Macvay & Co., of Westminster, who carried out the work.

Junior Institution of Engineers.—"Staff Officers in Industrial Works: Their Scientific and Practical Training and Duties" will be the subject of the presidential address of Sir A. Travor Dawson, R.N., M.INST.C.E., before this body on Wednesday evening next. Tickets of admission to the meeting, which opens at 8 o'clock, can be obtained by any of our readers on application to the secretary of the institution, 39 Victoria-street, S.W.

SEA-COAST EROSION. For a very complete and inexpensive library on the cause, prevention and repair of coast erosion the following three works are recommended: "Coast Erosion and Foreshore Protection," by John S. Owens, M.D., Assoc.M.Inst.C.E., F.R.G.S., and Gerald O. Case (price 7s. 6d., post free 7s. 10d.), with numerous illustrations and diagrams; "Sea-Coast Erosion and Remedial Works," by R. C. Allanson-Winn, M.Inst.C.E.I. (price 1s., post free 1s. 1d.); and "Erosion of the Coast and its Prevention," by F. W. S. Stanton, Assoc.M.Inst.C.E., F.S.I. (price 3s., post free 3s. 2d.), with numerous maps and other illustrations. The publishers are the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

E

Housing of the Working Classes in Rural Districts.

SCHEME RECENTLY COMPLETED AT MONTACUTE, SOMERSET, BY THE YEOVIL RURAL DISTRICT COUNCIL.*

By L. CAPLEN.

Owing to the important place that the housing question now occupies in the many duties of a public official, I trust that the description of the small scheme just completed at Montacute by the Yeovil Rural District Council may prove of interest to the members of the institution.

In consequence of the lack of suitable houses for the working classes, in 1905 the rural district council were approached as to the best methods that could be adopted to secure better housing conditions. The council caused full inquiries to be made throughout the district through the respective parish councils, as to whether there was sufficient housing accommodation, and in consequence of replies sent in found that some five or six parishes were either deficient in houses or that some of the existing ones were in such a state as to be unfit for occupation.

Before proceeding further it was thought that every opportunity should be given to local enterprise to meet the demand, and the council issued posters in the various parishes asking that the demand for houses should be given consideration by local builders and private individuals, and in the meantime postponed the adoption of the Housing Act for twelve months. It cannot, therefore, be said that the fullest opportunity was not given to local speculators or investors to supply such houses as were required.

Section A A.

Yeovil Rural District Council's Housing Scheme at Montacute: Plans of Twelve Cottages Recently Erected.

In Montacute there was no response to the demand, and a housing scheme had to be adopted. After some difficulty a good site was obtained sufficient for the erection of twelve houses. An important advantage that the land offered to the scheme was the fact that no new approach road had to be constructed, while the water main and main sewer already existed. A Local Government Board inquiry was held, and sanction was obtained to borrow £1,776, for a term of sixty years, for both land and buildings, at the rate of 4 per cent.

* Paper read on Saturday last at a meeting of the Institution of Municipal Engineers held at Exeter.

The houses have just been completed, and were recently inspected by the Right Hon. John Burns, President of the Local Government Board, who expressed himself as being well pleased with them, both as regards accommodation and appearance.

They are built in two blocks of six each, with Ham Hill stone for all external walls. With the exception of the end houses, each has a frontage of 15 ft. and depth of 24 ft. 4 in.; all internal walls are of brickwork. When selecting stone facings the council had in view that the work would employ both local labour and material, as the Ham Hill Quarries are situated fairly close to the site. The stonework is of uncoursed rubble, rough axed, and set in lime mortar. All main angles are formed in large, roughly squared quoin stones, and the whole pointed up stone colour.

As will be seen from the plans, the roof spans from front to back, and is hipped at each end of the blocks. A feature is that the covering consists of patent "Eternit" roofing slates, laid in diagonal pattern.

The accommodation is as fallows:—

Ground Floor.—Living room, 11 ft. 4 in. by 14 ft., cupboard under stairs; scullery, 10 ft. 6 in. by 7 ft.; larder, coal store, and water-closet. Each living room has a combination cooking range and boiling copper fitted. When cooking with these ranges hot water can be obtained from the coppers, which are fitted in the sculleries at the back of the ranges. Baths and sinks are fitted to sculleries, concrete paving to back of each house, and asphalt paths from the road to front doors.

First Floor.—Three bed-rooms, partially in the roof, with dormer windows; two bed-rooms have fireplaces. All windows are casements, and woodwork is treated with "Solignum."

The cost of the scheme is set out below, and it will be seen that, with a rental of 3s. 9d. per week per house, it is an entirely self-supporting one.

The council had numerous applications for the houses, which were let immediately on completion.

Cost of Houses.	£	s.	d.
Land, 4,000 sq. yds.	110	0	0
Architects' fees (agreed)	27	0	0
Compensation to tenant of land	5	0	0
Stamping of bond, contract and agreement	2	6	8
Advertising	2	15	0
Redemption of land tax	1	7	6
Public Works Loan Board charges	20	10	0
Contract for houses	1,534	0	0
Contract for boundary wall	85	0	0
Front wall, paths, &c.	17	10	0
Bill of costs, conveyances, &c.	21	0	0
Extras	1	0	0
Total	£1,827	9	2

Excess over loan, £51 9s. 2d. Cost per house, say, £152.

Cost of Upkeep.	£	s.	d.
Repayment of principal and interest at 4 per cent on loan of £1,776	71	0	9½
Do. if excess over loan of £51 9s. 2d. is borrowed	2	1	2
Rates—£7 per house gross, £6 rateable at 3s. 6d. in £ = £19 4s. 6d.; less 30 per cent reduction (£5 15s. 2½d.)*	13	8	9½
Water rate, 2d. per house per week	3	4	0
Income property tax, less rebate in consideration of interest paid to Public Works Loan Board	2	15	0
Insurance of houses, £1,000 at 1s. 6d. per cent		15	0
Collection of rents, at 2 per cent on £117	2	6	9½
Repairs, 10 per cent on gross rental	11	14	0
Allowance for voids, arrears, &c., two weeks' rent per house per year†	4	10	0
Collectors' books, stationery, &c.	1	0	0
Total	£114	15	6½

Gross rental, at 3s. 9d. per week, £117 0s. 0d.
Balance in favour of council, £2 4s. 5½d.

The houses were designed and supervised by Messrs. Petter & Warren, architects, Yeovil, and they are to be congratulated upon the results they have obtained.

"The Civic Engineer's Who's Who."—The first issue of "The Civic Engineer's Who's Who" (London: St. Bride's Press, Limited, 24 Bride-lane, E.C., 2s. 6d nett) gives wonderfully complete lists of the engineering officials of England and Wales. For a first issue it is very creditable.—*Glasgow Herald.*

* Half cost of work, as district council effected a considerable road widening opposite houses by taking portion of site.
† Reductions obtained, as rates are to be paid whether houses are empty or not.

COST OF REPAVING WORKS.

AN OBJECTION BY THE LOCAL GOVERNMENT BOARD AUDITOR.

The Hammersmith Borough Council have for some time past allocated a certain sum of money raised out of the rates each year for the purpose of bearing the cost of repaving with wood the main roads in the borough which are at present paved with that material. This policy, it was considered, was in accordance with the views of the London County Council as the loan-sanctioning authority with regard to the method of bearing the cost of works of this nature. Owing to difficulties which have arisen during the past few years between the borough council and the local tramway authority, it has been impossible to relay several of the main roads at the time when originally it was anticipated such work would be carried out, with the result that the funds raised from year to year have reached a considerable sum, although by no means sufficient to cover the estimated cost of carrying out the whole of the works of repavement which, if circumstances had permitted, would before now have been completed.

It is in these circumstances the Local Government Board auditor has raised a somewhat serious question in his report upon the audit of the accounts for the last financial year. The auditor points out that the sum raised up to and including March 31, 1912, is £18 067, which he considers exceeds anything which can be justified by financial or by legal argument, and goes on to say:—

"I am aware that special circumstances in connection with the tramways have occasioned delay in the work of repairing some of the most important roads, and that this to some extent gives financial justification for the accumulation of the 'reserve.' But under ordinary circumstances, it is obvious that the retention of a balance equivalent to a penny rate would be sufficient to equalise this cost, for, as I am informed, a tenpenny rate would be amply sufficient to renew all the wood pavements which have been laid in the borough. It is seventeen years since the first of these pavements was laid, and this renewal would normally be spread over a considerable number of years. The intention of this report is to call attention to the fact that there is no authority in law for collecting in advance the sums which are to cover the cost of works which will be enjoyed in the future, and that indeed there is no financial argument to support such a practice. The question of equalising the cost is the only one which arises, and it is a matter of a totally different character involving far smaller financial provision."

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

WEST MIDLAND DISTRICT MEETING AT BIRMINGHAM.

A general meeting of the members of the West Midland District of the Institution of Municipal and County Engineers was held at Birmingham on November 21st, with Mr. A. T. Davis, chairman of the committee, in the chair.

The resignation of Mr. H. Richardson as hon. district secretary was received with very much regret, and a hearty vote of thanks was accorded him for his services. Mr. F. C. Cook, of Nuneaton, was elected in his place.

The following members were elected to the Executive Committee:—

WARWICKSHIRE.—Messrs. S. Douglas, Kenilworth; A. K. Gray (associate member), Birmingham; H. Richardson, Birmingham; E. J. Goodacre (associate member), Nuneaton; and John Willmot, Warwickshire County.

WORCESTERSHIRE.—Messrs. F. Woodward, Stourbridge; and C. F. Gettings, Worcestershire County.

STAFFORDSHIRE.—Messrs. A. Burton, Stoke-on-Trent; W. B. Chancellor, Lichfield; H. J. Clarson, Tamworth Rural; A. D. Greatorex, West Bromwich; G. Green, Wolverhampton; and J. Moncur, Staffordshire County.

SHROPSHIRE.—Mr. G. W. Lacey, Oswestry.

HEREFORDSHIRE.—Mr. J. Parker, Hereford.

Mr. H. E. Stilgoe, city engineer, Birmingham, gave a very interesting account, illustrated by maps and diagrams, of the town planning schemes now in hand by the Birmingham Corporation.

Institution of Municipal Engineers.

JOINT SOUTHERN AND SOUTH-EASTERN DISTRICT MEETING.

At a joint Southern and South-Eastern District meeting held in the council chamber, 4 Southampton-row, London, on Wednesday, November 27th, a paper, "The Effect of Recent Decisions upon the Arbitration Clause" by W. Valentine Ball, M.A., barrister-at-law, was read and discussed. The president of the institution, Mr. Frank Latham, occupied the chair, and among the members present were Messrs. E. A. Stickland (past-president), Horace Boot (vice-president), H. Shepard (London), J. R. Fayers (Watford), E. A. Rogers (East Ham), W. H. Scott (Northwood), A. Winter Gray (Lambeth), W. H. J. Prior (London), C. T. Fulcher (Shoreditch), T. Mundy (Woolwich), P. R. Gibbs (Cookham) F. E. Ennals (Billericay), J. Lewis (Yiewsley), J. Taylor (Uckfield), and A. N. Hudswell (Woolwich). The visitors included Messrs. H. Percy Boulnois (London), Arthur J. Martin (London), H. Lester Baker, C. H. W. Biggs (London), and Captain F. Lugg, chairman of the Harbour, Docks and Quays Committee of the Penzance Corporation. Messrs. Arthur Palmer, honorary district secretary of the Southern District of the institution, J. Woolford Brook, honorary district secretary of the South-Eastern District of the institution, and B. Wyand secretary of the institution, also were present.

THE EFFECT OF RECENT DECISIONS UPON THE ARBITRATION CLAUSE.

By W. Valentine Ball, M.A.,
Barrister-at-law.

(1) Preliminary.
(2) The usual form of arbitration clause.
(3) The effect of an agreement to refer to arbitration.
(4) The allegation of bias.
(5) Where the arbitrator is practically judge in his own cause.
(6) Where the personal conduct of the arbitrator comes into question.
(7) Summary of the cases.
(8) Suggested reforms.
  (*a*) The deletion of the clause.
  (*b*) Reference to an independent arbitrator.
  (*c*) An amendment of the clause.
(9) Conclusion.

(1) PRELIMINARY.

In the present paper I propose to discuss the clause which is usually inserted in contracts for the erection of building and other works in order to secure the reference of disputes to arbitration.

One of the chief objects of arbitration appears to be to avoid actions at law. Whether there is wisdom in this general boycott of the law courts is a question upon which I do not wish to enter. I propose to consider whether, and by what means, the parties to a contract can make sure that the disputes which may arise during or after the execution of the works shall be referred to an agreed arbitrator, whose decision shall be final. I shall not discuss the complicated question whether the municipal engineer acting in the discharge of his duty to his corporation is an arbitrator or not. For instance, the question whether he is an arbitrator in granting his certificate, or in deciding whether a certain thing is an extra or not, might be the subject of very profitable discussion; but I shall not touch upon it. For convenience and to avoid needless repetition I use the term "employer" to signify the local authority, corporation company, or person for whom work is being carried out; and the term "contractor" to mean the company or person who is bound by contract to do the work. In dealing with decided cases I shall be careful to give accurate references to the text-books and law reports which may easily be consulted in any law library.

(2) THE USUAL FORM OF ARBITRATION CLAUSE.

Let me refer, in the first instance, to the material parts of a form of arbitration clause with which most municipal engineers are familiar. It is to be found in the form of contract approved by the Royal Institute of British Architects. As a matter of fact the difficulty with which it is my object to deal in the present paper is not likely to arise if the R.I.B.A. form is adopted in its entirety, because the arbitration clause which it contains need expressly provide that the "architect" and the "arbitrator" shall be two distinct persons. The material words of that clause (No. 32) are as follows: "Provided always that in case any dispute or difference shall arise between the employer or the architect on his behalf and the contractor, either during the progress of the works or after the determination, abandonment, or breach of the contract, as to the construction of the contract or as to any matter or thing arising thereunder . . . then either party shall forthwith give to the other notice of such dispute or difference, and such dispute or difference shall be and is hereby referred to the arbitration and final decision of A B, or in the event of his death or unwillingness or inability to act, of C D, or in the event of his death or unwillingness or inability to act, of a person to be appointed on the request of either party by the president for the time being of the Royal Institute of British Architects, and the award of such arbitrator shall be final and binding on the parties." As I have said, this is merely an extract from the clause. I have omitted those parts of it which touch upon the nice question whether the architect is or is not arbitrator in relation to any question which may arise between the employer and the contractor.

The question between the employer and the contractor when the contract is being prepared will be: "Whose name is to be inserted as arbitrator?"

That the parties will easily agree to the appointment of a person who is familiar with the kind of work to be done under the contract may be conceded They would also find it easy if a perfectly independent person was to be chosen to select a person eminent in his profession, whose decision would be satisfactory to ratepayers on the one hand and to shareholders on the other. But in recent years the practice has grown up of appointing an engineer or surveyor who is actually in the employment of a municipal or other local authority to act as sole arbitrator under a contract to which that authority is a party. There are probably hundreds of such contracts in existence at the present time. How far may the contractor be compelled to submit to them?

(3) THE EFFECT OF AN AGREEMENT TO REFER TO ARBITRATION.

It is necessary in this place to say one word on the subject of arbitration in general. A man cannot enter into a contract on the terms that neither he nor the person with whom he contracts shall have recourse to the legal tribunals of the land. As to arbitration, however, the Courts have long since held that the decision of an arbitrator may be made a condition precedent to bringing an action. The jurisdiction of the Courts is not really ousted.

If A agrees with B that, any dispute arising thereafter between them, it shall be decided by C, neither party can sue unless it be shown that C is dead or has refused to act. If A refuses to submit to C's decision, he can in effect be compelled to do so by the Court.

In actual practice the arbitration clause with which we have to deal, to-day closely affects the engineer or surveyor who is employed by a local authority in connection with the execution of a contract. When disputes arise they are referred to that engineer or surveyor, and the contractor—not unnaturally from his point of view—sometimes tries to get away from the decision of the very man with whom he has been at issue. He brings matters to a head by ignoring the "agreement to refer." This he does by commencing an action. The local authority then take out a summons pursuant to sec. 4 of the Arbitration Act, 1889, to stay the proceedings on the ground that there is no sufficient reason why the matter should not be referred in accordance with the submission.

(4) THE ALLEGATION OF BIAS.

The question is, What will the Courts hold to be sufficient reason? It is obvious that bias clearly proved would be sufficient to justify the Court in refusing to allow a particular man to sit as arbitrator; but the question of *bias* is not easy when considered in relation to a man who was a servant of the employer when the contractor agreed to his name being inserted in the contract as arbitrator. *Ex hypothesi* such

a man is obviously bound to his employer to some extent.

What, then, is sufficient *bias* in the legal sense?

I propose to deal with a number of recent and very important cases on this subject, with a view to showing that the time has arrived for local authorities to reconsider the whole position.

In order to succeed because of alleged bias a probability, not a mere possibility of bias must be shown (*Eckersley* v. *Mersey Docks*, 1894, 2 Q.B., 667). The mere fact that the arbitrator is the servant of one of the parties is not sufficient to disqualify him; for this is a fact which must have been known when the contract was signed. In *Ives* v. *Willans*, 1894, 2 Ch., 478, referring to the arbitration clause, in which the contractors had bound themselves to abide by the decision of the engineer, Lindley, L.J., said: "How does it happen that a man will agree to be bound by such a very stringent provision? The explanation of it is to be found in two circumstances. First of all, competition for this kind of work is very keen, and contractors compete with each other; and, in the second place, it has been ascertained by long experience that engineers of the highest character may be trusted, and when a contractor enters into such a very stringent provision as this he knows the man he has to deal with. I take it that a contractor such as Mr. Willans would not submit to be bound by a clause of that kind unless he had confidence in the engineers, and unless the engineers were persons of the highest character. If he had not confidence he would not submit to it; but, knowing the engineers, he does submit to it, because he has confidence in them, and knows that they can be trusted, even although it is their duty to look after the work of the contractor, to deal fairly with him in case of a dispute which is in substance, although not in form, a dispute between the contractor and themselves."

A distinction is to be drawn between circumstances known to exist at the time of the contract and those which afterwards supervene. For instance, in a Scotch case, a firm of contractors who had undertaken to build a public building agreed with the town council that a particular gentleman should act as arbitrator in case of disputes. The gentleman subsequently became elected "dean of guild," and thereby, *ex-officio*, a town councillor. It was held that this disqualified him from acting as arbitrator (*Edinburgh Magistrates* v. *Lawrie*, 1903, 5 F., 711).

The case of *Belcher* v. *Roedean School*, 1901, 85 L.T., 469, shows that the Court will be reluctant to revoke a submission to arbitration on the ground of interest. In that case a contract provided that all disputes and differences arising on a building contract were referred to the decision of the architect appointed by the building owners. The builders issued a writ against the architect for fraud and misrepresentation, and took out a summons to revoke the submission to arbitration. The architect declined to admit the charges made against him. It was held that an application to revoke a submission to arbitration was one to be granted with great caution, and that the submission ought not to be revoked.

(5) Where the arbitrator is practically judge in his own cause.

It is important to notice that *Belcher* v. *Roedean School Board (supra)* was decided on the principle that to have made the engineer arbitrator would substantially have made him judge in his own cause. Where, however, the matter in dispute is something in which the arbitrator is only indirectly interested, a reference to him would not be prevented. For instance, in *Skinner* v. *Uzielli*, 1908, 24 T.L.R., 266, the plaintiff had employed the defendants as underwriters under an agreement. Disputes were to be referred to a member of Lloyds as arbitrator. A dispute arose, one of the questions being whether it was the general practice at Lloyds to charge commissions. The Court allowed the arbitration to proceed upon the ground that members of Lloyds were the most convenient tribunal to decide the fact whether the alleged custom to take commissions at Lloyds existed. It was not impressed with the suggestion that a member of Lloyds would be inclined to find in favour of a practice which he followed himself.

It has been held that a mere expression of opinion in favour of one party is not sufficient reason to disqualify an arbitrator unless it appears that he has so made up his mind as not to be open to argument (*Jackson* v. *Barry Railway Company*, 1893, 1 Ch., 238). The following passage from the judgment of Lord Justice Bowen in that case is still good law. "It was an essential feature in the contract between the plaintiff and the railway company that a dispute such as that which has arisen between the plaintiff and the company's engineer should be finally decided, not by a stranger, or a wholly unbiassed person, but by the company's engineer himself. Technically the controversy is one between the plaintiff and the railway; but virtually the engineer on such an occasion must be the judge, so to speak, in his own quarrel. Employers find it necessary in their interests, it seems, to impose such terms upon the contractors whose tenders they accept, and the contractors are willing, in order that their tenders should be accepted, to be bound by such terms. It is no part of our duty to approach such curiously coloured contracts with a desire to upset them, or to emancipate the contractor from the burden of a stipulation which, however onerous, it was worth his while to agree to bear. To do so would be to attempt to dictate to the commercial world the conditions under which it should carry on its business. To an adjudication in such a peculiar reference the engineer cannot be expected, nor was it intended that he should come with a mind free from the human weakness of a pre-conceived opinion. The perfectly open judgment, the absence of all previously formed or pronounced views, which, in an ordinary arbitrator are natural and to be looked for, neither party to the contract proposed to exact from the arbitrator of their choice. They knew well that he possibly or probably must be committed to a prior view of his own, and that he might not be impartial in the ordinary sense of the word."

In a later case (*Freeman* v. *Chester Rural District Council*, 1911, 75 J.P., 132) facts were as follows: There a contractor brought an action to recover the price of certain works constructed for a local authority under a contract which provided for the reference of disputes thereunder to the engineer of the local authority. In answer to a summons to stay proceedings under sec. 4 of the Arbitration Act, 1889, he challenged the conduct of the engineer in relation to the works, the question in dispute being whether the engineer had not precluded himself by his own admissions from saying that the works had not been completed to his satisfaction, and that the period of maintenance had not expired.

The Court (affirming the decision of Mr. Justice Lush), in the exercise of the jurisdiction conferred upon it by the Arbitration Act, 1889, refused to order the action to be stayed.

The Master of the Rolls said: "Corporations are, in my opinion, often too fond of putting officers of theirs in the position of engineers under a contract, and these officers forget that, as they are performing other duties to the corporation, there may arise a conflict between their duties in these other offices and their duties as engineers under the contract which may give rise to unfair treatment of the contractor by the zeal with which they perform their other duties. Of course, if you have exalted an officer of that kind as the arbitrator under the contract, you cannot say, merely because he is an officer, that therefore he is an unfit judge; but if facts subsequent to the contract have given rise to a substantial dispute in which there are allegations of continued unreasonableness on his part, and that is the real dispute between the parties, I think we should not be acting in the real spirit of the law if we shut the doors of the Court to such a dispute, and forced it to be referred to arbitration." What they relied upon was his professional honour, his position, his intelligence; and the contractor certainly had a right to demand that whatever views the engineer might have formed, he would be ready to listen to argument, and at the last moment to determine as fairly as he could, after all had been said and heard.

(6) Where the personal conduct of the arbitrator comes into question.

The cases already cited have this common feature: the conduct of the arbitrator himself did not form the subject-matter of any of the disputes. In certain recent cases, however, the Courts have laid down a very clear principle applicable in such circumstances. It seems that in considering the question whether a person who is the servant of one of the parties can act as arbitrator in a dispute, the Court will consider the nature of the question which he has to decide. In *Blackwell & Co.* v. *Mayor, &c., of Derby*, 1909, 75 J.P., 129, the plaintiffs had contracted to carry out certain tramway work for the defendant corporation. The engineer had given a certificate, but had held back a sum of £1,500 under a penalty clause for delay. The company having brought an action, the corporation

objected that under the arbitration clause the dispute must be referred to the arbitration of the engineer. To this the company objected on the ground that their case was that the engineer did not allow them to have proper facilities for proceeding with the work. The Court of Appeal refused to stay the action, Lord Justice Buckley saying: "The fact that the referee was the officer of the corporation was not sufficient ground, but the point is here that the contractor's case—whether true or not is a matter to be determined—is this: 'I could not complete my contract in time, and the reason why I could not complete it in time was that you, the contractual referee, were an unreasonable person. You hindered me in every conceivable way; you would not let me deposit my materials in such a way as it is usual to allow me to deposit my materials—in advance of my work—you placed all sorts of impediments in my way.' How could you expect him to say, if he is a person of any character at all, that the acts which he did were unreasonable acts? It is not human nature to suppose that he can properly determine that he himself is an unreasonable person. That is the subject of the dispute. . . . I think that there is sufficient reason why the matter should not be referred, being such as this is, to this particular gentleman."

To this extent, then, have contractors secured emancipation from the arbitration clause; but the principle laid down by the Court of Appeal is not likely to be extended. The Courts are very jealous of any interference with contract. The fact that this jealousy exists makes it impossible for a contractor to hope to escape the other obligations imposed upon him by the contract. If he has underestimated the amount of excavation necessary, or the amount of materials to be provided for completion, the fault and the loss will be his. Again, if he has underestimated the time which the works will take, or if unforeseen circumstances for which the employers are not responsible have arisen to cause delay, the loss is the loss of the contractor. It is difficult to see how any of the losses arising from these causes can be avoided if the contractor has signed a contract which binds him hand and foot.

The most recent case on the subject, which was heard by the Court of Appeal in March last—namely, *Aird* v. *Lord Mayor of Bristol*, Court of Appeal, 1912—shows that the Court will not extend, although it still adheres to, the principle above laid down. If the conduct or dealings of the engineer himself is in question, the matter will be taken from his hands. In that case the dispute arose under a contract entered into between the plaintiffs and the defendants, and dated March 17, 1902, for the construction and completion of a new wet dock at Avonmouth, and entrance lock, two entrance piers, a new wall, and other work in connection therewith.

The contract contained an arbitration clause referring all disputes arising during the progress, or after the completion of the works, concerning the works or their cost, or the quantity or quality of the materials, or in respect of any additions, omissions, alterations, or deviations made to, in, or from the works or any part of them, to the engineer having the superintendence and control of the works of the Docks Committee of the Council of the City of Bristol, who should be competent to enter upon the subject-matter of such dispute with or without formal reference or notice to the contractors or the corporation. The value of the work done and materials supplied under the contract was £1,923 977 9s. 4d., in respect of which the defendants had paid £1,752,761 10s. 11d., and the action was brought by the plaintiffs to recover the balance—namely, £171,215 18s. 5d.—and damages for breach of contract.

The summons taken out by the defendants for an order staying the action, so that the dispute between the parties might proceed to arbitration in accordance with the arbitration clause, was opposed by the plaintiffs on the grounds (*inter alia*) that the engineer had, by his conduct in his capacity as engineer under the contract during the progress of the works, rendered himself unfit to be arbitrator.

Lord Justice Vaughan Williams, after pointing out that there was nothing in the facts as disclosed to show that the engineer had been guilty of any misconduct, said that of all the matters which had been alleged against the engineer, there were really only two of any substance. As regards these, they did not arise out of the original agreement between the parties, they did not fall within the schedule of prices where the price paid depended on the original schedule. The affidavits stated that specific agreements had been entered into, and that the engineer had departed from them. In such a case it was true to say that in so far as the engineer differed from the statement that agreements had been entered into and actually denied it, he was really acting as arbitrator in his own case. The question therefore to be determined was whether the engineer had in fact entered into these agreements, and whether he had departed from them. In his judgment, there was a strong *primâ-facie* case made as to the existence of these agreements, as well as a *primâ-facie* case of a departure from them. He would not go into details, because the action would have to go on, and it was not desirable at this stage to discuss the evidence. Putting it shortly, he was of opinion that in these two matters it was not desirable that the engineer should act as arbitrator. Under these circumstances, therefore, the appeal failed. In the event the trial was allowed to proceed. The last case to which I desire to refer is the decision of the House of Lords in *Roberts* v. *Hickman* (only reported in the second supplement to *Hudson's Building Contracts*). It was there held that the grant of a certificate by an architect will not be a condition precedent to the builder's right to sue, if, by writing letters to the employer, and allowing himself to be influenced by his views, the architect has disqualified himself from acting judicially, although guilty of no fraud or improper conduct.

It appears that in this case the architect had written to the contractor: "I regret I cannot enclose certificate, my clients' instructions being that the certificate I next give you is to be a final one, including for a complete settlement of the work done, into which I shall be prepared to go after Easter." He also wrote on another occasion: "Had you not better call to see my clients, because, in the face of their instructions to me, I cannot issue a certificate, whatever may be my own private opinion in the matter."

In this case, as will be seen from the above extracts, the conduct of the architect as *arbitrator* was not considered; it was his conduct in relation to the grant of certificates which was under discussion.

The Court held in effect that he had so mistaken his position and lost his independence by listening to the employer that the grant of a certificate could no longer be considered a condition precedent to the contractor's right to sue.

(7) SUMMARY OF THE CASES.

Let me attempt to summarise the cases to which I have alluded. The contractor will not be compelled to submit to the decision of the employer's engineer as arbitrator (1) if the matter in issue is an unseemly personal dispute raising a vindictive feeling between the engineer and the contractor, and the engineer has so strongly expressed his view that it amounts to a prejudgment (*Nuttall* v. *Manchester Corporation*, 1893, 8 T.L.R., 513); (2) if the nature of the dispute is such that the cross-examination of the engineer is essential; (3) if the matter in issue is something outside the original agreement—*e.g.*, a dispute as to whether the engineer and contractor had agreed to vary the original agreement; (4) if the conduct of the engineer himself is practically the only point in dispute.

(8) SUGGESTED REFORMS.

I hope I have said enough to show that, although there are probably hundreds of contracts now in force in various parts of the country in which the arbitrator is the engineer of the employer, circumstances may arise at any time which will prevent his acting when the time for his services arrives. Is it not therefore time to consider what alternative to adopt? I propose to consider a few of them.

(*a*) *The Deletion of the Clause.*—Deletion of the arbitration clause would involve recourse to legal proceedings for the settlement of all disputes. Doubtless it might open a vista of litigation, and would therefore be rejected on that ground; but there is one fact in this connection which it is well to bear in mind—namely, that a dispute arising under a building or engineering contract would not come before the Court and a jury, but before a special referee (*i.e.*, an engineer appointed by the Court), or before an official referee. In the result the proceedings would be very similar to those which would take place before the arbitrator named in the contract. It is a trial of this kind which takes place if litigation ensues owing to the failure of an arbitration clause. Save that a reference to an official referee is reference to a lawyer, it very much resembles a reference to arbitration.

(*b*) *Reference to an Independent Arbitrator.*—Reference to an independent arbitrator appears to present

almost if not quite as many objections as a reference to the Court. An independent person, even if he is an eminent engineer, has to be taught all about the nature of the work at the expense of the parties to the dispute. Witnesses to fact must be called in enormous numbers, while the expert witness, whose fees are considerable, must also be called at the expense of both parties. In the result the proceedings may drag on for days or even weeks. There are various ways of selecting an independent arbitrator. He may be named in the contract. If named, his independence may to some extent be affected by his being brought into business contact with one or other of the parties; but they would no doubt select a man who was not likely to have any such dealings with them. His appointment or selection may also be left to the president of the Institution of Civil Engineers for the time being, or to some other eminent personage. To leave it to a person who may happen to be president of an institution for the time being does not appear to be a very wise proceeding, inasmuch as the capacity of such person to select and appoint an arbitrator is a matter of pure speculation. It is much wiser, if it is desired to have an independent arbitrator, to leave him to be selected by agreement when the dispute arises, or, failing agreement, to be nominated by some eminent engineer of known capacity.

(c) *An Amendment of the Arbitration Clause.*—All the above proposals are open to the objection that they entail the expense inseparable from the appointment of an independent person. Numerous questions might arise in relation, say, to a sewerage contract, which could be decided by the engineer on the job without any objection being raised by the contractor. Suppose, for instance, the question was whether the cement supplied was capable of withstanding the prescribed tests. To have to refer such a matter to arbitration would be ridiculous. Again, the question whether a delay of, say, two days was justifiable could be decided in five minutes by the engineer who had been on the job, but could not be decided until after a long hearing by an independent arbitrator. Short of arbitration by the engineer "on the job," I have endeavoured to make it plain that the next best thing is for the parties to retain their hold over the selection of the arbitrator by means of one or other of the above methods. At present the alternative to the arbitrator mentioned in the contract is settlement of the matter in dispute by litigation. It would seem that by slightly modifying the usual form of arbitration clause the desired result can be attained.

I venture to make the following suggestion: Frame the arbitration clause so as to leave the decision of every question arising under the contract to the engineer, but subject to a proviso that, should it appear to the Court on an application to stay any action or proceeding brought in relation to the contract that the engineer is disqualified from acting as arbitrator, the matters in dispute will be referred to an engineer, to be agreed between the parties, or, failing agreement, to be nominated by the president of the Institution of Civil Engineers. Another alternative is suggested by Mr. E. J. Rimmer, in his "Arbitration Clause in Engineering Contracts" (Constable & Co.). It is that, while preserving the finality of the decision of the engineer upon certain special points, a proviso should be added to the arbitration clause, stating that if any action is brought the defendant may either (*a*) have the action stayed and remitted to the engineer, or (*b*) have the matter referred to an independent arbitrator appointed in one or other of the manners above suggested. The same gentleman suggests that the decision in *Aird* v. *Bristol Corporation* (*supra*) may be got over by a new clause preventing the engineer entering into any agreement with the contractors unless certain conditions are complied with. I do not attempt to draft a form of clause: the actual wording would have to vary according to the other conditions of the contract and the circumstances of the case.

It might be argued that such an agreement would operate as an attempt to oust the jurisdiction of the Court; but it really would not have this effect. It simply means that the various steps above mentioned must be taken before the law courts can be asked to decide a dispute or refer a matter to an official or other referee.

(9) CONCLUSION.

It will be noticed that I have been compelled to raise some broad general propositions on but a few cases. The fact that they are so few would seem to show that the demand for reform is not one of great exigency. But my researches in this matter have led me to think that what the local authority, which is responsible to the ratepayer, desires in relation to a contract is certainty. Certainty, so far as humanly possible in the matter of price and time; certainty that work shall be done under trustworthy supervision; and last, but not least, reasonable certainty that disputes shall be settled economically and expeditiously by a man in whom they have confidence. The suggestions I have put forward may, if adopted, avoid a good many of the pitfalls laid bare by the cases which I have cited.

The actual conduct of proceedings in an arbitration is hardly within the scope of the present paper. I cannot, however, conclude better than by reminding him who is about to act as arbitrator of the duty of a judge. Lord Bacon, in his essay entitled "Of Judicature," wrote: "Judges ought to be more learned than witty, more reverend than plausible and more advised than confident." And again: "Patience and gravity of bearing is an essential part of justice; and an overspeaking judge is no well-tuned cymbal. . . . The parts of a judge in bearing are four—to direct the evidence; to moderate length, repetition or impertinency of speech; to recapitulate, select and collate the material points of that which hath been said; and to give the rule or sentence."

DISCUSSION OF MR. VALENTINE BALL'S PAPER.

The President (Mr. Frank Latham), in thanking Mr. Valentine Ball for his admirable and excellent paper, said he was sure he was expressing the feelings of every member in proposing a hearty vote of thanks to that gentleman for the great amount of pains, time and thought he had bestowed upon it. It was a paper which he had heard read with a very great deal of pleasure, and he was sure that pleasure would be felt equally by others when they read it in the columns of The Surveyor and other journals. He moved a hearty vote of thanks to Mr. Valentine Ball for his kindness in preparing his paper and presenting it to the members of the institution.

Mr. Horace Boot (vice-president) said that, as chairman of one of the districts represented that night, it was with great pleasure that he seconded the proposition. As an engineer he had on many occasions stood in the position Mr. Ball had indicated—*viz.*, as arbitrator, as expert witness, and also as defendant and plaintiff on behalf of corporations. He could, therefore, having a certain amount of experience, say that very largely what Mr. Ball stated in his paper did actually take place. In his (the speaker's) opinion engineers, when acting for corporations, were not the right people to be appointed arbitrators. It was not fair, but unfortunately the duty was thrust upon them, not by the engineering profession, but by the legal profession—by the town clerks, who were so anxious to make engineers the sole arbitrators in all contracts. It was held that this was the only way to avoid litigation, which certainly to the lay thinker was always a good thing to do. There were few of them who had not had experience of litigation; they knew its expense and delays, and how often a wrong decision, especially on technical matters, was obtained. It was for this reason, if for no other, that this institution owed Mr. Ball a deep debt of gratitude for placing before the members such an able paper.

Mr. H. Percy Boulnois (London) said he had some knowledge of the subject, because, as they were aware, he had been himself surveyor at certain small towns—at Exeter, Portsmouth and Liverpool. The arbitration clause which was generally inserted, making the engineer arbitrator, was to his mind a mistake. Personally, he could safely say he had never had to go to arbitration in any contract he had carried out; but there were engineers and engineers, and some of them started with the idea that a contractor was like a poacher, and that he (the surveyor) should act the part of gamekeeper, or that it was a case of a cat watching a mouse. There was ill-feeling from the start of the work, and if this was so, was it fair that the engineer should be the arbitrator? Would it not be much better that an independent person should go in and act as arbitrator, who could thresh out all the points absolutely unbiassed, and come to a definite and proper conclusion? It seemed to him monstrous that a contractor should sign a contract containing such a clause, because he was thereby binding himself down to the engineer, not only as master during the execution of the works, but also as arbitrator practically upon his (the engi-

neer's) own doing. Of course in the case that had been placed before them that night the trouble the contractor always had in preventing the engineer from acting as arbitrator was that he must prove some sort of bias, or try to prove he had already acted as arbitrator, and hitherto the courts had been shy in throwing out the engineer as arbitrator. Again, it was better to have an independent arbitrator, because points might arise in his mind which might escape the mind of the engineer and contractor, while he would also hear evidence which the engineer would hardly be likely to call, because he would be calling his own servants, who would not give evidence in the same way as before an independent person. Then, again, there were a number of legal points that arose in disputes. The engineer was not a lawyer, neither, possibly, was the contractor, but the arbitrator had the power to call to his assistance a legal assessor, and all legal points could be threshed out with his assistance. Next, with regard to a reference to an official referee. This gentleman was not always a lawyer. The author of the paper said there was more delay before the expert arbitrator than before the official referee, but he (Mr. Boulnois) failed to see why. He had been before the official referee——

Mr. Ball: I don't think I could say that. There might be as much, or nearly as much.

Mr. Boulnois: That did not make much difference. It was, he thought, more difficult for the witness to make his explanation to the official referee—to a layman—than to an engineer, and he could not help thinking that if there was to be a reference at all, it was far better to go to an expert engineer than to an official referee. Then as regarded cost. He did not think that the cost of going to arbitration was, as a rule, very large, unless a very large sum was involved, and he thought that both the employers, whether a corporation or not, would not grudge the expense of going before an arbitrator, because they knew an outside arbitrator was absolutely unbiassed, and would give justice to both sides. He himself had quite recently held an arbitration which lasted for forty-four days, and the council employed a large number of expert witnesses. He was perfectly certain that no official referee could have grasped the technical details of that heavy arbitration, and it would have been almost an impossibility for him to come to the conclusion that he (Mr. Boulnois) came to when he came to give the award. The paper, he considered, was a most valuable one. It was the first of the kind he had read, and it had given him a number of valuable hints and much to think about. He was much struck with the advice given by the great Lord Bacon (who, incidentally, wrote "Shakespeare")—daunting to and he thought that what that great man had advised all judges and arbitrators should take to heart and try to act upon.

Mr. A. J. Martin (London) coupled with Mr. Ball in expressing thanks to Mr. Ball for his very interesting, thoughtful and well-balanced paper. Mr. Boulnois, the last speaker, had dealt with the matter from the point of view of a municipal engineer. His (Mr. Martin's) experience had been as a subordinate municipal engineer and as a consulting engineer. There were differences between the position of the latter and the municipal engineer in charge of a contract. The consulting engineer in the nature of things had to work for a number of local authorities, and consequently he was less liable to pressure from anyone of them than the municipal officer who gave his whole time to one authority. Many authorities, it appeared to him, had mistaken ideas of the position of the engineer when he was carrying out a contract for them. They thought he was acting as their servant, and that it was his business to give effect to their desires or any views they might express with respect to the contract. It was, he thought, the duty of the engineer to find out their minds on that, and, having it clear that he was not their servant, but was called on to deal out even-handed justice between the parties. At the same time the municipal engineer was in a more difficult position than the independent consulting engineer, who could keep his finger at the local authority. There was another difference between the consulting and the municipal engineer. His pecuniary interest of the consulting engineer lay with the contractor. He was mostly paid by commission. He had heard it suggested that the result of the system of payment was to give the engineer an interest to spend the contractor to enhance the value of his work in order to derive increased commission. He would not place much trust in the integrity of the professional man who would make such a suggestion as that. He must have a low standard of conduct who thought his brother professional man would be guilty of such temptation. The engineer was undoubtedly subject to certain influences which might impair his impartiality, such things as his relation to his clients, and also when any dispute arose out of his own conduct as engineer of the works. From that point of view he was unsuitable to occupy the position of arbitrator. But, on the other hand, he possessed an important qualification for the position that outweighed any disadvantages, and that was his intimate knowledge of the progress of the work. The most important qualification of an arbitrator as to impartiality was that he should possess such knowledge of the case as to enable him to weigh facts, and all the bearings, and have judgment, and this the engineer who had charge of the work possessed in a high degree. The fact they had to face was that contractors did take contracts in which this clause occurred. As had been pointed out, this might be through the pressure of competition, but his experience was that the contract was signed with no unwillingness. He had found that contractors were ready and willing to accept the arbitration of the engineer under whom they were working, and that in nineteen out of twenty cases they were satisfied with his award. That, he thought, was a high tribute to the fairness and impartiality of the engineering profession, though he should not say so if the tribute was not well deserved. He had known engineers in this country, Canada, the United States and Australia, and he was firmly convinced there was no body of men who had a higher sense of professional duty than they had. How had that high standard been reached? It was due to many causes. One was that the position was one of great responsibility. If they wanted to bring out the best in a man, the surest way was to trust him. They found that in dealing with workmen, with an office staff, or—he was a Territorial—in dealing with junior officers, if they trusted a man they put him on his honour to do his best. He believed that the great trust reposed in the engineering profession was one of the contributing causes of the high standard of professional conduct they maintained in their ranks, and for that reason it would be a mistaken policy to detract from the responsibility of the profession unless there was grave reason for so doing. He did not say the engineer should always be the sole and final arbitrator between the local authority and the contractor. It was only fair to give the contractor a final court of appeal. He did that in his own contracts. He had adopted a plan which seemed to him to be an eminently fair one, and that was that if a point of dispute arose the decision of the engineer should be paid while the work was in hand: the work was not to be held up by referring the matter to an outside party. But, at the completion of the work, if there should be any question of dispute remaining, and the contractor was not satisfied with the decision given by the engineer in the course of the work, he should have the right to appeal to an outside arbitrator. He could not agree with the contention that to leave the appointment of arbitrator to the president of an institution for the time being was not wise. He ventured to say that human fallibility entered into everything we did, but he could conceive no better or fairer way of appointing a person of responsibility as arbitrator than by the choice of a man for this purpose who had been selected by his professional brethren to fill the highest office in the profession.

Mr. A. E. Stickland, borough surveyor of Windsor, past-president, observed that after two speakers had made speeches upon a subject with which they were perfectly cognisant, it was unfortunate that he should be called upon, because during the last twenty years he had been concerned with the carrying out of many contracts, and had never had cause for arbitration. He believed the fairest way of dealing with a contractor was to meet him in an honest, straightforward manner. Personally he did not like the surveyor as arbitrator in any scheme. In some cases it might have a satisfactory result but it might lead to trouble. In the case of large towns, like Liverpool, Manchester or Leicester, the surveyor was arbitrator, but who carried on the work? It was left almost entirely to the subordinate officials; therefore the surveyor was more the referee than the arbitrator of the job. It seemed to him that when a surveyor passed his first exam. that he had placed himself in the position of the arbitrator, and how could he afterwards be set on one side? They had associations of all sorts and kinds in these days, and he

was looking forward to the time when there would be formed an Association of Arbitrators, whose members would be nominated by the president of the Institution of Engineers.

Captain F. LUGG, chairman of the Harbour, Docks and Quays Committee of Penzance, said he did not profess to know anything about building, though he did about shipbuilding, but as one went about the world one saw many things which bore upon the matters under discussion. The Avonmouth case had been mentioned in which the decision was left with the engineer, and if they made the engineer the arbitrator they would almost invariably have such a result as they had in that case. As he understood the facts, the engineer agreed with the contractor's representatives upon a considerable number of alterations of the work which the contractor was to do without extra expense. When it came to settling up the engineer complained that extras had been charged, and he declined to sign for something like £250,000. The case was taken to the House of Lords, and in the long run the firm of Aird lost. The case appeared to him (the speaker) to prove that if they allowed the engineer to be his own arbitrator, he was bound to act for himself. If the contract was once departed from, the best thing was to have every little alteration set down in black and white. It was inevitable in a great dock scheme to have alterations, and while there was a possibility of give and take, it was very desirable to make sure as they went along that the alterations met with the approval of the principals, and that they were duly recorded in black and white. That was one of the thoughts that occurred to him after reading Mr. Ball's paper. He did not say that they could make the engineer the sole arbitrator. He remembered a case in which there was an agreement made between the owner's representative and the shipbuilders with respect to the construction of a ship. It was certain that the alteration was made at the request of the owner's representative, but care was taken to avoid putting anything on record. The alteration increased the carrying capacity of the ship by over 100 tons. This was all right when the ship was afloat, but it happened that when the ship was high and dry she broke in two. When inquiry came to be made there was disclosure of the arrangement between the owner's representative and the builders. How far the owner knew of this he did not know, but it was quite certain that his representative had made it verbally. The case cost the shipbuilders an enormous sum of money, and nearly ruined them. He only quoted it to show how necessary it was when there was any deviation of the contract that the arrangement should be placed on record in black and white.

Mr. J. R. FYFFES (Watford) said he had listened with considerable interest to the paper, all the more so perhaps because he remembered having been subjected to a heckling in the witness-box by Mr. Ball for three quarters of an hour. It was difficult to agree with the proposition, so far as the arbitrator was concerned, that the lawyer element should come in, and personally he supported the view of Mr. Boulnois that the arbitrator should really belong to the profession to which the matter dealt with belonged. Although the author said that the lawyer was to have all the facts explained to him, it must be recognised that he would have a better grasp of them if he had a knowledge of the particular profession of the business in which the case occurred. It must be easier for the arbitrator who was a professional man to grasp the circumstances than it would be for a lawyer. There were, of course, legal aspects of a case which called for the assistance of the lawyer, but in the majority of cases a professional arbitrator was the better of the two.

Mr. C. H. W. BIGGS (London) remarked that he had come to the conclusion that directly they had to take extras they talked about the inexperience of the engineer, and that where there was a large contract involving a large amount of extras, the engineer seemed to be incapable of designing what he ought to design. If they could have a perfect design they would be all right, and they could have a perfect design when they restricted their architect to a building. The architect was different to the contracting engineer, and personally he had always differentiated between the two. The architect appealed to one branch—building: he knew almost exactly what was wanted from the foundation to the roof, and therefore there should be no extras. If there were the architect did not know his work. But, on the other hand, there was no engineer who could undertake to make a perfect design: directly he commenced to make out the work there must be changes, and these brought all the trouble. Who was to arbitrate that the changes were required? The engineer had to decide the requirements. He always thought the main question that the engineer of the work should decide was whether the work was carried out satisfactorily, and with materials satisfactory to him. If there had been changes the cause of the changes should be left to the decision of an independent arbitrator. If not the contractor had not the opportunity of going over the whole question as to what changes would interfere with the ordinary course of the work. He believed in an engineer being arbitrator, and in having an arbitrator to consult in the case of the engineer and contractor coming to loggerheads; in other words, there must be an independent arbitrator. Personally he believed in seeking to settle differences with friendly counsel, and in trying to keep parties out of the lawyers' hands. Mr. Boulnois had referred to a forty-four days' arbitration. The cost of such proceedings was not a nice thing, even if it was a case involving £70,000, which, he thought, was the amount of the contract in the first instance. If they got a perfect engineer they would have no trouble. He had known scores of cases where there was no trouble, but cases arose where an independent authority must be appointed to decide the differences between the parties.

The PRESIDENT (Mr. Frank Latham) said they must all have felt enlightened by the remarks they had heard from Mr. Boulnois and others upon an almost unique paper. He had never in his experience come across a paper of the kind presented that night—a paper presented by a barrister-at-law to engineers. He was sure they were grateful to Mr. Ball for the trouble he had taken in the matter. He was sure the districts in connection with which that meeting was held must specially appreciate the author's valuable paper. Mr. Boulnois had suggested that they should not treat contractors as thieves until they found them so. There was no doubt that a good many considered the contractor should be watched as a cat watched a mouse, and he thought they ought to carefully note the remarks of Mr. Boulnois. The contractor was of considerable value to the engineer, a great deal more valuable than the builder to the architect. There were difficulties which the contractor had to compete with in carrying out an engineering contract, as any one could see at a first glance. He undertook to carry through the work for the engineer, and the latter had simply to look on and see the structure he had developed from his brain take form and effect. Every engineer ought to feel grateful when he had a contractor who would come forward and tender for his work, and carry it out according to the best of his ability, thus maintaining the good name he had acquired for doing his work. After all it was to the advantage of the contractor to carry out the work in the best way possible. He was very pleased Mr. Boulnois had mentioned that aspect of the matter, because he had often thought of the difficulties of the contractor's position, and that, as a rule he did not want to bamboozle, but tried to do his best. Mr. Martin had stated that in nineteen cases out of twenty where the engineer was the sole arbitrator the engineer came out all right, and matters were settled amicably. But even so there was according to this one case out of twenty cases which was not settled amicably. He thought that much depended upon the engineer as to whether things were settled amicably or not. The whole of the contracts he had carried out amounted to a good round sum. He never had any trouble as far as the arbitration clause was concerned, and only once was the point disputed. The contractors wrote that they could not accept the clause leaving the arbitration in his hands, and it was altered. He could have made better terms for both sides if it had not been so, for he felt he was honest and he wished his work to be carried out well, and had every consideration for the contractor. Of course, the contractors did not know him, but they could have trusted him, and naturally he thought it would have gone better if the clause had been left in. The clause inserted was that any dispute was to be submitted to the president of the Institution of Civil Engineers. The absurdity of this arrangement became manifest in the case of a contract costing, say, £1,000. Something did not go right, and the appeal to such an authority might mean that the job would prove a pretty costly one before it was finished. Captain Lugg in his speech said it was most essential to have everything in writing. He (the president) would give his experi-

ence on that point. They were carrying out structural work, of which certain portions could be admitted. The firm of contractors would not fill up the schedule of prices. When it came to carrying out the contract it was decided to admit certain portions, while the contractors were to give certain concessions to the employers. Nothing was put down in writing, because each took the other's word, and there was a witness to what was said. The work went right until the completion, when the firm smashed. They gave a certificate for the whole amount of the contract, with extras on top of it. He (the president) was nonplussed. The official connected with the work was suspended from the firm's employ, and things got into a bad predicament, with the result that they had to pay the whole sum of the extras. Mr. Biggs had referred to the engineer *versus* the architect. Engineering had its pitfalls and difficulties, especially, as he knew, in estimating what water work was to cost. There was a schedule of prices and they had to do the work as near as they could. But the work was somehow carried out at less than 10 per cent over the estimate, and if this was so it was considered pretty satisfactory. In water work they had, of course, difficulties with foundations, and there were also floods and tides to contend with. He thought the details given in the paper would prove to be of great interest and value to engineers when they came to be read in their excellent journals.

Mr. W. VALENTINE BALL, in reply to the discussion, said all the speakers seemed to be agreed that some method of settling disputes between the employer and the contractor was essential. As Mr. Biggs had pointed out in engineering contracts it was exceedingly difficult to avoid the question of extras. Although this might be an easier matter in building contracts, it was not always possible to avoid extras, and there should be some person appointed to decide the points which arose. The question they had been discussing, of course, was who was the best person to give a decision on disputed points. Mr. Boulnois had referred to the question of having a lay as distinguished from a legal assessor. He (the speaker) had suggested in his paper that the reference to an official referee was much the same as the reference to an arbitrator, but there was this distinction, and it was in some cases an important distinction that whereas they had to pay the arbitrator, they did not have to pay the official referee. He was paid by the Treasury—which he did not consider too generous—and not by the litigants. It might be that the costs of litigation, which were necessary if they went before the official referee, were greater than the costs of arbitration, but still there was the fact. He was glad to hear Mr. Boulnois say that the contractors did not consider the costs of settling disputes a very serious matter.

Mr. BOULNOIS: I said both the contractor and the employer.

Mr. VALENTINE BALL, continuing, remarked that he had been struck by what Mr. Martin had said—*viz.*, that it was in the pecuniary interest of the engineer that the contractor should be paid liberally, because his commission depended, he (Mr. Ball) supposed, upon the amount of the certificates. Having regard to the few cases in which he had been able to find any question raised against engineers, that fact tended to raise the high sense he had always had of the engineering profession. As to what was said about his suggestion with regard to the president of the Institution of Civil Engineers, he hoped they would regard that expression of opinion as his individual impertinence. He would point out that he had been rather inconsistent because in making his recommendation as to what should be done he stated that in the last resort the arbitrator should be nominated by the president, his suggestion being that the necessity for appealing to him should be postponed until the parties to the contract had come to the conclusion that the engineer in the employ of employer was not a suitable person. As to another suggestion made by Mr. Martin, it seemed to him to be an admirable one, and he was grateful to that gentleman for having brought it forward. It was that if a dispute arose during the contract the settlement should be held over until after the work was finished. Strangely enough, that was what usually took place under the form used by the Royal Institute of British Architects. If the architect stated that something was not an extra, he told him to do the work, and the question whether it was an extra, and how it should be paid, was left over to be decided by the arbitrator at the end of the work. Mr. Biggs made the suggestion that in work of a certain amount instead of an arbitration clause there should be appointed an arbitrator who was to be paid a small percentage on the whole, the arbitrator to overlook the work and settle the certificates. That might be a way of dealing with the matter, but he supposed the powers of the arbitrator would have to be defined in some way in the contract. If they were, it might get over difficulties if the parties could agree. Mr. Stickland, he thought it was, pointed out that the instant the employer had paid for any extras on the certificates he had made the engineer arbitrator, and that it was difficult for him to get away from the position thereafter. He (the speaker) thought there were always a number of small questions arising in a contract as to whether the decision of the engineer was final, and he did not think the fact of his doing so should prevent his being arbitrator on the contract as a whole. He was grateful for the attention the members had given to the paper, and the kind way they had received it, and last of all, he was exceedingly grateful for the very valuable suggestions and comments that they had made on the somewhat technical paper which he had put before them.

The proceedings closed with the passing of a vote of thanks to the president for taking the chair.

MADRAS MUNICIPAL ENGINEERSHIP.

APPOINTMENT OF MR. J. R. COATS.

Mr. J. R. Coats, B.Sc., Assoc.M.Inst.C.E., has been appointed municipal engineer to the Corporation of Madras in succession to Mr. E. P. Richards, now chief engineer to the Calcutta Improvement Trust. After graduating in engineering at Glasgow University in 1904, Mr. Coats joined the city engineer's staff of the Glasgow Corporation, and was engaged on the construction of the southern scheme of main drainage for the city, acting as an assistant to Mr. W. C. Easton, the engineer of construction. In 1909 he left the city to take up an appointment with the Leeds Corporation as an assistant to the sewage engineer there, and two years later was appointed drainage assistant to the special engineer for the water and drainage schemes of Madras. Mr. Coats is in his thirtieth year.

Mr. A. Lindsay Houston, who was also trained in the city engineer's office under Mr. M'Donald, and whose special work was also on the main drainage scheme of the city under Mr. Easton, the engineer on construction, has, after a service of some twelve months in Madras, been appointed to succeed Mr. Coats as drainage assistant to the special engineer for the water and drainage scheme of that city.

Drainage Works and Sanitary Fittings.—A third edition, revised and brought up to date, particularly as regards the questions of concrete sewers, sewer ventilation and flushing, and the Public Health Acts Amendment Act of 1907, still further evidences the success of this little manual,* which manifestly deserves the attention and confidence of all concerned in the important subject with which it deals.—*The Bookseller*.

The Housing Problem at Stafford.—On Tuesday, at a meeting of Stafford Town Council, a letter was read from the Local Government Board with respect to a recent inquiry as to the complaint that the town council had failed to exercise their powers under the Housing Acts in cases where those powers ought to have been exercised. In their letter the board stated it was clear from the evidence given at the inquiry that the town council had not taken action under part 2 of the Act of 1890 in many cases in which such action was called for. In regard to a decision of the town council to erect twenty artisans' cottages under part 3 of the Act, the board state that the scheme is quite inadequate to meet the position as brought out at the inquiry. The board added that the position in the town demanded the immediate erection of no fewer than sixty houses, to be let at rents from 5s. to 6s. 6d. a week inclusive of rates, and it was not clear that further action on the part of the town council might not be necessary in the immediate future.

Utilisation of Humus from Slate Beds.

MR. W. J. DIBDIN AT THE SOCIETY OF CHEMICAL INDUSTRY.

On Monday evening last, Mr. W. J. Dibdin, F.I.C., F.C.S., read before the London section of the Society of Chemical Industry, at a meeting held at Burlington House, Mr. G. T. Holloway in the chair, a paper on "The Slate Bed Treatment of Sewage." In the course of his remarks Mr. Dibdin said:—

As a result of very careful experiments during a period of eighteen months carried out by Mr. T. J. Rushbrooke, the borough engineer of High Wycombe, the following facts are available, by his kind permission, as to the quantity of sewage treated and humus obtained from the slate beds, from which data the quantities per 1,000,000 gallons of normal sewage are deduced, after allowing for the percentage of moisture.

QUANTITY OBTAINED.

Gallons of sewage treated	Residue from slate beds. Cube yds.	Tons.	Tons per 1,000,000 gallons on a 15-gallon per head sewage.	Moisture per cent.	Tons dry	Tons 5 per cent moisture.
8,874,000	10·0	7·5	0·84	72·0	0·23	0·46
Corrected to a normal flow of 30 gal. per head per day these figures become						
5,916,000	10·0	7·5	1·26	72·0	0·34	0·68

or 3·4 tons of 90 per cent moisture per 1,000,000 gallons against 6·5 tons of 90 per cent moisture per 1,000,000 gallons from a septic tank, according to the Royal Commission Report.

COST OF DISPOSAL.

Sludging and 'agooring in connection with the old open septic tanks	Slate bed residue from drainage bed.
850,000 gallons of a 15-gallon per head sewage per day. Equal to— 570,000 gallons of a 30-gallon per head sewage per day. Actual cost— £40 per annum labour, £360 per annum carriage, &c. Corrected to 1,000,000 gallons daily of a 30-gallon per head sewage £70 per annum labour, £635 per annum carriage, &c. Against Royal Commission estimate of— £75 per annum, £— cost of land for digging in, &c.	The disposal of an inoffensive manurial earth will require little land. $\frac{34 \times 70}{65} = £36$ per annum

The difference between £70 and £36, or £34, represents the saving on handling only, and to this should be added, on the assumption that farmers will remove the air-dried humus at their own cost, £635 in regard to sludge removal and disposal, making £669 as the annual economy per 1,000,000 gallons daily. This sum capitalised at 3½ per cent equals £19,114, which is far more than sufficient to repay the whole cost of the slate beds. There is the further advantage that the whole of the nuisance of sludge disposal is abolished.

It will be noticed that no credit is taken for the value of the "manurial earth," as the amount of this is a debatable point.

How far, however, the above assumption that farmers will remove the humus free of cost is warranted may be judged from the fact that, from actual experiments made by Messrs Barr & Sons, of Taplow, on a 10-ton sample of air-dried humus, they report that it is evident that, while it possesses undoubted manurial properties, it has a very beneficial mechanical advantage in lightening heavy soils. To obtain best results the material should be stacked until it has attained a friable condition. Once it has attained this condition, it would, in their opinion, be an excellent medium for mixing with potting soils for general purposes, in addition to being a good manurial agent to dig into the soil.

Taken in conjunction with the fact that the Corporation of Manchester is making and selling at 25s. per ton a good manure made from the washings of the clinker contact beds, which are of the same character as that from the slate beds, this evidence of the utility of the only residue from sewage treated by the aërobic method in slate beds more than fully justifies the belief, without entering into any question of possible profit from its sale, that, when once farmers realise the difference between this residue and ordinary "sewage sludge," they will readily remove it free of cost and thus save all expense in connection with its disposal.

The following comparison of the above-mentioned Manchester manure with weather humus obtained from the slate beds at Devizes, as analysed by Dr. J. Gilbert Fowler, will be of interest:—

—	Manchester. Dried sewage manure.*	Devizes. Dried weathered humus †
Moisture	10 to 12 per cent	0·0 per cent
Organic matter	35 to 45 "	40·1 to 45·0 "
Containing nitrogen	1·25 to 2·0 "	1·85 to 1·99 "

EXPERIENCE AT PHILADELPHIA.

The following extracts from the report of the Bureau of Survey upon the purification of the sewage of Philadelphia, 1910, may be usefully referred to, as entirely independent evidence:—

"Between sedimentation and contact processes may be classed the Dibdin Slate Bed No. 16.—The best results were accomplished when this bed was filled twice a day, or at the rate of 2,000,000 gallons per acre per day. Crude sewage applied deposited three-fourths of the suspended solids; the effluent was slightly nitrified and rendered partially stable.—The result was obtained aërobically, and the bacterial work is undoubtedly largely supplemented by worms and other lower forms of animal life.—As the results accomplished by this bed are more than mere sedimentation, including oxidation of the applied sewage, it has been considered in two ways: first, as a sedimentation tank in which the resulting sludge has been digested and concentrated; second, as a contact bed producing partially a stable effluent. If looked upon as a sedimentation process, it would consist of nineteen superimposed quiescent basins, each about 3 in. deep. The bed should be filled at such a rate that the velocity is not high enough to disturb the deposit on the slates, and then the bed be allowed to remain quiescent for, say, one hour.—Before the bed is again filled the worms and other animals and the bacteria have attacked the organic matter of this deposit and are ready for the next thin layer of food, when the bed is subsequently filled. If considered as a contact bed, its large void space, as compared with a contact bed, filled with ordinary media, is of great aërating value, also due to the construction in horizontal layers, one slate resting upon another; on the under side of many slates a large, flat bubble of air must be entrained, which would tend to oxygenate the sewage while in the bed. The deposit upon the slates was inodorous mud, even gritty when rubbed between the fingers, and the microscopic examination revealed large amounts of sandy matter. When heated in a dish to obtain the dry residue, the worms came to the surface and their activity showed the aptness of the term 'living earth.'"

As an instance of one of the many varying conditions under which slate beds are working satisfactorily the installation at the Kazan Railroad Station at Moscow may be mentioned. This plant deals with 20,000 gallons per day, and the engineers responsible for its construction, Messrs. Simin & Co., of the Neptune Company, Moscow, report that the Kazan Railroad Board of Managers were so satisfied that they decided to instal the system for the first Russian garden city, in the suburb of Moscow, which has been established by the railroad company to celebrate its jubilee.

SPECIAL POINTS FOR CONSIDERATION IN NEW DESIGNS.

Although in many instances the albuminous solids in solution are reduced in a slate bed to the extent sometimes of 50 per cent, a slate bed effluent is not and has not been claimed as a final effluent. Some slate bed effluents are good enough to discharge into tidal waters, but in general some further treatment is required. It is necessary to point this out again, because in many quarters one meets with the idea that

* Ogden, "Proceedings" of Association of Managers of Sewage Disposal Works, 1910, p. 106.

† Dibdin, "Disposition and Analyses of Sewage Débris," Society of Public Analysts, March, 1907.

finality is claimed for the single contact in such beds. It was hoped that in the earlier papers it had been made clear that these beds were designed as sludge digesters.

Duration of the Beds. The permanence of the slate has a distinct bearing on the question of the period for which loans could be granted. For land treatment sixty years are allowed for repayment. For artificial systems thirty years only are allowed. In view of the indestructibility and permanent character of the slate beds it is worth considering whether the rate might not be lessened by the extension of the period for repayment and part of the cost laid on the next generation, who will profit by the installation as in the case of land, and a period of sixty years allowed for the repayment. This point is now raised in view of the proof of the value of the process. Hitherto time was needed to substantiate the method and the question was consequently postponed.

From the facts above set out it is clearly demonstrated that by means of the slate bed treatment the foul matters in sewage are resolved into an inoffensive residue which has a distinctly manurial value. Our ideas respecting sewage works and nuisance must be modified in view of the benefits secured by the conversion of the solid matters into a valuable aid to agriculture. The long expressed wish for the economical utilisation of the chief waste products of the community is satisfied by the healthy functions of aërobic organisms.

DISCUSSION OF MR. DIBDIN'S PAPER.

Mr. W. C. TYNDALE (War Office), in opening the discussion, denied that there was any resemblance between slate beds and septic tanks. After drawing attention to the necessity for humus traps, he stated that in his experience the only occasions when choking occurred in slate beds was when a great deal of cavalry refuse, including chaff and horse dung, came down from the barracks. That, of course, was not a fair sewage to put on to a slate bed, and they overcame the difficulty by screening. The speaker added that he had arranged experimental slate beds in his own office, feeding the mud on the slate beds with particles of meat and so forth, and had observed the development of the growth of organisms. When these experiments ceased the whole of the mud dried up to good garden earth.

Dr. J. A. VOELCKER said he considered some injustice was done to Mr. Dibdin in the Royal Commission's report. From his own personal experience of installations, he believed that all Mr. Dibdin's claims were justified. He was not inclined to assert that a really valuable manurial substance had been obtained from sewage, but there was one good thing about the humus from slate beds, and that was that the quantity was very small. The real value of such humus was in its mechanical effect on certain soils, such as clays, though farmers might think that as a manure it did not smell enough. With regard to the installations which had been so-called "failures," if one put one's hat on upside down and complained that it did not fit, one could not blame the maker; and so with sewage installations. If they worked them wrongly and sent down stable litter and dead cats and dogs, they could not blame Dibdin.

Mr. J. W. BARR (Barr & Sons, horticulturists, Taplow, spoke of 10 tons of humus which he had made use of, said he had at first been disappointed with the amount of moisture it contained. The benefit to the crops was in some cases doubtful, and in others slight, but it had a distinct value in opening and aërating the soil and assisting in retaining moisture.

Mr. H. Percy Boulnois (Westminster) referred to the first inquiry at Blaneau Festiniog, at which Mr. Dibdin suggested that a contact bed should be made with slates, but as the speaker's impression was that on that occasion the suggestion was to use slates thrown in anyhow. With regard to the Local Government Board, which he had long an inspector, naturally the board looked rather askance at new schemes until they were sure of the ground. He had only recently studied, and had been thinking of recommending, slate beds, and he wished to ask Mr. Dibdin a question as to the amount of sludge. He had been surprised at the small quantity having regard to the quantities he had been familiar with elsewhere. If Mr. Dibdin could reduce the sludge to the small amount given in the paper there would be a very great advantage. But would not the use of a mere settling and ventilation tank assist in the diminution of the sludge? As regarded the possible extension of the system, he thought Mr. Dibdin would have some difficulty in persuading the Local Government Board that slate beds would last as long as land. Bacteria did not attack slate, but there were political bacteria which attacked land, and he suggested that Mr. Dibdin might succeed if he forced the political aspect on the notice of the board.

Mr. A. J. MARTIN (Westminster) said he did not know much about the Malden installation, but he was under the impression that at Trowbridge a by-pass had been put in to divert the septic tank effluent from the slate beds. He was sorry not to see any officers of the Royal Commission present that evening to answer Mr. Dibdin's criticisms. He did not think Mr. Dibdin had been quite fair to the commission. The latter did not refer to the nature of the process, but to the results, which they considered were no different to those obtainable from a septic tank. He had been informed that the fine beds at Devizes had sludged up. But the gist of Mr. Dibdin's paper lay in the difference between slate bed sludge—he begged pardon, humus—and ordinary sludge. Here Mr. Dibdin seemed to have compared the best slate bed sludge with the worst tank sludge. World-famous experts had testified to the inodorous character of septic sludge. As to the slate beds, it was impossible to obtain perfect aërobic conditions owing to the changes in the rate of flow, especially seeing that the beds were to be emptied as slowly as possible.

Mr. DIBDIN: As quickly as possible.

Mr. MARTIN said he had always understood they were to be emptied slowly.

Mr. DIBDIN: From the time of the first contact bed I have always stated that they should be emptied as quickly as is reasonably possible.

Mr. MARTIN: I am referring to slate beds.

Mr. DIBDIN: They are contact beds.

Mr. MARTIN, continuing, observed that during the slow night flow the bottom of the bed could not be aërobic. The humus at Devizes was indistinguishable from completely septicised sludge. Mr. Dibdin had not given any figures as to the suspended matter in the effluent. That was most important, because the primary function of a preliminary process was to produce an effluent free from suspended matter for further treatment. Digestion of the solids was not of importance in comparison with that function. The slate bed was a very valuable means of avoiding nuisance, but they must not expect too much because of the slow flow at night. If that difficulty were removed Mr. Dibdin would have given them a process practically free from smell.

Dr. S. RIDEAL (Westminster) said he thought the analyses of the humus shown did not warrant the drawing of any definite conclusions. He thought the condition of the beds must be aërobic, because of the presence of fat in the humus. With regard to the suspended solids, he believed a good many went forward to the catchpit, to the filters, or to the land, and that somewhere they would find the missing tons. He noticed no analyses had been put forward as to the quality of the effluent, which was most important, especially in view of the Eighth Report of the Royal Commission, which made recommendations as to the discharge of effluents into tidal and other waters; but the effluents from slate beds would require, except under exceptional conditions, the removal of the suspended matters and further treatment.

Mr. H. C. H. SHENTON (Westminster), in a communication on a paper, said the slate bed and the coarse contact bed were identical in working, and the results were similar when the coarse bed was formed of such a material and drained in such a manner that it could discharge its humus. In a paper he read before the Society of Engineers thirteen years ago, the following statements were made: "Possibly a very coarse bed of durable material, very well drained, would produce the result of a more or less sludgy effluent from the first bed. The object is that the first beds should not sludge up. The author would therefore beg those interested in the subject to give this matter careful consideration. What is needed to perfect the bacteria bed system is some way of preventing the sludging up of the first beds. Were it not for the sludging up of the first beds, the tank treatment would be unnecessary. It [sludge] can be more easily removed from among the very coarse material than from among the very fine, with which it will form one mass." From that time to the present he had had considerable experience with coarse contact beds, dealing sometimes with crude sewage and sometimes with sewage which had passed through a tank, but which contained all the organic

matter in a broken-up form, special steps having been taken in order that this matter should be discharged from the tank into the contact beds, and he was ready to endorse to the fullest degree Mr. Dibdin's contention as to the merits of slate beds. He had found that where even a bed of clinker was provided with a false bottom, and with special draining channels for the full depth of the bed, a result was obtained comparable to that from the slate bed, but the construction of such beds was more expensive than that of slate beds, which were certainly superior, but even clinker beds constructed in that way were capable of discharging their humus, and did not become clogged, provided they had proper emptying arrangements. They would at certain times discharge their humus in large quantities, and that could be intercepted, and, as Mr. Dibdin had demonstrated, it had a considerable manurial value. He should like to be allowed to quote another statement made in a paper he read in the year 1904: "It would be a good thing to make provision for washing out the first contact beds to some extent occasionally—*e.g.*, by opening a large valve when the bed is full, so as to create a good rush out. The humus washed out might be caught in channels on the second beds, or it would probably remain on the surface, where it could be cleaned off, or it might be well to have a settling pool or channel to catch it between the first and second beds." He had constructed contact beds in a great many places upon the principles advocated by Mr. Dibdin, and where his teachings had been properly carried out the result had always been successful. The first beds, whether of slate or constructed on the slate bed principle, had unloaded their humus and had not required to be cleaned out. Further, the humus had been of an absolutely unobjectionable nature, and, above all, the clients had been well satisfied with the results. The same results had not attended the construction of settling tanks, the effluent from which was apt to become foul from various causes, and the sludge from which was objectionable in quality.

Mr. L. A. DIBDIN (Westminster) said he desired to reply to a few of Mr. Martin's points. At Trowbridge the by-pass had been constructed so as to affect only two out of the four slate beds, and it had not been used consistently even then. With regard to the night flow, the prolonged filling at night had been overcome by using a number of small beds, to and from which the flow was diverted automatically when the beds had been receiving sewage for a few hours. The beds were emptied as quickly as was possible without disturbing the fresh deposit. The actual rate depended upon the size and type of installation, and there could be no hard and fast rule.

Mr. W. J. DIBDIN said he did not think he had any reply to make to the first three speakers. With regard to Mr. Boulnois' statement as to the slate at Blaneau Festiniog, he had suggested the use of blocks of slate for contact beds, because it had been shown that any material that would not break down—glass, clinker, granite, ballast, or slate—was suitable. The idea of a plate bed had been in his mind for some time, but it was only when he found that he could get waste slate in plate form that he realised that the plate bed was economically practical. With regard to the actual quantities of sludge or humus, none had been removed from Devizes except one or two barrow loads required for the growing of cucumbers. They could go there and see for themselves what had been obtained. The figures from High Wycombe were not his figures, but were taken independently over a period of eighteen months on a system of careful measurement by Mr. Rushbrooke, the borough surveyor. As to Mr. Martin's suggestion that he (the speaker) had not treated the Royal Commission fairly, he (Mr. Dibdin) had quoted from the commission's own report, and might have quoted some passages which would have had a much stronger interpretation put upon them if placed in juxtaposition.

Mr. MARTIN: It is not the quotations, but your remarks that are unfair.

Mr. DIBDIN said he had stated that three sources of information were overlooked by the officers. The High Wycombe results were facts, and they had a distinct bearing upon the question. The annual expenditure at Devizes was very important, and the figures as to the quantity of sludge obtained at Devizes before the slate beds were introduced were equally important. There were certainly three sources of information as to the working of slate beds which were overlooked by the commission's officers. His only comment as to the report itself was that it would be of great interest if the officers of the commission would explain how that process, which was without nuisance even on a hot day, which produced the change between sludge and humus which they had seen that evening, and had an odour comparable with that of a damp cellar, could possibly be the same as a septic tank. With regard to the commission's estimate of the sludge or humus, they had calculated that only 1 per cent had been destroyed in effecting that change. He ventured to say that if he had come to that society and had claimed to have effected that conversion with a loss of only 1 per cent he should have had to meet some very severe criticism. The fine beds did not sludge up at Devizes. He had explained previously that in constructing the fine beds a lot of dust was introduced. It happened that the material came from ironworks, and rusted when wetted in the beds. In rusting it expanded, and caused loss of capacity, and lumps of iron cement were afterwards removed from the beds. It was utterly untrue to say that the fine beds had sludged up. As to the rate of emptying the beds, from the time of the first contact bed at Barking he had held that contact beds should be emptied as quickly as possible, so long as they did not pull the heart out of the bed, so to speak, in order to obtain the maximum aëration. With regard to the figures for suspended matters, those had been given in his previous papers before the society, and he had not seen the necessity for repeating them. With regard to Trowbridge, he was sorry about Trowbridge. He had offered, at his own expense, to take charge of the works and show that they could be used, but the offer was refused. Mr. Martin, after criticising him, had given him his whole claim. The slate beds were designed to avoid nuisance, and if it were effected the after treatment of the effluent was a small matter by any of the known processes. In reply to Dr. Rideal, anyone who liked to make the experiment with a piece of cheese, butter, or meat fat laid upon humus and treated as a model slate bed, would be able to see for himself that fat was very largely digested. He did not see the point of Dr. Rideal's remarks as to the necessity of treating slate bed effluents before discharge. As he (the speaker) had stated in his paper, and on all previous occasions, slate bed effluents were intended to be treated further, and only in exceptional cases could they be discharged direct into the stream. The suspended matters were now prevented from going on to the filters or contact beds by the provision of humus catchpits.

A New Type of Dwelling.—At the suggestion of the Local Government Board, the Billericay (Essex) Rural District Council on Wednesday decided to amend their building by-laws to allow an Australian. Mr. J. Good, to build a house at Wickford on a new plan. It was stated that the house was a type of Australian dwelling adapted to this country's needs by a system of pile foundations, and that it would go far towards solving the problem of erecting cheap workmen's houses in the district. Originally the council had refused sanction, as the plan was contrary to their by-laws, but Mr. Good appealed direct to the Local Government Board.

Manchester Main Drainage Works.—An event of a somewhat unusual character took place at Manchester last week when the Lord Mayor and Lady Mayoress (Mr. and Mrs. S. W. Royce), their daughter, and considerably over 100 members and officials of the corporation paid a visit of inspection to the new main drainage works which, as stated in our issue of the 29th ult., are being carried out from the plans of the city surveyor, Mr. T. de Courcy Meade, M.INST.C.E., at a cost estimated at about £1,000,000. Up to the present three contracts have been let, namely: Work No. 9—the one examined by the visitors—to Messrs. Aird, Limited, for about 1,290 yds. of sewer and storm overflow; Work No. 10 to Messrs. Kolne & King, Limited, about 5,407 yds.; and Work No. 16 to Mr. John Moffatt, the last-named being principally a rivers improvement, covering a distance of 1,770 yds., and including the provision of a large settling pond. All these works are in progress. At a subsequent luncheon at the town hall Mr. de Courcy Meade's services in connection with the scheme were the subject of a flattering tribute by the Lord Mayor, and the toast of his health—proposed by his lordship—was received with an enthusiasm which was as striking as it was obviously sincere.

Bills of Quantities for Reinforced Concrete.*

By JOHN M. THEOBALD, F.S.I., M.C.I.

I trust it is unnecessary for me to say that, in reading this paper, I am making no reflection upon the quantities supplied by the specialists under the present system, either upon the score of inaccuracy or otherwise. Such a charge would, of course, be quite unjustified and unjustifiable; my criticism is solely directed against the system, and not against its exponents.

The client who is about to erect a building goes, in the ordinary way, to an architect to prepare the plans, and then either he, or his architect with his permission, employs a surveyor to prepare the bills of quantities, who, when the final account is presented, can be cross-examined upon the items. This is what the client likes. This right of criticism gives him a sense of security and makes him feel he is getting value for his money, and it is the absence of this facility for cross-examination that makes some people light shy of availing themselves of the many advantages of reinforced concrete. This may strike you as being very absurd and unreasonable—as no doubt it is—but the feeling of insecurity is there, and any means by which it may be lessened or removed are surely well worth employment.

Lest you may think that this theory is an effort of my imagination, I may mention that, in my own experience, I know of two buildings in which steel construction was used in preference to reinforced concrete solely for this reason.

At the present time, when an architect decides to construct a building of reinforced concrete he sends a set of plans, sections and elevations to one or possibly more firms of specialists, who then submit a scheme of construction under their respective systems, together with an approximate estimate of the cost. The firm whose tender is accepted by the architect then prepare their working drawings, which, with a bill of quantities (also supplied by them), are sent to the contractors, and the accepted tender is either incorporated by the quantity surveyor in the quantities sent to the general contractors, or is the subject of a separate contract, as the case may be.

Reinforced concrete, from the point of view I am taking to-night—that of the quantity surveyor—has but recently emerged from a healthy infancy; but, now that its employment is being adopted on all sides, there is a feeling, not confined to the members of my own profession, that the specialist contractor should receive the same treatment as the builder, and it is with the grounds for that opinion that I propose to deal this evening.

In advocating the claims of the quantity surveyor in connection with reinforced concrete, I am well aware that I shall be told that time does not admit of his employment, and that until the details are complete he would be unable to commence his work, and the delay thereby entailed might be considerable. I may say at once that I admit the objection, and my reply is that the client must wait. If the building were, let us say for argument's sake, a steel-frame building, the steelwork details would have to be prepared, and I am sure that I should be libelling the members of the Concrete Institute if I were to suggest that they take longer to supply their details than do the steel manufacturers.

Of course there may be cases in which rapidity of construction is everything. Under those circumstances, I say at once that the preparation of bills of quantities by a quantity surveyor is impracticable. He may still, however, be advantageously employed in the preparation of a schedule of prices and subsequent measurement. It has been my experience—and I think all architects and engineers will agree—that the average client's conviction that the world will cease to revolve upon its axis unless his particular building is erected in an utterly impossible time is not warranted. It is only natural that he should require the work completed with the least possible delay, and a visit to quantity surveyors' offices at, say, eight, nine, ten, or even eleven o'clock at night should convince him that they fully recognise the necessity for "hustling."

Under the present system the quantities issued by the concrete specialists, by their own showing, are prepared before the working details are complete, and though granting the necessity (which I do not), I admit that they are in a better position to do their work under these conditions than would be the quantity surveyor, by reason of their employment of constants and formulæ of which he would have no knowledge. It must surely frequently happen, however, that in making the various details it is found necessary to alter the drawings from which the original quantities were prepared, and the latter are, consequently, inaccurate to that extent.

I believe that under the present régime their correctness is not guaranteed, which, assuming for sake of argument that the drawings from which the building is subsequently erected differ from those from which the quantities were prepared, would seem to press unduly hard upon the contractor. I say the contractor because I consider the risk in this case is more likely to be his than the building-owners', as the alterations would more probably tend to increase the cost of the building than to diminish it. If I am wrong in my statement or the deduction I have drawn from it, I shall, of course, be corrected. It is obviously not a point upon which a quantity surveyor can have first-hand knowledge.

FORMS OF CONTRACT.

The forms of contract under which reinforced concrete construction is carried out are, as far as my own experience extends, four in number:—

(1) The "lump-sum" contract, in which the contractor undertakes to erect the building for a stipulated amount—no mention being made of the method of dealing with any variations that may be made during the progress of the work.

Anything in the nature of a "lump-sum" contract of this description is, in my opinion, most unsatisfactory. As I am dealing more fully with this particular form of contract under the next heading, I will merely mention that, unless a surveyor be employed, the contractor's account for extras has apparently to be accepted—his original priced bill of quantities not being accessible, presumably, without his permission. This form of contract would not be entered into in the case of an ordinary building, and I fail to see why any exception should be made in favour of reinforced concrete.

(2) The "lump-sum" contract in which the bills of quantities do not form part of the contract, but the contractor undertakes to deposit a copy of his priced bill of quantities, which, as regards prices only, is to form a basis for arriving at the value of any extra or omitted work.

In a large reinforced concrete job upon which I was recently employed under this form of contract there were various mistakes in the bills of quantities—both for and against the building-owner—with which I was, of course, precluded from dealing, and one of the parties to the contract—I emphatically decline to state which—profited thereby.

I need hardly say that I am using this case solely to illustrate my point—the unfairness of the "lump-sum" contract—and not with a view to emphasising the possibility of errors in the quantities. Everybody makes mistakes, quantity surveyors among the number; but in cases of error in the original quantities, the disability under which one or the other of the parties to this form of contract is placed is so obvious that I cannot understand why it is ever entered into. In a few cases, of course, there may be some reason for so doing, but, speaking generally, I can find no argument in its favour.

(3) The "lump-sum" contract, in which the bills of quantities form part of the contract.

This form of contract has none of the disadvantages of the two previous examples. It is certainly fair to both employer and contractor, provided a competent surveyor is employed, but it relieves those responsible for the bills of quantities of all liability for their accuracy. If, however, as I said before, this liability is never accepted, the criticism, of course, has no point.

(4) The "lump-sum" contract, in which the bills of quantities form a schedule only, and the entire building is remeasured.

My only comment on this form of contract is that, unless under circumstances where the erection of the building in the shortest possible period is of

* Extracts from paper read at the last meeting of the Concrete Institute.

vital importance, it seems needlessly extravagant. It is quite possible, however, that the cost of the initial and subsequent measurements may not exceed the alternative cost of the preparation of bills of quantities and measurement of variations.

If, however, I urge the employment of a fully qualified quantity surveyor for the preparation of quantities for reinforced concrete, I do so even more emphatically when we arrive at the question of variations.

It is apparently not usual for the concrete specialists, who prepare the original quantities, to settle the extras and omissions at the completion of the contract. I hasten to add that I am speaking from my own experience only, and if I am wrong in my conclusion I shall doubtless be corrected.

Quantity surveyors, from bitter experience of variations, have learnt to "take off" with a wealth of detail which would probably surprise you if you were to take the trouble to wade through their dimensions.

The methods of the modern quantity surveyor are the outcome of three, if not four, generations' knowledge of the theory and the practice of his profession, and it has probably taken him between seven and ten years of constant application to acquire it. The education of an engineer—with which term I, of course, include the specialist in reinforced concrete—is even more arduous, and the exercise of both professions in the person of one individual requires a Superman!

Had I the good fortune to be an engineer instead of a quantity surveyor, I should welcome the opportunity of placing a laborious, and proportionately less remunerative, portion of my work upon other shoulders.

Let us just see whether the employment of a quantity surveyor would have obviated any of the disadvantages of the various forms of contract I have enumerated.

In the first case, that of the "lump-sum" contract purely and simply, the measurement of the extras by him would, I venture to think, result in a greater degree of accuracy, and would probably be advantageous from the building-owner's point of view. I have never yet been refused access to a contractor's priced bills of quantities, even when I was not legally entitled to see them, and I do not think any contractor would refuse permission to a quantity surveyor, although he would probably—and quite legitimately—decline to hand them over to the building-owner himself.

In the second case, that of the "lump-sum" contract, in which the quantities do not form part of the contract, his employment would be amply justified. For any shortage in the quantities he would be responsible to the contractor, and for any excess of measurement to the building-owner. If I am correct in saying that no responsibility is taken at the present time, the advantages are obvious, both to the building-owner and the contractor; while, assuming an error against the latter, the reinforced concrete specialist would possibly be saved a successful [illegible]

In the third example, that of the "lump-sum" contract where the quantities form part of the contract, the advantages of the introduction of the quantity surveyor are chiefly confined to the method of "taking off" the original quantities and the consequent facilities for dealing with the variations. The responsibility is less, admittedly; but I think any quantity surveyor worthy of the name would prefer to take the responsibility for the accuracy of his quantities at, of course, a slightly increased fee to compensate him for the risk.

In the last case, where the bills of quantities form a schedule only, and the building is remeasured, I rather fancy that no reinforced concrete specialist would be prepared to give the time to such remeasurement, and the quantity surveyor therefore gratefully takes the crumbs which fall from the rich man's table!

Should the employment of quantity surveyors become customary, it will undoubtedly lead to a greater degree of uniformity of method of measurement of reinforced concrete, as at the present time the acquaintance of my profession with yours is not of long standing. I hope, however, that this undesirable state of things, from our point of view, will shortly be remedied, when it is possible that you may find we may eventually prove a blessing in disguise, and even of some slight assistance to you, by relieving you of what I should imagine to be the least interesting portion of your work, and leaving you free to devote your time to that branch of structural engineering in which you have achieved such phenomenal success.

I apologised at the commencement of this paper for introducing a subject which, from its very nature, could be but of indirect interest to you, and I repeat that apology now. My object has been to introduce the subject as shortly as possible, with a view to giving the maximum amount of time to the subsequent discussion, which cannot fail to be of very great interest to the members of both professions.

A NOTE ON WORKING-CLASS HOUSING.*

By B. Wyand,
Secretary of the Institution of Municipal Engineers.

The following brief particulars of a scheme for working-class dwellings which is being considered in London may be of interest in view of to-day's discussion. I am not prepared to go beyond the details I give here, as my notes are gathered merely from an interview with Mr. Albert C. Freeman, consulting architect to the promoters, and from a pencil 16-scale block plan which he showed me.

The proposed building is to be erected in Mile End—an East-end district of London, inhabited by the very poorest population—on a site of 4¼ acres, and accommodation is to be provided for 1,000 tenants. The block will occupy the outside of the site, leaving a large central space for a playground. The entire roof space (some 1,200 ft. run) will form a garden, with a special section for children's "small holdings." Although the building is a continuous one, it will be cut up into what may be termed "blocks" of five apartments on each floor, the idea being to obviate the formation of long corridors, which are draughty, a source of nuisance, and extremely dangerous in case of fire. On the ground floor will be small shops, let at rentals which will enable their keepers to vend food and other commodities at a cheap rate.

Every apartment will be furnished upon a system which, I understand, has been in vogue in the United States for some time. Thus, the beds will fold back into the walls when not in use, and the privacy of the members of the family will be preserved at night by means of collapsible screens. It will be a case of one "apartment" one family. The whole building will be heated by radiators (on the low-pressure system), and neither fireplaces nor coal will be required. For cooking, a small gas-cooker, on the slot system, will be provided in each apartment. The radiators and fittings, it may be interpolated, will be protected by wire guards. In each apartment there will be a sink, and a bath and two water-closets will be provided for each block of five apartments.

The common rooms will include *crèche* (with trained nurses, taking children at one penny per day per head), refreshment-room (with licence), wash-house, smoking-room, library, reading-room and kitchen. Additional slipper baths will be provided at a moderate charge.

The building will, of course, be of fireproof construction throughout, and there will be fire appliances (of a more or less automatic nature) on every floor of every block. Reinforced concrete will be used largely in its construction. All floors will be of composition in colours, so as to obviate the necessity for coverings. The water supply will be from artesian wells on the site, and the electric current for lighting purposes will be generated by the utilisation of waste steam.

The average rental will be 6s. 6d. per week per apartment, and this will be strictly inclusive, the tenants paying for no extras except the slot gas they may use for cooking.

It is scarcely necessary to say that the scheme is, to some extent, a philanthropic one, although it is estimated that there should be a 4 per cent return on capital. Whether it will go through yet remains to be seen.

A West London Improvement.—It is recommended that the London County Council should make a contribution of £15,000 towards the cost of the widening of Argyll-place, Kingly-street, Great Marlborough-street, and Poland-street. The improvement will afford a direct connection between Great Marlborough-street and Noel-street, and will create an alternative route to Oxford-street for traffic proceeding between Bond-street and Soho. The total cost of acquiring the property needed for the improvement is estimated at £111,700.

* Paper read on Saturday last at a meeting of the Institution of Municipal Engineers held at Exeter.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for November is awarded to

Mr. H. E. LUNN,
Town Hall,
Islington,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

288. Mechanics.—Explain clearly the distinction between a vector, a scalar, and a rotor quantity. ("Beginner.")

289. Strength of Materials.—Compare the resistances to bending of a wrought-iron I beam, flanges 6 in. by 1 in., web 8 in. by ¾ in., when upright, and when laid on its side, thus ⊢.

290. Design of Struts.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength. ("Designer.")

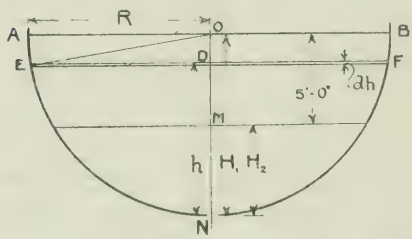
291. Hydrostatics.—Calculate the total and resultant pressures on the interior curved surface of a hemispherical bowl of radius r placed with its diametral plane horizontal and just filled with water. (W. H. B., *Bocking.*)

292. Foundations.—Sheet piling is required round the foundations of a warehouse to hold in the soil, which is of a loose, sandy nature. Give neat sketches showing how this would be carried out. (T. R.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

286. Hydraulics.—A hemispherical cistern is 20 ft. in diameter, and it is full of water. How long will it take to lower the depth of the water 5 ft. if the water escapes through a 3-in. diameter sharp-edged hole in the bottom of the cistern? The coefficient of discharge for the hole is 0·60. (H. V. O., *West Bromwich.*)



Referring to the above figure, suppose the water level to have fallen to any position, as EDF, and let the head DN over the orifice be h.

Let the initial head be H_1
" " final " " H_2
" " area of the orifice " A
and coef. of contraction " K

Then at any head h over the orifice, the discharge $= K.A.\sqrt{2gh}$ cubic ft. per sec.

Suppose during a very small period of time dt the water level falls a further distance dh, then in time dt,

discharge $= K.A.\sqrt{2gh}\,.\,dt.$

The area of water surface at EDF $= \pi.ED^2$ and volume discharged in time $dt = \pi.ED^2 \times dh$.

But $ED^2 = OE^2 - OD^2$
$= OE^2 - (ON - DN)^2$
$= R^2 - (R - h)^2$

$$\therefore \text{Volume} = \pi\left\{R^2 - (R-h)^2\right\}dh$$

$$\therefore K.A.\sqrt{2gh}\,dt = \pi\left\{R^2 - (R-h)^2\right\}dh$$

$$\text{or } dt = \frac{\pi}{K.A.\sqrt{2g}}\left\{R^2 - (R-h)^2\right\}h^{-\frac{1}{2}}\,dh$$

$$\text{or total time, } T = \frac{\pi}{K.A.\sqrt{2g}}\int_{H_2}^{H_1}[R^2 - R + h)^2]h^{-\frac{1}{2}}\,dh \text{ secs.}$$

$$= \frac{\pi}{K.A.\sqrt{2g}}\int_{H_2}^{H_1}(2Rh^{\frac{1}{2}} - h^{\frac{3}{2}})\,.\,dh$$

$$= \frac{\pi}{K.A.\sqrt{2g}}\left[\frac{4}{3}.R.H_1^{\frac{3}{2}} - \frac{4}{3}RH_2^{\frac{3}{2}} - \frac{2}{5}H_1^{\frac{5}{2}} + \frac{2}{5}H_2^{\frac{5}{2}}\right]$$

$K = 0{\cdot}60$; $A = \frac{\pi}{64}$; $\sqrt{2g} = 8$

$R = 10$; $H_1 = 10$; $H_2 = 5$.

$$\therefore T = \frac{\pi}{6 \times \pi \times 8}\left[\frac{4}{3}.10.10^{\frac{3}{2}} - \frac{4}{3}10.5^{\frac{3}{2}} - \frac{2}{5}.10^{\frac{5}{2}} + \frac{2}{5}.5^{\frac{5}{2}}\right]$$

$$= \frac{8}{6}\left[\frac{14}{15}.10^{\frac{5}{2}} - \frac{34}{3}.5^{\frac{3}{2}}\right]$$

$= 2251$ secs.
$= 37$ mins. 31 secs.

(H. E. L., *Islington.*)

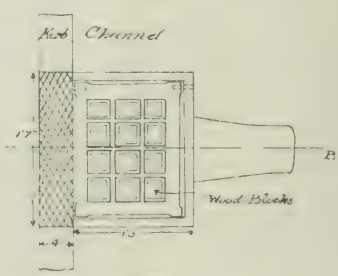
287. Street Gulley.—Will some reader kindly supply a sketch of some form of street gulley, the grid of which is in the face of the kerb and not in the channel of the roadway? ("Anxious.")

Referring to the section of the gulley:—

(*a*) is the well of a cast-iron street gulley, made from 3 to 5 ft. deep to catch the detritus from the surface water, so that a fairly clear liquid may go down the sewer. This part of a gully may be built in brickwork, but cast-iron gullies can be removed and used elsewhere.

(*b*) is the overflow weir in the face of the kerb.

(*c*) is a hinged cover which may be opened for cleansing. It is made of a cast-iron frame,



Plan.

filled with wooden blocks slightly raised from the iron.

(*d*) is a plate of cast iron supported in front of the sewer opening. The lower part of it dips into the water, forming a water-seal to prevent sewer gas rising through the opening to the street. There is a large grooved hole in the plate, which, when not in use is covered by a disc. The disc is removed to admit cleaning rods and for inspection purposes.

This type of gulley is not very effective, especially when the opening is covered by a grid, as water flowing swiftly down the channel will not readily enter an opening on the side of its course, unless the channel is dished round the gulley, when undesirably large pools of water will accumulate. It is better that the opening should be in the channel,

The Surveyor
And Municipal and County Engineer.

Bath Cattle Market.—On Wednesday the Mayor of Bath formally opened the reconstructed Cattle Market. So complete have been the alterations and improvements that the market is now regarded as a model market in the West of England. By the reconstruction provision is made for 200 cattle and 810 sheep, while temporary accommodation is made for 300 sheep and 56 cattle.

CORRESPONDENCE.

"*be silent in arguance; for fierceness makes error a fault and truth discourteous*"
—GEO. HERBERT, "*The Temple*."

BITUMINOUS MATERIALS.

To the Editor of THE SURVEYOR.

SIR,—Mr. J. Hutchinson, in his letter which appeared in your issue of November 22nd, suggests a discussion in your columns "on the definition" and "the exact meaning to be attached to the words asphalt, bitumen, &c.," but I would point out that these words have always had proper and distinct meanings, and instead of inviting a discussion on the subject I consider it would be more advisable if authorities drew up and issued to road engineers, not merely the correct definitions of the different words, but also—as I suggested in my letter which you were good enough to publish in your issue of August 30th—a list of the countries where native and natural bitumen occur together, with analysis and other distinguishing characteristics of each.

Perhaps Mr. Hutchinson will kindly refer to my former letter. If the specification I suggest were drawn up in a complete manner, this should enable engineers, in the event of the source of any particular material not being stated, to ascertain or determine for themselves the locality from which any certain bitumen or asphalt has been derived.

One of your other correspondents mentions that the Road Board was in its infancy in 1910, and was then taught to say "tar"—a most unfortunate remark, by the way. If this is so it could hardly have grown up sufficiently in this short time to assume the position of instructor, and expound, as he suggests, to engineers the real meaning of the words bitumen and asphalt.

If the definitions of bitumen and asphalt are to be set forth,—and advice, I presume, would also be given as to the suitability, advantages and disadvantages of each material—then this should only be carried out by those who are without question in a position to furnish this information, as to be able to judge of quality it is necessary to have knowledge of the materials being reported upon.

There are, I must say, many points in Mr. Hutchinson's letter that I do not agree with; and may I ask if the definitions your correspondent gives of asphalt and bitumen are those which he suggests should be issued to engineers, or is his contribution subject to revision? It is, of course, impossible to go fully into a question of this kind by correspondence, but I have endeavoured to give in a pamphlet on this subject I hope shortly to issue a few particulars which I think may prove of service to engineers.

Mr. Hutchinson says "bitumens are either native or artificial," and although I have used the term "artificial bitumen" for some time past when describing various materials that are being introduced as "bitumen," I do not suggest or agree that "artificial bitumen" is an established commercial material. On the other hand, I contend that the word bitumen, in any form, should only rightly be applied to natural products, and seeing that the sources where all genuine natural bitumens occur are known, it will be understood, if specifications of all these known bitumens with their distinguishing characteristics are issued, that it would be possible for anyone, by comparing the distinguishing points of any certain material with those given in the specifications, to learn if the material being judged was natural and where it was derived from. Attempting to judge by analysis alone is useless, as the figures can be imitated by mixtures of other materials, and it is the peculiar properties of the various natural bitumens that enable them to be easily distinguished.

It is agreed, I think, by all authorities that bitumen is a natural product, but the exact line between bitumen and asphalt cannot be clearly drawn, as bitumen is found as an impregnation of limestone, sandstone and shale. Aspraltum and Manjak are, again, other forms of bitumen, used in the manufacture of varnish, and as they are in most cases hard, coal-like substances, a definition that describes them simply, and yet accurately, is "hard bitumen." They are practically free from mineral matter, and I cannot therefore agree with Mr. Hutchinson that the Trinidad material should be placed under the same heading as asphaltum, as the former is a totally different material, and contains a fair proportion of mineral matter.

In touching on only a few points, I am afraid

I have taken up a considerable amount of your space, but clear definitions of bitumen, asphalt, &c., should certainly be issued to engineers, and in my opinion this might be done by the Road Board, providing the views of authorities on the subject are taken; or, better still, if a committee of experts was appointed to deal with this and all other matters relating to bitumen. The same course might be adopted with regard to stone, sand, &c., and these committees could report to the main body. It occurred to me that the course I suggest might meet with the approval of all concerned, including those who at present do not appear to be in agreement with some of the steps that are being taken by or on behalf of the Road Board to discover the most suitable method of road construction for modern traffic requirements.—Yours, &c.,

A. E. H. DUSSEK.

Canal Bank,
Deptford, S.E.
November 27, 1912.

To the Editor of THE SURVEYOR

SIR,—I have read the letters of Mr. J. Hutchinson and Mr. C. Nathan on this subject; but some mistake is evidently being made, as the definitions given and some of the views your correspondents express do not agree with the known data of bitumen and asphalt, and Mr. Nathan and Mr. Hutchinson are, in my opinion, in error on several points.

I am at a loss to understand how "limestone impregnated with natural bitumen" can be said by Mr. Hutchinson to be the same as "calcareous rock impregnated naturally with bitumen"—one is impregnated naturally, but the other may be a manufactured composition.

I ask Mr. Nathan if he will kindly explain, without referring me to any of his other articles, &c.—

(1) Why "pure natural asphalt" is the same as "solid bitumen" and where "pure" natural asphalt is found?

(2) Why "asphalte" spelt with an "e" is different to asphalt without an "e," and what is the difference? Why "calcareous rock impregnated with bitumen" is the same as "natural rock asphalt"?—it should surely be "naturally" impregnated with bitumen.

(3) Why "asphaltum" is the same as "the residuum obtained from the distillation of asphaltic or semi-asphaltic base petroleums?"

Does Mr. Nathan say that "Gilsonite" and other similar asphaltums are residuums?

I join issue with Mr. Nathan on each of his three recommendations, and I am more than surprised at his reply to Mr. Hutchinson when he definitely asserts that asphaltum is "the residuum obtained from distillation of asphaltic or semi-asphaltic petroleums."

The meaning of the words asphalt and bitumen should certainly be defined for the use of engineers who may not be acquainted with them, but unless this is done correctly I do not think the definitions are likely to stand for very long without being disputed.—Yours, &c.,

JAS. BASTIAN.

39 Stanhope-gardens,
Highgate.
December 3, 1912.

To the Editor of THE SURVEYOR.

SIR,—The question of a proper nomenclature for road materials of a bituminous nature seems to crop up periodically in yours and other papers devoted more especially to the question of roads and road materials, and the nett result of these periodical discussions is for a new set of definitions to be propounded.

Surely it would be wiser for engineers, surveyors and others to be guided to a certain extent, if not entirely, by the enormous amount of work that has been done in America with this particular class of hydro-carbon.

I am aware that there is a certain amount of prejudice against following American ideas, but surely the results of research, whether performed in Germany, France, the United States, or other countries, should merit due consideration, and the question of the country of origin of any research be of no moment.

In order to systematise the definitions of asphalts, both natural and artificial, Prevost Hubbard, chemist to the Office of Public Roads in Washington, prepared a bulletin, entitled "Bitumens and their Essential Constituents for Road Construction and Maintenance," which defines clearly, from a chemical point of view, all the various types of binders.

As this bulletin is issued officially by the United States Department of Agriculture, it seems a pity, in the absence of any similar publication from a Government source in this country, that individuals should suggest further definitions for a group of materials already clearly defined.—Yours, &c.,

D. NORTHALL LAURIE, F.I.C.

Westminster, S.W.
November 29, 1912.

FIRE PROTECTION AND THE LONDON COUNTY COUNCIL.

To the Editor of THE SURVEYOR.

SIR,—Since drafting my letter of November 25th, which you did me the honour of printing in your last issue, the chairman of the Building Act Committee of the London County Council, Mr. Taylor, has been at pains to show that his Building Act Department has been more active during the past seven years in dealing with the London Building Act Amendment Act of 1905 than indicated in my communication, where I pointed out that only 527 buildings had on official showing been put in order up to June 12th last, and that some 50,000 cases were awaiting the council's attention.

Mr. Taylor, in the interests of the county council, emphasises the fact that 1,043 certificates were granted in respect to new buildings under sec. 7 since 1905, and he also put on record that 351 cases have been disposed of under sec. 11, and 4,430 applications for exemption have been granted under secs. 10 and 12.

I had no reason for complaining of inattention to new buildings, for I was fully aware that these new structures in respect to which the owners deposit plans are dealt with as a matter of routine. I was complaining of *existing* buildings, and my letter being due to the deaths resulting from the Kensington fire, I naturally referred to buildings coming within the same section of the Act as Messrs. Barker's premises—*i.e.*, sec. 9.

In putting forward the fact that 351 cases have been settled under sec. 11, and 4,430 cases under secs. 10 and 12, Mr. Taylor has raised an entirely new issue as to a further class of existing buildings, which I also consider to have been badly neglected by the London County Council, even if perhaps not as markedly neglected as those coming under sec. 9. This class of building includes the dangerous "projecting shop," and a large number of smaller buildings exceeding 30 ft. in height occupied "other than a dwelling-house by two or more families."

According to the evidence of the superintending architect before the House of Commons, no fewer than 48,566 such cases under secs. 10 to 12 have been notified to his department as requiring attention. Thus, in addition to there being some 50,000 cases awaiting attention under sec. 9, there are to-day as a matter of fact also some 44,000 cases still awaiting attention under secs. 10 and 12. To put it quite plainly, Mr. Taylor, being dissatisfied with my complaint in respect to the 50,000 cases, now compels me to point to a further 44,000 cases, making 94,000 cases in all, awaiting the council's pleasure since 1905.

It had not been my intention to bring two issues forward at the same time. The 50,000 cases were to my mind sufficient to go on with; but now that fresh issues have been raised, I consider it my duty to extend the scope of the matter complained of, and to say that while in the first instance the inattention is largely due to the council not giving the Building Act Department a sufficient staff and proper encouragement, in the fresh matter the inattention is largely due to what I consider the council's policy of not allowing the district surveyors to undertake certain duties which they are quite competent to carry out, and which should largely have been carried out by them under the Act.

Complaint has further been made that when I said the 50,000 cases could be dealt with in the course of the next five years, this would be impossible, and would be inflicting hardships. I wish emphatically to state that it is quite practicable and feasible to attend to the 50,000 cases with a suitable and well-staffed organisation in the course of five years, and, further, that the district surveyors of their fifty districts can easily attend to the majority of the 44,000 cases newly referred to without putting much, if any, strain upon the county council's Building Act Department. It is largely a matter of the earnest of the

council, of staffing and of organisation, and of further allowing the district surveyors to do their duty without undue interference.

Some other critics have suggested that if all these structural alterations were carried out within the next five years there would be a great disorganisation in the building world of the Metropolis. These critics are entirely mistaken. The amount of alteration in quantity and value is comparatively small, compared with the quantity and value of building work done during any active building period of similar length between 1880 and 1910.

I regret again to have to occupy such valuable space in putting forward these facts and making complaints regarding the sluggishness of the London County Council in respect to the administration of the Building Act Amendment Act of 1905, but this question of fire protection is one affecting such a large number of buildings and such a large number of lives that it is impossible to let the present state of affairs rest. The London County Council in its corporate capacity must be made to realise its duties and grave responsibilities as to safety of life in our Metropolis.—Yours, &c.,

EDWIN O. SACHS.

British Fire-Prevention Committee,

CALL TO ARMS.

To the Editor of THE SURVEYOR.

SIR,—The Institution of Municipal and County Engineers have recently sounded the above, and with what effect time alone will show.

Much as this "call to arms" is needed, it sounds somewhat strange, as already there is, in the Institution of Municipal Engineers, a body with similar aims, already armed and ready to fight the cause of the municipal engineer. Would not the result have been better and more certain if only the institution had and still would throw out an invitation and get the younger institution to join forces with them? United these institutions could accomplish much, and offer more than each or both separately. They are both institutions of municipal engineers, and the members of each are municipal engineers, while some seventy members are in both institutions. Why, then, the separation and distinction, with each institution undermining the other? While we are content to quarrel and fall out over petty differences, it is no wonder that other institutions step in (see "Associate's" letter in last week's issue).

Will the seventy members belonging to both institutions support this appeal?—for they, being in both camps, should be best able to bring about a fusion of the two institutions; also will those who hold similar views also do their share? Both institutions have different strong points and strongholds, and reach into widely different quarters, so that a fusion would link up the whole municipal chain, without a weak link.

Up to the present qualifications have not been regarded as they are now and will be in the future. This question of qualifications is becoming impossible to all but a few. To-day one qualification is required, to-morrow another, and the next day another, and so on, until one's only chance is to belong to a number of institutions. This, although possible to many who are willing to work, is impossible to most by reason of the expense. I constantly hear the complaint of the expense of maintaining memberships and wonderings if it is worth while.

Only by amalgamations, absorptions, and consolidations of the institutions will the present-day municipal engineer and his assistant, with few exceptions, be enabled to gain the full advantage that these institutions should offer him. Let him then work to this end, and, if he cannot make things possible for himself, at least do something for those who are to come after him.—Yours, &c.,

INTERCEPTING TRAPS IN HOUSE DRAINS.

To the Editor of THE SURVEYOR.

SIR,—Much has been said, with but little value or effect, as to the facility of rats in obtaining ingress to the house drains through the water seal of the intercepting trap; nevertheless, while admittedly the water seal offers but a weak defence to the incursion of these vermin, if the trap were abandoned, as is advocated by its opponents, there would then be no obstacle or barrier whatever to the passage of rats from the public sewers to the private drains.

The gravest objection brought against the trap is that it is subject to possible chokage; but surely the same argument may be employed against chimneys. Moreover, the chokages that occur in the majority of cases may be traced to insufficient flushing—*i.e.*, to the disproportionate excess of solids to fluids passing through the drains—and it is therefore strong argument in favour of increasing the sparse 2-gallon flush to an effective 3 gallons. In the case of lavatories, baths and sinks the water authorities rightly exercise no restrictions in the quantity of water used for ablutions. Why, then, should such parsimonious stint be practised in regard to water-closets, in which, more than any other appliance in a house, abundant and efficient flushing is vitally essential, and of paramount importance? Cases of stoppage might also be largely decreased if waste waters from baths and lavatories (instead of as at present being allowed to trickle into the drains) were collected in automatic flushing tanks, and discharged in considerable bulk at periodic intervals.

The continued good health of a community depends largely on the perfect sanitary condition of the entire district, and consequently upon the condition of each individual system of house drainage, and to ensure perfection (as far as is attainable) every house drainage system should be periodically inspected and defects remedied. In olden days it was the duty of each householder to sweep and cleanse the footway abutting on his premises, but this obligation now rests with the municipal authority, whose duty it also is to collect all refuse, and as it is admitted that there is great laxity and indifference on the part of householders in attending to and examining their house drainage systems, why should not this work be taken over by the municipal authorities? It may be cited as an argument against inspection of private house drains by municipal authorities that they possess no powers to enter private premises for such purposes unless and until cases of infectious illness arise; but this could easily be arranged by legislation, and I venture to predict would be more warmly welcomed by property owners than are the visits of the surveyors deputed by the Government to survey private premises for the purposes of land tax, and the inspectors for "stamp-licking," "shop-closing," and other such-like Government fantasies, and at least there would be the satisfaction that the health of the public would be benefited.—Yours, &c.,

WALTER JENNINGS, Director,
George Jennings, Limited,
Sanitary Engineers.

63 to 67 Lambeth Palace-road, S.E.,
46 Dover-street, W.
December 2, 1912.

THE MANCHESTER APPOINTMENT.

To the Editor of THE SURVEYOR.

SIR,—I wish to express my admiration of your remarks in the footnote to "Associate's" letter regarding the above in last week's issue of your paper, also to compliment "Associate" upon his action in bringing this subject forward.

"Associate" is but one of several hundred others similarly situated, the only difference being that he is bold and honest enough to protest while the several hundred others are content to grumble and express dissatisfaction and discontent between themselves. I hope that the others will now arouse themselves and let the council of the institution in question know that "Associate" is not alone in his disappointment—that there are others.

"Associate's" letter will, as likely as not, go unsupported, the several hundred others being quite content to read his letter and agree with it when discussing this appointment among themselves. Instead of which, would cases such as these not be earlier remedied by taking the complaint straight to headquarters, and thus bringing the council more in touch with the urgent requirements of those who are rising but slowly from the base of the ladder?

Might I appeal to those who share "Associate's" views to lay their protest now, one and all, and this matter will be quickly set right? The council can be relied upon to do their utmost once they understand the situation, but they can best understand the requirements when, and only when, each associate, &c., goes to the trouble of "expressing the requirements" of the particular case. Thus the council are

enabled to view the case from their various aspects, & to compliment. Yours, &c.

MEMBER.

December 3, 1912.

To the Editor of THE SURVEYOR.

SIR,—The letter in your issue of the 29th, signed "Associate," respecting the above appointment is to be commended, and I think the council of the Institution of Municipal and County Engineers might well take up the question. If I am not mistaken, an assistant was advertised for some short time ago, when precisely the same conditions applied, precluding anyone holding only the diploma of the Institution of Municipal and County Engineers of any hope of success.—Yours, &c.,

ICONOCLAST.

November 29, 1912.

WHAT IS A GARDEN CITY?

To the Editor of THE SURVEYOR.

SIR,—I do not want in any way to intrude in the interesting correspondence now taking place in your journal, but I notice Mr. Price, in his letter of the 26th ult., evidently misses the main point of my letter of the 19th ult. Mr. Price is perfectly correct in quoting me as having said: "First Garden City, Limited, is a commercial company whose sole object is the development of an estate of 4,500 acres at Letchworth *as a garden city.*" The last four words are most important, as they mean that, although First Garden City, Limited, is a commercial company which conducts its affairs on business lines, it recognises the fundamental principles of garden city development—namely: (1) The adequate and scientific planning of the area on which the new town is built, and particularly the limitation of the number of houses per acre; (2) the provision of a wide belt of agricultural land surrounding the town, to be permanently kept free from town development or houses; and (3) the retention, for the new community itself, of the "unearned increment" of the land after a return of 5 per cent to the shareholders and all proper reserves.—Yours, &c.,

HAROLD CRASKE, Secretary,
First Garden City, Limited.

Letchworth, Herts.
December 2, 1912.

CONTINENTAL VISITS.

To the Editor of THE SURVEYOR.

SIR,—The Whitsuntide visit of the Institution of Municipal and County Engineers to Paris was such an excellent one, from every point of view, that I suggest the council of the institution should consider the advisability of arranging one to another city—for instance, Berlin.—Yours, &c.,

A MEMBER.

November 29, 1912.

Leeds Sewerage Scheme.—In a few weeks' time a commencement will be made with the first half of an important scheme of main-intercepting sewers in Leeds. The scheme will cost about £200,000, and it is hoped to complete it in four years.

New Method of Road Coating.—It was reported at the last meeting of the Kent County Council that the county surveyor, Mr. H. P. Maybury, was desirous of applying to some of the hard main roads of the county, where there is a good subsoil, a new method of coating composed of crushed shingle, sand and bitumen. In districts where shingle is obtainable cheaply the process may be largely resorted to. A 1-in. coat of the mixture would not cost more than 1s. per yard super., and the life of the material is estimated at three to four years. The Roads Committee, having inspected a section of road on which this coating has been laid, and finding that it makes a good surface, felt sufficient confidence in the scheme to recommend the council to authorise the acquisition of the plant required for its use on a larger scale. It would be necessary to buy a disintegrating machine and an engine to drive it, also to erect a temporary building to protect the machine from the weather, the whole cost being estimated at £700. The committee recommended that this expenditure should be sanctioned, and the council approved.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Birmingham T.C. (December 2nd. Mr. R. H. Bicknell).—£1,250 for works of street improvement and sewerage in Mason-lane, Erdington; £670 for the purchase of land for widening High-street (city); £1 500 for the extension of cottage baths in Coventry-street; and £5,000 for the provision of cottage baths in Lower Dartmouth-street.—Mr. Prideaux, who appeared to support the application, said Mason-lane formed a link between the main Sutton-road and the main Kingsbury-road. The lane was now 17 ft. wide, and it was proposed to make it into a 42-ft. road. With regard to the baths, the idea was to provide washing baths for the people in the poorer parts of the city, at a nominal cost of 1d. per bath. Further than that, arrangements had been made by which women could bring their children to have a bath at an equally reasonable cost. Up to the present these cottage baths had been a great success. It was proposed to extend the Coventry-street baths so as to give accommodation for twelve more men and six more women; and at Lower Dartmouth-street for eighteen more men and eleven women.

Blackburn R.D.C. (November 20th. Mr. F. O. Stanfield).—£200 and £321 for works of sewage disposal in the townships of Billington and Wilpshire respectively, including the execution of works in the township of Salesbury.—The clerk, Mr. John Birch, stated that in 1910 the Local Government Board sanctioned loans of £1,282 for Wilpshire and £248 for Billington, to enable the council to lay main outfall sewers for the property in the parish of Wilpshire in the neighbourhood of the Blackburn and District Orphanage, and for the treatment of that sewage and of the sewage coming from the Epileptic Colony at Langho. It was proposed to enlarge the works considerably, as they would have to deal with a much larger volume of sewage than they were thought capable of treating. During the progress of the work certain modifications were suggested. The alterations consisted in the main of the introduction of a sewage separator in place of additional septic tanks, which were part of the 1910 scheme, and the alteration of the old filters from contact beds to percolating beds.

Devonport T.C. (November 20th. Mr. W. W. E. Fletcher).—£4,500 for the extension of the infectious diseases hospital.—It was stated by the town clerk, Mr. R. J. Fittall, that, subject to the sanction of the board, a contract had been entered into with the manor authorities for the purchase of 3 acres of ground adjoining the present site. The price to be paid was £4,381, and extras would bring it up to £4 501, and so they were asking for a loan of £4,500 for the purchase, to be spread over a period of sixty years for repayment. The extension of the building would be dealt with in a subsequent application, after they had settled with the board as to the form the new buildings would take.

East Grinstead U.D.C. (November 19th. Mr. A. G. Drury).—£1,890 for the purchase of two plots of land adjoining the council's sewage farm; for fencing the new cemetery; and for drainage work in Matthews-hill, West-hill, Ship-street and Hermitage-lane, East Grinstead.—The surveyor, Mr. W. E. Woollam, stated that the population of the district was growing, and as the land adjoining the sewage farm was in the market he considered it was a good opportunity of acquiring it. He gave details as to the working of the sewage farm. The land was not ideal for sewage purposes, and it would be much better to have a larger area than if the land was of a more porous nature. The inspector: You think the acquisition of this land is necessary for future requirements? The surveyor: Yes. The inspector: I may take it that this land is required more or less to secure a zone? The clerk: Yes.—There was no opposition to the various schemes.

Nottingham T.C. (November 28th. Mr. Edgar Dudley). £860 for the purchase of 5,400 sq. yds. of land with a view to widening part of Hucknall-road to 0 ft. The city engineer, Mr. Arthur Brown, and the town clerk, Mr. W. J. Board, furnished the necessary particulars, and there was no opposition.

Pembroke (Co. Dublin) U.D.C. (November 20th. Mr. P. C. Cowan).—£9,000 for the purpose of carrying out works in connection with the electric light under-

taking in the township.—It was stated by the town clerk, Mr. J. C. Manly, that while the undertaking was run at a loss from 1901-9—a gradually decreasing loss—it started for the first time with a profit of 16 guineas, as appeared from the accounts. During the past three years the profit had increased, with the result that on March 31st last the undertaking showed a profit of £1,779. Mr. S. L. R. Price, electrical engineer, gave particulars of how the loan was to be applied—*viz.*, £2,927 for new generating plant; batteries, £2,475; buildings, £1,587; new condensing set and pump, £600; provisional sum, £525; purchase of free wiring installations, £279.

Somerset C.C., Axbridge R.D.C. and Weston-Super-Mare U.D.C. (November 27th. Mr. R. H. Bicknell).—This was an inquiry with respect to an agreement entered into by the Somerset County Council, the Axbridge Rural District Council, and the Weston-super-Mare Urban District Council, with a view to improving a narrow road leading from Brent Knoll to the Weston-super-Mare boundary, the ultimate intention being that the road should be taken over as a main road by the county council. The immediate matter for consideration consisted of applications made by the rural district council and the Weston Urban District Council, respectively, for power to borrow sums of £4,000 and £1,000 respectively, toward the cost of the improvement. The total estimated cost of the work is £7,500, toward which £2,000 represents a grant made by the Road Board, and £500 to be contributed by the county council. The length of road affected is 5¾ miles, and the area of land sought to be acquired is 3¾ acres. Numerous witnesses were called—the majority being officials of the authorities concerned. Figures were given as to a traffic census taken by the county council, and the evidence of several witnesses tended to show that, owing to the unsatisfactory means of approach and exit provided by the road, Weston was largely shunned by motorists, while it was explained that members of the Road Board who had inspected the locality had, in addition to recommending the grant, expressed themselves strongly in favour of the improvement scheme being carried out.

Southwick U.D.C. (November 20th. Mr. H. Shelford Bidwell). £450 for works of surface-water drainage.—Mr. J. E. Dell, clerk to the council, explained that it was really for the continuation of the main surface-water sewer to the north of the Green, and that by a supplementary resolution the council had decided to apply for an additional £100, in reference to the former application. The surveyor, Mr. G. B. Warr, explained the plans, and in dealing with the cause of the flooding said the water percolated through the Downs chalk and ran freely through the sandy subsoil until it came to marl, when it was retarded and rose to the surface.

Sutton-in-Ashfield U.D.C. (November 27th. Mr. Edgar Dudley).—£600 for an improvement in Low-street.—This street, it was explained, was the principal thoroughfare in Sutton, and was practically a dividing line between the old and new parts of the town. Property here realised higher prices than in any other part of the town. The area required was 49 sq. yds., which, at the purchase price of £600, worked out at about £12 5s. per yard. On the opposite side of the street land had been sold in large quantities at £9 per yard. In this case the vendors would set back the buildings at their own expense, and the land purchased would be thrown into the street.

York T.C. (November 27th. Major J. Stewart).—£2,350 for the completion of the new street from Pavement to Piccadilly.—The city surveyor, Mr. F. W. Spurr, stated that the new street would be a public highway, and would probably be a main road. The by-laws provided for 42-ft. streets, while the new street would be 50 ft. wide. The pavements would be 8 ft. wide, and the carriageway would be 34 ft. The work was not commenced, and no payments had been made. A certain amount of filling in of the roadway would be required. They did not expect to have to pay for the material for filling in the road. The facing of the road would be tar-macadam, while the pavements would be flagged with 2½-in. concrete flags. The inspector: You don't think the tar-macadam will last twenty years? Mr. Spurr: I think it will, with some repairs. The inspector seemed surprised at the statement, and asked Mr. Spurr if the tar-macadam would have to be renewed within five years. Mr. Spurr: Certainly not; certain repairs may have to be done.

APPLICATIONS FOR LOANS.

Cardigan T.C.—£1,800 for water supply extensions.

Chelmsford R.D.C.—£3,000 for the provision of cottages

Eastleigh and Bishopstoke U.D.C.—£450 for a public convenience.

Hartshorne R.D.C.—£2,200 for Fictonall water scheme.

Hebden Bridge U.D.C.—£220 for the provision of new stabling.

Margate T.C.—£5,500 for a bathing pavilion.

Newbury T.C.—£300 for gas suction plant at the sewage pumping station.

Norwich T.C.—£900 for school extensions.

Orsett R.D.C.—£2,500, excess loan for Stanford sewerage works.

Stoke-on-Trent T.C.—£12,000 for electricity services and plant.

Walton-upon-Thames U.D.C.—£500 for the provision of new stables.

LOANS SANCTIONED.

Bourne R.D.C.—£1,771 for the erection of industrial dwellings.

Brighouse T.C.—£3,000, to be repaid in thirty years, for renewing water mains.

Bromley T.C.—£715 for private street improvement works.

Harrogate T.C.—£2,700 for the erection of a glass and iron annexe to the royal pump room.

Nelson T.C.—£21,462 for private street improvement works.

Newbury T.C.—£3,210 for school extensions.

Preston T.C.—£4,500 for street improvements.

Stoke-on-Trent T.C.—£1,696 for a new wing to the Penkhull schools, and £550 for street improvement works.

Thakeham R.D.C.—£300 for experimental works in connection with the Starrington water supply.

Wem R.D.C.—£250 for a water supply scheme for Tilley.

West Suffolk C.C.—£3,256 for the erection of an infants' department at Brandon, and alterations to existing buildings.

York T.C.—£3,030 for the purchase of land for a recreation ground.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Building—Auckland £3,200, Bucks £2300, Edinburgh, Ilkeston, Middlesex £3,000, Wilts £12,000; housing and town planning—Aberystwyth, Acton, Carnarvon; refuse collection and disposal—Finsbury, Newport; roads and materials—Aberdeenshire, Surrey; sewerage and sewage disposal—Wrexham; water, gas and electricity—Egremont £22,307; miscellaneous—Huddersfield.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Auckland U.D.C. Municipal buildings are to be provided at an estimated cost of £3 200.

Blackpool T.C.—Plans have been approved for public conveniences in Middle-walk.

Braintree U.D.C.—The tender of Mr. W. Potter, of Braintree, at £336, has been accepted for the erection of offices and dressing sheds at the swimming bath.

Bucks C.C.—The Amersham Grammar School is to be enlarged, at an estimated cost of £2,300.

Cambridge T.C.—Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester, have just supplied their warm-air ventilating patent "Manchester" stoves with descending smoke flues to the Melbourne-road Schools, Cambridge.

Edinburgh T.C.—The Public Health Committee have expressed approval of the general principle of the establishment of a crematorium in the city and agreed to recommend that the council should approve of such a structure being erected in Warriston Cemetery. —The Plans and Works Committee have approved the provision of a sixty-stall public wash-house, at an estimated cost of £6,000, and the city superintendent has been instructed to obtain estimates.

Essex C.C.—The tender of Mr. J. Rayner, of East Hanningfield, at £1,115, has been accepted for the erection of a new school at Cold Norton.

Harrogate T.C.—The various tenders required in the erection of a glass and iron annexe to the Royal Pump-room, estimated to cost £2,700, have been allocated as follows: Excavator and mason, C. A. Nettleton, £320; carpenter and joiner, F. Harvey, £505; glazier, Braithwaite & Co., £177; painter, W. Norman, £52; fibrous plaster, W. H. Horn, Limited (Bradford), £153; ironfounder, Carron Company (Stirling), £925; copper roofing, Braby & Co., Limited (London), £382; wood block flooring, Burgess & Co. (Liverpool), 5s. 1d. per yard; marble top counter, Emley & Sons (Newcastle-on-Tyne), £18. The borough surveyor, Mr. C E. Rivers, expects the work to be completed about Whitsuntide.

Ilkeston T.C.—Mr. E. B. Hall, architect, has been instructed to prepare plans and estimates for extensions to the town hall.

Middlesex C.C.—On Thursday of last week, on the report of Mr. H T. Wakelam, the county surveyor, that Walton Bridge was in a dangerous condition, it was decided to substitute steel decking for the existing timber decking, which was described by a member as being "absolutely rotten," and the surveyor was authorised to obtain tenders for the work the cost of which was estimated not to exceed £3 000.

Montrose T.C.—A proposal for the extension of the burgh hall, at an estimated cost of £3,000, is under consideration.

Torquay T.C.—The borough surveyor, Mr. H. A. Garrett, has prepared an amended plan of the proposed fish market, the estimated cost of which is £295, and it has been decided to invite tenders for the work.

Wilts C.C.—A scheme has been approved for the extension of the county council offices at Trowbridge, at an estimated cost of £12000, exclusive of furnishing.

HOUSING AND TOWN PLANNING.

Aberystwyth T.C.—A tender has been accepted to build thirty workmen's dwellings at Trefechan, for £4,972.

Acton U.D.C.—Consideration is being given to a recommendation of the Works Committee for the provision of workmen's dwellings on city garden lines, the plans of which have been prepared by Mr. Yorath, deputy-surveyor.

Ampthill U.D.C.—The question of providing workmen's cottages is under the consideration of a special committee.

Birkenhead T.C.—The council have accepted the offer of Sir William Lever of the Storeton estate for £145,000. The reason prompting Sir William to make the offer was the interest he takes in town planning and to put into practice the strong opinion he holds that the land adjoining a large town should be acquired by the municipality to enable it to control future developments. The estate was recently purchased by Sir William, and he makes no profit by the sale. The land adjoins the borough, and is a beautiful residential district, 1,538 acres in extent.

Buckfastleigh U.D.C.—The surveyor, Mr. A. Warren, has been instructed to prepare plans and specifications of a scheme for workmen's dwellings, each house to contain not less than three bed-rooms.

Cambridge T.C.—The council have accepted the tender of Messrs. Kidman Brothers, at £1,724, for the erection of twelve workmen's dwellings.

Carnarvon T.C.—A scheme has been conditionally approved for the housing of the working classes. Under the first part of the scheme it is intended to acquire land for the erection of sixty-four houses at rentals ranging from 5s. to 6s. per week, while another part provides for twenty-five houses renting from 3s. to 4s. per week. The scheme in its entirety is estimated to cost about £20,000.

Edinburgh T.C.—A committee of the corporation recommend that a town planning scheme should be prepared for the area of the old slaughter-houses and the adjoining ground in Fountainbridge.

Harrow U.D.C.—A town planning scheme, to include all the area unbuilt upon on both sides of the Hill, has been prepared, and application for sanction will be shortly made to the Local Government Board.

Pembroke (Co. Dublin) U.D.C.—Eighty-eight cottages, erected at a cost of nearly £24,000, were formally opened last week. The rents vary from 4s. 4d. to 7s. per week.

St. Austell U.D.C.—Purchase prices and other particulars are to be obtained in respect of suitable sites for the erection of workmen's dwellings in various parts of the town.

PARKS AND OPEN SPACES.

Birmingham T.C.—The council agreed on Tuesday last to purchase a plot of land at the junction of Sheepcote-street and Grosvenor-street West, at the price of £3,540 (or 20s. 11d. per square yard), as a recreation ground. Another plot in Lawford-street is also to be acquired, at 10s. per square yard, as a recreation ground.

Lincoln T.C.—The council have agreed to a contribution of £500 being made from the funds of the Waterworks Committee towards laying out the pleasure grounds in Westgate, on condition that a portion of the disused reservoir be converted into a swimming bath.

Manchester T.C.—It has been agreed to purchase 10½ acres of land as an extension of Platt Fields Park, at a price of £750 an acre.

Paignton U.D.C.—It has been agreed to purchase, for £4,467, a stretch of sand known as Preston Beach, this sum to include the purchase of a vacant space of land adjoining the beach, which it is suggested should be utilised as an additional recreation ground, and as public tennis, croquet and bowling courts. The surveyor, Mr. C. O. Baines, has been instructed to prepare a plan for laying out the ground.

REFUSE COLLECTION AND DISPOSAL.

Finsbury B.C.—At a recent meeting of the council a discussion took place on the report of the Wharf and Cleansing Committee, recommending the purchase of two petrol motor wagons, at an estimated

cost of £700 each. Mr. Owen Richards opposed the recommendation. One, at least, of the metropolitan boroughs that had adopted motor traction had scrapped their wagons in a short time. Mr. E. H. Tripp did not think a case had been made out to justify the council embarking on so heavy an expenditure. Mr. G. Beard said that motor traction was more expeditious than the horse vehicle, and municipalities ought to be up to date. Mr. L. Phillips, chairman, said he sincerely believed that the work of the borough could be done more economically by motor traction than by horse vehicles. The report was rejected by a majority of thirty to eleven

Largs T.C.—The two-cell refuse destructor erected for the burgh of Largs by Messrs. Heenan & Froude, Limited, Manchester, was inaugurated last week. Mr. J. A. Robertson, electrical engineer of Greenock, was consulting engineer in connection with the installation.

Newport (Mon.) T.C.—It is proposed to establish a refuse destructor on the east side of the river, and in the neighbourhood of the corporation power station.

ROADS AND MATERIALS.

Aberdeenshire C.C.—The question of a road improvement scheme at Aboyne estimated to cost £3,900, is under the consideration of the Deeside District Committee.

Burton-on-Trent T.C.—Property of the value of £1,250 is to be purchased for the purpose of the further widening of Station-street.

Camberwell B.C.—The borough surveyor, Mr. William Oxtoby, has this week submitted a report on the tarring and gritting of the roads in 1912, in which he states that the number of roads treated is 252, of which more than half had been coated in previous years. It is, he said, generally understood that unfavourable weather conditions immediately adversely affect the work of tar-spraying. The past summer has an unfortunate record in that respect, consequent on which the operations were seriously interfered with and the programme curtailed. Inadequate supplies and delays in deliveries of materials, attributable to the transport workers' strike, also tended to retard progress. The prices of materials have been much higher this year, and an improved rate of pay has been given to the men employed on the work. Noting these facts, it is with great satisfaction he is able to report a much reduced average cost per super. yard in respect of both materials and labour, as compared with the corresponding figures for 1910 and 1911. New boilers and specially selected working plant (purchased in anticipation of this year's work) in place of improvised machinery that in previous years had been used, no doubt have contributed to this favourable result, while, of course, as is to be expected, the men employed are becoming more efficient through continued experience. The total average cost in the six districts was 1·361d. per square yard, compared with 1·65d. in 1911 and 1·68d. in 1910.

Crimsby R.D.C.—It has been decided to purchase a tar-spraying machine from the Lincoln Asbestos Company, at a cost of £20 10s. The sprayer is capable of spraying 3,500 yds. per day of ten hours when worked according to the firm's suggestions. The cost, it is stated, does not exceed ¼d. per square yard, inclusive of all material used.

Hexham R.D.C.—A grant of £250 has been made by the Road Board for the improvement of the road surface.

Nottingham T.C.—The Improvements Committee recommend the purchase of the necessary land for the widening of Derby-road, at an estimated cost of £285.

Penybont R.D.C.—The tender of Mr. Rees Jones, junr., of Coychurch at £1,086, has been accepted for street works at Aberkenfig.

Rawmarsh U.D.C.—A committee has been appointed to go into the question of widening a portion of High-street, and to confer with the West Riding County Council with a view to obtaining a grant for the work from the Road Board.

Stoke Newington B.C.—The estimate of £4,200 to cover the cost of strengthening the foundation and renewing the wood paving in Lordship Park has been agreed to, and the tender of Messrs. William Griffiths & Co., Limited, for carrying out the work, has been accepted.—Land to the value of £1,410 has been purchased for widenings in Park-street and Church-street.

Surrey C.C.—It has been resolved that in any new contract which might be entered into with the Godalming Town Council, the county council should contribute as part of such contract two-thirds of the costs of paving with sectional hard-wood blocks, 5,130 yds. super. of the main roads in the borough by way of annual payments not exceeding £276 per annum for a period of ten years, and a sum of £24 4s. per annum for a further period of ten years; also, that the county council should contribute a sum not exceeding £66 in respect of the wood-paving work not included in the above-mentioned loan.—The county surveyor, Mr. A. Dryland, has made a survey for a new road to form a loop on the Portsmouth-road between Bevensey Brook Bridge and the village of Esher. The main purpose has been to find an alternative route for an entirely new road between the two points, so as to afford better ingress and egress to London from the south-west. It has been decided to forward the scheme to the Road Board. The survey of the suggested improvement of the East and West road, between Shalford and Reigate, is, it is reported, nearly completed.

Torquay T.C.—The borough surveyor, Mr. H. A. Garrett, reports that he has tar sprayed about 9 miles of road during the past season, at a cost of £499.

Windermere U.D.C.—Consideration is being given by the Highways Committee to the plans and estimates of several important improvements on the Patterdale-road, connecting Windermere with Kirkstone Pass. A considerable portion of the expense will be borne by the Westmorland County Council, and the total cost is put at £1,693 the estimates being based on the assumption that the land necessary will be given by the adjacent owners.

SEWERAGE AND SEWAGE DISPOSAL.

Chelmsford T.C.—With respect to the question of the disposal of trade effluents, the council have adopted a resolution affirming the urgent necessity of amending the law as recommended by the Royal Commission on Sewage Disposal, so as to ensure effectual preliminary treatment of the refuse or the payment of a reasonable charge to the local authority, and requesting the President of the Local Government Board to introduce legislation on these lines in the next session of Parliament.

Rawmarsh U.D.C.—It has been decided that the construction of the storm-water drain in Dilks-road shall be carried out by the council's workmen.

Wrexham R.D.C.—A drainage scheme for Coedpoeth, estimated to cost £9,000, is under consideration.

WATER, GAS, AND ELECTRICITY.

Bewdley T.C.—The corporation have instructed Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, to report on the existing water supply works and the proposed extensions for the supply of water to Stourport.

Chirk R.D.C.—The council have adopted the scheme of Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, for the water supply of the district, and are applying to the Local Government Board for sanction to a loan to carry out the necessary works.

Droitwich R.D.C.—The council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, ASSOC.M.INST.C.E.), of Newcastle-on-Tyne and Birmingham, to prepare a scheme of waterworks for the parish of Crowle.

Egremont U.D.C.—The tender of Messrs. Waring & Sons, of Huddersfield, at £22,307, has been accepted for the new water supply scheme.

Newry U.D.C.—The question of an improved water supply is to be considered at a special meeting of the council to be held at an early date.

Oswestry R.D.C.—The council have instructed Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, to prepare the detail plans and estimates of the proposed water supply scheme for submission to the Local Government Board.

St. Pancras B.C.—The tender of the Brush Electrical Company, Limited, at £14,050, has been accepted for a 5,000-kw. Ljungstrom turbine for the King's-road generating station.

Spalding R.D.C.—The Council have appointed Mr. Silcock, of Leeds, to advise them as to the completion of the water scheme taken over from the South Lincolnshire Water Company.

Thakeham R.D.C. Experimental works are to be carried out in connection with the proposed water supply for Storrington.

Tynemouth T.C.—The results of the working of the electricity undertaking last year were the most favourable yet obtained. The gross profit was £7,500—more than 10 per cent on the nett capital expenditure outstanding at the beginning of the year. The nett profit was £1,305, against £911 in the previous year.

MISCELLANEOUS.

Colne T.C.—It has been decided to apply for the necessary powers for the transfer of the Colne and Trawden Light Railways Company's undertaking. The council are proceeding by Bill instead of Provisional Order, as it holds out a probability of securing a longer term for the repayment of the necessary loan and permission to borrow money for working capital.

Huddersfield T.C.—A Parliamentary Bill is to be promoted for tramway schemes, waterworks extensions, a superannuation scheme, and a small extension of the borough. The tramway proposals include extensions to Brighouse (to join the Halifax Corporation system), to West Vale (viâ Elland), to Marsden, to tap the upper portion of the Colne Valley, and other extensions to Crosland Hill, Kirkheaton, and Dodlee, Longwood. Another proposal is to purchase the Deanhead reservoir from the Deanhead Commissioners for between £12,000 and £13,000.

Wandsworth B.C.—With respect to a representation from the Stepney Borough Council in opposition to the proposal of the London County Council to establish railless traction, this council have adopted a resolution affirming that they see no reason for any obstacle being put in the way of the London County Council in endeavouring to provide improved means of locomotion, provided proposals to erect overhead equipment are subject to the approval of the borough council concerned.

PERSONAL.

Mr. James Davies has been appointed surveyor for the Tenby district of the Pembroke Rural District Council.

Mr. C. Turton, surveyor to the East Grinstead Rural District Council, has had his salary increased by £165 for the year ending December 31st next, for his services in connection with the Ashurst Wood sewerage scheme.

Mr. George Sheppard, who has recently retired from the position of borough surveyor of Newark after thirty-seven years' service, and is now consulting engineer, has been presented by the officials of the corporation with a piece of plate and a framed illuminated address.

Mr. A. Dale was on Monday last appointed city architect of Nottingham, at a salary of £450 per annum, and Mr. F. B. Lewis, who has had to retire through ill-health, will continue in the service of the corporation as consulting city architect, at a retaining salary of £250.

Mr. E. Park, who was recently appointed surveyor to the Sedbergh Rural District Council, served his articles with Mr. W. F. Y. Molineux, surveyor and engineer to the Ulverston Rural District Council, from 1904 to 1908, and was assistant to Mr. John Banks, F.S.I., land agent and surveyor, Kendal, from 1908-9, afterwards filling the position of assistant under the Ulverston Rural District Council. Mr. Park is a member of the Institution of Municipal Engineers.

Mr. George Bell, borough surveyor of Swansea, took the chair at the first annual dinner of the Swansea Municipal Officers' Association held recently. In the course of his presidential address he said he was astonished lately by being told that within the next ten years the country would have eliminated public bodies from its system. This was contrary to his opinion. So far as he could see, the tendency would be for the State to relegate further powers and responsibilities to local authorities.

Messrs. G. A. Ballard, city engineer's office, York; E. H. Colcutt, Road Board offices, Westminster; J. R. Hill, town hall, Rochdale; L. W. Kershaw, engineer's office, Tyburn, Birmingham; F. P. Kindell, [illegible] offices, Bexhill-on-Sea; A. J. G. Maffin, Bernard and Sons' chemical works, E. J. T. Manchester, Brisbane Water and Sewerage Board; W. H. Newton, sewerage engineer's office, Leeds; G. D. Sweetman, town hall, Islington; A. E. Wheatley, town hall, Manchester; and S. Whitehead, borough engineer's office, Nelson, have been elected associate members of the Institution of Civil Engineers.

Mr. John A. Brodie, city engineer of Liverpool, is (says the *Liverpool Post and Mercury*) now on his way to Delhi to complete the commission he and others undertook at the request of the Indian Government in connection with the laying out of Delhi, the new capital of the Indian Empire. Mr. Brodie left Liverpool on Thursday last week, and on Friday he proceeded to the Continent, en route for his destination, viâ Brindisi, where he will join the steamer "Persia," of the P. and O. Line, for Bombay. The steamer is expected to arrive at that port on the 13th inst. Mr. Brodie will be away for about two months, and the experts with whom he is associated will, on completion of their engagement, present their report to the Indian Government.

Municipal Work in the East Indies.—A report by the Registrar of Imports and Exports at Singapore states that the Municipal Commissioners of Penang anticipate the expenditure of about £6,300 on water fittings and meters, motor vehicles, and a fire engine.

New Park for Wimbledon.—At the meeting of the Wimbledon Town Council on Wednesday it was decided to enter into an agreement for the purchase of Wimbledon Park estate, with its lake and lands adjoining, at a cost of £65,000. The property is to be converted into a public open space.

Street Lighting in Leeds.—The system of high pressure lighting installed in several Leeds thoroughfares by the Corporation Gas Committee for demonstration purposes has been considered by the Street Lighting Committee, who feel that the system is too costly. They have consequently requested the Gas Committee to remove the lamps within a month.

Dover Improvements.—Dover Corporation on Tuesday approved an amended scheme for the building of a viaduct road and the carrying out of improvements in the pier district, at a total cost of £103,981. The South-Eastern and Chatham Railway have agreed to pay £40,000 towards the cost of the viaduct road, which will form the approach to their new Marine station. The total cost to the town, after allowing for resales of land, is estimated at £54,381. Negotiations have now to be carried out with the Local Government Board concerning the rehousing of people displaced in the district.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED, by the Horsham Rural District Council, a number from two to six Movable Shelters for the Treatment of Consumptive Patients; must be strongly constructed, capable of being easily moved from place to place, and suitable for the accommodation of one patient in each shelter.—Reply, stating lowest price and full particulars, with earliest date of delivery, to the Chairman, Health Committee, care of A. C. Coole, Esq., Clerk to the Rural District Council, Carfax, Horsham. The Council do not bind themselves to accept the lowest or any offer.

WANTED—second-hand oil engine, 10 to 20 h.p., with or without plunger pumps, preferably three-throw.—Surveyor, Town Hall, Hants.

THEORY OF ENGINEERING CONSTRUCTION. A reference-book for Civil Engineers and Students. By Ernest H. Essex, A.M.I.C.E. 8¾ in. by 5¾ in. 216 pp. Cloth gilt, 5s. Post free, 5s. 3d. Comprising a selection of Notes and Formulæ on the Theory of Construction, arranged in the form of Answers to the Questions set at Examinations for the Election of Associate Members of the Institution of Civil Engineers.

"Students of engineering construction are indebted to Mr. Essex for his book. . . . The book will have its use for students who are preparing for examinations, and to go through it will be found an excellent exercise for all who have to follow construction as a business." *The Architect.*

"The examples chosen refer to problems of general professional interest, and the solutions are well reasoned and neatly expressed. As an adjunct to scientific text-books the volume ought to be useful, and it may also be serviceable as a guide to candidates for examination." *The Builder.*

London: St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C.

THE PROTECTION OF VALVES.

AN EFFECTIVE METHOD OF BUSHING.

Air pumps and other valves, whether hard or flexible, have frequently, as is well known, to be discarded before the body of the valve is worn out, owing to the enlargement of the central hole resulting from the wear caused by the vertical movement on the stud. The effect of this is illustrated in Fig. 1, from which it will be seen that the valve is rendered useless, as portions of the holes in the valve grating become exposed and the vacuum is seriously impaired, if not altogether destroyed. In order to meet the difficulty, engineers have hitherto attempted to bush valves, but with very qualified success. So much is this the case that it has been found that even vulcanising the bushes into the valves has not been sufficient to secure them for any length of time, and that once the bushes become loose they wear the

FIG. 1.

holes so badly that they have to be cut, frequently ruining and even destroying the valve after very short service. This method of bushing the valves is illustrated in Fig. 2.

The Dermatine Company, Limited, 95 Neate-street, S.E., call the attention of practical engineers and pump makers to the new patent anchor gunmetal bushes for both flexible and hard valves (Hart and Fiegehen's patent), an invention which it is claimed has solved the problem. As will be seen from Figs. 3 and 4, the bush is embedded and vulcanised into the valve in such a way that, it is claimed, it cannot under any circumstances work loose, and, while preventing wear on the central hole, allows the valve

FIG. 2.

to seat itself readily on the grating. In the case of flexible valves the arms of the valve are hinged so as to allow the valve to "saucer" readily (Fig. 3). With hard valves, again, there is just sufficient flexibility with the wire loop (Fig. 4) to prevent the bush on the seating of guard irons cracking the valve, which is liable to occur with the old rigid metal bushing. The new bush has been adopted by a number of well-known engineering and textile firms and companies, by the Metropolitan Water Board, and by several municipal corporations, including Brighton, Bournemouth, and Aston Manor.

The foregoing remarks in regard to this method of bushing valves suggests a reference to the firm's own valves for air-pump and other purposes. These valves are made of the widely used material known as "Dermatine." Belts made of "Dermatine" are also extensively used in various parts of the world. They are of uniform width and thickness, and it is claimed for them that they stand heat and damp, or

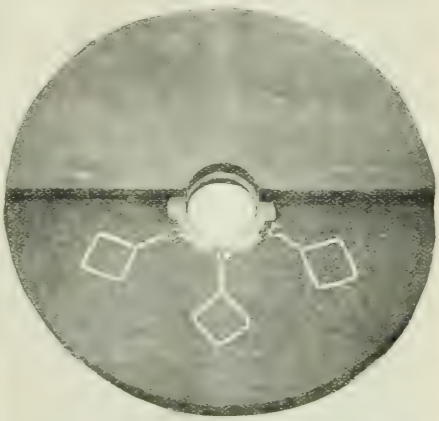

FIG. 3.

seams are as strong as the belt itself, and therefore do not slip on the pulleys, and are practically noiseless in use. The belting is made of the best long staple flax, 3-ply warp, and the very strongest cotton duck weft. The flax yarn is specially selected, and the whole woven to stand hard wear. The fabric, after a special preparation, is incorporated in "Der-

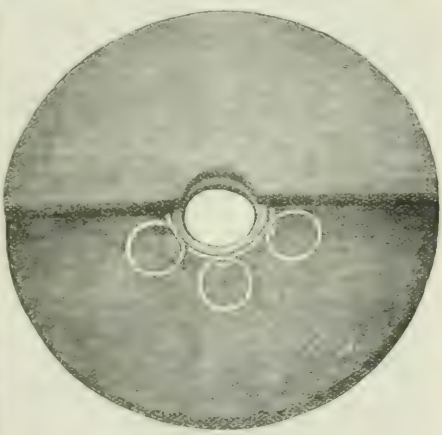

FIG. 4.

is sewn with several rows of special strong thread, [illegible] many belts, an impossibility. Other important applications of "Dermatine" are hose, and cup, ram, and pump rings. The hose is extensively used by local authorities for flushing, sewage pumping, fire brigade, and other purposes, though these are said by no

Sewage Disposal in the United Kingdom (By Henry [illegible] Cousin, B.Sc. Pp. 78. 6d. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.) . . . gives a concise but comprehensive outline of the present position with regard to the question of sewage disposal. The main portions of the book are [illegible]

Sewage Pollution in New York Harbour.

METROPOLITAN SEWERAGE COMMISSION'S REPORT.

[The following is an extract from the report of the above commission, issued August 1st last, giving the opinion of the commission as to the degree of cleanness which is necessary and sufficient for the water of New York Harbour.

To arrive at a decision as to the degree of cleanness suitable for the waters of New York Harbour, it is necessary to consider what is required on the score of public health and decency. Risk of disease is of paramount importance, but it is not the only consideration.

At the outset it must be understood that, in order to improve the present polluted condition of the harbour, public works will be required. Were it not for the expense involved, practically all the sewage which is produced in the cities bordering on the harbour could be carried to some distant point and there be purified or applied to agriculture or discharged into the sea. Were the harbour as clean as it could be made, it is doubtful if the water would be employed otherwise that as at present. The danger of accidental and direct pollution would make the taking of shellfish for food unsafe within the harbour limits. The benefit of bathing without danger of contracting disease can be obtained by the establishment of bathing pools supplied with clean water and by suitably protecting the sea beaches.

The harm done by excessive pollution of the harbour water is indisputable. Although experts differ with respect to the amount of sickness which is produced by sewage contaminated water, the commission considers that there is considerable danger in coming in contact with it, whether through bathing, fishing, the eating of shellfish, or otherwise. Water which is black, greasy and effervescing with sewage, and in which plainly recognisable ingredients of sewage exist, should not be tolerated in any part of the harbour.

SEWAGE WORKS RECOMMENDED.

It is evident from the studies made by the commission that large quantities of sewage can be assimilated by the waters of the harbour without risk of creating offensive conditions, and if the dangers which lie in bacterial impurities be disregarded, it will be possible to discharge into these waters, without injury and without excessive cost for public works, large quantities of sewage from which the most objectionable matters have been removed. The commission considers that in many parts of the city the construction of disposal works which make use of the principles of screening and sedimentation in combination with outlets which will secure a prompt diffusion of the treated sewage in the water is the remedy now required, and that these works should be so built as to form part of a more extensive and composite plan for the exclusion of sewage from the harbour if greater protection should be needed in the future.

Upon the matter of the jurisdiction which should be exercised over the harbour, the commission, in its report of April 30, 1910, expressed the opinion, which it now reiterates, that it would be desirable to establish by Acts of the Legislatures of the States of New York and New Jersey an inter-State sewerage commission to protect the harbour waters. If this inter-State action cannot be brought about, then the conservation of the harbour waters of the Metropolitan District of New York should be undertaken by a New York Commission.

DEGREE OF CLEANNESS.

With regard to the degree of cleanness that should be maintained in the harbour waters, the commission is of opinion that no single standard, such as the amount of dissolved oxygen present, would be practicable. As a result of much thought, many investigations and the best expert advice procurable, the commission has adopted for its guidance the general standards of requirements stated below:

(1) Garbage, offal, or solid matter recognisable as of sewage origin, shall not be visible in any of the harbour waters.

(2) Marked discoloration or turbidity due to sewage or trade wastes, effervescence, oily sleek, odour or deposits shall not be caused, perhaps in the immediate vicinity of sewer outfalls, and then only to such an extent and in such places as may be permitted by the authority having jurisdiction over the sanitary condition of the harbour.

(3) The discharge of sewage shall not materially contribute to the formation of deposits injurious to navigation.

(4) Except in the immediate vicinity of docks and piers and sewer outfalls, the dissolved oxygen in the water shall not fall below 3·0 cubic centimetres per litre of water.* Near docks and piers there should always be sufficient oxygen in the water to prevent nuisance from odours.

(5) The quality of the water at points suitable for bathing and oyster culture should conform substantially as to bacterial purity to a drinking water standard. It is not practicable to maintain so high a standard in any part of the harbour north of the Narrows, or in the Arthur Kill. In the lower bay and elsewhere bathing and the taking of shellfish cannot be considered free from danger of disease within a mile of a sewer outfall.

The report from which the above extracts are made was issued on August 1st last, and, like its predecessor, issued April 30, 1910, is in three parts. Part I. describes the sanitary condition of the harbour and discusses the question of its pollution in easily understood terms. Part II. gives the commission's opinion, and the opinions of various persons consulted by the commission, as to the degree of cleanness which should be considered necessary and sufficient for the water. Part III. contains tables and plottings of analytical data relating to the condition of the harbour. An extensive table of contents and numerous page and sectional headings facilitate reference to the various subjects contained in the report. Details of this report have appeared from time to time, and have been dealt with in these pages. We may add, however, that the present volume is presented in a highly attractive form, and contains a mass of information, particularly in the results of microscopic examinations, numbers of bacteria and dissolved oxygen, with many tables and diagrams and several maps, rendering it valuable for reference.

Collection of House and Trade Refuse.—A paper on this subject will be read by Mr. J. O. Neumann at a meeting of the Institute of Sanitary Engineers to be held at Caxton Hall, Westminster, on Monday, the 16th inst. The chair will be taken at 8 o'clock by Sir John A. Cockburn, M.D., K.C.M.G.

Producer Gas.—A paper on "The Generation and Distribution of Producer Gas in South Staffordshire" will be read by Mr. H. A. Humphrey, M.INST.C.E., at a meeting of the Institution of Civil Engineers to be held at the Institution of Mechanical Engineers on Tuesday evening next. The chair will be taken at 8 o'clock.

Preliminary Studies in Bridge Design.—This little book,† a reprint of articles which appeared in THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

---

* With 60 per cent of sea water and 40 per cent of land water, and at the extreme summer temperature of 86 deg. Fahr., 3 cubic centimetres of oxygen per litre corresponds to 68 per cent of saturation.

TESTS OF ROAD STONES IN THE UNITED STATES.

GENERALISATION AS TO SERVICE RESULTS.

A bulletin recently issued by the United States Office of Public Roads contains a description of the tests carried out to determine the physical properties of rocks used for road making, and an interpretation of the results of these tests. In addition, there is a "discussion" of the behaviour of similar materials in service. The tests made are those for: (1) Hardness, (2) toughness, (3) wear-resistance, (4) cementing value, (5) specific gravity, and (6) absorption of water. The following summaries, from a table included in the report, relate to the more important of the rocks tested, and have been prepared for the purposes of the present article.

The rocks tested included the following, the number of samples tested in each case following the name:—

Amphibolite, 16; andesite, 63; basalt, 183; chert, 52; conglomerate, 9; diabase, 217; diorite, 72; dolomite, 183; felsite, 11; gabbro, 42; gneiss, 152; granite, 219; limestone, 718; marble, 37; peridotite, 5; quartzite, 90; rhyolite, 42; sandstone, 340; schist, 136; shale, 9; slag, 55; syenite, 27.

SUMMARIES OF MAXIMUM AND MINIMUM VALUES.

Extent of the variation in specific gravity in each case.—

More than 1·0. Sandstone, slag, 0·8 to 1·0; chert, gabbro, granite, limestone, peridotite, rhyolite, syenite.

0·6 to 0·8: Conglomerate, diabase, dolomite, gneiss, quartzite.

0·4 to 0·6: Amphibolite, schist.

0·2 to 0·3: Felsite, basalt, diorite, marble, shale.

Average specific gravities:—

Above 2·9: Amphibolite, diabase, gabbro, peridotite, schist, slag.

2·7 to 2·9: Basalt, diorite (2·86), dolomite, gneiss, marble.

2·6 to 2·7: Andesite, conglomerate, felsite, granite, limestone, quartzite, sandstone, shale, syenite.

Below 2·6: Rhyolite (2·56), chert (2·55).

Maximum water absorption, lb. per cubic foot:—

Over 10 lb.: Andesite, chert, limestone, sandstone.

6 lb. to 10 lb.: Dolomite (9·4), rhyolite (7·15), basalt (6·4).

4 lb. to 5 lb.: Shale, slag, syenite.

3 lb. to 4 lb.: Conglomerate, felsite.

2 lb. to 3 lb.: Diabase, 2·73 (217 samples); granite, 2·77 (136 samples); marble; quartzite, 2·95 (90 samples).

Below 2 lb.: Amphibolite, 1·65 (16 samples); diorite, 1·63 (72 samples); gabbro, ·97 (42 samples); gneiss, 1·24 (152 samples); schist, 1·35 (136 samples)

NOTE.—That for maximum absorption a small number of samples counts against the merit of a low figure.

Minimum water absorption, lb. per cubic foot.—

All were below 0·51 lb.

0·2 lb. to 0·3 lb.: Conglomerate, chert, peridotite (5 samples).

0·1 lb.: Marble.

0·05 lb. to 0·10 lb.: Dolomite, schist, syenite.

0·05 lb.: Andesite, diorite, quartzite.

0·04 lb.: Amphibolite (16 samples), gabbro, granite (219 samples), slag.

0·03 lb.: Diabase (217 samples), rhyolite (42 samples).

0·02 lb.: Gneiss, felsite (11 samples), limestone (718 samples), sandstone (340 samples).

NOTE.—That for maximum absorption a large number of samples counts against the merit of a low figure.

Maximum French coefficients of wear-resistance:—

Above 40: Amphibolite, sandstone.

30 to 40: Basalt (30·4), diabase, gabbro (30·8), granite, schist (31·7).

25 to 30: Andesite, diorite (25), syenite.

20 to 24: Felsite, gneiss, limestone, quartzite, rhyolite.

15 to 20: Marble, slag.

10 to 15: Chert, conglomerate, peridotite.

NOTE.—A large number of samples counts against the merit of a high figure for maximum wear-resistance.

Minimum French coefficients of wear-resistance:—

Above 10: Felsite (only 11 samples).

Above 5: Diabase, gabbro, quartzite.

3 to 4·1: Amphibolite (16 samples), diorite, rhyolite (4·1), slag (3).

2 to 3: Syenite (2·8), andesite, basalt, dolomite, gneiss.

Below 2: Chert, granite (but with 219 samples), limestone (718 samples), sandstone (340 samples), schist (136 samples).

NOTE.—A large number of samples reduces the demerit of a low minimum figure for wear-resistance.

LABORATORY TESTS AND SERVICE RESULTS.

It is pointed out in the bulletin that it would "be impossible to judge accurately the qualities of a road material from laboratory tests alone, unless supplemented by the experience obtained by observation of similar material in service." The discussion of results applies "only to materials which are to be subjected principally to horse-drawn traffic, as ordinary macadam roads have been found impracticable when much automobile traffic exists."

Trap Rocks.—It is concluded that, excepting the cementing test, which sometimes gives values lower than those corresponding to the results of experience, the laboratory tests of trap rocks tally with the results of service tests.

Limestone and Dolomite.—It is concluded that the results of laboratory tests furnish a very fair indication of the probable behaviour of the material in service.

Chert.—Usually shows good wear resistance, and better binding qualities in service than those indicated by cementing tests. The following are quoted in full:—

Granites. Lack of toughness and binding power renders the granites, as a class, unfit for use in any but the foundation courses of macadam roads. The laboratory test will usually show these defects, except in the case of highly altered material, which will invariably show a good cementing value in the laboratory. Experience has shown, however, that even such material should not be used for surfacing on account of the ease with which it disintegrates under traffic.

Sandstones.—The laboratory tests do not agree concerning sandstones as closely as they should with the results in practice. This is especially true in their wearing and binding qualities, for, although these tests quite frequently run high in the laboratory, it is undoubtedly true that, except in some instances, material of this nature is unsuitable for use except in the foundation courses. As a rule, therefore, it is necessary in judging this material only to determine whether it has sufficient strength to stand up under the roller.

Chert.—Chert is a very hard material, and usually shows good resistance to wear and rather low cementing value in the laboratory. It has been found, however, that it in general develops good binding qualities on the road.

Gneiss, Schist and Slate.—Owing to their foliated structure, gneiss, schist, or slate should never be used in road construction when a better material is available.

Marble and Quartzite.—Neither marble nor quartzite is of much value to the road builder for the wearing courses of macadam roads, the first on account of the crystalline structure, and the second on account of its extreme hardness and lack of binding power.

"Fluate."—The manufacturers of this material—in regard to which an inquiry appeared in last week's issue—are, a correspondent informs us, the Bath Stone Firms. "Fluate" is a waterproofing composition for brick and stone walls.

Northampton Polytechnic Institute.—The annual prize distribution and students' conversazione will take place this (Friday) evening. The distribution of prizes and certificates will be performed by the Marquess of Northampton, K.G. The conversazione for members and students will be continued to-morrow, when the institute's building in St. John-street, Clerkenwell, will be thrown open to the whole of the members and students and their friends.

Municipal Engineering (Edited by Sydney G. Turner, ASSOC.M.INST.C.E. Price 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.).—This volume consists of model answers to questions set at recent examinations of the Institution of Municipal and County Engineers, and is the second edition. It is practically identical with the first issued. It is not suggested that it should take the place of recognised text-books, but it provides useful summaries of various subjects, as well as indications as to how different types of questions may be answered. Every effort has been made to render the answers as accurate and comprehensive as possible, though they contain more than a candidate would be expected to supply. The answers are founded upon examinations held in Birmingham, London and Manchester. The appendix contains examples of questions on sewerage, sewage disposal, tramway construction, bridges, water supply, road construction, buildings, sanitary science as applied to towns and buildings, drainage, and other matters.—*Local Government Journal.*

Some Recent Publications.*

The Law Relating to Electric Lighting, Power and Traction. By the late John Shiress Will, K.C. Fourth edition, by W. E. Tyldesley Jones, of Lincoln's Inn, Barrister-at-Law. Price 27s. 6d. London: Butterworth & Co.

This is the fourth edition of the late Mr. Shiress Will's well-known work and as it is about ten years since the third edition appeared, it will be readily seen that there was a good deal of work to be done by the reviser and editor. During the last decade the law relating to electrical undertakings has much increased in importance owing to the vast amount of capital which has been sunk in these enterprises. The same period has also witnessed many important changes and developments in the law. In this connection it is sufficient to refer to the passing of the Electric Lighting Act of 1909, the considerable body of new law which has been established by judicial decisions, and the advent of the railless trolley car, with the consequent necessity of devising new appropriate clauses for the Acts authorising this system.

In the light of these and other changes, it is only to be expected that the revision effected in this fourth edition is of a very substantial character. The introduction, which comprises a concise, yet comprehensive, survey of the law, has been entirely rewritten. The main body of the work is divided into two parts, dealing respectively with the law relating to electric lighting and power, and that relating to electric traction. The method of arrangement adopted in regard to Part I. is to print the full text of the various statutes, an exhaustive note being appended to each section. It will be generally conceded by those accustomed to the practice of the law that this is the best way of arranging a book of this kind if accuracy is to be secured, as there are innumerable pitfalls in the path of anyone who attempts to paraphrase an Act of Parliament. Inasmuch as all cross references are duly set out in their proper places in the note to each section, and the volume is provided with a very full index, it is not a difficult matter to find *all* the provisions which apply to any given subject, if the reader desires to do so. Appended to the statutes are forms of provisional order, power act, &c., and the rules, regulations and forms of account prescribed by the Board of Trade, the London County Council, and other authorities.

Part II. of the work consists of an introduction devoted specially to electric traction, the text of the Railways (Electrical Power) Act, 1903, a series of model clauses, and the Board of Trade regulations, &c. In the case of a book of this kind which has a long-established reputation, the task of the reviser and editor is not an easy one, inasmuch as his work naturally suggests comparison with that of the original author. It is sufficient to say that, judged by this high standard, the new edition for which Mr. Tyldesley Jones is responsible does not fall behind its predecessors, and we are confident that "Will on Electric Lighting" will continue to be regarded as an indispensable part of the equipment of those legal practitioners who are concerned with this branch of the law, and of those engineers who are charged with the administration of electrical undertakings, and who consequently require an authoritative and readily accessible legal guide.

Street Pavements and Paving Materials. A Manual of City Pavements: Their Methods and Materials of Construction. By Geo. W. Tillson. Second edition. Price $4 net. New York: John Wiley & Sons.

The first edition of this standard work was published twelve years ago. Since then a number of new pavements have been introduced, and modifications of methods of constructing the old pavements have been made. This has necessitated a thorough revision of much of the book. New chapters on concrete pavements and the protection of pavements have been added. The book's chapters now reads as follows: (1) History and Development of Pavements, (2) Stone, (3) Asphalt, (4) Brick Clays and the Manufacture of Paving Brick, (5) Cement, Cement Mortar, and Concrete, (6) Theory of Pavements, (7) Cobble and Stone-block Pavements, (8) Asphalt Pavements, (9) Brick Pavements, (10) Wood Pavements, (11) Broken-stone Pavements, (12) Concrete Pavements, (13) Plans and Specifications, (14) Construction of Street Car Tracks in Paved Streets, (15) Width of Streets, Kerbs, Sidewalks, &c., (16) Asphalt Plants, (17) The Protection of Pavements.

One of the most interesting chapters in the book is that on the theory of pavements in which such matters as cheapness, durability, resistance to traffic, non-slipperiness, ease of maintenance, favourableness to travel, and sanitariness are discussed. The following formula is given for determining the annual expense of a new pavement: $A + CI + \frac{R}{N}$, where N is the life of the proposed pavement, C the cost per square yard, I the rate of interest, R the estimated total cost of repairs if distributed over the entire life, A the sinking fund to be paid each year to equal C at the end of N years. When the annual cost for the repairs of a pavement exceeds the sum given by the above formula a new pavement should be laid.

The book is practical as well as theoretical, and must be regarded as one of our best standard works on the subject.

A Text-book on Roads and Pavements. By Fredk. P. Spalding. Fourth edition, revised and enlarged. Price $2 net. New York: John Wiley & Sons.

The motor car has given rise to many new problems in road building, both in the city and country, and has led to extensive scientific study of the materials used for road building. This has necessitated a re-writing of the present book and its issue in a fourth edition, materially enlarged.

The book is an elementary treatise on the general subject, and covers country roads as well as city pavements. The following are the chapter headings: (1) Road Economics and Management, (2) Drainage of Streets and Roads, (3) Location of Country Roads, (4) Improvement and Maintenance of Country Roads, (5) Broken-stone Roads, (6) Bituminous Macadam Roads, (7) Foundations for Pavements, (8) Brick Pavements, (9) Asphalt Pavements, (10) Wood-block Pavements, (11) Stone-block Pavements, (12) Concrete Pavements, (13) City Streets. The work is well arranged and well printed, but lacks one essential feature of a scientific book—there is no index.

Vol. clxxxviii. of the "Proceedings" of the Institution of Civil Engineers contains four papers, or groups of papers, selected for discussion. The first, "Experiments on the Strength and Fatigue Properties of Welded Joints in Iron and Steel," by T. E. Stanton and J. R. Pannell, is somewhat beyond the range of practical interest of Surveyor readers. The three next, taken together for discussion, were: "Reinforced-Concrete Wharves and Warehouses at Lower Pootung, Shanghai," by S. H. Ellis; "The Direct Experimental Determination of the Stresses in the Steel and in the Concrete of Reinforced-Concrete Columns," by W. C. Popplewell; and "Composite Columns of Concrete and Steel." These papers have a direct bearing on reinforced-concrete structural work, including bridges, in which columns of reinforced concrete often play an important part. A paper on "The Central Heating and Power Plant of McGill University, Montreal," by R. J. Durley, provoked an interesting discussion, in which, among others, Prof. Coker, Mr. F. W. Jennings and Sir Charles Parsons took part. The last group consisted of two papers: "The Water Supply of the Witwatersrand," by D. C. Leitch, and "Investigations Relating to the Yield of a Catchment Area in Cape Colony," by E. C. Bartlett. The discussion and correspondence following these papers occupy seventy-two pages of the book, and the considerations brought forward were, in several cases, of much interest. Among the names of those taking part in the discussion or contributing to the correspondence the following are prominent: Mr. Baldwin Latham drew attention to important facts and figures, especially in connection with gaugings of streams in various parts of England. Mr. E. P. Hill criticised the methods of water engineers in dealing with rainfall and run-off data. Mr. M. B. Duff discussed rainfall data, and compared figures for maximum run-off with the maximum run-off as computed by Dickens' formula. Mr. W. J. Olive criticised Mr. Bartlett's paper with respect to rainfall and run-off, and referred to the

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

elaborate Burkli-Ziegler formula. Mr. R. Ryves also discussed this part of the subject, and suggested that the Ryves and Chamier formulas should be compared with results obtained by gaugings in South Africa. A number of engineers discussed the conditions in the areas under consideration, and the works described in Mr. Leitch's paper. These papers, with the discussion and correspondence, form an important contribution to the literature of water engineering.

TEST DEFLECTIONS IN REINFORCED CONCRETE.

At a meeting of the Society of Engineers (Incorporated) held on Monday evening, Mr. Percy J. Waldram, F.S.I., M.C.I., read a paper on "Test Deflections in Reinforced Concrete," a subject which, he stated, was one requiring the closer attention of engineers before a standard of deflection was fixed by the proposed London County Council regulations, a standard which might or might not be correct or even safe.

The stiffness of a beam was no criterion of its strength unless due regard were paid to the factors of depth and fibre stiffness. The small deflections of reinforced concrete beams were sometimes quoted as evidence of the strength of the material, but it was seldom noted that the deflections were small because the greatest loads placed on reinforced concrete were very much less than those commonly used upon wood or steel. Reinforced concrete was a much weaker material than steel or ordinary fir for beams of equal size.

The draft regulations for reinforced concrete compiled and approved by the London County Council were submitted to the principal architectural and engineering institutions for criticism, and published in the "Minutes" of the council. The author had been consulted in a case where the parties had agreed to work to the regulations as published, when the opportunity of applying them to the problem of a somewhat difficult design gave disquieting results. For instance, the clauses determining the strength of columns were quite unworkable, and those relating to deflection proved positively dangerous, as was shown by examples.

A standard of deflection suggested by the author was referred to, but he pointed out that the effect of end fixing was not yet fully determined, and that it was impossible to legislate on an uncertain basis. The minute range of the deflections made it all the more necessary to use the greatest care in fixing a standard.

Reference was then made to the calculations necessary to determine the strength of reinforced concrete beams, and a number of formulæ were given, with explanatory notes. The application of these to well-known tests was shown by a series of graphs, and particular attention was directed to one in which the conditions were such as were general, supposed to make the calculations almost impossible, on account of their intricacy. By the author's method, however, the problem was shown to be very much facilitated.

Problems in Engineering with Solutions.* —The English journal THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER carries on a section devoted to various questions which might be put in an examination for the position of municipal engineer in an English town or city. The questions are given one week and answers provided by various correspondents given in subsequent issues. The volume noted above is the first one to be made up from the questions and answers. As is well known, the position of municipal engineer in England is one of most varied activity, so that the subject covered by the questions and answers extends through the whole field of engineering. For example, the chapter headings are as follows: Mechanics and Hydrostatics; Strength and Elasticity of Materials; Theory of Structures; Surveying and Levelling; Water Supply and Hydraulics; Sewerage; Sewage Disposal; Road Making and Tramways; Building Construction and Materials; Law and Miscellaneous. While the questions and most of their solutions are distinctly British in character, the wide range of subjects and the method of treatment make the book of some value to American engineers. There is a good deal to be said in favour of the question and answer method of instruction.—*Engineering News.*

* Being Questions and Answers reprinted from the Assistants' and Students' Sections of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. First Series, 1909-10. Edited by Sydney G. Turner, A.C.G.I., M.INST.C.E. London: St. Bride's Press, Limited. Price 6s. nett.

HEAVY MOTOR TRAFFIC.

THE HORNSEY TEST CASE.

At the last monthly meeting of the Middlesex County Council the Highway Committee reported that they had been in communication with the Hornsey Borough Council on the subject of a certain road in the borough, the carriageway of which was of macadam and unsuited to such traffic. The effect of the traffic on the road had been disastrous, and rendered necessary very heavy expenditure. They had taken counsel's opinion, and were advised by Mr. Macmorran, K.C., that they had a good case against the motor omnibus companies under sec. 23 of the Highways and Locomotives Amendment Act, 1878, amended by sec. 12 (1) of the Locomotives Act, 1898. The borough council proposed to bring a test case in the High Court, and they asked the Highway Committee to contribute a share of the costs of the action. The committee were of opinion that the county council could not reasonably be expected to contribute to the costs incurred by the Hornsey Council. It was stated by a member that the road in question was not a main road, and that any decision obtained would not govern main roads. It was resolved, however, to send the matter back to the committee for further consideration.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. THOMAS, M.INST.C.E., County Surveyor, Buckinghamshire.

A meeting of the Institution of Municipal and County Engineers will be held at Caxton Hall, Westminster, this (Friday) evening.

PROGRAMME.

7 for 7.30 p.m. Assemble in Room 13 at Caxton Hall, which adjoins S. James's Park (District Railway) Station.

8 p.m. Discussion on paper entitled "Rail Corrugation," by Mr. H. T. Wakelam, M.INST.C.E., county engineer, Middlesex.

10 p.m. Light refreshment.

CHAS. JONES, M.INST.C.E.,
Hon. Secretary,
Borough Engineer,
Ealing, W.

EASTERN DISTRICT.

Chairman—Mr. ALFRED FIDLER, M.INST.C.E., Northampton.

An Eastern District meeting is to be held at Lyons' Victoria Mansions Restaurant, Victoria-street, Westminster, to-morrow (Saturday).

PROGRAMME.

4 p.m. Meeting of the Eastern District Executive Committee at the offices of the institution, 11 Victoria-street, Westminster, S.W. Note.—The members of this committee were elected at the Grays meeting, and have been circularised.

6 p.m. Dinner at Lyons' Victoria Mansions Restaurant (Victoria-street, Westminster). Tickets 2s. 6d. each.

7 p.m. Discussion on the report of the Departmental Committee of the Local Government Board in reference to Intercepting Traps on House Drains, to be opened by Mr. H. P. Boulnois, M.INST.C.E.

8 p.m. Music and conversation.

8.30 p.m. Suggestions and discussion in regard to the work of the institution, with special reference to the Eastern District.

A cordial invitation is given to members of the district to attend the Eastern District meeting and the dinner and discussion.

ERNEST J. LITCHFIELD, M.INST.C.E.,
Hon. District Secretary,
Borough Engineer,
Southend-on-Sea.

SOUTH-EASTERN DISTRICT.

A meeting of members of the above district will take place at Sidcup at 2.30 p.m. on Wednesday, January 8th, when the road sections will be inspected.

Mr. Maybury has kindly consented to supply the re-

vised cost of the trial lengths up to December 31st; the meeting will be followed by a dinner at Frascati's Restaurant, Oxford-street, at 6.30 p.m.

MEETING AT SWANSEA.

A meeting of the institution will be held at Swansea on Saturday, January 11, 1913.

Thomas Cole,
Secretary.

11 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

COUNCIL MEETING.

At a meeting of the council held on November 27th the following applicants were recommended for admission:—

To Membership: Messrs. B. H. Noble, surveyor, Alford Urban District Council; R. G. Whitley, engineer and surveyor, Bentley-with-Arksey Urban District Council; and H. J. Godfrey, surveyor, Cricklade and Wootton Bassett Rural District Council.

To Associate-Membership: Mr. W. J. Thorp, road surveyor, Harrogate Corporation.

Transfer to Membership: Messrs. G. F. Andrassey, architect and assistant engineer and surveyor, Chelmsford Rural District Council; and C. T. Fulcher, deputy surveyor, Shoreditch Borough Council.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

New Members, &c.—From the applicants recommended for admission at the last meeting, seven members and two associate members were elected, and one transfer was made to the membership class.

Royal Sanitary Institute Congress.—The president was deputed to represent the institution at the congress to be held at Exeter in July.

Provincial Council Meetings.—It was decided that two provincial council meetings should be held during the present financial year, one in the Northern and one in the North-Western District.

Next Council Meeting.—It was decided that, owing to the Christmas holidays, the next meeting of the council be held on Saturday, December 21st.

B. Wyand,
Secretary.

39 Victoria-street, S.W.
November 30, 1912.

INSTITUTION OF WATER ENGINEERS.

President—Mr. J. S. Pickering, M.Inst.C.E., borough surveyor and water engineer, Cheltenham.

WINTER GENERAL MEETING.

The seventeenth Winter General Meeting of the Institution of Water Engineers will be held at the apartments of the Geological Society, Burlington House, W., on Saturday, December 14th. The proceedings will commence at 10.30 a.m., or as soon as the business of the special general meeting called for 10 o'clock is completed. The usual informal dinner will be held on Friday evening.

The following papers have been promised for reading and discussion:—

(1) "Some Recent Examples of Pollution of Public Water Supplies," by J. C. Thresh, D.Sc., M.D., &c.

(2) "The Valuation of Water Undertakings on Transfer to Local Authorities," by E. J. Silcock, M.Inst.C.E., F.S.I.

(3) "Recent Advances in the Science of Water Purification" by Adolph Kemna, D.Sc.

Advance copies of these papers will, it is hoped, be available for the use of those wishing to take part in the discussions, but as only a limited number will be printed early application should be made.

Programme.

10.30 a.m.—The minutes of the seventeenth ordinary general meeting and of the special general meeting will be read and submitted for confirmation; ballots will be taken for council for the year 1913-14, and for new members; reading of papers and discussions thereon.

The meeting will be adjourned for luncheon or otherwise as circumstances may require.

Percy Griffith,
Secretary.

20 Victoria-street, S.W.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. John D. Watson, M.Inst.C.E., F.R.San.I.

ANNUAL GENERAL MEETING AND DINNER.

The eleventh annual general meeting and dinner of the Association of Managers of Sewage Disposal Works will take place on Thursday next the 12th inst., at the Holborn Restaurant, London.

Programme.

11 a.m.—Council meeting.

2 p.m.—Annual general meeting, York Room; chairman's annual report; balance-sheet; general business.

2.45 p.m.—Lieut.-Colonel Alfred A. S. Jones, V.C., M.Inst.C.E., past-president, will present a paper, "Eighth Report of the Royal Commission"; Mr. Arthur J. Martin, M.Inst.C.E., presents a paper, "Tanks — and other Matters"; Mr. Wm. Makepeace presents a paper, "Fine Grade Filters"; discussion.

At the annual dinner, which will take place in the Gordon Salon at 7 p.m., presentations will be made to Colonel Jones and to Mr. Daniel Ledson, hon. secretary of the Manchester District branch of the association.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

President—Mr. Harold F. Coales, Assoc.M.Inst.C.E., Engineer and Surveyor, Sunbury-on-Thames.

The ordinary monthly meeting of the above association will be held at the Town Hall, Twickenham, to-morrow (Saturday), at 6.30 p.m. under the presidency of Mr. Harold F. Coales, Assoc.M.Inst.C.E. After the general business of the association has been dealt with, a paper, entitled "Notes upon the Effect of Intercepting Traps in House Drainage," by Mr. E. Willis, Assoc.M.Inst.C.E., F.S.I., will be considered. A matter dealing with fire hydrants will also be taken, and it is hoped that members will endeavour to be present to take part in the discussion of these subjects.

James W. Croxford,
Hon. Secretary.

Clifden House,
Brentford.

FOUR BOOKS FOR MUNICIPAL ENGINEERS.—There is a field for enterprising local authorities to lead the way by providing municipal crematoria. Mr Albert C. Freeman's book—"Crematoria in Great Britain and Abroad," with 70 illustrative plans and designs, price 5s. (post-free 5s. 4d.)—is the standard work on the subject. Mr. Freeman is also the author of "The Planning of Poor-Law Buildings and Mortuaries," price 7s. 6d. (post-free 7s. 10d.), a companion work in which the illustrations are again a valuable feature. "Roofs and Floors of New Buildings: their Structure and Stability," by Ernest H. Essex, Assoc.M.Inst.C.E., price 2s. 6d. (post-free 2s. 8d.), embodies in a most concise manner the calculations necessary for the strengths of timbers in floors and roofs. "The Housing of the Labouring Classes and Back-to-Back Houses," by H. Percy Boulnois, M.Inst.C.E., price 1s. (post-free 1s. 1d.), contains 41 diagrams, and comprises, says "The Architect," "valuable information on one of the most embarrassing of social problems." The above four works are all published by the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

TEMPORARY SURVEYING ASSISTANT.—December 7th.—Hazel Grove and Bramhall Urban District Council. £2 2s. per week.—Mr. Frederick Pidgeon, clerk.

HIGHWAYS SURVEYOR.—December 7th.—Keynsham Rural District Council. £175 per annum.—Mr. Frank G. Whittuck, clerk.

ROAD FOREMAN.—December 11th.—Tonbridge Urban District Council. 35s. per week.—Mr. W. L. Bradley, engineer and surveyor, The Castle, Tonbridge.

CLERK OF WORKS.—December 11th.—Corporation of Ramsgate. £4 4s. per week.—Mr. A. B. Clarke, town clerk.

OUTDOOR ENGINEERING ASSISTANT.—December 14th.—Rivers Committee of the Manchester Corporation. £200 per annum.—Mr. Thomas Hudson, town clerk.

INSPECTOR OF NUISANCES AND SURVEYOR.—December 16th.—Thurnscoe Urban District Council. £140.—Mr. J. Ledger Hawksworth, clerk.

SURVEYOR'S ASSISTANT.—December 17th.—Bridgwater Rural District Council. £50—£60.—Mr. W. Alexr. Collins, engineer and surveyor. Applications to be endorsed "Assistant."

BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—December 21st.—Corporation of Ludlow. £200 per annum.—Mr. John H. Williams, town clerk.

SURVEYOR.—December 21st.—St. Bartholomew's Hospital.—Mr. Thomas Hayes, clerk to the governors.

CLERK OF WORKS.—December 21st.—East Suffolk County Council.—Mr. W. Jervis, chief surveyor of main roads, County Hall, Ipswich.

DEPUTY BOROUGH ENGINEER AND SURVEYOR.—December 23rd.—Corporation of Warrington. £200 per annum.—Mr. Andrew M. Ker, borough engineer and surveyor.

ENGINEER-IN-CHIEF.—December 31st.—Mersey Docks and Harbour Board.—Mr. Alfred Chandler, general manager and secretary.

SECOND ARCHITECTURAL ASSISTANT.—Public Works Department of the Government of Ceylon. Age between twenty-five and thirty. £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W. Quote M 5,711 on left-hand top corner of application.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

BELFAST.—January 1st.—Designs for 126 houses of two apartments each, and 126 houses of three apartments each, for the corporation. Premiums are offered of £25, £15, and £10.—Mr. R. Meyer, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

HARROGATE.—February 3rd.—Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

DUBLIN.—February 6th.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A.—The Town Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

MANCHESTER.—December 7th.—For the erection of a school, for the Education Committee.—Accountant, Education Offices, Deansgate.

NEWPORT (Mon.).—December 9th.—For the construction of an underground convenience, for the corporation.—Mr. A. A. Newman, town clerk.

DURHAM.—December 10th.—For alterations at a school, for the Education Committee.—Mr. J. Dawson, clerk, Shire Hall, Durham.

ASHTON-UPON-MERSEY.—December 10th.—For the erection of shelter and conveniences, for the urban district council.—Mr. J. W. L. Foulkes, clerk.

WEST HAM.—December 10th.—For the erection of fire brigade station and firemen's dwellings at Silvertown, for the corporation.—Mr. Fred. E. Hilleary, town clerk.

LEEDS.—December 11th.—For alterations to a council school, for the Education Committee.—Mr. J. Graham, secretary.

DUNGANNON.—December 12th.—For erecting twenty-two single and eighteen double cottages, for the rural district council.—The Clerk.

WIMBLEDON.—December 13th.—For alterations and additions to slipper baths, for the corporation.—Borough Engineer and Surveyor.

DOVER.—December 14th.—For additions and alterations to a school, for the corporation.—Mr. R. E. Knocker, town clerk.

ABERAVON.—December 14th.—For the construction of offices and boundary wall, for the corporation.—Mr. James Roderick, borough surveyor.

CHELMSFORD.—December 16th.—For sinking a borehole, for the corporation.—Mr. George Melvin, town clerk.

ABERDARE.—December 16th.—For the erection of twenty-three playsheds at council schools, for the Education Committee.—Mr. T. Botting, Education Offices, Aberdare.

STOCKPORT.—December 16th.—For extensions to technical school, for the Education Committee.—Mr. A. Lawton, secretary, Town Hall.

MONMOUTHSHIRE.—December 16th.—For the erection of a higher elementary school, for the Education Committee.—Mr. C. Dauncey, secretary, County Council Offices, Newport.

ABERTILLERY.—December 16th.—For extensions to the generating station, for the urban district council.—Mr. W. Gait, clerk.

FELIXSTOWE.—December 16th.—For the enlargement of a public convenience, for the urban district council.—Mr. H. Clegg, surveyor.

KENT.—December 19th.—For the erection of a school at Tonbridge, for the Education Committee.—Mr. F. W. Crook, secretary, Caxton House, Westminster.

EXETER.—December 23rd.—For the extension of the isolation hospital, for the corporation.—Mr. H. Lloyd Parry, town clerk.

TWICKENHAM.—December 27th.—For the construction of a stone-pitched inclined embankment along the river frontage, for the urban district council. Mr. H. Jason Saul[illegible]s, clerk.

Iron and Steel.

HAMPTON.—December 10th.—For the supply and erection of a duplicate set of condensing steam engine air compressors and other subsidiary works, for the urban district council.—Mr. Sidney H. Chambers, surveyor.

LARNE.—December 11th.—For the construction of 2,060 lin. yds. of 3-in. cast-iron pipe and collecting tank, for the rural district council.—Mr. S. M. Wallace, clerk.

MANCHESTER.—December 12th.—For the supply of reversible water-tube condensers at gas station, for the corporation.—Mr. Thomas Hudson, town clerk.

GUILDFORD.—December 18th.—For the construction of surface-water drain, manholes, gullies and connections, for the corporation.—Mr. A. D. Jenkins, town clerk.

BRADFIELD.—December 21st.—For the supply of engines and pumps for waterworks at Stratfield Mortimer, near Reading, for the rural district council.—Mr. R. E. Rawstorne, clerk, 4 Bridge-street, Caversham, Reading.

HARROGATE.—For the supply of 85 tons of 3-in. diameter cast-iron pipes and special castings, for the corporation.—Mr. Arthur W. West, waterworks manager and engineer.

Roads.

DORKING.—December 7th.—For the supply of broken granite, granite chippings, and coal-tar, for the urban district council.—Mr. W. A. Clegg, surveyor.

SOUTHAMPTON.—December 9th.—For the supply of refined tar for surface treatment of the main roads, for the county council.—Mr. H. Barber, clerk.

BECKENHAM.—December 9th.—For making up Overbury-avenue and Hampden-road, for the urban district council.—Mr. F. Stevens, clerk.

SOUTHAMPTON.—December 9th.—For the supply of columnar basalt, Clee Hill basalt, Welsh granite, coverack, or similar syenite, quartzite, and tarred-macadam, for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

SOUTHAMPTON.—December 9th.—For the hire of steam rollers, for the county council.—Mr. H. Barber, clerk.

STRETFORD.—December 9th.—For paving certain passages, for the urban district council.—Mr. Geo. H. Abrahams, clerk.

WAKEFIELD.—December 9th.—For the execution of private street works, for the corporation.—Mr. J. P. Wakeford, city surveyor.

SURVEYORSHIP.

ST BARTHOLOMEW'S HOSPITAL.

Notice is hereby given that a meeting of the Electors Committee will be held on Monday, the 6th January, 1913, at 3.15 o'clock in the afternoon, to elect a Surveyor to this Hospital.

Candidates, who must be members of the Royal Institute of British Architects, or of the Society of Architects, or of the Surveyors' Institute, are required to lodge 36 copies of their applications and testimonials with the undersigned on or before Saturday, the 21st December, 1912.

Further particulars will be forwarded on request.

THOMAS HAYES,
Clerk to the Governors.

November 28, 1912

BOROUGH OF LUDLOW.

APPOINTMENT OF BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES FOR THE BOROUGH OF LUDLOW.

Notice is hereby given that the Town Council will, on Thursday, the 16th day of January, 1913, appoint a competent and fully qualified person to perform the duties of the above joint offices.

The salary for the joint offices is £200 allocated as follows: £80 for the Borough Surveyor and £120 for the inspector of nuisances), with office accommodation, including stationery.

The duties will be:—

(a) The ordinary duties of a Borough Surveyor.

(b) The ordinary duties of an Inspector of Nuisances, as defined by the Sanitary Officers (Outside London) Order, 1910.

(c) The duties imposed by the Housing and Town Planning, &c., Act, 1909 and the Orders of the Local Government Board thereunder on an Inspector.

(d) The duties of an Inspector under the Petroleum Acts.

The appointment (as to the Inspectorship of Nuisances) is under the terms of Article IX. of the foregoing Order of the Local Government Board, and is subject to the approval of the Board.

The person appointed will (to comply with the Public Health Acts) be required to give security for the due performance of his duties, which security is fixed at £25. And will be required to give an undertaking not to be concerned in any work that may interfere with his official duties.

And I also will be required to agree to give at least one month's notice previous to resigning the office or to forfeit the sum of £5 as liquidated damages.

Applications, with copies of testimonials, endorsed "Borough Surveyor," to be delivered at my office not later than 5 o'clock in the afternoon of Saturday, the 21st day of December next.

The Council does not bind itself to make any appointment.

Personal canvassing of the members of the Council will be considered a disqualification.

JOHN H. WILLIAMS,
Town Clerk.

Town Clerk's Office, Ludlow.
November 23, 1912.

CITY OF MANCHESTER.

The Rivers Committee invite applications for the position of Cost Clerk and Engineering Assistant in the Main Drainage Works. Salary £200 per annum.

Applications, in writing, stating experience, with copies of three recent testimonials, to be sent to the Chairman of the Rivers Committee, Town Hall, Manchester, not later than 10 a.m. on Saturday, the 14th December, 1912. Canvassing, directly or indirectly, will be a disqualification.

THOMAS HUDSON,
Town Clerk.

Rivers Department,
December 3, 1912.

COUNTY BOROUGH OF WARRINGTON.

APPOINTMENT OF DEPUTY BOROUGH ENGINEER AND SURVEYOR.

The Corporation of Warrington invite applications for the position of Deputy Borough Engineer and Surveyor.

Candidates must be under 35 years of age, but over 40, and must have had Municipal experience, and possess a thorough knowledge of the duties of a Borough Engineer and Surveyor's Office. Preference will be given to candidates who have passed the examination for Associate Membership of the Institution of Municipal and County Engineers.

Salary £200 per annum.

Applications, stating age, experience, qualifications and present [illegible] accompanied by copies of not more than [illegible] testimonials, to be delivered at my Office not later than 12 noon on Monday, the 23rd day of December next, endorsed "Deputy Borough Engineer and Surveyor."

Canvassing the Members of the Council, personally or by letter, will be deemed a disqualification.

ANDREW M. KER,
Borough Engineer and Surveyor.

Town Hall,
Warrington.
December 3, 1912.

EAST SUFFOLK COUNTY COUNCIL.

MAIN ROAD RECONSTRUCTION SCHEME.

APPOINTMENT OF CLERK OF WORKS.

Applications are invited for the appointment of Clerk of Works to take charge (under the County Road Surveyor) of Works of Reconstruction of Main Roads in the County, for the three years ending 31st March, 1916.

Applicants must possess a sound practical knowledge of latest methods of road construction, and must not be more than 35 years of age. Candidates must be prepared to devote their whole time to the duties of the office, and commence work as early as possible.

Applications, endorsed "Clerk of Works," to be made in candidate's own handwriting, stating wages required (which must include all travelling and other expenses, except postages, telegrams and stationery), and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than 21st December, 1912.

Personal canvassing will disqualify.

Forms of application and particulars of the duties may be had on application to—

W. JERVIS,
Chief Surveyor of Main Roads.

County Hall,
Ipswich.
December 3, 1912.

BRIDGWATER RURAL DISTRICT COUNCIL.

SURVEYOR'S ASSISTANT.

Applications are invited for the post of Junior Assistant in the Engineer and Surveyor's Office. Salary £50 per annum, rising by annual increments of £5 to £60 per annum.

Applications, in candidate's own handwriting, stating age and experience, together with copies of three testimonials, to be delivered to the undersigned by December 17th, endorsed "Assistant."

No application will be considered unless candidate has had practical experience, and preference will be given to a Student of the Institution of Municipal and County Engineers.

Canvassing in any form will be considered a disqualification.

W. ALEXR. COLLINS,
Engineer and Surveyor.

36A Eastover,
Bridgwater.
November 27, 1912.

THURNSCOE URBAN DISTRICT COUNCIL.

APPOINTMENT OF INSPECTOR OF NUISANCES AND SURVEYOR.

The above Council invite applications for the position of Inspector of Nuisances and Surveyor, at a salary of £140 per annum.

The district comprises 1,200 acres, and has a population of 4,500, with a road mileage of 6 miles.

The person appointed must devote the whole of his time to the office, and will also be required to carry out the duties of Inspector under the Housing Acts. Inspector of Dairies and Cowsheds, and must possess a thorough practical knowledge of the duties appertaining to the various offices.

The appointment will be subject to the approval of the Local Government Board.

Applications, in the handwriting of the candidates, stating age, qualifications, and other particulars, together with copies of two recent testimonials, to be sent to Mr. M. Nokes, Chairman of the Council, not later than Monday, December 16th, 1912, endorsed "Surveyor."

Canvassing in any form will be deemed a disqualification.

J. LEDGER HAWKSWORTH,
Clerk to the Council.

Council Offices,
Bolton-upon-Dearne,
Rotherham.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. DECEMBER 13, 1912. No. 1,091.

Minutes of Proceedings.

The Engineer as Arbitrator.

We were compelled by considerations of space to defer our comments upon the admirable paper on "The Effect of Recent Decisions upon the Arbitration Clause" read lately before the Institution of Municipal Engineers by Mr. W. Valentine Ball, M.A., barrister-at-law, and reproduced in our last issue. The municipal engineer who has a duty to perform to his authority is not infrequently appointed as sole arbitrator to settle disputes under contracts to which his own employers are a party. In such cases his position is, to say the least, a rather invidious one, and it often happens that when the occasion for his services in this judicial capacity arises the contractor realises very keenly that he would rather have his case adjudicated upon by some more independent tribunal. He then finds that, although the agreement to refer disputes to arbitration does not operate to oust the jurisdiction of the ordinary courts of law, he is precluded from bringing an action unless the arbitrator has given a decision, or he can show some sufficient reason why the matter should not be referred in accordance with the submission. It would appear at first sight that the admitted bias—to a certain degree—of an arbitrator who is bound to one of the parties ought to be a sufficient reason to preclude him from acting. In this connection, however, the courts have taken the view (and rightly so, in our humble opinion) that the contractor must abide by the terms of a contract which was entered into by him with a full knowledge of the circumstances; and that if he agrees that the engineer is to act as arbitrator in case of dispute, he cannot afterwards be heard to say that the very man whom he has already accepted is disqualified from acting on the ground of bias. If, however, circumstances affecting the impartiality of an agreed arbitrator arise *after the contract has been entered into* the position is evidently quite different, and in cases of this kind which were cited by Mr. Ball it was held that after-acquired bias (if such an expression may be permitted) may constitute a legal disqualification so as to prevent an arbitrator from acting.

Another class of cases in which it has been held that the engineer is precluded from acting as arbitrator are those in which to allow him to act would be to make him judge in his own, as distinguished from his master's, cause. For example, if facts subsequent to the contract have given rise to a substantial dispute in which there are allegations of continued unreasonableness on the part of the engineer, and that is the real dispute between the parties, the engineer would not be allowed to arbitrate upon the point. Again, a very similar class of cases, and one to which the principle just enunciated is equally applicable, occurs where the personal conduct of the arbitrator is of the essence of the dispute. The ground covered by Mr. Ball's paper up to this point is no doubt familiar to most engineers, but the author will receive the grateful thanks of most of them for having put into concrete form and logical order a series of propositions about which their ideas hitherto have been more or less hazy. Perhaps the most interesting part of the paper, however, was the section which was devoted to "suggested reforms." The proposed alternatives to the usual form of the arbitration clause were three in number. First, the entire deletion of the clause, involving recourse to legal proceedings for the settlement of all disputes in regard to which a friendly agreement could not be arranged. This appears to us to be entirely undesirable, and we confess that we are not much impressed by Mr. Ball's reminder that a dispute arising under a building or engineering contract would not be tried by a judge and jury, but by a referee. This might be the case if the dispute were of a substantial character involving the investigation of complicated facts and figures. But the absence of an arbitration clause would open the door to a large amount of petty litigation in the course of the execution of a contract of any magnitude if the parties found themselves unable to work upon a friendly footing. The second proposed reform was that the reference should be to an independent arbitrator. From many points of view this is of course a very satisfactory method to adopt for the settlement of disputes, but it is a very expensive proceeding, inasmuch as in case of dispute evidence has to be given on every minute point, owing to the arbitrator's lack of knowledge of the subject matter or circumstances of the contract. The third suggestion is Mr. Ball's own, and we will leave it for the consideration of our readers, merely saying for ourselves that it appears to be a very practical and reasonable one. It is that the arbitration clause should be framed so as to leave the decision of every question arising under the contract to the engineer, but subject to a proviso that, should it appear to the court on an application to stay any action or proceeding brought in relation to the contract that the engineer is disqualified from acting as arbitrator, the matters in dispute will be referred to an engineer to be agreed between the parties, or, failing agreement, to be nominated by the president of the Institution of Civil Engineers.

* * *

A State Highway System for California.

In August of last year a highway commission for the State of California was appointed, a sum equivalent to about $3\frac{3}{4}$ millions sterling having been previously voted for the making of a State system of highways. The routes already planned amount to over 2,300 miles; surveys are in hand, and the letting of contracts has begun. The main features of the system are two nearly parallel routes, running lengthwise from north to south of the State, one of them traversing the great central trough formed by the Sacramento and San Joachin valleys, and the other following the coast. The latter is located near the coast in some parts, and elsewhere passes through valleys some way inland. The general character of the highway system is imposed by the main topographical features, the greater part of the area being bounded on the east by the Sierra Nevada range and on the west by the coast line which runs nearly parallel to the mountains. The conditions

generally are such as point to the economic wisdom of the decision to make a State system of highways, planned and carried out as a whole. The area of the State is greater than that of the United Kingdom or Italy, and its population cannot be expected to reach two millions for some years to come. The conditions do not, therefore, favour the gradual building up of a State system of roads after the manner which has rightly been regarded as suited to the conditions in the State of Massachusetts and elsewhere. In California the highway system seems likely to be relatively more important in comparison with railways than are the highway systems of many of the other States of the Union and most European countries. The economic conditions and the distribution of the population are not such as to lead to the construction of a close network of railways, and outer influences are limited by the position of the State, a long and somewhat narrow area lying between the great mountain range and the sea, and marching on the north and south with areas by no means thickly settled, and not occupied by great centres of activity. The State is nearly 800 miles long by a little under 200 miles in width, but the most important part of it at the present stage in its development is only some 150 miles wide from the mountains to the sea. The climatic conditions usually associated with the name of the State are those of the south end, protected to the northward by a transverse mountain range. The northern part of the State is colder, and wetter. At San José, near San Francisco, the mean temperature of the year is about 58deg., which is about the mean temperature of Greenwich for the first week in June and the second week in September. At the same place the mean temperature from May to September is from 4deg. to 7deg. above that of Greenwich, and is about 10deg. above for the remainder of the year. In the south very high summer temperatures are reached. The State lies roughly between the same parallels of latitude as Algeria, the northern half of Morocco and the southern half of Spain. The northern extremity lies near the latitude of Oporto, Naples, Uskub, Mustapha Pasha, and Boston, U.S.A.; the southern extremity near that of Tripoli, Jerusalem, Lahore, and Nanking. Local climates are, of course, much affected by the great differences in altitude between the coast and the uplands. The very large sum, relatively to the resources of the State, which is now being expended, and the definite planning of a main road system for so large an area, suggest that the work of the Californian Highway Commission is specially worthy of the attention of those highway engineers who follow the developments of road engineering in many different countries.

The Road Board and the Metropolis.

The circular letter which has been sent by the Road Board to the highway authorities of Greater London is a timely and welcome document, a satisfactory feature of which is the indication of the total amount which the Board are prepared to treat as available, at present, for grants or short loans within this area. The decision [illegible] will not be extended for more than five years is sound finance, having regard to the class of work [illegible] As regards the particulars required from the [illegible] we think that costly widenings in closely built cities were not contemplated as within the scope of the Road Improvement Fund, which would indeed be quite inadequate for any such purpose, even if there were not any necessity for spending money on the country roads.

It was to be expected that the motor omnibus would loom large in any circular issued by the Road Board to Metropolitan highway authorities, and we trust that under the head of "Reconstruction of Road Crusts" special attention will be paid to the substitution of 9-in. concrete foundations in those streets where 6-in. foundations have been found inadequate. We offer the suggestion, and if it is worth anything at all it is worth at least half-a-million sterling, that a 9-in. concrete foundation need not be made with Portland cement throughout its thickness in view of the fact that other and cheaper materials than Portland cement concrete are amply strong enough to withstand the stresses which are imposed upon the lower part of a thick crust of this kind. Another welcome feature of the circular is the paragraph relating to the acquisition of land for widenings of important roads. The powers of the Road Board in this matter exceed, both in force and in simplicity, the powers of any other authority. The significance of the word "vacant" should not, however, be overlooked in this connection. Having regard to the purpose for which the Road Board was created, the extent and limitations of its sources of revenue, the urgent calls which are made upon it from various quarters, and the magnitude of a few specific works which it may be called upon to facilitate, most unprejudiced judges will, we think, agree that the Board has come to a wise decision with regard to the manner in which, and the extent to which, the Road Improvement Fund may be used at the present time within the area of Greater London.

Public Health of Staffordshire.

We have been favoured with a copy of the report of Dr. George Reid, the medical officer of health to the Staffordshire County Council, for the year 1911, and a perusal of it shows that the period under review was one of considerable progress and activity in many directions. The report incidentally forms a very good object lesson of the valuable work which is being done all over the country by the co-ordination of the work of the local medical officers of health which is effected by the county medical officer. Naturally a document of this kind, dealing with the public health administration of a county the conditions of which are in many respects peculiar and difficult, is concerned with a wide variety of subjects. Perhaps the most important part of the report, however, is that which deals with insanitary dwellings and overcrowding. In this connection Dr. Reid reports a considerable general improvement in regard to the activity and energy which are being displayed in dealing with this problem, and he quotes extensively from the reports which he has received from various localities. Some of the passages cited are of a very striking character. For example, the medical officer of health of Amblecote writes: "Just as the police officer can summon and get fined the man who uses obscene language in the street, so should the sanitary officer be able to deal in the same way with the filthy occupier, whose reckless habits are a menace to the lives of not only his own, but his neighbours' children." Again, the medical officer of health of Brierley Hill says: "The knowledge that a closing order under the Housing, Town Planning, &c., Act, 1909, is [illegible] a great incentive to many owners to take steps to put their property into habitable condition, and in a number of cases a preliminary intimation, or a personal interview, alone was sufficient to induce them to put their houses in repair. From the strongest utterance comes from the medical officer of health of the Borough of Stafford, who outlines a detailed plan for the provision by the municipality for the poorest of its members of sanitary houses, at a rental within their means, and for the inauguration of an educational scheme by which the tenants may be taught and encouraged to make proper use of the houses.

These observations show at once that much has been accomplished and that a great deal still remains to be done in certain districts. We have perused Dr. Reid's report with the greatest interest.

* * *

Newport Pagnell: A Report.

We have before us a copy of a report dealing with the sanitary circumstances and administration of the Newport Pagnell Rural District, which has just been published by the Local Government Board. The report was presented to the board by Dr. W. W. E. Fletcher, who had been deputed to hold a local inquiry, and, apart from the specific matters with which it deals, it raises once more the question of the necessity of providing an adequate staff for sanitary inspection. The district, which has two sanitary inspectors, comprises an area of 67,060 acres, and a population of upwards of 19,000 persons. Moreover, each inspector has hitherto held office as surveyor under the Public Health Act, 1875, and has been employed in a number of other capacities, in regard to each of which he has received some trifling remuneration. In these circumstances Dr. Fletcher's report reflects great credit upon these officers, who have done all that lay in their power, handicapped as they have been, to secure efficiency in the sanitary administration of the district. In 1909 the district was visited by one of the board's assistant inspectors, who concluded that the services of a third sanitary inspector were required. Dr. Fletcher, however, appears to have come to the conclusion that the existing staff is sufficient, providing that they have increased facilities for travelling. The council have accordingly resolved to continue with only two sanitary inspectors as hitherto, each of whom will still hold several minor appointments; they will, however, receive an inclusive salary, and each of them will be expected to provide and maintain a motor-cycle.

We are rather surprised that the report is silent as to the desirability of separating the office of sanitary inspector from other appointments—and particularly from that of surveyor. The whole tendency of modern legislation is, happily, to cast many additional duties upon medical officers of health, and as a consequence to increase the work of the sanitary inspectors. We have more that once expressed the opinion that the former should be whole-time officers, and we are also of opinion that the latter should be free from the cares of other work to devote themselves to the single task of carrying out their most important duties as sanitary inspectors.

Town Planning in Calcutta.

We have read with much interest a preliminary report which Mr. E. P. Richards, M.INST.C.E., chief engineer to the Calcutta Improvement Trust, has made to the trustees with regard to the policy which ought to be pursued in order that the planning of main traffic roads and the work of dealing with insanitary areas may proceed in harmony and in such a manner that neither work will check the other. On another page of the present issue we have summarised the main points of the report, and have added some passages taken from an *Indian Engineer* editorial, showing that the work of the trust is appreciated by the leading professional journal in India, and containing allusions to what has, up to the present, been a serious difficulty of the general situation. We hope, however, that matters are now to be placed on a better footing and that the energy with which Mr. Richards is throwing himself into his important task may, in the near future, be fruitful of results. Mr. Richards finds Calcutta a city very different from that garden city, Madras, with which, as assistant to the special engineer, and for a short term as engineer to the corporation, he was intimately acquainted. The half-million inhabitants of Madras are distributed between several towns and numerous villages and suburban areas included within the city boundaries, and we can well believe that Mr. Richards' close acquaintance with the varied conditions presented in this remarkable area was regarded as a valuable qualification by the trustees who are charged with the duty of town improvement in Calcutta. We wish Mr. Richards every success in his work, and we sincerely hope that the Calcutta authorities generally will take a broad and liberal view of the position and allow the trustees to change Calcutta into a city worthy of its place in the Empire.

*

The Maintenance Clause.

A case of much interest and importance, involving a consideration of the legal effect of the maintenance clause in an engineering contract, was decided last month by Mr. Justice Rowlatt at the Manchester Autumn Assizes. The plaintiff, Mr. H. M. Nowell, had contracted with the Manchester Corporation, who were the defendants, for the construction of certain works, including a retaining wall and bridge. The contract contained a clause requiring the contractor to make himself familiar with the ground in which the work was to be erected; and the maintenance clauses (the period being one year) required the contractor to make good all failures of the work, and particularly "all slips, settlements, accidents, or defects on or upon any portion of the work." During the period of maintenance serious cracks appeared in the wall and bridge, and considerable evidence was given on the question whether these were due to bad workmanship or faulty design. The learned judge held, however, that this question was immaterial, inasmuch as on the true construction of the contract, and particularly of the clauses above referred to, the contractor was bound to make himself familiar with the soil, to erect the wall, and to maintain it *in that soil* for the period named, without failure or imperfection. It has not infrequently been held that unforeseen difficulties due to subsoil which render work more expensive to construct are among the risks that a contractor must take. We are unaware, however, of any previous case in which this principle has been applied to the *maintenance* of works, although, as the learned judge pointed out, it is difficult to see any distinction between the two in principle. The Manchester case is therefore of great importance to engineers, and should be carefully noted by them.

*

The International Road Congress Traders' Committee.

We print elsewhere in this issue an official announcement which conveys some idea as to the character and extent of the admirable work which has been done by the Traders' Committee of the International Road Congress to further the success of that cosmopolitan gathering, a conference which will undoubtedly be the most important of its kind that has ever been held in this country. Generously as manufacturers and others have already responded to the efforts of the committee, collectively and individually, to obtain donations towards the funds necessary to ensure this success for the congress, a perusal of the list of donors suggests that there are many others who might reasonably be expected to subscribe. It may be that the appeal of the committee has not reached them, or, having reached them, is still under their consideration. In the former case we would ask those concerned to communicate at once with the hon. secretaries of the Traders' Committee; in the latter we would ask for realisation of the wise maxim, familiar in its Latin form, that he gives twice who gives quickly. Practical help might also be given to the committee in the way of suggestions for excursions and receptions that would appeal to the congress delegates from other countries, and by the submission of the names of those who, by securing spaces as exhibitors, would assist to make the congress exhibition as comprehensive and representative as possible.

Municipal Works in Hand at York.*

By F. W. SPURR, City Engineer and Surveyor.

In the following paper I do not intend to go closely into detail, but to confine myself to a description of a half-dozen works I have in hand at the present time.

I only consented to the meeting being held at York because your secretary assured me it was necessary to have an early meeting of the North-Eastern District representatives in some accessible and central place. I could therefore do no other than consent, although I could ill afford the time necessary for preparing even these notes. I trust, however, that the meeting will serve its purpose, and that some of the notes I am about to give will be of service to the institution.

The works I have referred to comprise: –

(1) The extension of the sewage disposal works at Naburn.

(2) The construction of storm-water tanks at Fulford pumping station.

(3) The construction of a new street linking up the centre of the city with Fishergate and Walmgate.

(4) The erection of thirty cottages for rehousing those displaced in carrying out the above scheme.

(5) Tar-macadamising of all cobble-paved streets.

(6) The extension of tramways.

EXTENSION OF SEWAGE DISPOSAL WORKS.

The extension of the sewage disposal works comprises the construction of two septic tanks, having a capacity of 1,200,000 gallons, making with the existing tanks a total capacity of 2,700,000 gallons, with ten continuous filters (each 104 ft. diameter and 6 ft. deep), in addition to two detritus tanks and humus tanks.

The contract for these works was recently let to Messrs. George Bell & Sons, Limited, of Manchester, their tender amounting to £21,351.

As the whole scheme provides for twenty-one new filters, it will be seen that a further contract will be necessary before this work is completed.

As probably some of you are aware, we have been treating a portion of the sewage of the city by means of open septic tanks and percolating filters for the last thirteen years, and for that purpose two of the precipitating tanks were converted for use as open septic tanks, the sewage passing through the length of both tanks before being carried by proportionate weirs and channels on to the two experimental filters, which I might here state have done their work in a very efficient and satisfactory manner, treating regularly 535,000 gallons per day, equalling 415 gallons per square yard per day.

I propose to construct the septic tanks of concrete with blue brick facings in cement mortar, a method of construction that has given the utmost satisfaction in the existing work. Arrangements for sludging and cleaning will be a repetition of what is provided in the existing tanks, the sludge being drawn off into a culvert at the deep end of the tanks, which is carried to a pump well near the buildings, and from which the sludge can be dealt with by the existing pumping plant.

It may be interesting here to state that the only part of the existing scheme which the Local Government Board consider superseded consists of six sludge presses and a length of sewage inlet channel. The presses will be abolished and the length of outlet channel will not be further required on account of diverting the end of the rising main to a new position, which more readily provides accommodation for detritus tanks. The steam-raising plant, air compressors, sludge rams—in fact, all other machinery—will be utilised in the new scheme for the purpose of tank cleaning and the removal of sludge to lagoons. I estimate that this plant will be required for about a month in each year, after which it will be entirely shut down and the power and lighting for the remainder of the year will be obtained from the electric generating plant installed at the York City Asylum not far away.

The two detritus tanks, each 51 ft. long by 11 ft. 3 in. wide, will be provided with an electrically driven dredger, and the detritus will be loaded into tip wagons running alongside the tanks.

The filters, ten in number, will be constructed on similar lines to the two existing ones which have proved so successful; the floors will be of concrete rising to the centre, and the walls of 9-in. brindled pigeon-holed brickwork in cement mortar. Floor tiles will be laid radially, and two tiers of air pipes extending almost to the centre of the filter will be provided at intervals of 2 ft. in the depth of the filtering media, which will not be smaller than about 1¼ in.

I have not yet fixed definitely on the type of distributor to be used, but it will be self-propelling, and of such construction as will permit compressed air being utilised for the purpose of cleaning the arms. Since I adopted this method on one of the existing filters some twelve months ago there has been no necessity to use the unsatisfactory brush, which, as you know, necessitates the removal of a plug at the end of each arm and the consequent pollution of the effluent channel.

The humus tank is divided into four sections, the bottom of each section being an inverted pyramid, the method of cleaning being by means of sludge syphons emptying into a steel tank in an adjoining position, from which it will be forced by means of compressed air to the sludge culvert. Provision is also made in the scheme for lifting the sewage by ejectors from each of the tanks back into the sewage channel whenever it may be necessary to empty them for sludging or other purposes.

It might be of interest if I give you the loan periods granted by the Local Government Board for this work, which are as follows:—

Detritus tanks, channels, rising main, bacteria beds, carriers, footpaths, banks, roads, ironwork, pipes, humus tanks and channels, and compressed-air chamber—thirty years.

Piling river bank, dredger lines and motor, ejector, sprinklers, electric cable to City Asylum, air compressor and motor, and steel ram—fifteen years.

In the working of the new plant against the existing I estimate a saving of £1,842 per annum, or £1,217 against £3,059.

STORM-WATER TANKS, ETC., AT FULFORD PUMPING STATION.

The works at Fulford are being installed to meet the requirements of the Local Government Board with regard to storm water, which up to the present time has been delivered direct into the river without any treatment of any kind.

The works provide a detritus tank and two storm-water tanks, each of 500,000 gallons capacity, and the sewage will pass through all three before overflowing to the river.

The character of the ground has necessitated special construction, inasmuch as it is subject to heavy flooding from the river, and as a consequence it has been necessary to guard against upward pressure.

It was my first intention to provide shallow and inexpensive tanks arranged with automatic valves to the river, so as to equalise any upward pressure during floods, but this scheme did not favourably impress the Local Government Board, who, as you know, look with suspicion on any possible short-cuts or by-passes. This being the case, it was necessary to alter the whole construction and practically provide covered tanks weighted by means of earth filling over a concrete roof. Piling has also had to be resorted to for the foundations, in order to resist the additional weight due to roof load. The length of the piles will average over 40 ft., and these are being driven by the Atlas Concrete Pile Company.

As the floor of the tanks will be subjected to either an upward or a downward pressure, it will be constructed of ferro-concrete, the reinforcement being woven mesh metal in two layers. The tanks will be emptied by decanting the storm water through floating arms, and the residue will afterwards be drawn off by gravitation to the receiving well immediately in front of the pump culverts.

The existing pumping plant consists of two direct-acting inverted triple-expansion plunger pumps for pumping to the Naburn disposal works, and these have a capacity when working singly of 4,665,000 gallons per twenty-four hours.

In addition to the above, two steam-driven centri-

* Paper read at a North Eastern District meeting of the Institution of Municipal and County Engineers at York on November 30th last.

nugal storm pumps are provided, each capable of lifting 10,000 gallons a minute and discharging direct into the river. These pumps will be replaced in the new scheme by electrically driven submerged centrifugals, but instead of discharging direct into the river they will be arranged to discharge into a receiving channel adjoining the detritus tank, and from this to the two storm-water tanks. A third centrifugal pump, but of the horizontal type, will be provided with a capacity of about 3,000,000 gallons a day for lifting sewage to the Naburn works, thus augmenting the main pumping plant, and I am hoping to be able to shut down the steam plant at night during dry periods of the year.

The normal daily flow of sewage is about 3,500,000 gallons per day, but as this is in a great measure diluted by subsoil water and leakages from the two rivers, the Local Government Board only require 7,200,000 gallons to be treated as sewage, anything in excess of this amount to be treated as storm water.

I regret I cannot give you further details of the new plant, as they are not yet settled.

The contract for the construction of the tanks has been let to Messrs. J. Bentley & Co., of Bradford, the amount of the tender being £10,754.

The loan period for these works is twenty years, and for pumping machinery fifteen years.

NEW STREET.

The new street referred to in my opening remarks is one which is now partially constructed, and tenders for the remaining portion will be obtained very shortly. The width of the street is 50 ft., and the total length 380 lin. yds. The object of its construction was to facilitate through traffic from the direction of Walmgate and Fishergate, and also to relieve congested traffic in Fossgate. The total cost of the street will amount to about £48,000, and of this amount £40,000 represents the amount expended on the purchase of property, leaving about £8,000 for street works, which include a bridge over the river Foss of 37 ft. span the full width of the street.

It will be seen from the drawings exhibited that a large amount of filling has been necessary to obtain the required headway over the river Foss and to ensure an easy gradient over the whole length of this road.

On account of the unsatisfactory state of the ground in the locality of the river Foss, considerable difficulty was experienced in the abutment foundations, also in the crossing of the river with an iron pipe sewer, especially during the construction of the latter, it being necessary to enclose all the sewer for the purpose after an accident by the contractors to dam the river above the point of crossing had proved unsuccessful.

The carriageway is constructed with a concrete foundation 6 in. thick, and finished with 4 in. of tar-macadam, while the footways will be paved with 2½-in. concrete flags, made at the corporation depot.

REHOUSING SCHEME.

The rehousing scheme has been brought about by the demolition of cottages on the site of the above-mentioned street, and the Local Government Board have sanctioned a scheme which provides for the erection of thirty cottages in five blocks of six, arranged on three sides of an oblong, the distance between the building lines being 118 ft., made up as follows: Two gardens 9 ft. each, two footways 6 ft. each, and two carriageways 15 ft. each, leaving a space of 46 ft., which it is proposed to utilise for recreation purposes.

Twenty of these cottages comprise a living-room 16 ft. by 12 ft., a scullery 8 ft. 9 in. by 8 ft. 6 in., and three bedrooms, with water-closet, coal-house and larder arranged within the main walls of the building. The remaining ten cottages are similar to those above described, except that they have four bedrooms.

Each cottage is provided with a copper and a bath in the scullery, a supply of hot water to the bath being arranged from the copper, while the kitchen range will be provided with an L boiler and tap for the supply of hot water for every-day use.

My first scheme was for cottages in blocks of four, and generally of larger dimensions than those included in the final scheme, but as it was found necessary to reduce the cost to a minimum, it was necessary to rearrange the whole scheme.

The estimated cost of the scheme is £7,547, made up as follows: Land, £1,092 8s. 4d.; cottages, £6,000; road making, sewering, &c., £455; total, £7,547 8s. 4d.

This work is out for cottages alone at £200 each, and I am expecting them to be erected for this amount. The rents for these cottages will amount to about 4s. 6d. for the smaller cottage and 5s. for the larger one, in addition to which rates will amount to 2s. per week per cottage, including water and poor rate.

TAR-MACADAM OVER COBBLES.

In February last the corporation made an application to the Local Government Board for a loan to cover the cost of paving all cobble-paved streets in the city with tar-macadam, eighty-six streets being included, representing an area of 44,528 super. yds., the estimated cost amounting to £7,575. Sanction for this amount has been given by the Local Government Board, the period for repayment being seven years.

The tender of Messrs. Henry Ellison, Limited, of Cleckheaton, amounting to £3,976, was accepted in May last for about half the work, and they are now engaged in carrying it out.

The reason for this work was that my council consider cobble paving to be unsatisfactory, insanitary and very noisy, and complaints from this cause are very numerous.

In addition to the area of cobble paving above named, a further area of 21,290 sq. yds. has been dealt with in a similar manner during the last four years, this work being done by administration, the cost being borne out of revenue.

In most cases it has been possible to get a layer 3 in. thick over the cobbles, but where this thickness could not be obtained, the cobbles have been lowered, but in all cases new channels composed of lock-grip setts 8 in. wide have been laid. Wherever cobble paving has been treated in this manner, it has proved most satisfactory, and is very much appreciated by residents in the streets so treated.

TRAMWAY EXTENSIONS.

The present system of electric tramways was commenced in September, 1909, the first section between Fulford and the city being opened in January, 1910. A second section to Dringhouses was brought into use in March, 1910, while the third section to Acomb, and a fourth section to Haxby-road were brought into use in June, 1910. The author was responsible for the whole of the permanent way, street improvements, the strengthening of Lendal Bridge, erection of car sheds and waiting shelters, &c., the total cost of this work amounting to £111,000. I am glad to say that the working of the scheme has proved successful, and the extension now to be taken in hand is through a very populous district, and I have every reason to believe that this will also prove as successful as the first installation.

The route length of the extension now to be taken in hand is 1 mile 1 furlong 3·80 chains, for the most part double track, and it includes a triangular layout at the junction of Queen-street, Blossom-street and Nunnery-lane.

The foundation for the track is composed of 6 to 1 concrete, 7 in. thick under the rails, finished with 1½-in. floating to receive 4½-in. creosoted redwood paving blocks, grouted with "Plascom." The rails will be British Standard Section No. 3, 6½ in. deep by 7 in. wide on flange, the weight being 100 lb. per yard, and they will probably be manufactured out of "Sandberg" steel. The joints of the rails will be welded by the Thermit process, and anchored on each side at a distance of about 1 ft. from the joint, intermediate anchors being provided at distances of about 15 ft., and the tie-bars will be cranked so as not to interfere with the coursing of the paving blocks. All joints (excepting, of course, at junctions with manganese steel) in the existing tramway track are welded by the Thermit process, and I am very pleased to say that up to the present time I have not found a single defective one. I believe this good result is obtainable in all cases where proper care is taken when the joints are being made, and always providing that it is carried out during mean temperatures. All points and crossings will be of manganese steel, firmly bedded into the concrete by means of cast-iron sole pieces, and the points will be of the double movable type, the facing points at junctions being electrically operated. I may say that on a short length of this track where the ordinary traffic is small tar-macadam will be substituted for wood pavement.

The electrical equipment will be carried out under the supervision of my colleague, Mr. J. W. Hame, the city electrical engineer. The total estimated cost of the extension, including electrical equipment, is £18,566.

Institution of Municipal and County Engineers.

DISCUSSION ON RAIL CORRUGATION.

Mr. R. J. Thomas, county surveyor, Buckinghamshire, the president, occupied the chair on Friday evening last at a meeting of the Institution of Municipal and County Engineers at Caxton Hall, Westminster, at which Mr. H. T. Wakelam, M.Inst.C.E., F.G.S., county engineer, Middlesex, presented a short paper dealing with the information received by the Tramways Committee of that body in connection with their investigations on the subject of rail corrugation. The attendance at the meeting included Messrs. W. Ashbee (Hanwell), W. N. Blair (St. Pancras), W. Bridges (Kilburn), A. T. Bridgewater (East Ham), J. S. Brodie (Blackpool), A. H. Campbell (Edinburgh), T. Cole (secretary, Westminster), J. W. Cockrill (Great Yarmouth), A. W. Currie (Stoke Newington), P. Dodd (Putney), W. J. Dresden (Battersea), W. Fairley (Westminster), W. H. Grieves (Sutton, Surrey), H. A. Giles (assistant secretary, Westminster), W. J. Hadfield (Sheffield), M. Hainsworth (Teddington), W. Harpur (Cardiff), R. B. Holt (Leeds), C. J. Jenkin (Finchley), W. T. Lancashire (Leeds), H. Marten (Streatham), E. B. Martin (Rotherham), H. Mattinson (Manchester), T. J. Moss-Flower (Westminster and Bristol), E. B. B. Newton (Paddington), J. P. Norrington (Westminster), A. P. Piggott, J. C. Radford (Putney), L. Raine (Hungerford), J. L. Redfern (Gillingham), F. Reed (Putney), R. Shaw (Ilford), G. G. Shepherd, S. C. Stone, G. Sturgess, J. Sutcliffe (Deptford), R. J. Thomas (Aylesbury), H. T. Wakelam (Middlesex), A. G. Whitfeild (Gold Coast) and H. G. Whyatt (Grimsby).

The President (Mr. R. J. Thomas), in opening the proceedings, said they were met that evening to discuss a paper, prepared by Mr. Wakelam, on the vexed question of the corrugation of tram rails. Proceeding to explain how this arose, he said the Tramway Committee of the council had been considering the question and sent out a formidable list of questions. As they could see, there were an endless variety of questions and a large number of answers, which it was felt should be placed in the hands of someone to tabulate. It was obvious that to a busy man the work of tabulation was one which would occupy a great deal of time and require a considerable amount of ingenuity. It was suggested that a meeting should be held to discuss the question, and Mr. Wakelam was asked to put his report in the form of a paper, the discussion of which he thought would prove interesting, if only because of the variety of opinions expressed.

RAIL CORRUGATION.

By H. T. Wakelam, M.Inst.C.E., F.G.S.,
County Engineer, Middlesex.

When accepting the invitation of the council of the institution to tabulate and report upon the returns received to the queries sent out by the Tramways Committee in connection with the above subject, the writer was not aware of the large amount of labour and time the work would involve—especially to one placed like himself, whose ordinary time is so strenuously taken up. It was only through a concession of a large portion of his limited leisure that he was able to prepare the compilation of replies to the numerous questions (71) circulated to engineers in charge of tramway systems in the United Kingdom.

After preparing the somewhat voluminous compilation it was necessary before the writer could arrive at any degree of finality on the question to prepare also an analytical tabulation, in a condensed form, to afford information sufficient to enable him to form any sort of conclusions as to the cause, or causes, of rail corrugation. Even after preparing the compilation and the analytical tabulation it was an onerous and difficult task to deduce from them sufficient data from which any degree of opinion on the subject could be given. This may be judged from the many different views set forth in the answers received to the questions circulated, some of the engineers replying stating

That corrugations develop most quickly on rails laid on rigid beds.
" " are most pronounced where the subsoil is plastic.
" " are most prevalent where the subsoil is waterlogged.
That corrugations are independent of the nature of the subsoil.
" " are independent of speed.
" " appear mostly on flat curves and straight tracks.
" " are more pronounced on outer rails.
" " are more pronounced where speeds are high.
" " are more pronounced where speeds are low.
" " are more pronounced where "coasting" is done.
" " are more frequent on gradients of 1 in 100 to 1 in 400.
" " are more pronounced at stopping places and on down grades.
" " are general on both up and down grades and on both flat and steep grades.
" " appear on the outside rails of curves, and on the inside rails of straight tracks.
" " are most prevalent on flat tracks.
" " are found on manganese steel points.
" " appeared in one case on a straight track only, and at one particular place only.
" " are most prevalent where brakes are applied.
" " are found in some places at an acute angle, but mostly at a right angle to the rails.
" " are continuous where they occur.
" " are found on single tracks where cars travel both ways.
" " are found on light tracks where the subsoil is spongy and marshy.
" " appeared only, in one case, where the rails were originally packed on a concrete bed.
" " are found on the same formation on both up and down tracks.
" " are most marked where the carriageways are not paved from kerb to kerb.
" " are mostly intermittent, but in places continuous.
" " appeared in some places, altered in their wave-lengths, and finally disappeared.
" " are not found on both rails at the same place
" " are found on inner rails, about double the length of, and slighter than, those on the outer rails.
" " do not appear where "coasting" is done, and where ordinary brakes are used.
" " are removed by cars.
" " are not found where the speeds are low.
" " are not found on ballasted tracks.
" " are not found on down grades.
" " are not influenced by slight differences in construction.
" " are not found where ordinary track brakes are used.
" " are not found to be more prevalent where the subsoil is waterlogged than otherwise.
" " are not found at stopping places.
" " are not found where the rails were originally laid in solid (puddled) concrete beds.

That loose rails tend to corrugation.
" corrugations in one system practically disappeared where the rails were lifted and tightened to the track bed; and
" the trouble is not created by the use of ordinary brakes.

From the foregoing and from the other information contained in the answers received to the questions circulated, it may be argued that the trouble is chiefly set up by combined influences, such as

(*a*) The constant oscillatory motion of the car wheels on the rail surface; due (1) to high speeds; (2) to bogie cars; (3) to short wheel bases; and (4) to heavy car platforms.

(*b*) The rigid bed, which, for stability of the road surface, must necessarily be laid down. In this connection it can be assumed with safety that the more rigid the road bed the more intense the impact of the rolling stock.

(*c*) Curvature of track. In this connection it is clear that the curves generally of tramways, steam railways and electric railways are affected by corrugation to a greater extent than straight tracks.

The aforesaid influences, conjointly with driving and braking, may be factors towards the trouble, although later in this paper the writer furnishes information which makes it exceedingly difficult for any definite opinion to be formed as to what is in reality its cause.

Speeds are much higher to-day than were possible with the old cable tracks, which tracks suffered from corrugation to a limited degree only. The trouble in this connection was always attributed to braking. Constant and rapid braking, under the fast traffic of to-day, no doubt cause varying and irregular impacts between the wheel tyres and the rails. These varying impacts, with the influences already referred to, may have a considerable bearing on the question, especially when (what are known as) "wheel flats" are correlatively considered. It may be that vibration, combined with the influences already mentioned, may also have some bearing on the question. To prove the length of vibratory waves along tramway rails

FIG. 1.

produced by varying speeds of rolling stock, the writer made actual experiments a few days ago on the Middlesex County system, and found that, in connection with a car travelling at a speed of 12 miles an hour, the wave was noticeable on the rail head at a distance of 240 yds. from the car; that at a distance of 160 yds. vibration was general; that at a distance of 70 yds. vibration was distinctly accentuated as the car passed over each joint; and that vibration was not so pronounced on the curves as on the straight tracks.

Thicker rail webs than those commonly used on tramways would no doubt obviate vibration to some extent, and in this connection lengths of track so constructed may well be laid for the purpose of experiments, with both high and low carbon rails.

Very little corrugation appears to be noticed where the car traffic is of a light nature, and the trouble appears to increase in ratio to the traffic. Tracks used by bogie cars are more corrugated than those confined to cars with fixed frames. This may be due to the oscillation caused by the small wheels of the former.

Tramway rails of the same section and make, subjected to the same tests, corrugate to varying degrees, and also vary considerably under actual wear. Rails supplied by firms in Barrow-in-Furness, Belgium, Leeds, Lorain, and Middlesbrough, to one particular system of tramways, have been known to corrugate. Corrugations (see illustrations) affect tramway rails laid on concrete beds of almost any strength or thickness. Corrugation is also experienced where the rails are laid on longitudinal wood sleepers (embedded in concrete), for instance, the system of construction adopted in the town of Hull.

It was stated at the Paris Congress that, from actual tests, soft rails corrugated less than hard rails. The tests were stated to have proved that in comparisons of wear after the first 30 000 cars over the tracks, the result of the next 65,000 was in favour of soft rails. Hard rails are, however, universally accepted as being the most economical for general wear.

In reply to questions sent out by your institution, it was stated (1) that in the town of Perth the trouble affects both rails, but on one particular length of track only; and (2) that at Sunderland corrugations appeared and disappeared on tracks where speeds were fairly high, and that, after disappearing for a time, they are again showing. In the latter connection it would be of interest to know whether or not there have been alterations or changed conditions in the tracks, or rolling stock, or in regard to the speeds at which the cars travel.

Those engineers who replied from the following towns—*viz.*, Accrington, Ashton-under-Lyne, Heywood, and West Bromwich—stated that the tramways there are not at all affected by corrugation. They appear to be exceptions to the general rule, and those members of the institution who are particularly interested in the subject may perhaps like to make an inspection in those localities, with a view to ascertaining whether or not there are favourable or local circumstances in regard to their immunity from the trouble.

There are undoubtedly unknown conditions attaching to the formation of corrugation which appear to be always in force. And it appears also to be the fact that there is some neutralising action which causes corrugations to appear and disappear. For instance, the case of the Sunderland tracks, already referred to, may well be cited.

The trouble does not affect the rail tread only. In some systems the wall faces of the grooves are also affected.

Being so much engrossed in the problem, the writer was impelled to extend the scope of his inquiries in the direction of permanent ways designed for steam and electrically driven trains. He is glad he did so, because the information gleaned in this direction forms not the least valuable portion of this paper.

Rail corrugation does not confine itself to tramways only, it is also met with very extensively on both ordinary steam and electric railways, as the following notes show. First, in this connection, it is of interest to know that corrugations are met with to a considerable degree on many lengths of such railways, and the illustrations accompanying this paper show the pitch and shape they take. Illustration No. 1 shows corrugations with an inch pitch on one of the chief English railways under fast trains. Illustration No. 2 shows an enlargement of the corrugations shown in No. 1. Illustrations Nos. 3, 4, 5 and 6 show varying corrugations on a line branching from one of the main trunk railways. The trains passing over these lines are all steam driven. This fact altogether upsets the theory of those who state that corrugations are set up by electrolytic action.

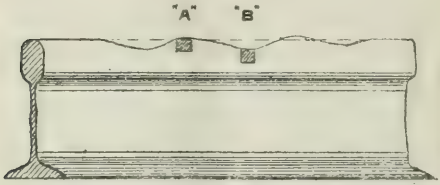
In regard to tracks used by electrically driven trains where the usual "side supported" construction has been adopted corrugations are constantly met with.

An important case having a great bearing upon the subject-matter of this paper is that of an electric tube railway, in which case the track, which has been in use about six years, was constructed to the design shown in illustration No. 8. Up to the present there is no sign of corrugation on either the curves or on other parts of the system. In contradistinction there is an electric railway, under the same control as the electric tube railway just mentioned, which was constructed on the ordinary steam track principle (illustration No. 10). On the latter corrugations have proved most troublesome—especially on the curves—although the rolling stock employed is common to both No. 8 and No. 10 systems. The rails used in each case were identical—*viz.*, Sandberg silicon.

Owing to the successful results obtained by the adoption of the centre supported track (illustration

No. 8) on the electric tube railway referred to in lieu of tracks on rigidly supported beds (illustration No. 9), it is, I understand, the intention of the executive engineer of another railway to reconstruct the whole of the system of which he has charge, on the centre supported plan (illustration No. 8). In his opinion, corrugations or "batterings" (which latter are, in reality, fully developed corrugations) are due to rigid beds.

From the foregoing facts, notwithstanding anything previously referred to in this paper, it may be well



assumed that the principal cause of the trouble arises from or in connection with track construction.

An experiment recently carried out on a curve of 10 chains radius (on an ordinary ballasted railway track) affords ground for reflection. Shortly after the curve was laid corrugations or batterings were very pronounced, and careful measurements as to their positions, depths and pitches were recorded. After a time the curve was taken up and relaid with new rails of an exactly similar pattern and make to those first adopted. After some wear batterings or corrugations appeared again at the same identical spots, and to the same depths and pitches.

The above sketch shows, in diagrammatic form, the waviness of the corrugations which appeared in both sets of rails laid for experiment. Drillings were taken from the crest of one of the rails at points "A" and "B" with a view to finding out whether or not there were any chemical changes in the structure of the metal at the points affected. It was analytically proved, from the drillings, that the chemical compositions were exactly the same in both cases.

Grinding, as you are aware, is much practised to get rid of corrugations as they appear. The writer has no information on the point as to whether rails corrugate more quickly after grinding than before.

Ordinary steam railways are, it is well known, built up on the side-supported principle, by constant packing of the track sleepers by platelayers. On these, as shown in illustration No. 10, corrugations are very prevalent.

For the purpose of this paper the writer has tried to find out in connection with both steam and electric railways—

(*a*) Whether the pitch of the corrugations or batterings varied with the speed of the trains?

(*b*) Whether the corrugations varied in their pitch in ratio to the speeds?

(*c*) Whether corrugations or batterings were more frequent on curves than otherwise?

The information received on points (*a*) and (*b*) is to the effect that trains travel over rails at different speeds, but no alteration in pitch of corrugations is forthcoming. In regard to point (*c*) corrugations or batterings are undoubtedly more frequent on curves than otherwise.

The writer thinks that from the foregoing information the cause of corrugation has been, for practical purposes, brought down to what may be termed a reducible minimum. By this he means that corrugation must form some inherent attachment to all track constructions which do not possess more or less resilient beds, on the lines of that shown in illustration No. 8, and it rests with some ingenious person to design a track for electric traction on roads which will give both resiliency and stability for tramway traffic, with reasonable maintenance charges, and, at the same time, provide a surface which will satisfactorily sustain for a reasonable period the ordinary road traffic.

The writer thinks that the replies received to the questions circulated make it abundantly clear that corrugations are not caused by—

(*a*) Electrolytic action.
(*b*) Rolling stock (*per se*).
(*c*) Driving and braking.
(*d*) Soft rails; or
(*e*) Resilient tracks.

That whatever the real cause may be, it is aggravated by—

(*a*) Impact and vibration.
(*b*) Hard rails.
(*c*) Rigid beds.
(*d*) Curvature.

A great deal of the information contained in this communication has already been sent by the writer, in the shape of a report, to the Tramways Committee of the institution. It is at the request of the latter that this paper has been prepared and presented to-night, with an invitation to those present to express their views in connection with the abstruse problem of the actual cause of rail corrugation.

DISCUSSION OF MR. WAKELAM'S PAPER.

Mr. M. Hainsworth (Teddington) said the subject was one of very great interest to local authorities, and he considered that the thanks of the meeting were due to Mr. Wakelam for his paper and also to the

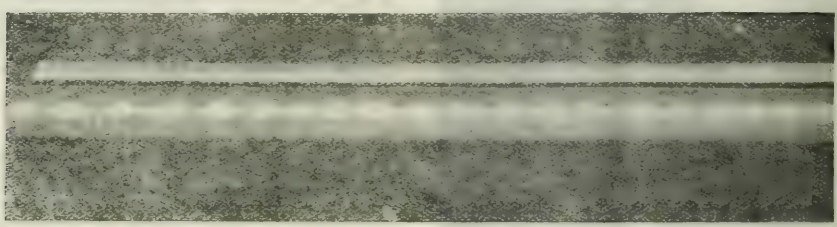


Fig. 2.

Tramways Committee of the institution for going into the matter. In Teddington they had suffered considerably from the trouble of rail corrugation, and particularly as regarded noise. It was alleged that the noise arose from corrugation and also from defective joints. The tramways company took steps to remedy the cause of complaint, and they welded the joints of their rails, ground down the joints to the level surface, and ground out the corrugations. The result was very noticeable: the noise was abated, and although it was twelve or eighteen months since the work was done there had been no recurrence of the noise, although he had to admit that the corrugations were now reappearing. A suggestion which he wished to put forward was that crystallisation of the fibre of the steel owing to constant vibration, as in the case of shafting in a shop or mill, might be held to account for corrugation. Owing to defective joints also it might be that wheels became irregular in shape and that the impact which resulted produced this trouble. He had wondered, too, whether rusting of the surface had anything to do with the matter. Then, again, the surface of the rails being attacked and corrugation arise by a similar process.

Mr. W. Fairley (Westminster) said he wished to bring some information forward which he thought might be of use to Mr. Wakelam. He had under his direction a small portable railway with a gauge of 3 ft. The rails were only 20 lb. per yard and very flat on the top. This little railway was worked by a petrol locomotive. Anyone who had anything to do with tractors of that description well knew that a good deal depended upon the man who was working the locomotive. The tractor only weighed between 18 and 20 cwt., and drew between 4 and 5 tons. The whole essence of the thing was that, in starting the tractor,

it had a certain amount of slip. He was interested to find on this tramway that corrugation occurred on the rails exactly similar to that found on the tramway systems of this country—the corrugation running at right angles to the face of the rail. They went into that, and the only conclusion they could come to was that this arose from slip. The part where the rails were affected was quite straight, and the speed was low at that point, but the locomotive there begins to start the trucks, and in doing so they had to manipulate it so that in a measure it went forward "hunting" they called it—pulling on the springs. After pulling on the springs it had to go back for a short distance, and if the wheels were rotating it must cause wear on the rail. He had given this as an instance where they had corrugation of the rail on a tramway which was not an ordinary tramway, neither steam nor electric. Yet they got exactly the same appearance on the rails. Might he suggest that after all, slipping had something to do with this? If anyone liked to go down to St. James's Park Station and watch the District trains there (and for preference go to the end of a train when a train was starting), the motor which was in the rear of the train evidently developed greater power than it could utilise, and if they went to the rear car when the train was starting they would see it "hunted"—that was pushed a series of waves up against the end of the train. In that case they would see that the wheels were revolving at a much higher speed than the train was going at. In the case of tramways where they were drawn by geared motors on the bogies, each of these bogies had a certain amount of play. The amount of play might be very small, but it was still there. He suggested that the possible reason for this might be the effort of starting the motor in pushing, and pushing on the springs forward and backward a little bit, and causing a grinding motion on the rail. Once they got

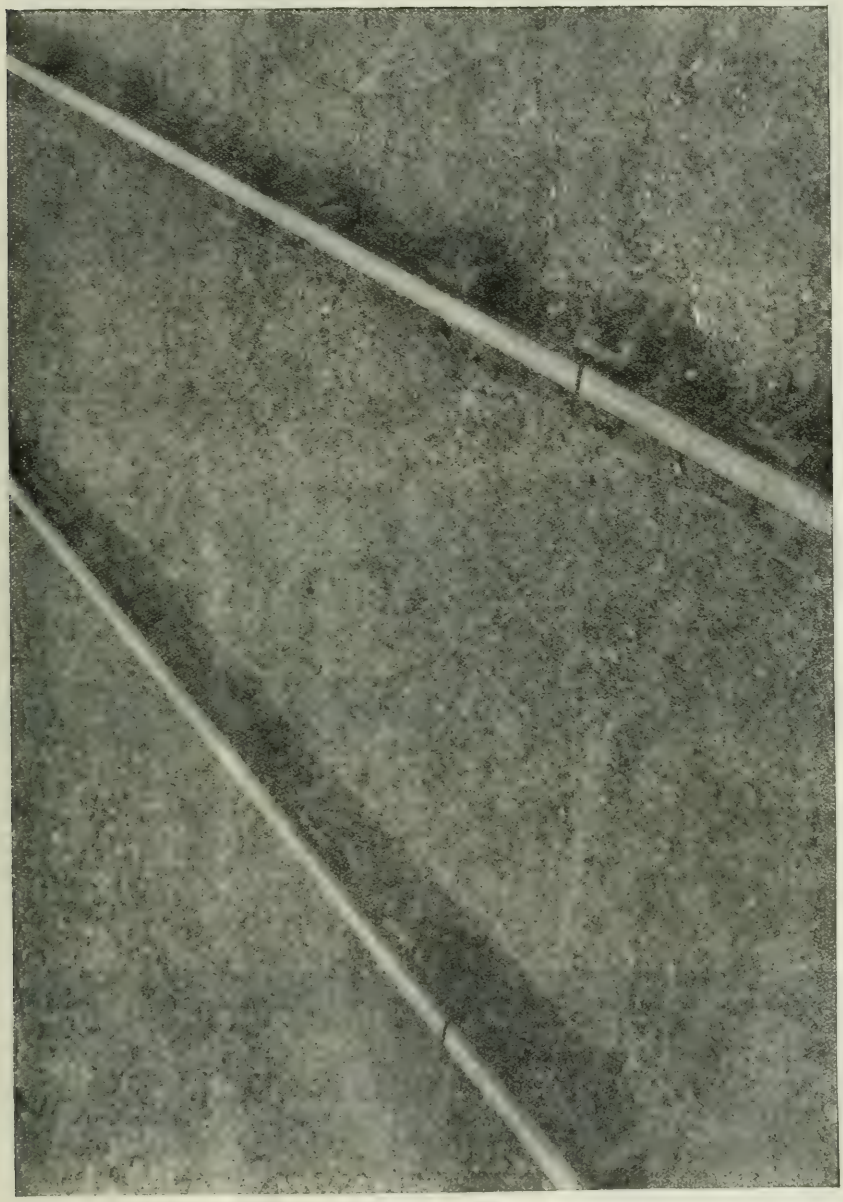

Fig. 3.

one spot on the rail they soon got another. They in the suburbs had had some interesting experiences recently of the effect of motor-'buses on macadam roads. If they looked at a macadam road which had had a fair amount of wear of motor-'bus traffic for some time, in the gaslight or moonlight, they would see the road was corrugated, only the corrugation was much more pronounced than was shown on the surface of the rails. He believed that arose first from a small indentation or pot in the road, and the motor running on to it jumped on to the next, and formed one after another. He thought the institution was greatly obliged to Mr. Wakelam for the immense amount of labour he had undertaken in tabulating these returns and writing this paper. What he admired most about the paper was the extreme honesty of it. It told them, "there are all the returns, and the returns are so contradictory that you cannot make much of them." He had put forward this theory of a light motor working on a tramway as one which might give them some clue as to corrugation.

Mr. W. J. Hadfield (Sheffield) stated that he was in charge of the construction and upkeep of about 80 miles of tramways in the city which he represented, and he was greatly troubled with corrugation. Mr. Hadfield went on to complain that, although the paper stated that questions on the subject had been circulated to engineers in charge of tramways throughout the United Kingdom, it was extraordinary that they had not been received by either Sheffield, Leeds, Manchester, or Glasgow, and he did not think it was for the good of the institution that towns of that kind should have been omitted. Everyone's thanks were due to Mr. Wakelam for what he had done, for the work he had undertaken was one which not many members of their body would have attempted. One reason suggested by the paper as a cause of corrugation was the constant oscillation of the car wheels on the rail surface due to the bogie cars. They had a fair amount of corrugation in Sheffield, but as they had no bogie cars they must dismiss those as a cause of corrugation. Cable tracks, the paper pointed out, suffered from corrugation to a limited degree only, and the trouble was always attributed to braking. The old cable line between Handsworth and Birmingham had been the subject of a careful investigation by a committee of the Municipal Tramways Association, and their report with regard to the corrugation which occurred showed that on that portion of the tramway inside the city on which the cars were run at a speed of 7 miles per hour no corrugation took place, while on the portion of the system outside the city where the cars were run at a speed of 9 miles per hour extensive corrugation developed. The speed of the cars running on the inside section was subsequently increased to 9 miles per hour, and corrugation then became general on that section, showing that the critical speed on that system was between 7 and 9 miles per hour. The wheels of the cars were 24 in. in diameter. In Sheffield, as a result of careful investigation, they had decided that braking had nothing to do with corrugation. The matter of vibration was most important, and ought to be considered carefully; in fact, according to one of the members of the Municipal Tramways Association Committee, there were eighteen separate and distinct movements in the

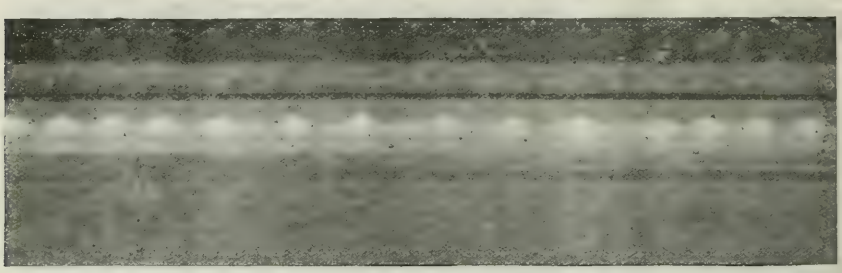

Fig. 4.

Fig. 5.

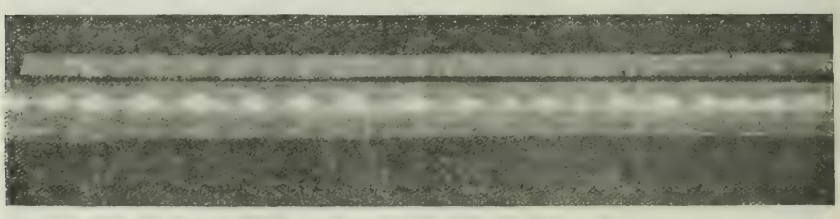

Fig. 6.

passage of a tramway car which ought to be investigated. With regard to rails, they adopted one of the British Standard sections, but found it unsuitable, the web splitting. If a rail were weak enough to split it would be weak enough to vibrate. In Liverpool, Leeds and Sheffield the tramway authorities had altered the rails according to their own ideas, and he himself was now using a 120-lb. rail—30 lb. more than the British

structive. There were references to the chemical composition, but nothing was said as to alterations in the structure. In Sheffield they had gone into that question. They had cut out pieces of corrugated rail, planed off the corrugated parts and put them into acid, and he had obtained most useful results in that way.

The President, referring to Mr. Hadfield's remarks

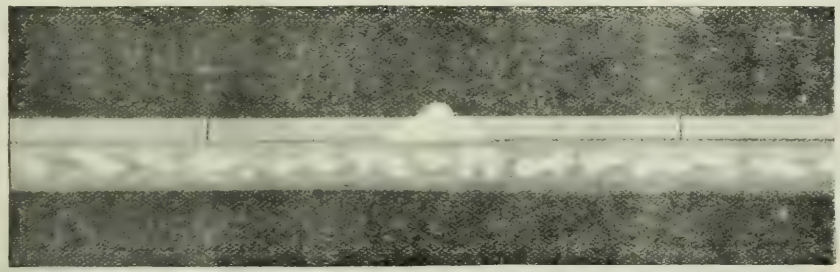

Fig. 7.

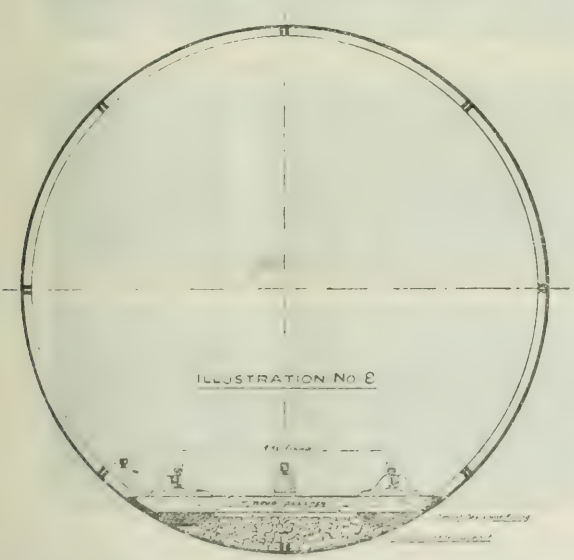
Standard section—and strengthened the web of the rail. It was stated that in some towns there was no corrugation, but it would be interesting to know what was the practice in those places in laying tramways. If conditions should be analysed closely they ought to get at the reason for the absence of corrugation. For

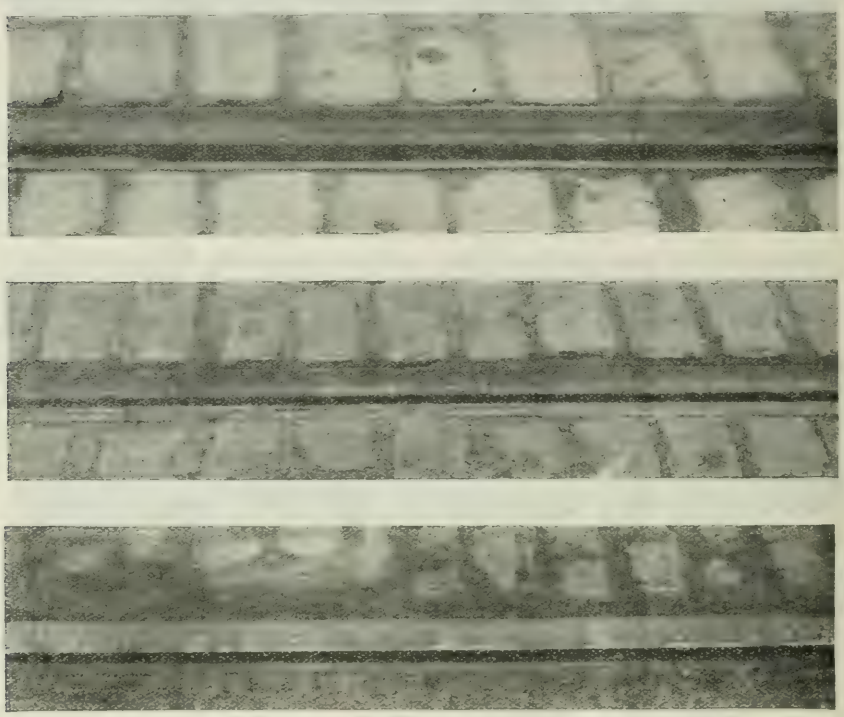
with regard to the omission of the four towns in connection with the Tramway Committee's inquiry, said his information was that the towns in question were applied to for information, but that no replies were received.

Mr. W. Harpur (Cardiff) proposed a vote of thanks to Mr. Wakelam for the very excellent paper he had given them. Mr. Wakelam was entitled to more than ordinary thanks for the immense amount of work, not only in writing the paper, but in tabulating the returns. It did not solve the difficulty, but it gave them any amount of room for thought and experiment and for endeavouring to try further what they could find out in reference to this vexed question of corrugation. Mr. Hainsworth said something in reference to grinding out corrugations. He would like to give them his own experience in regard to that. He was very proud for a time in finding that they had no corrugations on their tram rails in Cardiff for the first three or four years after construction. He was constantly being asked by tramway engineers about corrugations. He told them they did not know what corrugations were; they did not know anything about them. But they started, and once they did start they came on very quickly with hammered joints as well as corrugations. We took up the portions of the rail which were corrugated, ground out the corrugations, and they succeeded as Mr. Hainsworth said they did at Teddington. Since then they had followed that principle. As soon as they found a corrugation beginning to occur they got it ground out, and thus they kept the thing down to a minimum. Up to the present it was the only solution they had been able to find. The trouble was they found where they had loose rails they corrugated, and where they were tight on the bed they corrugated. That made one wonder whether or not the rigid rail was the best. It was a most troublesome thing to come to a conclusion. He must say he rather fancied the rigid bed had a great deal to do with corrugation. Naturally, if they had got two hard substances, one hammering upon the other, it had a bad effect upon the rails, and more or less upon the wheels also. Mr. Wakelam did not say anything in his paper as to whether he had heard of corrugation upon the trolley wires. He did not know whether anyone else had, but he was told that corrugations had appeared on the trolley wires the same as the rails. If that was a fact it showed that neither a rigid bed nor an elastic



instance, were the joints welded? He thought it was not impossible that the welding of the joints had something to do with it. The comparisons in the paper between the different tube railways were in-

bed had anything to do with the question. That was a point he would like, if they could, to find out something about. The question of the rails was the only thing they had to deal with in their institution; they had nothing to do with the trolley wires, and they had no occasion to find out about corrugation of those wires. They must try and find out that information from another source. Mr. Fairley mentioned about the question of slipping having something to do with it. He thought there must be a good deal in what Mr. Fairley said upon that point. His experience was that slipping was not at the start and stopping of the motor. He found where they had a compulsory stopping place for some little distance before the cars reached the stopping place they got no corrugation, but in between where the car attains its maximum speed there they corrugate. They found that corrugation occurred also where they had an optional stopping place—that was, where the cars pulled up when they were asked. Many of the cars run over those places. At compulsory stopping places they found no corrugation for some distance before and after. That convinced him it was the speed, which he would thought there was something in that, and to the fact that they were more or less loose, not so firmly connected as with the fixed truck cars. In the case given in the paper in which no corrugation had appeared, he would like to know how long the rails had been laid, and the frequency of the service of cars upon those tracks, because those were points which had a great deal to do with corrugation. Further, he would like Mr. Wakelam to ascertain the speed at which cars run over those lines. In summing up Mr. Wakelam thought that from the foregoing information the cause of corrugation had been, for practical purposes, brought down to what might be termed a reducible minimum. By this he meant that corrugation must form some inherent attachment to all track constructions which do not possess more or less resilient beds, and it rested with some ingenious person to design a track for electric traction on roads which will give both resiliency and stability for tramway traffic, with reasonable maintenance charges, and at the same time provide a surface which will satisfactorily sustain for a reasonable period the ordinary road traffic. He quite agreed with Mr. Wakelam that

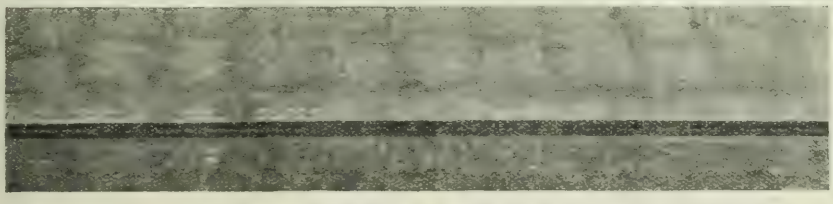


Early Indications of Tramway Rail Corrugation.

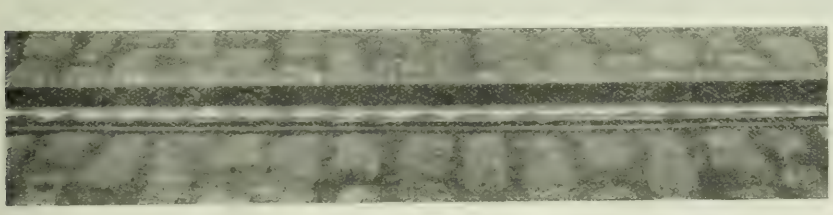
not say had everything, but had mainly to do with corrugation. That seemed to be largely borne out by what Mr. Hadfield had told them about the cable trams at Birmingham. Where the speed was 7 miles they had no corrugation; where the speed was 9 miles corrugation appeared. His experience at other places seemed to confirm that up to the hilt. But he was afraid that was not the experience of some other people. There was one statement he would like Mr. Wakelam to explain further, that in connection with a car travelling at a speed of 12 miles an hour the wave was noticeable on the rail head at a distance of 240 yds. from the car, that at a distance of 160 yds. vibration was general; that at a distance of 70 yds. vibration was distinctly accentuated as the car passed over each joint, and that vibration was not so pronounced on the curves as on the straight tracks. He wanted to ask Mr. Wakelam did he mean that he could see the corrugation at a distance of 240 yds.? Then Mr. Wakelam stated that "tracks used by bogie cars were more corrugated than those confined to cars with fixed frames. This might be due to the oscillation caused by the small wheels of the former." He this was just the thing that was wanted—that was, a certain amount of resiliency with stability—but the difficulty was how were they going to get that on the ordinary road. If they had a resilient tram track they must pull their paving to pieces; their paving must go with it or it was impossible to have a resilient track. He quite agreed with what Mr. Wakelam said, but he was afraid if that which he suggested was to be attained it must mean that the tram tracks must be taken off the streets and put elsewhere, either to a separate piece of road or to where the road traffic is not allowed to run as well as the tram lines. He hoped this paper might have the effect of putting those who had tram tracks under their care upon further investigation, and that they would find some solution for this troublesome question. It was a troublesome question, because corrugation of the rails not only meant corrugation, but a terrible noise, upsetting the nerves of people who lived upon the roads, and it also meant that they could not keep their track in decent order. The one thing followed the other, and unless they could find some solution they would be constantly troubled as they were at the present time. Mr. Fair-

ley spoke about the corrugation of road surfaces. It tended to show that they not only had rails which corrugated with high-speed traffic, but they got their corrugated roads, unless they had a surface which could not be corrugated, and they had not got that yet. As far as he could see, speed had more to do with the question of corrugation than anything else, but at the same time they could not suggest the reducing of speed. The tendency was to increase speeds everywhere, and for that reason they must try to find some other solution.

Mr. R. B. Holt, permanent way engineer, Leeds Corporation, said he wished to express his appreciation of the efforts of Mr. Wakelam to solve this elusive problem of rail corrugation single-handed. He had spent many years on this problem both personally and as a member of the committee appointed by the Municipal Tramways Association. He realised fully what an onerous work it was, and he thought that Mr. Wakelam must have discovered that the task of Hercules to clean out the Augean stables was mere child's play compared with this. Mr. Wakelam, no doubt, found that nothing of a reliable and satisfactory nature could be obtained from the replies to queries. He had generally found such replies to be erroneous and misleading; they generally recorded impressions, not facts, and it had been found possible to obtain quite different information on personal investigation. Mr. Wakelam's experiments in regard to rail vibrations were interesting, and he would like to have further information as to the type of recording instruments used, and perhaps Mr. Wakelam would inform him whether the results obtained were constants for different tracks and different cars at the same speeds. Reference was made to the absence of corrugations on some tracks, and on others the trouble was said to increase in ratio with the traffic; personally he had found no system which was entirely free from corrugations in one form or another, though some of these tracks suffered little or nothing from its presence. Many places had corrugation markings, very pronounced in appearance, but these did not develop. The rails which had suffered most on the tracks which he was responsible for were those of British standard quality, basic Bessemer steel. The earlier rails with low carbon cement, with a high percentage of manganese, gave better results, and the best results had been obtained from the use of Sandberg steel rails (basic Bessemer), with high percentage of carbon, silicon and manganese. These latter rails were by no means immune from corrugation markings; but after fine service in all positions, it had not been found necessary to grind out corrugations on rails of this quality. He would like to state that the appearance of bright corrugation markings (that was bright patches or bars across the rail treads) was not dependent upon the number of cars which had passed over the rail at that place. He had frequently seen markings of this description after the passage of one car which had been obliterated by successive cars. As would be seen in the interim report of the Corrugation Committee of the Municipal Tramways Association, artificial corrugation had been produced on rails by means of white oil paint fed through pads pressed lightly against the wheel tyres; but it was impossible to produce these indications at will, nor was it possible to obtain the same result again at exactly the same place. From this it would appear that the corrugative influence was without the rail. He found that corrugation was just as prevalent on tracks operated by single truck cars. In Leeds they had no other type, and they had suffered to a considerable extent. He was pleased to note that Mr. Wakelam did not consider that rails possessed any inherent tendency to corrugate; this had long been his conviction, but some rails were undoubtedly more prone to the destructive reaction than others. He could not support Mr. Wakelam in his finding to the effect that hard rails and rigid beds aggravated the cause of corrugations, neither did he see his reason for assuming that the rolling stock and resilient tracks were not the cause of corrugation. He had not found any reasonable connection between speed and the pitch of corrugation, but it was apparent that, under normal conditions, there was a critical speed somewhere between 7 and 12 miles per hour, above or below which corrugations did not appear to any great extent. He did not think that Mr. Wakelam could really be of the opinion that "flats" on wheels had the remotest bearing on the subject. Flats might only occur once or so on a wheel 8 ft. or more in circumference, and frequently long stretches of corrugation appeared at one time, in addition to which the vibration periodicity necessary to produce corrugations of 2½-in. pitch would vary between 63·36 impulses per second at 9 miles per hour and 105·12 impulses per second at 15 miles per hour. It might be of interest to the meeting to know that the Corrugation Committee of the Municipal Tramways Association, as the result of a number of experiments carried out in different places with a differential recording apparatus which recorded the relative difference between the distance travelled and the distance represented by the revolutions of the wheels, together with the slip and skid which took place, and also by means of hardened-steel studs inserted in the wheels of a car, discovered that slip and skid were continually taking place, and that a purely rolling motion seldom takes place. From this and numerous other experiments extending over a considerable period it was deduced that the slip and skid referred to took place owing to the different diameter of the wheels, which was prevalent, and which was largely the result of the unequal wear produced by the relative difference in the speed of the two motors. They thought that the slip and skid referred to, which resulted in attrition, might be responsible for the formation of the hollows, and that a purely rolling action, combined with increased pressure of hammer-



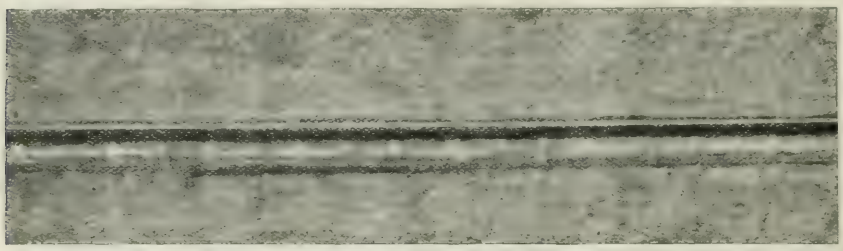
Development of Corrugations.



Corrugations on Flat Level Surface.

ing action, might account for the brightness of the crests. This, combined with synchronous vibrations between rails and wheels, appeared to him to afford an excellent field for the closest investigations; indeed, he was sure it was the threshold of the door leading to solution.

Mr. E. Benedict (Westminster) said that, as a former secretary of the Light Railways and Tramways Association, he had taken a great interest in the operation he had spoken of could be brought about he was sure they would have a better chance of getting to the root of the matter. A suggestion of Mr. Worby Beaumont, to which no allusion had been made that evening, was to his mind the only theory which accounted for the ridges of the corrugations being bright and the hollows dull. If the scooping out of the hollows was due to friction, surely they ought to be bright, but the theory was that, under certain condi-



Corrugations which Appeared after Four Years.
(Photo taken eighteen months after first appearance.)

question, and had read no end of reports, not only of that body, but of the Municipal Tramways Association and the International Tramways Association, whose headquarters were at Brussels. He had attended two of the congresses of the last named body, and at both of these the question of corrugation was brought forward. When he was secretary of the Light Railways

tions and with certain qualities of rail, cold rolling resulted in corrugation; in other instances it resulted in the spreading of the rail, and, when the rail was very hard, in pitting. If the rail was of such a quality as to allow rolling and hammering to affect it, then where the ridges were formed the wheel jumped over, leaving the ridges bright. That seemed to him very

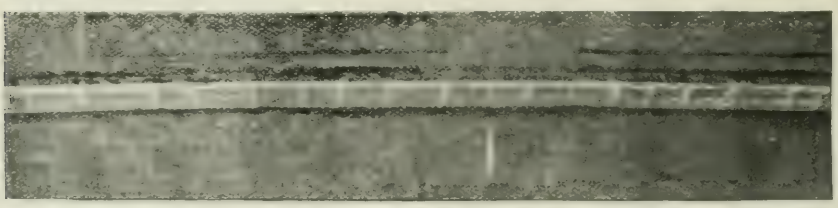
(Flat level curve.)

and Tramways Association he tried hard to get the different interested societies to work together, but did not succeed in attaining his object. His successor, however, had succeeded, and the Light Railways and Tramways Association had co-operated with the Municipal Tramways Association in preparing the recently issued interim report. It appeared to him that the

near to the right thing. Mr. Worby Beaumont's contention was that it did not appear so often on steam railways because the wheels were larger, and so the weight per width of rail was less intense and spread over a greater surface. When they got small wheels the stress was much more intense, and that was why these corrugations appeared. It appeared to him to



Corrugations on 45' Radius.
(Level curve.)

Institution of Municipal and County Engineers had been working in a lonely furrow. Why should the labours of other associations be ignored? The action taken by the institution necessitated an enormous amount of industry, but the work had all been done before, and the overlapping which had taken place caused a great waste of energy. There was no reason why foreign nations should not work with us. Some of the municipal men at Glasgow were very useful members of the International Union, and if the co-

be a very sensible theory, which might be further investigated.

Mr. J. C. Radford (Putney) mentioned that he had seen corrugations appearing in road surfaces soon after the latter had been formed. He had often wondered why it was, and his impression was that it was due to the road ruckling under the roller. There might be something in it. Traffic would increase the corrugations.

Mr. Hadfield observed that Mr. Worby Beaumont's

theory seemed entirely to agree with what he said. The stress was put upon the web of the rail and it pulled it out. As to railways and tramways, the centre of gravity was very much higher in railways than in tramways.

Mr. HARPUR said he knew of a railway in South Wales on which the traffic was light—motor trains chiefly—and the rails on that line were badly corrugated. He attributed that to the light rolling stock, because on the heavy coal carrying lines they did not have it.

Mr. R. B. HOLT (Leeds) expressed regret that Mr. Worby Beaumont was not present that evening. His theory, as far as he (the speaker) could see, was that it was not so much a transference of metal as that the skin of the rail was stretched to such an extent that there was permanent distortion. They had some special tests made by Prof. Carpenter at Manchester University, and the view he took was that the metal was amorphous, the fact of the metal being so showing that hammering had taken place at that point.

Mr. J. W. COCKRILL (Great Yarmouth) stated that he had 14 miles of tramway track in his town, and no corrugations appeared on the first 6 miles done for five or six years. They allowed it to stand, and it ran itself out, but it appeared again after about eighteen months, and they started grinding. There was not much to do, however, and there had been no corrugations since. In another case they ground a little, and that had lasted about two years, and it seemed therefore that the operation would only be necessary every second year on their system.

The PRESIDENT (Mr. R. J. Thomas), in putting the vote of thanks, observed that, as far as he was personally concerned, he was in the fortunate position of having no tramways to look after, though they had something worse to look after in the corrugation of roads.

The vote of thanks was passed.

Mr. WAKELAM, in replying, said it had been a great pleasure to undertake the task of tabulating these returns and preparing the paper, though we found a difficulty in arriving any decision as to what was the cause of corrugation from the replies to the seventy-one questions which they formulated and circulated. There had been very many experiments carried out to find out the cause, there had been acid tests, driving tests, and all manner of other tests, and nobody seemed to have come to a definite conclusion as to what was the cause of the trouble. Mr. Benedict had referred to cold rolling and cold flowing having something to do with the cause of the trouble. Mr. Holt had replied to that, and had said that Prof. Carpenter, of the University of Manchester, had made a great number of microscopic observations in connection with that point, and he believed that his results did not quite coincide with the results or opinion that had been put forward by Mr. Worby Beaumont. Mr. Benedict also referred to the work of tabulation, and he was kind enough to say that he hoped the tabulation would be published by the papers, but he did not understand why the replies should be published, especially as Mr. Benedict stated that the work had already been carried out by other institutions, and they already had the information. He was sorry they did not know that the other institutions had got this information, because it would have saved himself and the Tramway Committee and the secretary of their institution the great amount of work and trouble which had been taken in collecting this information. They were glad to hear that Mr. Benedict was in a position to give them, because from the replies to this institution and the replies which had been given to the other institutions they might benefit, and might jointly come nearer to a solution. Mr. Harpur raised the point of corrugation in connection with trolley wires. Mr. Fairley referred to slip being the cause of corrugation. He did not think those two theories could go together, because there was very little slip in connection with the trolley wire. He did not think it was slip which was the cause of the trouble. The theory had been put forward that expansion and contraction of the rail head was the cause of corrugation. Engineers who laid tramway rails were very careful to see that the analyses of the composition of the rails were complied with. If these analyses were complied with, he did not see why one part of the rail should expand and contract and the other part remain in the same state. For that reason he did not think that expansion and contraction was the cause. Rails which were of the same construction microscopically and otherwise suffered in different degrees in different parts of the track. Therefore it could not be cold rolling or cold flowing, or anything of that kind, which caused a rail to corrugate for 20 yds. or 30 yds., and then remain good for 2 miles. A point put forward by another institution similar to their own was that a greater amount of resistance in the rail might cure the trouble. A rail having ·6 of carbon was difficult to handle, and if they got a higher amount of carbon than ·6 he did not know what was going to happen to the rail, because they were going to have a lot of breakages; and, as Mr. Harpur was good enough to remind him, there was difficulty not only in the handling, but the bending, of the rail. The Sandberg rail had proved itself as receptive of corrugation as the ordinary carbonised rail. There had been a large number of tests carried out, but it appeared to him that the whole thing had got into the state which resolved itself into one thing, that all the information which had been obtained on the subject should be sent to Dr. Glazebrook at the National Physical Laboratory at Teddington, where they could carry out comprehensive tests and researches, and let them know what was the cause of the trouble which people did not appear to be able to solve. He knew—and confessed—that the paper he had laid before them was not the last word on corrugation. Perhaps he might say that he was almost as ignorant of the cause of corrugation now as when he went into the tabulation and preparation of this paper. A friend of his had assisted him with tests with two pieces of steel, and with a plane surface moving regularly backward and forward over the steel there was, after a time, corrugation. There was no slip in connection with that, and no grinding motion, but still there was corrugation. Then, as to the rigid bed. There was no doubt that the rigid bed had a great deal to do with corrugation. When they took into consideration the condition on the Central Railway of London, undoubtedly there was a good deal to be said on that point, and resiliency would do a great deal to alleviate if not to rid them entirely of the trouble. Mr. Harpur wanted him to explain the distances referred to in the paper as to vibration waves. This vibration wave was noticeable at a distance of 240 yds. from the rail. The distance was measured by a tape measure on the road, and it was signalled when the car got to a certain spot. The instrument was put on, and the greatest distance at which it was noticeable was 240 yds. He had no evidence as to the difference of the wave in relation to the speed of the cars. That applied also to the 160 yds., the 70 yds., and also to the vibration on the curves. Mr. Harpur also called attention to the fact that speed might be a factor, if not the cause, of corrugation. He did not think Mr. Harpur could have read the paper very carefully, because he would see the corrugations were more defined and noticeable where speeds were low on the curves than on the straight tracks, so it could not be speed which was the cause of the trouble. He had only to say as to corrugations appearing and disappearing that that was a curious thing. That had been mentioned in the case of Sunderland, where they experienced the same phenomena in connection with corrugations. If corrugations appeared and disappeared, as they had been known to, it seemed they were further from a solution than when they started, because they must find out the cause of the appearance and the cause of the disappearance. It was his opinion that money would be wasted if isolated experiments were carried on; but with regard to tabulation, a good deal of money could be saved if this information were sent to Dr. Glazebrook and he went into the whole question. Whether it was a national question he did not know, but to tramway companies and to corporations who were interested in the upkeep of tramways, and who had to spend some thousands a year, as they had in Leeds, he should say that money spent in connection with researches by Dr. Glazebrook would be very well spent.

WEST MIDLAND DISTRICT MEETING AT BIRMINGHAM.

A West Midland District meeting of the Institution of Municipal and County Engineers was held at Birmingham on the afternoon of Thursday, November 21st, Mr. A. T. Davis, M.INST.C.E., county surveyor of Shropshire and chairman of the district, in the chair. The chairman was supported by Mr. A. D. Greatorex, M.INST.C.E. (West Bromwich). The members assembled in the reception-room at the Council House

Birmingham, those present being Messrs. Hy. E. Stilgoe (Birmingham), H. H. Humphries (Birmingham), J. E. Parr (Birmingham), W. E. Ballard (Birmingham), C. F. Gettings (Worcestershire), H. J. Coleby (Atherstone), F. C. Cook (Nuneaton), W. Plant (Stafford), A. E. Currall (Solihull), G. W. Lacey (Oswestry), W. A. H. Clarry (Sutton Coldfield), R. C. Moon (Nuneaton), W. H. Jukes (Tipton), W. O. Thorp (Malvern), F. Woodward (Stourbridge), G. Green (Wolverhampton), members; A. R. Gray (Birmingham), H. W. Barker (Birmingham), B. C. Hammond (Worcester), R. Fletcher (Worcester), E. J. Goodacre (Nuneaton), associate members; and H. Bradley (Worcester), student.

The minutes of the last West Midland District held at Stourbridge on July 6th—were read and signed.

Mr. A. T. DAVIS thanked the members for electing him as chairman of the district, and proposed the election of an executive committee. This was seconded by Mr. A. D. Greatorex, who suggested that the number to serve on the committee should be fifteen, exclusive of the district representative, district chairman and district secretary, who are also to act on the Executive Committee. The proposition was supported by Mr. Gettings and carried unanimously.

The following resolution, proposed by the chairman and seconded by Mr. H. E. Stilgoe, was carried unanimously: "Resolved that the following members and associate members of the institution be elected *en bloc* to serve as an Executive Committee:—

Warwickshire.—S. Douglas (Kenilworth), member; E. J. Goodacre (Nuneaton), associate member; A. R. Gray (Birmingham), associate member; H. Richardson (Birmingham), member; J. Willmot (Warwick County), member.

Worcestershire.—C. F. Gettings (Worcester County), member; F. Woodward (Stourbridge), member.

Staffordshire.—A. Burton (Stoke-on-Trent), member; W. B. Chancellor (Lichfield), member; H. J. Clarson (Tamworth), member; A. D. Greatorex (West Bromwich, past-president), member; G. Green (Wolverhampton), member; J. Moncur (Staffordshire), member.

Shropshire.—G. W. Lacey (Oswestry), member.

Herefordshire.—J. Parker (Hereford), member.

The CHAIRMAN announced with regret the absence through illness of Mr. H. Richardson, hon. district secretary, and further announced Mr. Richardson's resignation as secretary. Mr. G. Green (Wolverhampton) proposed, and Mr. G. W. Lacey (Oswestry) seconded, that a very hearty vote of thanks be given to Mr. Richardson for his services, and the hope conveyed to him that he would have a speedy return to health.

The CHAIRMAN proposed the following resolution, which was seconded by Mr. H. H. HUMPHRIES (Birmingham), and carried unanimously: "Resolved, that Mr. F. C. Cook, ASSOC.M.INST.C.E., borough surveyor, Nuneaton, be appointed as hon. district secretary."

The position was accepted by Mr. COOK, who thanked the members for electing him.

The CHAIRMAN asked the members to try and arrange for visits to their towns during the coming year.

Mr. H. E. STILGOE, M.INST.C.E., city engineer and surveyor, Birmingham, then described to the members the following town planning schemes which are being dealt with at Birmingham: Harborne and Quinton, 2,320 acres; East Birmingham, 1,443 acres; North Yardley, 2,861 acres; South Birmingham, 7,000 acres. Plans of the schemes were exhibited and inspected by the members.

The CHAIRMAN proposed, and Mr. GREATOREX seconded, a hearty vote of thanks to Mr. Stilgoe for arranging the meeting at Birmingham, and for his explanation of the town planning schemes.

An appeal was made by Mr. GREATOREX to the members to subscribe annually to the Widows' and Orphans' Fund of the institution.

The CHAIRMAN, on behalf of the institution, thanked the Lord Mayor of Birmingham for granting the use of the room for the purpose of the meeting.

In the absence of Mr. Richardson, the duties of secretary were performed by Mr. J. E. Parr, ASSOC.M. INST.C.E. (Birmingham).

SOUTH-EASTERN DISTRICT.

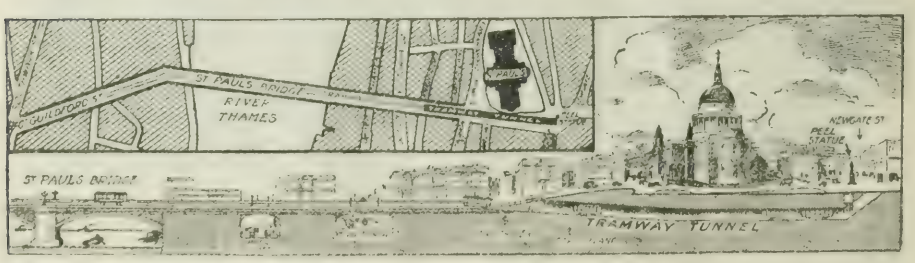
A meeting of the District Executive Committee of the South-Eastern District was held at 11 Victoria-street, S.W., on Saturday last, when particulars were discussed with respect to the meeting—particulars of which appear elsewhere in this issue—to be held at Sidcup on Wednesday, January 8, 1913, to be followed by a dinner at Frascati's Restaurant. Replies to the invitations sent out have been most satisfactory, and the committee trust that those members who have not replied will be able to attend the meeting and the dinner in the evening.

The British Association.—Next year's meeting of the British Association will be held at Birmingham, opening on September 10th, and extending over eight days.

London Tramways Scheme.—At their meeting on Tuesday last the London County Council, after considerable discussion, decided not to proceed with the scheme to construct a tramway from the Marble Arch along Edgware-road to Cricklewood. It had been proposed to seek the necessary powers in the next Session of Parliament.

The Institution of Civil Engineers.—The highest marks in the October associate membership examination have been obtained by Mr. C. Quartanos, of Newcastle-on-Tyne, and Mr. H. Knowler, Wimbledon, Surrey. The council have accordingly directed that Mr. Quartanos, who is ineligible for the Bayliss Prize by reason of his not being a present or former student of the institution, shall receive honourable mention, and that the prize—of the value of £15—shall be awarded to Mr. H. Knowler, STUD.INST.C.E., under the conditions of its foundation.

PICTURE PLAN OF SUBWAY FOR THE PROPOSED SOUTHWARK TO CHEAPSIDE TRAMWAY.



From the *Daily Mail* we reproduce the above picture plan of the subway for the proposed new tramway route through the City of London. An official protest against it has been sent by the Dean and Chapter of the Cathedral to the Chairman of the L.C.C., as it is considered that the construction of the subway, part of which will be 22 ft. below St. Paul's Churchyard, would entail serious risk of weakening the foundations of Wren's great building. The plan shows that the new tramway will run from Southwark Bridge-road, through Southwark, along Guildford-street, and across the new bridge over the Thames. It will be carried overhead across Queen Victoria-street and through a subway from Knightrider-street through Cannon-street, Watling-street, and St. Paul's Churchyard, to Peel's statue in Cheapside.

THE GENERATION AND DISTRIBUTION OF PRODUCER-GAS IN SOUTH STAFFORDSHIRE.

By HERBERT ALFRED HUMPHREY, M.INST.C.E.

[Abstract of a paper read at an Ordinary Meeting of the Institution of Civil Engineers on Tuesday last.]

The South Staffordshire Mond Gas (Power and Heating) Company is a pioneer undertaking, since it is the first example of a company giving under Parliamentary powers a supply of producer-gas for public purposes. The advantages of such a supply have now been amply demonstrated, and, in view of the probability of other schemes of a similar nature being carried out in the future, precise information and data should prove of interest. The Act contains clauses prohibiting the sale of gas for domestic purposes or for illumination, and the limit of carbon monoxide in the gas distributed is fixed at a maximum of 14 per cent.

The area of supply comprises 123 square miles, within which there are six corporations, sixteen urban district councils, and three rural district councils. For the central station an area of about 40 acres of land, adjacent to railway and canal, was secured at Dudley Port, Tipton, which is practically the centre of gravity of the whole area. The designs of the central station plant and buildings, and the distribution system, were carried out by the author, as consulting engineer to the company, and the contract for the whole of the work was let to the Power Gas Corporation, Limited.

The unit of plant adopted was based on a capacity for gasifying 140 tons of coal per day, and consisted of eight Mond gas producers, together with the necessary gas-cooling, cleaning, and compressing plant; plant for the recovery of sulphate of ammonia and tar; and the machinery, comprising steam boilers, circulating pumps, electric generating plant, motors, fans, &c. The first unit erected was started in operation in February, 1905, and at the present time additions are being made which will increase the output by about 80 per cent.

Of the eight Mond producers one is a spare, and each producer is rated at 20 tons of coal per twenty-four hours, but in meeting the peak of the load the producers have been worked at 50 per cent above their rated capacity.

OPERATING RECORDS AND OTHER DATA.

Typical analyses of the fuel used are given, and the methods of handling the fuel and ashes are described. Curves have been plotted showing the coal gasified, sulphate of ammonia made, and the tar sold per month for the thirty months from January, 1910, to June, 1912. Other curves give the total gas made and the total gas sold for a period of eighteen months, and, in order to show the fluctuations of the gas supply from hour to hour, the meter-readings at the central station are plotted in the form of a curve covering a period of one week. At the peak of the load an output of 1,000,000 cubic feet per hour has now been reached, and the plant, which was designed for gasifying 140 tons per day, has reached the rate of 200 tons per day. Curves showing the principal temperatures and pressures throughout the plant have been plotted, and tables showing the calorific value of the gas over long and short periods are given. The Mond producer-gas distributed averages over 150 B.Th.U. per cubic foot, and the regularity of the calorific value is remarkable.

DISTRIBUTION OF GAS.

Owing to the fact that considerable portions of the area of supply are subject to subsidence, due to the presence of disused coal mines, and for other reasons, such as cost, number of joints, &c., steel mains were adopted in preference to cast iron. The author mentions his experience on this subject. Special attention is paid to the coating of the steel mains laid underground, to prevent attack due to the acid water which is prevalent in the district. All mains between 36 in. and 21 in. in diameter, inclusive, are of the locking-bar type, particulars of which, and of the method of jointing, are given. For the smaller mains, welded steel pipes with screwed joints are employed. Up to September, 1912, there were laid 22,666 yds. of locking-bar pipes with lead joints, and 29,181 yds. of steel pipes with screwed joints, making a total of 29·45 miles. Additional mains are now being laid. Drawings showing the types of pipes, joints, &c., are also given, and the special precautions taken to ensure a continuous supply are mentioned.

CALCULATIONS FOR FLOW OF THE GAS.

The method of calculating the size of mains required and the formulas used are set out in an appendix, and an account is given of some important experiments carried out by the author to ascertain the loss by friction in a long length of trunk mains. For this purpose the trunk main between the central station and Bilston, consisting of 10,254 yds. of pipes ranging in size from 36 in. to 27 in. in diameter, was used, and air was blown through these pipes in varying quantities and at various pressures. The results obtained are given in tabular form and show the extent to which the presence of a large number of branches, crosses, valves, and other specials serves to increase the frictional losses. Plans of all the mains laid up to date are given, and the more important features of the distribution system are discussed.

USES OF THE GAS.

The gas supplied to the consumers is used for two purposes—namely, for the production of power in gas-engines and for various forms of heating in furnaces, &c. There are at present over one hundred and fifty gas-engines connected with the company's mains, and it is a significant fact that practically every suction-producer situated near the mains has been shut down, the owner finding it more advantageous to take a supply from the Mond gas-mains. From this cause forty-five gas-producer plants have been thrown idle, twenty of these being suction-plants and twenty-five pressure producer-plants.

A schedule of prices under which gas is supplied is given in an appendix, the price varying, according to the quantity taken, from 1½d. to 2¾d., and the present costs of production and distribution of the gas are compared with the estimates given when the Bill was before Parliament. These figures show that the estimated costs of production based on a much larger plant have been practically realised in connection with the first unit installed. The average price received from consumers was, in June, 1912, about 1·75d. per 1,000 cubic feet, and this is equivalent, having regard to its calorific value, to lighting-gas at 7d. per 1,000 cubic feet, so that the benefits derived by the consumers are obvious. They are further illustrated by some actual examples of saving due to the use of the gas.

A list of the heating operations for which the gas is used is given, and additional uses for the gas are constantly being found. Temperatures up to 1,600 deg. C. are being regularly maintained, and the use of gas for heating operations has proved very satisfactory, the constancy in the calorific value of the gas enabling results to be repeated with certainty. Also, there being no stand-by losses and no fuel and ashes to be dealt with, there is realised additional economy and cleanliness. It is probable that the success which has attended the supply of a cheap fuel gas in South Staffordshire will direct attention to this important subject and will serve to demonstrate the advantages which could be derived by other industrial areas from a similar supply. The subject has been removed from the experimental stage and the safety and convenience of such a supply has been amply proved. For the year 1911 there was a gross trading profit of £8,856, and it is expected that when the new plant, now in course of erection, is brought into use, the financial results will be greatly improved.

North Woolwich Pumping Station Extension.—North Woolwich pumping station is to be enlarged, at a cost of £51,000. The London County Council have spent £4,000,000 during the last fifteen years upon Metropolitan schemes.

Ferro-Concrete Bridge Work in Suffolk.—The opening of a new bridge over the Stour between Sudbury and Ballingdon took place recently. The structure, which is 150 ft. long and 36 ft. wide between parapets, is built in five spans entirely of ferro-concrete. The spans are supported between the abutments by four rows, each containing four ferro-concrete piles, 16 in. square by 17 ft. to 30 ft. in length. Three steam rollers, weighing approximately 35 tons, were used in the tests, which resulted in a maximum deflection of a trifle over $\frac{1}{8}$ in. The work, which has cost £1,900, has been carried out by Messrs. Holloway Bros., Limited, to the designs of the county architect, Mr. A. A. Hunt, for the West Suffolk County Council.

The Effect of Intercepting Traps in House Drainage.*

By EDWARD WILLIS, Assoc.M.Inst.C.E., F.S.I., Engineer and Surveyor to the Chiswick Urban District Council.

The origin of the intercepting trap in house drains may be considered to be largely due to the conditions which were found to exist in sewers laid prior to or about the middle of last century. Undoubtedly at such time many sewers in use were practically elongated cesspools, and defective both in construction and gradient, the result of such defects being that offensive and often dangerous gases were considered to be given off.

Some of these gases, being lighter than air, travelled along the several house drain connections, and rose to the highest available position in such drains or soil pipes. It was at this point that serious trouble apparently arose therefrom, since it is known to every municipal engineer that ventilating pipes to water-closets, sinks, lavatories or baths were practically unknown prior to the above date, and when the traps became unsealed the alleged dangerous gases were driven into the houses.

Even the heavier gases, such as carbon-monoxide, together with deleterious micro-organisms, often obtained access to the house, thus lowering the vitality of residents and creating a predisposition to disease.

The old-fashioned "D" trap was a frequent cause of trouble, for with the then fashionable pan-closets the safe wastes or overflows often discharged into the sewer side of the "D" trap. Theoretically the sewer was nearly always twice trapped by the moving pan containing water above the base of the hopper, and by the "D" trap at the base of the container, yet in practice the direct pipe from the safe to the sewer side of the trap formed a complete circuit of sewer air from the street to the interior of the house. It was another frequent practice to take the overflow from the main water supply cistern into a soil pipe on the sewer side of the "D" trap, and wastes to sinks, baths and water-closet safes were similarly treated, thus affording direct access for sewer air to the surface of water in cisterns, or into bath-rooms and lavatories, which often adjoined bed-rooms and living-rooms, and were sometimes "en suite" therewith.

It is evident that such conditions, even assuming the whole of the house drainage to have been otherwise comparatively good, would tend to result in disease or delicate health, and when some of the early sanitary reformers first evolved the idea of the intercepting trap, it was hailed as a panacea for many drainage evils.

Undoubtedly, assuming the conditions which then existed, the intercepting trap may have served a useful purpose, but the time has come (in fact, for many years such time has been present in the opinion of many surveyors) when it is a moot point if this appliance is still always desirable. Assuming the previous remarks are correct, the principal object of the intercepting trap has passed away, as sewers and house drains, such as those described above, are practically unknown in the modern development of towns and cities.

It is quite possible in some of the larger and older towns that there may be still some sewers of the character mentioned, and if the drains have not been relaid to modern requirements, one would even suggest that, subject to efficient ventilation at either end, a properly designed intercepting trap might still exercise a useful purpose from the point of view of the householder, but from the local authority's standpoint the author is convinced, and has been for many years, that the use of an interceptor is detrimental to efficient sewer ventilation, and results in the sewage commencing to decompose prior to its delivery into the sewer.

From the recent report, it seems certainly probable that the Local Government Board will approve of by-laws omitting the use of this appliance, or will make the use of the interceptor optional at the discretion of the local authority, now that sewers and house drains are laid under efficient supervision and tested hydraulically by capable and trustworthy officials. The Local Government Board deserves the congratulations and thanks of all sanitarians for pleading such a quantity of evidence for the use of local authorities, and such evidence has certainly opened up a wide field of practical investigation, which should result in great benefit to the general public.

The subject is so essentially a practical one, with which every surveyor to a local authority must have had a greater or less degree of experience, that no excuse is needed again to debate upon the many experiments or results deduced therefrom, which are detailed in the report itself or in the appendices.

The author, while engaged as a building surveyor, personally examined upwards of 1,000 interceptors, both in house drains during construction and after these were in actual use, and in many instances his observations agreed with those mentioned in the report, though in a few his experience does not entirely coincide therewith, as will be mentioned hereinafter.

For convenience of reference it seems desirable in the following notes to keep to the headlines adopted in the report, and the author's deductions from the report and extracts from his own experience will be briefly noted under each heading, and summarised at the conclusion of the paper.

Disadvantages of the Intercepting Trap.

Upon examination of intercepting traps, both during the construction and testing of house drainage and in many instances subsequently to the occupation of the premises, the author had the advantage of testing their effectiveness with actual paper and fæces, instead of adopting artificial fæces, as appeared necessary in the very useful experiments carried out by Mr. Patten Barber.

His experience agrees to some extent with that of the last-named engineer, but not entirely, since he found that no 2-gallon flush would clear any type of interceptor experimented with, and the 3-gallon flush only occasionally was successful in removing fæces and paper. A full bath of water emptied in the orthodox method through the waste pipe was also never successful in entirely removing the paper and fæces from many of the traps tested, but a single large pail of slops or water on a reasonably short house drain was in every case successful where the other above-mentioned means of flushing were unsuccessful.

This points to one necessary alteration in the present regulations and design of sanitary fittings—*viz.*, improvements in the method of flushing house drains.

His experience of the blockage of intercepting traps has been extensive, and the causes have been found to include stoppers, paper, fæces, dusters, brushes, and the usual miscellaneous assortment of minor articles, while cement has also been found to be the cause, in some instances, by unduly restricting the effective area of the trap.

The actual setting of the interceptor does not appear to have received sufficient consideration. The best depth of water seal and cascade may also be included in the same category.

In the experiments carried out by him many years ago, before there was any thought of a commission or departmental committee's report upon this subject, he deduced the following—*viz.*, that with a normal house drain and water-closet flush, cascades of less than 2 in., or from 4 in. to 6 in in depth in an ordinary interceptor were seldom self-cleansing, but that when approximately between 2 in. and 4 in. in depth the interceptor tended to be self-cleansing after one or two flushes.

His experiments did not include consideration of the actual capacity of the trap, and he therefore does not propose to deal further with this item or with the other more general matters mentioned in this section of the report, as these are already well known, unless it becomes necessary so to do in replying to the criticisms on the paper.

Advantages of the Intercepting Trap.

The opinion that traps of small water seal act as permanent barriers to the passage of rats through drains has now been clearly demonstrated as fallacious. In one case the author was personally examining an ordinary disconnecting chamber, when a rat came up through a trap (the cleaning arm being

* Paper read at a meeting of the Lower Thames Valley District Surveyors' Association on Saturday last.

properly sealed), and was running along the channel, but upon seeing him turned and dived through the trap again. On another occasion, when accompanied by a witness, a similar thing happened, thus adding proof to the above contention that the intercepting trap does not entirely prevent the excursions of rats into the house drainage system. If, then, the intercepting trap is not ratproof, the ordinary ground floor of basement water-closet, with small water seal, is also not ratproof. Therefore, should the intercepting trap be obsolete, some special provision must be made to eliminate the risk of rats entering into the basement or ground floor premises through the water-closet.

In connection with this matter the author would strongly emphasise the importance of using syphonic or valve closets, primarily because of the effective double seal, which is given by both these appliances, and, secondly, owing to the advantages that would accrue from the more efficient flush obtained by each, and specially referred to above as being urgently required to cleanse both drain and trap.

With reference to the Bristol experiments, the author has again had the advantage of actual experience practically identical therewith. In a certain street where a sewer is headed up by the flood tide whenever any obstruction prevents the proper use of the outlet flap valve, the included air is forced through every house trap with the smallest seal, and the other traps only show slight movement of the water, but no bubbling. This points to another helpful solution of the problem—*i.e.*, that if the water seals of our closets are increased, there is no prospect of sewer or drain air obtaining admission to the house, even when under great pressure, if a trap at ground level with shallow water seal can be provided and have attached thereto a ventilating pipe which would always act as a primary vent for sewer or drain air when under pressure in times of flood, heavy rains or special flushing. The Bristol experiments may therefore be said to have also been of great benefit in proving the above point.

CHEMISTRY OF SEWER AIR.

In connection with this portion of the report, it is both impossible and inadvisable for an engineer to discuss it in detail, but the author differs with the observation of one of the witnesses where he implied that sewer air is only harmful when accompanied by offensive odour.

His experience proves that such is not the case, and this could probably be further proved by many other engineers. Carbon-monoxide, which is highly dangerous, and carbon-dioxide are both odourless gases, and he has no doubt from the occasional effect of sewer air on lamps, that both these or similar harmful gases are at times generated in sewers and drains.

He once had a most unpleasant experience of an assistant being practically overcome, probably through carbon-monoxide, and it was with great difficulty he forced him through the sewer into fresh air. The sewer in question was only 580 ft. in length and 3 ft. in diameter, and there was actually no fæces, but only clean water running at the time of inspection, and no odour whatever was noticeable therein, but flocculent matter was visible in the bottom and at the sides.

The currents of air in sewers and the condition of the latter should therefore always be the subject of careful examination prior to the entry of any men, or work by them therein.

BACTERIOLOGY OF SEWER AIR.

The evidence under this heading is somewhat extraordinary after the usual preconceived ideas respecting it, but certain points are very instructive—viz., that the ordinary flowing sewage apparently gives off practically no bacteria until the water is subjected to agitation and splashing.

It seems particularly strange that the external air should in some instances contain more pathogenic micro-organisms than the sewers, and the only solution that occurs to the author in regard thereto is that in unventilated sewers the deleterious gases that may be given off have also a germicidal action upon micro-organisms, while those that reach the atmosphere or surface of the street are benefited or nourished by the purer air obtainable. In any case, the results obtained by the witnesses have astonished the majority of sanitarians.

BACTERIOLOGY OF DRAIN AIR.

Briefly, the substance of the report is that drain air is infinitely worse bacteriologically than sewer air. If this is actually true, then undoubtedly from a bacteriological point of view it would seem advantageous to dilute drain air with sewer air; but in any case, from the observations and experiments, there appears to be no serious objection to sewer air mixing with drain air.

One general point in connection with the evidence under this heading is that, if some contrivance can be evolved for efficiently flushing with disinfecting media the soil pipes and all exposed portions of the drain and its contents, the danger of drain air would be removed. It is probable that some such arrangement may eventually be found beneficial.

GENERAL EVIDENCE.

This is somewhat on the lines which one might expect from the other portions of the report. Sewer men, as a rule, do not certainly appear to suffer from illnesses more than other municipal employees.

The experiments in connection with animals are not quite unanimous, but the consensus of opinion appears to point to ordinary sewer air being not unduly harmful to them.

One of the most important pieces of general evidence that the report advances appears to be the general health in Germany, where intercepting traps are absolutely tabooed. In Cologne they were tried for a time, but the disadvantages so far outweighed the advantages that they were removed.

VENTILATION OF SEWERS.

The report seems to imply that the ventilation of sewers is not so important as has been considered in the past, and the author does not entirely agree with the findings of the committee in regard thereto. He cannot help stating that he would not risk the lives of any of the men under him in sewers which were solely unventilated, unless it were first possible to circulate a current of air through, and a lamp requiring oxygen for combustion burnt satisfactorily in them. He is, therefore, particularly keen upon the advantages which would accrue to the ventilation of sewers if the intercepting trap is omitted. Primarily he considers "house drainage" is part of the sewerage system of a district, and as such each house should share the burden of efficient ventilation.

SUMMARY AND CONCLUSIONS.

For those who have not time to read the whole report, the author would strongly recommend them to consider this part in detail. It is an excellent résumé of what has gone before, and even if only the summary of conclusions had been made public, the Local Government Board would have performed a service of lasting benefit to the general public. Unfortunately the result of the report is not yet set forth—*viz.*, as to whether the Local Government Board will enforce the use of the intercepting trap, will make it optional, or will cease to allow its use in the future.

The suggestions that have been made to root out all existing traps are, of course, absurd, since no sanitary expert would advise the wholesale destruction of an appliance which although not perfect, has in many cases, and may even still in some cases, prove of benefit, but it does seem most important that in the development of new estates where sewers are laid under efficient supervision, and where drains should be equally efficient, the trap should be omitted, and each house take its normal share in the ventilation of sewers.

CONCLUSION.

In concluding the above notes the author would like to express his appreciation of a report so full of information, a great deal of which would have been unobtainable by the ordinary observer. The experiments appear to have been carried out in a most careful, systematic, and thorough manner, and the results obtained therefrom must undoubtedly be treated with the utmost deference by all thoughtful sanitary experts.

Personally, he is of opinion that the deathblow of the intercepting trap has fallen. It may take a long while to entirely disappear, but a strong case has been made out for its future omission. What, then, will take its place? He suggests the following points for consideration—*viz.*:—

(1) Improved flushing arrangements whereby rapid discharge of large volumes of water are obtained daily through every portion of the house drainage system, which would prevent stagnation or retention of paper and fæces in the pipes.

(2) Effective double seals on all water-closets slop-closets, sinks, lavatories, and baths.

(3) Effective ventilating pipes clear of the second

water seal, recommended above, and ventilating or puff pipes between the first and second seal.

(4) Entire abolition of fresh-air inlets at or near the ground level.

(5) The erection of all ventilating pipes above the ridge of the highest roof immediately adjoining, and as far removed as possible from any window.

(6) An efficient ventilating pipe of the height before described, at each end of any drain which necessarily passes under the building.

(7) The provision of iron drains whenever passing underneath domestic or public buildings.

(8) The provision of at least one trap of shallow water seal, say not less than ½ in. and not more than 1½ in., with provision, by drip tap or otherwise, for always keeping same sealed, and with vent pipe therefrom if the ordinary ventilating pipes were omitted on any branches from internal drains.

(9) All waste pipes to be treated similarly to soil pipes as regards double seal traps and ventilation, and the abolition of open heads.

(10) Means of efficiently flushing all ventilating and soil pipes.

(11) Statutory regulations requiring the examination of house drains not less than once in every six months, with lesser intervals when special conditions render same desirable.

CORRESPONDENCE ON MR. BOULNOIS' PAPER.

The December issue of the *Journal* of the Royal Sanitary Institute contains three interesting communications submitted in connection with the discussion duly reported in The Surveyor of the 22nd and 29th ult.—on the report of the Departmental Committee of the Local Government Board on Intercepting Traps in House Drains, which Mr. H. Percy Boulnois, M.Inst.C.E., recently initiated.

Mr. W. C. Tyndale (War Office) said he agreed with Mr. Boulnois that the report was a most useful one, as, apart from the question of the use of the intercepting trap, it threw light on other matters, and stamped with official recognition certain views with regard to sewer air, &c., which hitherto had not been generally accepted. It was satisfactory to feel that their useful servant, but half enemy, the sewer, was not quite the bad character that it had generally been believed to be, and that its breath, although offensive, was not necessarily deadly. Personally, he was glad to find that the use of iron pipes for house drainage was looked upon with favour, but, on the other hand, he had wondered at the light-hearted suggestion that a way to get over the charging with sewage of a disconnecting manhole, when the trap became blocked, would be to continue the drain from the trap, through the manhole by a closed iron pipe, with a lid provided for the clearing out of the trap. It had evidently not been considered what would be the result of opening the lid on a surcharged drain to get at the trap. It might possibly result in an inquest on the operator, with a verdict of "Found drowned." No, this was no remedy for the flooding of the manhole. A better course would appear to be to put up with the surcharging, and to have the socket of the clearing arm fitted with one of the best forms of locking stoppers, actuated by a chain from the top of the manhole. The committee had considered this arrangement, but offered the objections that such stoppers were expensive, and that they might become defective, and fail to act; but as to this he might say that excellent stoppers were to be obtained, which cost only about 5s., and were practically proof against corrosive action. A great deal had been said as to the tendency of a trap to retain the solids of sewage, and in the report of the committee it was stated that experiments showed that with a 4-in. trap from 52 to 67 per cent of solids were retained, and with a 6-in. trap from 73 to 78 per cent, with a 2-gallon flush. Dr. Parkes had shown how misleading such results might be on account of the nature of the artificial solids used in the experiments. They all recognised that traps did retain solids, and Mr. Boulnois had pointed out that the drains also did the same; indeed, it was common knowledge that this was the case. No one that he ever heard of had ever suggested that a 2-gallon flush was expected to remove the solids at once through the drains and trap to the sewer. But he should like to draw attention to the fact that while fresh sewage was arriving in the drains and trap previously arrested solids were simultaneously being carried along the drains, and out of the trap, to the sewer, so that the arresting of solids was of short duration, and practically no decomposition in the trap and drains took place. Anyone unacquainted with the working of a good system of drains would discount many statements which had been made that all the percentage of solids left in the trap never passed out but broken up and decomposed, and that the trap and drain were charged with a mass of putrid sewage. He attributed most of the greater number of cases of blockage were caused by the falling into the trap of the stoppers of the cleaning arm, and by the admission of foreign substances. As to the first, he had found that this might be obviated by the use of a proper stopper, which, as in the second he experience, which was extensive in connection with all classes of dwellings, taught him that certain details of a drainage system offered opportunities for the introduction of articles which would stop up almost anything, to say nothing of a trap. This was more particularly so in the case of the dwellings of the lower orders, and it was in connection with the trap at those dwellings that the greater number of blockages were usually found. The women frequently emptied pails down the water-closets without always knowing what the pails contained, and rags, bits of hearthstone, small brushes, &c., were passed into the drains. The children also, having so little space and opportunities for amusement, seized with delight the opportunity afforded by a grating of any sort to push in pebbles, sticks, and in fact anything they could lay their hands on, and they not infrequently lifted the grating of a gully and endeavoured to stop it up. He was of opinion that if the authorities would turn their attention at least to the better covering of gully traps, the locking of the gratings, and the putting out of reach of children the fresh-air inlets, the percentage of stoppage of traps would be considerably reduced. In the case of the married quarters in barracks, the regulations provided for the fixing of a special slop-water gully close to the back entrance, and these had proved of great advantage in the prevention of the stopping up of traps. Mr. Boulnois said that "our long-cherished belief in the efficacy of the trap has been rudely shaken." He did not agree. It all depended upon what was expected of the trap. His view had always been that its main object was to shut off from the house drains the very foul air from the sewers. He was quite content to believe, and welcomed gladly the statement that sewer air was comparatively free from microbes, but, on the other hand, he could not agree with the suggestion that sewer air was less foul than that of house drains. (Of course, he was speaking of a proper system of the latter.) It was common experience that it was frequently possible to tell on opening the manhole on a house system whether there was a trap on the outlet drain, or whether the stopper of the trap was in its proper place, as if not the drains were found to be charged with that peculiar and highly offensive odour which was easily recognisable as sewer air. The enormous difference between the atmosphere in a good system of house drainage and that of the sewers convinced him that, whatever an intercepting trap might not do, it at any rate freed the house drains from most offensive smells. It was true that drain air was offensive on the discharge of a water-closet, but these conditions were only intermittent, while the offensiveness of sewer air was perpetual. He could not contemplate with equanimity the laying on of highly offensive air to a system of house drains which otherwise would be inoffensive, nor the possibility of causing the soil and ventilating pipes to become the disseminators of sewer gases at altitudes and in positions which were recognised to be suitable for house drain ventilators. He considered that the omission of the intercepting trap would have the most disheartening effect on all those whose aim and object it was to provide and maintain clean and comparatively inoffensive drainage systems, as without a trap all such efforts would be in vain. In his opinion any legislation having the object of abolishing the use of the intercepting trap would be the first retrograde step in domestic sanitation, and a grave one at that, since this became more or less a science.

Mr. W. Kaye Parry (Dublin) said that for the last thirty years he had a very extended experience as regarded intercepting traps on house drains. During that period he had issued from his offices 4 500 reports on the drainage of houses, institutions, hospitals, and other buildings. Each one of these reports had

been based upon a careful and thorough examination of the drainage, together with the application of the usual tests. More than half of these inspections he had made personally, and the great majority of the remainder had been made by his partner. During the same period the drainage of some 1,550 buildings had been completely reconstructed under his supervision and that of his partner and staff, and in respect of each of these new systems of drains a certificate had been issued to the effect that they were satisfactory. In each case where a certificate had been issued an intercepting trap had been provided, and in all instances the drain had been subjected to the water test. A stoppage of the interceptor would, therefore, be speedily followed by the flooding of the low-level yards and areas, thus causing great discomfort to the occupants. It was not unreasonable to infer that had such occurrences been experienced he would have been made aware of the trouble in view of the sanitary certificate. Some of these certificates dated back as far as 1884, and yet he was unable to recall one single instance in which a complaint had been made of inconvenience caused by such stoppages. Of the 4,500 inspections made some 1,800 had been re-examinations of houses previously inspected, and he had never yet come across a drain gorged by a choked interceptor. His experience led him to the opinion that when a proper type of intercepting trap was used, and when the drains were properly laid, graded, and flushed, the interceptor did not get blocked. If these traps were abolished it would be impossible to provide fresh-air inlets on house drains, and without air inlets house drains would be always more or less foul, even if they were provided with special shafts. It was the free passage of pure air through these drains which kept them sweet and free from smell. When either air inlets or outlets were obstructed, the air in the drains was always found to be offensive, and complaints were made of bad smells. All modern house drains had an inspection chamber, and some of these chambers were in small enclosed areas and yards. Occasionally the covers of these chambers were lifted when inspections were being made or for other purposes, and in the absence of intercepting traps all the foul gases of an evil smelling sewer would then be released in close proximity to the dwelling. Whatever benefit might accrue as regarded the better ventilation of public sewers by the abolition of the intercepting trap, it would involve the sacrifice of the most important features connected with the perfect sanitation of the individual houses. If trouble was experienced in some towns from stoppages in intercepting traps, the remedy consisted not in the abolition of the traps, but in the reconstruction of the house drains on more perfect lines. His experience led him to believe that the intercepting trap was an effectual barrier against the incursion of rats. They were very seldom found in well-drained houses, and when they existed their presence had almost invariably been traced to incursions from adjoining houses where the sanitation was imperfect.

Prof. Bostock Hill (Warwickshire County Council) said he could not help feeling that in some quarters at least there was a tendency to attribute all the evils to the intercepting trap—a bête noir. His experience as a Public Health Committee was a limited and valuable one, and did not appear to be in accordance with those views. The one great fallacy underlying the objection to the use of the intercepting trap appeared to be the supposition that all sewers were of the same type, while, as a matter of fact, the conditions existing in different localities were widely different. It had been quite customary to make use of sewers to carry down pipes from the separate system, and particularly in those places where the sewers were of inconsiderable size. These sewers much more closely approximated to drains in their character, and could not be compared with the large sewers of London and many other towns. He had had [illegible] years' experience of that type of sewer. He believed he had seen more than one instance when the absence of an interceptor had caused injury to health as well as nuisance to householders. He was not, in consequence, prepared to advise local authorities to abolish those traps, but rather to attempt to discover in each case where they had been the cause of complaint why such complaint had arisen, and how they could be remedied. He endeavoured to show before the Institute some years ago that the unnecessary multiplication of traps was an evil, but the complete abolition of interceptors was a totally different thing, and one which should not be universally accepted as sanitary practice on the evidence at present submitted.

CEMENT LINING FOR STEEL PIPES.

At a meeting of the New England Waterworks Association (the *Contract Record* of Toronto states), Mr. Alfred D. Flynn, department engineer, Board of Water Supply, New York City, read a paper entitled "Protection of Steel Pipes in Catskill Aqueduct," describing the lining of some 33,000 ft. of steel pipe with cement.

Steel having been selected as the metal for the pipe plates, attention was directed to the best method of protecting it. Reports of experience from many places and special examinations of many steel pipe lines of varying ages gave convincing proofs that none of the pipe coatings commonly used was possessed of qualities giving it more than a few years' useful life. One or two cases of use of Portland cement mortar on a small scale in pipes and wide experience in reinforced-concrete construction of the protective action of the cement on the steel pointed to a method for coating the pipes. After some study it was decided to jacket the steel syphons of the aqueduct outside with rich concrete mixed about one part of cement to three parts sand and six parts broken stone or gravel, with a minimum thickness of 6 in., and to line them with Portland cement mortar, 2 in. thick at the minimum.

For lining the pipes, two distinctly different methods have been adopted by the two contractors; on Contract 62 grouting with forms has been employed, and on Contract 68 mortar has been applied by means of the "cement gun." In this particular work grouting proved to be more economical and the "gun" has been discontinued.

It is hoped that these pipes will last a hundred years; they may last much longer, barring accidents. Some abuse or unappreciated condition may lead to earlier partial failure, necessitating reconstruction. The gain in smoothness of interior by covering the rivet heads and the plate laps has been computed to so increase the hydraulic capacity that three pipes equal four without lining. The total cost for the syphons with three lined and jacketed pipes is estimated as about the same as for four pipes constructed and coated in the more usual way. Obvious incidental advantages are secured by the more permanent construction.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

MEETING AT TWICKENHAM.

An ordinary meeting of the above-named association was held at the Town Hall, Twickenham, on Saturday last, when the chair was taken by the president of the association, Mr. H. F. Coales, ASSOC.M. INST.C.E. The attendance was even better than that at the previous meeting, and a paper on the effect of intercepting traps in house drainage was given by Mr. E. Willis, ASSOC.M.INST.C.E., F.S.I., engineer and surveyor to the Chiswick Urban District Council. A discussion upon the paper—which appears elsewhere in this issue—afterwards took place, but was adjourned owing to the lateness of the hour.

The question of the ownership and use of fire hydrants was discussed, and was also adjourned for further consideration at the next meeting.

The committee considered, among other items, the thickness of walls in various classes of reinforced concrete buildings, various forms of roof covering, and the question as to who is the owner of gravel surplus from the laying of a sewer in an old parish road at least 100 years old.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. C. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Ltd. Price 10s. 6d.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

HIGHWAY: DEDICATION. RIGHT OF ACCESS. — The decision of Mr. Justice Joyce in *Tottenham Urban District Council* v. *Rowley* (noted at p. 912 of vol. xli.) has been affirmed by the Court of Appeal. It will be remembered that the case raised an important question as to the dedication of a street where only a portion thereof has been made up. The defendant laid out a new street, known as Keston-road, in accordance with approved plans. The road runs east and west, being bounded on the north by a public park belonging to the council, and on the south by houses of the defendant. The southern half only of the road was made up, but the whole road was thrown open and used by the public. The council having made an opening in their fence in order to obtain access to the road from their park, the defendant blocked up the opening, contending that the northern half of the road had not been dedicated as a public highway. Mr. Justice Joyce held that the whole of the road had been dedicated, and that the council were entitled to access thereto from the park. In the Court of Appeal the Master of the Rolls said that the defendant contended, with truth, that the mere intention indicated by depositing plans to make a highway was not sufficient by itself to establish that his intention had been carried into effect. The judge had, however, found a dedication of the whole road, and he (the Master of the Rolls) did not think they would be justified in interfering with that finding on the evidence. On the appeal the defendant only challenged the finding so far as regards the northern half, but his lordship was unable to follow this. There must be a dedication of the whole or none. Another point made was that the plan showed a footpath along the northern side. There was at present no footpath, but in any case the owner of adjoining land was entitled to gain access to the highway. It was a right to be exercised reasonably, so as not to interfere with the rights of the public. The council were entitled to a reasonable extent and at reasonable times to cross the footpath, which was a different thing from driving along the footpath. Any other view would lead to absurd consequences. Could not the owner of a suburban villa cross the path on a bicycle, or drive his pony-trap up to the stable at the side of his house? In his opinion, the rights of the public were subject to reasonable exercise by adjacent owners of their private rights. It was not open to the defendant to say, "I intended to dedicate to the public without giving any rights to adjoining owners." Such a qualified dedication, if it were possible in law, which he doubted, must be established by clear evidence, and no such evidence was forthcoming in the present case.

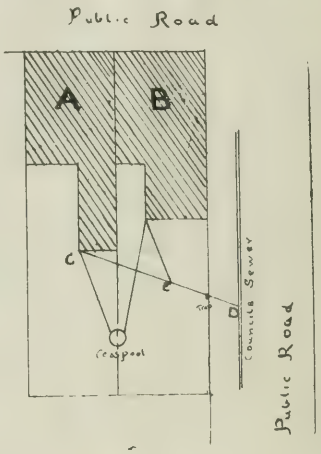
QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

PRIVATE STREET WORKS.—"J. G. S." writes: My council have recently made up a street under the Private Street Works Act, 1892. Tenders were advertised for, but none received, and the work was carried out by me. I shall be glad to have your opinion on the following points: (1) Can the council include 10 per cent for contingencies in addition to the 5 per cent for "commission in respect of surveys, superintendence and notices" in preparing estimates for the provisional apportionments? I believe it was so held by the King's Bench Division in or about the year 1909. (2) Can the cost of advertising and printing notices be included in the final apportionment as actual expenses, and added to the cost of the execution of the actual works, or must such expenses be defrayed out of the 5 per cent commission for surveys, superintendence and notices? (3) Can the council include a profit, say, 10 per cent, on the actual cost of labour and materials to the council, in making up a new street, in the final apportionment of ascertained expenses to be paid by the owners? The work of making up the street in question was carried out by the council's workmen, as, although tenders were advertised for, none were received.

(1) I am not aware of any such decision, and I think it is very doubtful whether such a vague item as "contingences" can properly be included. (2) I think these expenses must be defrayed out of the 5 per cent commission. (3) In my opinion they cannot.

HOUSE DRAINAGE.—"Doubtful" writes: Some twenty-four years ago two houses were drained to one common cesspool. The local authority some eighteen years ago laid in sewers. The property A



and B then belonged to one man, and was connected to the sewer by means of a single drain (C—D), since when the property has passed into several hands. Can B cut off the drain from A, and is the pipe from E to D a public sewer?

The pipe from E to D is a public sewer. Inasmuch as it is less than 20 years since the properties ceased to belong to one owner, the owner of A cannot have acquired the right to drain through B's property by prescription. I do not think a grant or reservation of such a right would be implied on the severance of ownership, because this mode of drainage is merely a convenience and not a necessity. Unless therefore the right was expressly granted or reserved on the severance of ownership B can cut off the drain from A. If the premises are leasehold, the lease of B probably contains the usual reservation of the right of drainage through the property.

WATER SUPPLY: "PROPER SUPPLY."—"A. Q. H. A." writes: The accompanying sketch shows a group of cottages, all of which obtain their water from a well, the water being good. The council have constructed sewers adjacent to the cottages, and desires to serve notice on the owners to connect the closets to the sewers, but, owing to the fact that water has to be carried from the well, it is impossible to install water closets. Other closets are already connected to the sewers by means of the slop-water system, but it is impossible to adapt this system to the first-mentioned ones, owing to their situation. The district is supplied with water by a joint water board, which would probably lay the mains free of cost on condition that all the cottages took a supply. Could it be held that the existing water supply is not a proper supply within the meaning of sec. 62, Public Health Act, 1875, and consequently the process of this section adopted, and afterwards that indicated by the enclosed notice?

This section applies "when on the report of the surveyor of a local authority it appears to such authority that any house . . . is without a proper supply of water, and that such a supply . . . can be furnished thereto at" such cost as specified in the section. This appears to leave the question of what is a proper supply to the decision of the local authority, upon the report of their surveyor, subject presumably to appeal to the Local Government Board under sec. 268 of the Act. In my opinion, therefore, if on the report of their surveyor the supply appears to the corporation not to be sufficient, they can proceed under sec. 62. When a sewer and water supply sufficient for the purpose are available the powers of the special Act as to closet accommodation can be put into operation.

The Surveyor
And Municipal and County Engineer.

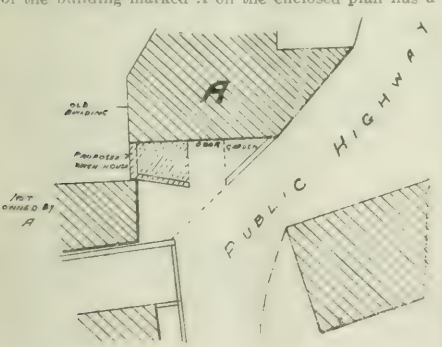
PUBLIC HEALTH (BUILDINGS IN STREETS) ACT, 1888.—"Lakes" writes: I shall be glad if you will give me an early reply as to whether you consider the owner of the building marked A on the enclosed plan has a



right to erect a wash-house in front of his building, as shown by the dotted line, the space now being a garden surrounded by a dwarf wall.

The peculiar arrangement of these buildings makes this a difficult question to answer, but assuming that the wall facing towards the street of the building not owned by A is the front main wall thereof, I think the erection of the proposed wash-house without the consent of the urban district council would be a contravention of sec. 3 of the Public Health (Buildings in Streets) Act, 1888.

RAIN-WATER PIPE.—"G. J. R." writes: In constructing a building I have fixed a down pipe to convey water from the roof to the ground, after which it flows on to and over the public footpath. The surveyor to the urban district council has served me with a notice requiring me to connect the down spout with the surface-water sewer. I am willing to place an iron channel across the public path and connect to it, but wish to avoid the extra expense of connecting with the surface-water sewer. (1) Can the district council force me to connect with the surface-water sewer? (2) If not, and I put an iron channel across the public path, who would be responsible for the maintenance, renewal and cleansing of the iron channel? (3) If I fixed an iron channel, have the local authority power to decide on the pattern and strength of the channel?

(1) The rain-water pipe falls within the definition of a "drain" (*Holland v. Lazarus*, [1904] 1 K.B. 289). The council can therefore apparently require it to be connected with the sewer under sec. 25 of the Public Health Act, 1875. (2) I think the owner would be responsible. (3) If the street is a highway repairable by the inhabitants at large, the consent of the council would have to be obtained, and might be given conditionally on the channel being approved by them.

STREET WIDENING.—"H. F. H." writes: An urban district council's by-laws state that new streets must be constructed of a minimum width of 36 ft. The council are desirous of widening a very narrow main street (12 ft. 3 in. in width) within their district, and have prepared an expensive scheme of widening to a width of 25 ft. The question has arisen as to whether, on application being made to the Local Government Board for sanction to a loan for the purpose, the board would refuse their sanction on the ground that the council were not complying with their by-laws as to width of new streets. Will you please advise whether the widening of an existing street comes within the definition of a new street?

Sec. 154 of the Public Health Act, 1875, authorises the purchase of premises for widening a street, or (with the sanction of the Local Government Board) for making a new street. A proposed new street under this section must comply with the by-laws in force as to new streets, otherwise the board would not entertain an application for sanction to a loan. (See Lumley's "Public Health Acts," 7th Edition, p. 325). Apparently, however, this does not apply to the widening of an existing street.

"POUNDS."—"C. F. S." writes: Scattered about many rural districts are "pounds" used formerly for the detention of straying cattle? I shall be glad of your observations as to the ownership of these various "pounds" at the present time. In this district a number of them appear to have been claimed by the lord of the manor. I cannot find anything in the Highways Act dealing with the matter, excepting the 1847 Act (Police), which deals with towns.

An old parish pound which was originally acquired by the surveyor of highways passes to the district council as his successor. A pound not so acquired probably belongs to the lord of the manor ("The Law Relating to Highways," by H. H. Copnall, 2nd edition, p. 78).

SUMMER SCHOOL OF TOWN PLANNING.

In view of the success of the first Summer School of Town Planning held at the Hampstead Garden Suburb in August last under the auspices of the University of London, it has been decided to hold a second summer school next year at the same centre. It will last for a fortnight, commencing August 2nd and continuing till August 16th, and during that time lectures and demonstrations on town planning and subjects practically connected therewith will be given by some of the leading authorities. Last summer certificates were awarded to the students by the Extension Board of the London University, and a number of architects and engineers have already found these certificates of great advantage. Next year it is hoped that, with the experience of the first summer school, the course will even be an improvement upon last year's. The Hampstead Garden Suburb, the 400 acres extension of which forms a great portion of the town planning scheme recently submitted to the Local Government Board by the Finchley District Council, makes an ideal centre for a study of this kind. The practical difficulties which town planners have to overcome can here be studied on the site as they actually occur, and the lectures are rendered of considerably more value by constant illustration of outdoor practice. The school will, as before, be specially adapted to the needs of municipal engineers, architects and surveyors.

Particulars can be obtained upon application to the hon. secretary of the Summer School, Mr. J. S. Rathbone, the Institute, Hampstead Garden Suburb, London, N.W.

Road Construction and Maintenance in Glasgow.—Paving with granite or whin setts in Glasgow during the financial year ended May 31st last cost, according to the report of Mr. Thos. Nisbet, the master of works, £10,959. The total expenditure on the maintenance and repair of streets was £85,463, the amount being smaller owing to the impossibility, on account of railway and other strikes, of obtaining, at the proper times, the necessary supplies of material.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

290. Design of Struts.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength. ("Designer.")

291. Hydrostatics.—Calculate the total and resultant pressures on the interior curved surface of a hemispherical bowl of radius r placed with its diametral plane horizontal and just filled with water. (W. H. B., *Barking.*)

292. Foundations.—Sheet piling is required round the foundations of a warehouse to hold in the soil, which is of a loose, sandy nature. Give neat sketches showing how this would be carried out. (T. R.)

293. Road Making.—State the advantages claimed for the parabolic camber over the circular camber in road construction, and give a sketch with figured dimensions of a camber which produces the best results. (A. S. C., *Hove.*)

294. Traction.—Compare the tractive force required for heavy vehicles over roads of various surfaces and grades, and show how this affects the cost of transport. (H. V. O., *West Bromwich.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

288. Mechanics.—Explain clearly the distinction between a vector, a scalar, and a rotor quantity. ("Beginner.")

Physical quantities are divided into two classes, according as they (1) are or (2) are not related to any definite direction in space.

(1) In the first class there are such quantities as numbers, time, temperature, mass and energy.

They are absolutely specified when two things are given:—

(*a*) The kind of quantity.
(*b*) The amount of it present.

Such expressions as 3 ft., 10 lbs. and 20 ° F. are examples of this class, and can be geometrically represented by straight lines drawn to a scale such that their lengths are proportional to the amount of the quantities, as in 3, 10 and 20 in the given expressions.

(2) A quantity which is related to a definite direction in space is called a vector quantity.

The quantities displacement, force, momentum, acceleration and velocity are vector quantities.

Consider displacement which is a pure vector. The displacement of a point is the distance the point is moved in a given direction. Hence displacement may be represented by a straight line drawn to scale so that the lengths of the lines represent the magnitudes of the displacements, and the directions of the lines give the directions in which the body is displaced. An arrowhead is used to indicate the sense of the motion.

All vectors are confined by the parallelogram law, so familiar in the case of finding the resultant of two forces acting at a point.

A vector can be moved parallel to itself; then it will be readily seen that the same vector can be used to represent the motion of points moving with the same speed in parallel paths.

The wind may be cited as an example of a vector; it has magnitude, direction and sense, but not position.

A vector quantity is a vector having a definite position in space, or a "localised vector."

Thus, a force is only fully specified when its magnitude, direction, sense and its point of application are given.

Rotation about a fixed axis is specified by giving its magnitude (or angular velocity), sense (whether to right or left hand), direction of the axis, and the position of the axis. For it is clear that the rotation about one axis is very different from a parallel axis 1 ft. away from the first.

Such quantities as force, acceleration, rotations and spins are examples of rotor quantities; they possess all the properties of vectors, and are usually treated as such. In fact, rotors are confined by the same laws as vectors. They are localised vectors. (H. V. O., *West Bromwich.*)

A scalar quantity is one which can be specified without any reference to direction or position—such as algebraic quantities, mass, and time.

A vector quantity is one of which direction is a necessary element—such as velocity, acceleration and force, and it can be completely expressed geometrically by a straight line when length, direction and sense are known, though the line may have any position in space.

A rotor quantity is a vector whose position in space is definitely fixed, and is thus completely specified as a vector, with the addition that one point on its axis must be known.

A straight line representing a scalar may be moved to any position whatsoever, and still completely represent that quantity; for a vector, the line may be moved parallel to itself to any position; but the similar representation of a rotor quantity can only move to and fro along its own axis—*i.e.*, its direction must always pass through a fixed point. (H. E. L., *Islington.*)

289. Strength of Materials.—Compare the resistances to bending of a wrought-iron I beam, flanges 6 in. by 1 in., web 8 in. by ⅜ in., when upright, and when laid on its side, thus ⊟.

The resistance of a beam to bending $= f\frac{I}{y}$

where f = maximum fibre stress.
I = the moment of inertia of the section about an axis perpendicular to the plane of bending.
y = distance of extreme edge from axis.

When the beam is upright the total depth = 10″.

$\therefore y = 5$ and $I = \frac{6 \times 10^3}{12} - \frac{5\frac{1}{4} \times 8^3}{12}$

$= 500 - 224 = 276.$

$\therefore$ Resistance to bending $= f\frac{276}{5} = 55{\cdot}2f.$

When the beam is on its side the total depth = 6″.

$\therefore y = 3''$ and $I = 2 \cdot \frac{1 \cdot 6^3}{12} + \frac{8 \times \frac{3}{8}^3}{12}$

$= 36 + \frac{9}{32} = 36{\cdot}3$

$\therefore$ Resistance to bending $= f\frac{36}{3} = 12{\cdot}1f$

To compare these resistances the induced stress f must be the same in both cases, and the ratio of the bending resistances becomes $\frac{55{\cdot}2}{12{\cdot}1} = 4{\cdot}55.$

(H. E. L., *Islington.*)

The moment of resistance or resistance to bending of a beam is obtained from the formula $MR = \frac{fI}{y}$.

Where MR represents moment of resistance.

f represents tensional or compressional strength of the material, per square inch.

I represents moment of inertia of section in inch units.

y represents the distance of the extreme fibres from the neutral axis, in inches.

As the material is the same in each case, the value of f, whether for tension or compression, is constant for any position of the beam, and may therefore be neglected in this calculation.

After eliminating f, the resistance of the beam

to bending depends upon the value $\frac{I}{y}$—that is, upon the "modulus of the section."

Let the upright position (I) of the beam be (1), and the horizontal (—) position be (2).

Then $MR_1 : MR_2$ as $\frac{I_1}{y_1} : \frac{I_2}{y_2}$

$$\frac{I_1}{y_1} = \frac{\frac{6 \times 10^3}{12} - \frac{5 \cdot 25 \times 8^3}{12}}{5} = \frac{500 - 224}{5} = 55 \cdot 2$$

$$\frac{I_2}{y_2} = \frac{\frac{2 \cdot 6^3}{12} + \frac{8 \cdot 0 \cdot 75^3}{12}}{3} = \frac{36 + 0 \cdot 28}{3} = 12 \cdot 09$$

$MR_1 : MR_2$ as 55·2 : 12·09 or $\frac{MR_1}{MR_2} = \frac{55 \cdot 2}{12 \cdot 09} = 4 \cdot 57$ nearly).

The resistance of the beam to bending is 4·57 times greater when upright than it is when laid on its side, that is, —. (A. S. C., *Hove.*)

THIRD INTERNATIONAL ROAD CONGRESS.

FOREIGN AND COLONIAL DELEGATES.

The Governments of the following countries have accepted the invitation of H.M. Government to appoint delegates to attend the forthcoming International Road Congress, London, 1913: Algiers, Argentine, Austria, Belgium, Bulgaria, Chili, Colombia, China, Cuba, Denmark, France, Germany (including separate delegates from the States of Prussia, Bavaria, Saxony, Baden, Brunswick, Hamburg, and Alsace-Lorraine), Hungary, Japan, Luxembourg, Switzerland, Monaco, Netherlands, Norway, Russia, Servia, Siam, Spain, and the United States.

The following Governments within the British Empire have appointed, or propose to appoint, official delegates: Canada, India, New South Wales, New Zealand, Queensland, South Australia, and Victoria.

In addition to delegates appointed by the Governments, many provinces, municipalities and local authorities in all parts of the world have appointed representatives to attend the congress. The most recent intimation received by the local organising council arrived this week from Mayor Gaynor of the City of New York, who writes: "The matter of good roads is of the highest importance. No road is a barbarism; roads mean civilisation, and the best roads the best civilisation. I shall be very glad to appoint delegates from the City of New York."

FORMATION OF TRADERS' COMMITTEE.

The organisation of the congress is in the hands of a committee formed of representatives of railway authorities, scientific institutions, learned societies, organisations of automobilists, cyclists, road users and others. The organising council received some time ago offers of practical assistance from many of others engaged in the road industry, and it was decided to form a Traders' Committee. This committee is composed of representatives of all branches of road makers, including manufacturers of steam rollers and road locomotives, road tarring appliances, stone paving, and those engaged in the construction of bituminous roads, wood-paved roads, quarry owners and others. The president of the committee is Lord Cowdray; the vice-president, Mr. Edward Hickman, J.P.; the chairman, Sir Herbert Praed; and the vice-chairman, M. E. B. Chittenden. Other members of the committee are Messrs. J. W. Astolown, H. K. Bamber, J. G. Barford, H. D. Blake, H. F. Berry, F. E. Bristowe, F. M. Bond, A. Brooks, W. Chappell, S. Constable, D. G. Comyn, L. Cooper, A. E. Dalzell, J. Dairy, H. F. Ellerton, H. Grace, W. T. Graves, W. Pearce Green, T. J. Jennings, J. Mackay, W. Manuelle, T. Milne, P. Morris, H. Pitts, J. Purdy, Colonel Thompson, and Dean Ward. The hon. secretaries are Messrs. H. Beadle and H. L. Wettern.

The Executive Committee of the congress will be glad to welcome any further offers of assistance, and to make any additions which may be necessary to secure that all branches of the industry are adequately represented.

The Traders' Committee at the moment is applying themselves in three directions: (1) In raising funds for the congress; (2) in arranging excursions and entertainments for the members of the congress; and (3) in making proposals to render the exhibition to be held in connection with the congress of the utmost value to the British trade. As regards funds, the committee have already collected the sum of over £1,000, and they have received considerable assistance from the Association of Bituminous and Other Paving Material Manufacturers.

The list of subscriptions to date is as follows:—

	£	s.	d.
Anglo-Mexican Petroleum Products Company, Limited	105	0	0

A list of excursions which will be open to members of the congress has been prepared by the committee, and a number of practical proposals for making the exhibition of the utmost value have been adopted.

CORRESPONDENCE.

"In all things, all sincerity, all earnestness, all reverence, all humility, all truth and truth's consistency."
GEO. HERBERT, *"The Temple."*

BITUMINOUS MATERIALS.

To the Editor of THE SURVEYOR.

SIR,—Notwithstanding that Mr. Jas. Bastian's criticisms do not appear to me to be a very helpful contribution towards the solution of the nomenclature problem, I will, nevertheless, reply to his questions as follows:—

(1) The word "pure" prefacing natural asphalt or solid bitumen is meant to imply that it is the unadulterated hydro-carbon as provided by Nature.

(2) Natural rock asphalt should be spelt with a final "e," not only because it is the present practice, but also because it is the Continental spelling of the word asphalt. I quite agree that the definition of this material should be a lime ore naturally impregnated with bitumen so as to differentiate it from the synthetic product which has been proved to be inferior to the natural material.

(3) Despite Mr. Bastian's surprise, I still didactically adhere to my statement as to what is known as "asphaltum," and do not admit that gilsonsite, which is one of the purest forms of solid native bitumen, comes into this category at all, but, on the contrary, is a natural material.

Perhaps Mr. Bastian will now, instead of expressing his opinion that Mr. Hutchinson and myself are in error on several points, assist in endeavouring to arrive at definitions which will stand without being disputed for all time. Meantime, it might help matters if Mr. Dussek, who refers to my having mentioned what is common knowledge that the Road Board was in its infancy in 1910, and state, by what logical reasoning I know not, that if this is so, it could hardly have grown up in this short time to now assume, as I suggested, the position of instructor, and explain to road engineers in this country the real meaning of the unquestionably still much misunderstood words asphalt and bitumen, notwithstanding which he somewhat contradictorily, in the last paragraph of his letter, endorses this suggestion, but with the proviso that the views of those who have made a study of the subject are taken, which undoubtedly the Road Board did in a like manner before issuing their specifications relating to tar.

It will, of course, be of great interest to peruse Mr. Dussek's pamphlet on the subject when issued, but, with all due deference to Mr. Dussek, his pamphlet

is not likely to carry the same weight with road engineers as one issued by or under the auspices of the Road Board.—Yours, &c.,

CECIL NATHAN.

3 London Wall Buildings,
London, E.C.
December 7, 1912.

STEAM HAULAGE.

To the Editor of THE SURVEYOR.

SIR,—I have read with much interest the paper by Mr. Symons on the above subject, published in a recent issue of your paper, and having regard to the number of inquiries which I am receiving with regard to this type of haulage, it is evidently one which is receiving the consideration of many municipal surveyors.

It has occurred to me that possibly some further information as to the results of actual working may be useful to those who are considering the subject, and as my council two and a-half years ago decided to purchase a steam wagon and trailer, principally for haulage of road and other materials, I am able to give the results of the first two years' working.

Our wagon was purchased in July, 1910, from Mann's Steam Wagon Company, of Leeds, for £625, and is capable of carrying 5 yds. in the tipping body of the wagon and 3 yds. in the trailer.

The Local Government Board granted a seven years' loan without public inquiry.

The wagon is also fitted with a 1,000-gallon removable street watering tank, but we have not used this very much, as we find it considerably more remunerative to use the wagon for haulage of material.

The following is a brief statement of the cost of working and work carried out:—

	Year 1910-1911. £ s. d.	Year 1911-1912. £ s. d.
Repayment of loan and interest ...	100 3 11	100 3 11
Wages, driving and extra loading	172 19 10	184 0 2
Fuel ...	42 3 6	47 18 2
Engineer's stores, &c.	19 13 4	20 5 0
Repairs allowed . .	40 0 0	40 0 0
,, (actual)	(25 10 8)	35 16 4
Insurance ..	6 7 9	6 16 8
Rent of cover shed	3 15 0	3 15 0
	£385 3 4	£442 5 0

From these amounts there were certain sums to be deducted for private haulage, undertaken at a profit, thus reducing the nett cost to the council.

	Year 1910-1911. Miles.	Year 1911-1912. Miles.
Wagon ran (full)	2,785	2,786
,, ,, empty	2,456	2,455
	5,241	5,241
Ton mileage of materials carried ..	16,175	19,360
Cost per ton-mile (net cost)	4·82d.	4·26d.

I may say that, comparing the two years' work of the wagon with the previous years, when all haulage was carried out by horses, the wagon has saved my council at least £300 per annum.

Our average distance of haulage may be stated at approximately 2 miles, and there are many points which must be considered before it can be said that a steam wagon is suitable for the requirements of a particular district. Facilities for loading quickly, average distance of haulage, amount of work to keep the wagon running, are some of the principal points of consideration.

At the time my council were considering the purchase of the wagon I found several surveyors were most ready to afford me information as to their experience, for which I was much indebted to them, and I shall only be too pleased in return to afford any surveyor who may be in a similar position any information as to my experience of the work and cost of steam haulage.—Yours, &c.,

HORACE C. FREAD,
Engineer and Surveyor, Esher and the Dittons Urban District Council.

Thames Ditton.
December 9, 1912.

INTERCEPTING TRAPS IN HOUSE DRAINS.

To the Editor of THE SURVEYOR.

SIR,—The letter from Mr Walter Jennings, published in your issue of the 6th inst., with reference to his "closet of the century," appears to me an entirely retrograde step.

During the last sixty years water-closets have been undergoing the natural process of simplification, which is inevitable with all human inventions, and in that period we have come from the Bramah closet with its filthy pan and container down to the simple, clean and safe wash-down closet, with its P trap discharging directly into a 4-in. ventilated soil pipe. Now Mr. Jennings wants to go back on this, and to introduce a second trap about 2 ft. below the first one. This necessitates the ventilation of the space between the two traps, and he shows for this purpose two puff pipes, one marked "inlet" and the other "outlet;" it also necessitates a trap on the flush-pipe, as shown by the drawing (which is not very clear in this respect) in his advertisement of the closet, and all this in addition to the "anti-syphonage pipe" which is necessitated by the presence of the fourth, or usually so-called "intercepting trap," at the lower end of the house drain. This complicated battery of traps is a quixotic attempt to deal with an imaginary evil, but their use will be fortunately limited by the cost. The advertisement will no doubt appeal to many people who have more money than knowledge of the subject, as this arrangement will probably work all right with clean water in the showroom, but I venture to predict that after twelve months' ordinary use the space between the two seals would be very foul indeed, even with a 3-gallons flush. I quite agree with Mr. Jennings that a 3-gallons flush is very desirable for any water-closet, as there is no point upon any house drain where it can be more effectively used. I also agree "there is great indifference on the part of householders in attending to and examining their house drainage systems." But this is not to be cured by more inspections, for which we have ample powers, but by better education, and by making all forms of sanitary appliances as simple and at the same time as effective as possible.—Yours, &c.,

R. READ.

WHAT IS A GARDEN CITY?

To the Editor of THE SURVEYOR.

SIR,—I think Mr. Craske and myself are quite agreed as to the meaning and objects of a "garden city." As I have said previously, I have every sympathy with the "garden city" movement, and it was only the attempt to ignore its commercial aspect and unduly laud the philanthropic side against which I protested. So long as "garden cities" must be developed by "commercial companies on business lines," I fail to see how it can be said that the motives are "entirely disinterested," as claimed by Mr. Culpin. The motives and objects of the man or woman who invests in consols or corporation stock are no doubt quite praiseworthy, but I do not see that they are of a philanthropic character; though seeing that they only get about 3½ per cent against the 5 per cent interest paid by the garden city companies, it is obvious that the holder of consols is at least equally as disinterested as the shareholder in a garden city company.—Yours, &c.,

A. J. PRICE.

Lytham.

THE INSTITUTE OF SANITARY ENGINEERS: ELECTION OF COUNCIL.

To the Editor of THE SURVEYOR.

SIR,—Again I wish to make use of your excellent and far-reaching columns on behalf of the "cause of the profession," and trust you will again grant me this privilege.

An entire change of the council of the above institute is needed, and members are about to be given the opportunity of making one. In the new ballot list shortly to be issued may I appeal to members to vote for municipal engineers in almost every case, and to pick out the most eminent of these for the honoured posts? A reference to the recently issued membership lists of the other institutions will probably greatly assist in detecting the best and most qualified, and I hope that this opportunity will be seized to the full to make this institute of still greater value municipally to its members.—Yours, &c.,

FELLOW.

December 10, 1912.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

East Ham T.C. (November 12th. Mr. R. H. Bicknell). -£3,883 for the purchase of 9 acres of land for the purpose of a public recreation ground. The town clerk, Mr. C. Eustace Wilson, stated that the council desired as long a period as possible in which to repay the loan. The borough engineer, Mr. J. E. W. Birch, said it was proposed to lay out the new land by distress labour. The inspector: What will be the cost of laying out? Mr. Birch: The estimated cost is £1,210 for contract, and a further £264 for distress work. The price of material will be £418.

Runcorn R.D.C. (December 10th. Mr. F. O. Stanford). £18,500 for a sewage disposal scheme for the townships of Grappenhall, Latchford Without, and Thelwall.—This was an adjourned inquiry, and the sitting was mainly occupied in hearing the objections of the Manchester Ship Canal Company and a number of ratepayers and property owners in the district of Latchford Without.

Sandgate U.D.C. (November 22nd. Mr. W. O. E. Meade-King).—£5,500 for the purposes of a water supply, including the construction near the Moore Barracks of a reservoir to hold 200,000 gallons, and near the Seabrook-road, Hythe, of a reservoir to hold 150,000 gallons, and the execution of other works.—It was stated that the proposal was to utilise water from the council's own sources at present running to waste and carry it to a high-level chamber, so as to enable them to dispense with purchasing from the company water in bulk. The council wished to be able to supply the whole of their district, and they would be able to give a constant water supply to all the houses in the parish of Sandgate, instead of a supply during certain hours as at present. The surveyor, Mr. C. Jones, stated that the total weight of the reservoir and its contents would be about 2,369 tons. The weight of the soil which was on the site was 3,254 tons.

Stockport T.C. (December 10th. Mr. F. H. Tulloch). —£15,000 for the extension of the police buildings.—It was explained by the town clerk Mr. R. Hyde, that the scheme would provide for sixteen new cells, a new parade room, and new police offices and quarters. The courts would remain untouched. The extension would meet the requirements of the borough in the way of a central police station for the next thirty years.

Westhoughton U.D.C. (November 19th. Mr. P. M. Crosthwaite).—£440 for additional stabling, &c., at their storeyard, and £2,140 for works of water supply, including the construction of a water tank to hold 200,000 gallons at Syndale Hill.—The clerk, Mr. T. Partington stated that a request had been made for a supply of water at a greater pressure and the Bolton Corporation, from which the supply was obtained, had agreed to give a supply from Entwistle reservoir conditionally on the council undertaking to lay 230 yds. of 12-in. pipes and erecting a water tower or tank at Syndale Hill to equalise the strain on their high-pressure filters in connection with the reservoir. The council had agreed to those conditions, and the benefits that would accrue from those arrangements might be summed up in a few words—namely, the cisterns would hold 200,000 gallons, or one day's supply—and would minimise the risk of the water being stopped through any accident to the Bolton mains or any other cause. With a supply of 200,000 gallons in the power cistern the council would be able at any time to cope with a fire independent of the supply from the Bolton mains. Evidence was also offered with respect to the proposed loan for additional stabling.

APPLICATIONS FOR LOANS.

Aldershot U.D.C.—£6,800 for the completion of the surface-water drainage scheme.

Alnwick U.D.C.—£4,000 for a water supply scheme.

Brighton T.C.—£1,000 for new houses on small holdings land.

Bromley T.C. £463 for laying artificial stone paving.

Bungay U.D.C. £3,500 for a housing scheme.

Colne T.C.—£2,000 for a water supply scheme, and £4,875 for works of paving.

Croston U.D.C.—£2,100 for works of sewerage.

Dartford U.D.C.—£1,900 for street improvement work and £420 for the provision of a fire station and hose.

Felixstowe U.D.C. £1,000 for street lighting purposes.

Cainsborough U.D.C.—£1,000 for gas cookers.

Cateshead T.C.—£23,000 for a refuse removal scheme.

Clastonbury T.C.—£4,295 for new gas mains and cookers.

Marlborough T.C.—£2,600 for a housing scheme.

Marsden U.D.C.—£1,050 for road works, £350 for a motor ambulance house, and £7,000 for extensions to the sewage outfall works.

Middlesex C.C.—£441 for works at the New Hanwell school, and £1,400 for a site for a school at Southall.

Neath T.C.—£1,075 for extensions of the gas service.

Reigate T.C.—£6,000 for the construction of new roads.

Wanstead U.D.C.—£2,000 for sewerage works.

Wolstanton U.D.C.—£500 for a water carriage scheme.

Worthing T.C.—£1,940 for improving Chapel-street.

LOANS SANCTIONED.

Berwick T.C.—£21,850 for a water supply scheme.

Colne T.C.—£21,462 for private street improvements.

Darwen T.C.—£10,600 for street improvement works.

Dewsbury T.C.—£7,415 for the electricity undertaking and £900 for a water aëration plant at the public baths.

Doncaster T.C.—£1,214 for paving works.

Guildford T.C.—£925 for the purchase of a motor fire engine and £408 for alterations at a fire station.

Hendon U.D.C.—£3,799 for works of road improvement.

Newport (Mon.) T.C.—£2,685 for alterations at Friar-street depot.

Norden U.D.C.—£1,155 for sewerage works.

Ramsgate T.C.—£3,205 for the extension of the East Cliff.

St. Thomas R.D.C.—£600 for workmen's cottages at Whimple.

Shrewsbury T.C.—£1,438 for widening two bridges.

Westhoughton U.D.C.—£3,000 for granite paving works.

FORTHCOMING INQUIRIES.

DECEMBER.	£
16.—**Biggleswade.** For the provision of dwellings (Mr. W. H. Collin)	4,526
16.—**Leigh-on-Sea.** For gas supply and street works (Mr. R. H. Bicknell)	6,505
17.—**Blackpool.** For the provision of public conveniences (Mr. M. K. North)	2,100

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Building—Barnsley £15,000, Lambeth, Middlesex £21,250, West Hartlepool; housing and town planning —Bungay, Hendon, Stafford; refuse collection and disposal—Gateshead; roads and materials—Dunoon, Tenby, Twickenham; sewerage and sewage disposal—Bulkington, Larne, Warwick; water, gas and electricity—Aberdeen £25,000, Carlisle £7,000, Nuneaton £15,000, Torquay.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Oldham T.C.—The Cleansing Committee have agreed to advance the wages of employees by 1s. per week until they are sixty years of age, after which they will revert to the present scale. Sweepers' wages will be advanced from 18s. to 19s. per week, and those of the gangers and dandymen from 19s. to 20s. per week.

BUILDINGS.

Aberdeen T.C.—A sub-committee has been appointed to inquire into the question of providing baths in the up-town district.

Barnsley T.C.—A committee which has been considering the subject recommended the council to build a new town hall and municipal offices, at an estimated cost of £15,000.

Bradford T.C.—The Baths Committee on Monday revoked the decision arrived at by the council in October to construct an open-air bath at Fairweather Green, owing to difficulties that have arisen with respect to the site.

Builth Wells U.D.C.—The council are considering the erection of a pavilion at an estimated cost of £1,000.

Carnoustie T.C.—The burgh surveyor has received instructions to prepare plans for the extension of the pavilion and tennis courts on the links.

Glamorganshire C.C.—A higher school, designed by Mr. D. Pugh-Jones, county architect, and built at a cost of £9,447, has been formally opened.

Hornsea U.D.C.—A suitable site has been obtained for the proposed new pavilion.

Lambeth B.C.—The question of erecting a swimming bath on the land adjoining the town hall at Brixton-hill is under consideration.

Littlehampton U.D.C.—The Duke of Norfolk has offered to provide a bandstand on the foreshore, and the council have accepted the gift.

Middlesex C.C.—A secondary school is to be built at Goldhawk-rise, Hendon, at an estimated cost of £21,250.

Motherwell T.C.—Alterations, estimated to cost £1,000, are to be carried out at the public slaughter-house.

Rathdown No. 1 R.D.C.—Plans have been passed for a public library to be built at a cost of £1,500.

Southampton T.C.—The tender of Messrs. C. J. Lear & Son, of Alverstoke, at £14,576, has been accepted for building a new school at Regent's Park.

Uckfield U.D.C.—Negotiations are to be opened up with the rural district council as to the advisability of erecting a joint hospital to be maintained by both councils.

Uxbridge U.D.C.—Six slipper baths are to be erected at the depot Waterloo-road at a cost of £300.

West Hartlepool T.C.—The council have accepted the offer of a public swimming bath from an ex-mayor and have agreed to provide a site for the building.

Weymouth T.C.—A scheme for the improvement of the harbour is to be carried out at an estimated cost of £12,000.

HOUSING AND TOWN PLANNING.

Bungay U.D.C.—A scheme has been approved for the purchase of 12 acres of freehold land and the erection of twenty workmen's dwellings, the houses to be in blocks of four each with 16 ft. frontage at an approximate cost of labour and land of £145 per house.

Farnham U.D.C.—A scheme has been passed for the erection of fourteen cottages at a cost of £3,120.

Hendon U.D.C.—It has been agreed to build fifty artisans' dwellings at Child's Hill, subject to the sanction of the Local Government Board to a loan of £8,990, and the tender of Messrs. C. H. Gibson & Sons, of High Wycombe, has been conditionally accepted for the work.

Newquay U.D.C.—An offer of land on a 200 years' lease has been accepted for the purpose of erecting workmen's dwellings.

Northampton T.C.—In connection with the scheme for fifty cottages at Kingsthorpe, the tender of Mr. J. W. Gossage, at £8,946, has been accepted, subject to the sanction of the Local Government Board.

Stafford T.C.—The council on Tuesday appointed a Housing Committee with power to prepare a scheme for the erection of sixty artisans' dwellings.

PARKS AND OPEN SPACES.

Hove T.C.—Acting on a report by the borough surveyor, Mr. H. H. Scott, the Parks, Baths and Cemetery Committee recommend that trees and shrubs should be planted on the north-east side of Hove Park at an estimated cost of £45; that the iron railing at Portland Recreation Ground be painted at an estimated cost of £8; and that a brick wall be erected on the north side of Portland Recreation Ground, and an iron hurdle fence on the west side, at an estimated cost of £185.

Withernsea U.D.C.—The surveyor, Mr. J. H. B. Kirton, has prepared a scheme for new public gardens to contain a bowling green, tennis courts, and, in all probability, a pavilion in the centre, and he has received authority to proceed with the laying out of the ground.

REFUSE COLLECTION AND DISPOSAL.

Gateshead T.C.—The council have approved the design of Messrs. L. G. Mouchel & Partners, for the erection of a staith in Pipewell-gate, for the purpose of refuse disposal, at a cost of £10,000. The cost of the scheme, including the purchase of adjoining property, and the provision of stables, is estimated at £23,000.

Saddleworth U.D.C.—The council have decided to undertake the removal of domestic refuse in Uppermill Ward and Greenfield Ward, and for this purpose two additional horses are to be purchased.

ROADS AND MATERIALS.

Bristol T.C.—The consulting engineer, Mr. T. H. Yabbicom, has reported to the Sanitary and Improvements Committee that he has been able to negotiate a series of purchases of land and buildings for street widenings. The chairman of the committee stated that in one instance Mr. Yabbicom had obtained a reduction in price from £2,000 to £300.

Cork T.C.—The Works Committee have passed an order for the repair of North and South Main streets, including the laying of Trinidad asphalt pavement, at a cost respectively of £1,660 and £1,322.

Dunoon T.C.—The burgh surveyor has prepared a plan for the widening of the promenade, which will have to be reconstructed in consequence of damage done by a recent storm, and negotiations are to be opened up with the feuars with a view to obtaining the necessary strip of land for the scheme.

Eastleigh and Bishopstoke U.D.C.—The county council have agreed to lay down about 1,100 to 1,150 yards of 2-in. slab paving in Southampton-road, in order to improve the footpath, at a cost of £230 to £300 on condition that the district council are willing to pay half, and this the council have decided to do.

Gower (Glam.) R.D.C.—Plans are being prepared for an alternative road from Bishopston to Kittle, Gower, thus obviating the danger and inconvenience of the steep incline known as Kittle Hill. The road is to be continued over the common at Bishopston and a bridge erected over the stream at a point above the existing ford.

Hornsea U.D.C.—Street improvement works, estimated to cost £368, are to be carried out.

Luton T.C.—Butlin-road and Shaftesbury-road are to be made up, at a cost of £546.

Middlesex C.C.—It is proposed to lay down "Durax" paving in the Uxbridge-road, at a cost of £4,018.

Portslade U.D.C.—The Road Board have promised a grant of £50 in connection with the surfacing with granite of a portion of the old Shoreham-road, from Southern Cross to Portslade Lodge.

Preston T.C.—Property in Market-street, High-street, Lawson-street and Starchhouse-street is to be purchased for £2,650, for the purpose of a local improvement.

Runcorn U.D.C.—Moughland-lane is to be widened, at an estimated cost of £870.

Swindon T.C.—Plans have been provisionally approved for the widening of Coate-road, at a cost of £3,348.

Tenby T.C.—Upon the recommendation of the surveyor, Mr. B. Morley, it has been decided to pave The Norton, one of the main thoroughfares, with granite.

Twickenham U.D.C.—The council have approved the plans and estimates of the surveyor, Mr. F. W. Pearce, for making up the following roads under the Private Street Works Act, 1892: Cole Park-road, £5,117; Cole-road, £462; Hill View-road, £821; and Ivy-road, £341.

Walsall R.D.C.—The surveyor, Mr. W. Young, has been authorised to forward to the Road Board, in support of an application for a grant, estimates in bad prepared of the cost of widening and generally improving Portland-road, Aldridge, and Thornhill-road, Streetly. He said the amounts were £1,753 and £1,366 respectively.

West Bromwich T.C.—The Highways Committee recommend the purchase of land and houses for the improvement of the road from Hollyhedge-road to Water-lane, and Cooper's Hill-street.

Westhampnett R.D.C.—A tar-spraying machine, with a boiler capacity of 80 gallons, is to be purchased, at an approximate cost of £40.

SEWERAGE AND SEWAGE DISPOSAL.

Acton U.D.C.—A public convenience, to cost £700, is to be provided at the Mount.

Bulkington U.D.C.—The surveyor, Mr. Edward Cuthbert, has received instructions to prepare a sewerage scheme.

Clevedon U.D.C.—The surveyor, Mr. G. W. Knowles, with the assistance of the medical officer, has been asked to report on a sewerage system for the lower portion of the town.

Halifax T.C.—The tender of Mr. B. Riley, at £2,215, has been accepted for a sewerage scheme for Northowram.

Larne U.D.C.—Mr. G. Midgley Taylor has received instructions to prepare a sewage disposal scheme for the town.

Llanelly R.D.C.—The council have instructed Mr. E. J. Schenck, of Westminster, to prepare a scheme of sewerage for parts of the parish of Llanelly Rural and Pembrey, including Felinfoel, Dafen, Bryn, &c.

Scarborough R.D.C.—The surveyor, Mr. J. A. Iveson, has prepared a sewerage scheme for part of West Ayton.

Warwick T.C.—The services of an engineer are about to be engaged to draw up a scheme for pumping the sewage automatically by electric power to extend the covering tanks at the outfall works, and to lay about 30 more acres of land for irrigation purposes.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—A sub-committee is considering the specifications for the covering of the reservoirs, at an estimated cost of £25,000. The Mannofield reservoirs occupy about 9 acres, and it is suggested that when they are covered in earth they should be laid on the top of the covering, and the available space laid out as a recreation ground with bowling greens.

Beverley T.C.—The tender of Messrs. Worth, Mackenzie & Co., at £1,546, has been accepted for the supply of a gas engine and pumping plant at the waterworks.

Cannock R.D.C.—Improved pumping machinery is to be provided at the waterworks at a cost of £250.

Cardigan T.C.—Authority for a loan is to be sought to carry out a scheme for extending the present water supply. The engineer, in his report, states that his proposal to the council was that they should combine provision for more water for the higher houses in the borough, with the supply of St. Dogmell's, and in order to accomplish this it would be necessary to build a new reservoir to hold approximately 70,000 gallons. The approximate cost would be from £1,800 to £1,900.

Carlisle T.C.—A water supply scheme for the outlying districts, estimated to cost £7,000, is to be carried out.

Derry T.C.—The council have abandoned the proposed Burngibbagh water scheme, which they adopted only recently. In the course of the discussion on the subject at the last meeting of the council, the city surveyor stated that in October, 1911, there was a flow of 800 gallons per minute in the Burngibbagh stream. The quantity never fell below that during the dry weather; there was plenty of water there if it was pumped to keep the city safe during a water famine. As to filtration, only the water from Killea was filtered. With regard to the quality of the water, he could only take the analyst's report, which was favourable.

Hastings T.C.—The council have accepted the quotation of Messrs. C. A. Parsons & Co. for carrying out alterations to the turbine at the electricity works, and supplying a new alternator, for the sum of £1,728, and the offer to purchase the existing alternator for the sum of £100.

Huddersfield T.C.—The corporation are seeking power, in the Parliamentary Bill they are promoting, to purchase the Dean Head reservoir from the Dean Head Commissioners, and to maintain the reservoir as part of the waterworks undertaking.

Keighley T.C.—The Waterworks Committee recommend the acceptance of the following tenders in connection with the proposed line of pipes from Denby Hill to Moss Carr: William Morley & Sons, of Keighley, at £2,359, for carting pipes, excavating and refilling trenches and other subsidiary works; Guest & Chrimes, of Rotherham, at £376, for the supply of sluice, air and other valves.

Lanarkshire C.C.—The District Committee of the Middle Ward propose to ask Parliamentary authority to provide additional waterworks involving the construction of a storage reservoir in the parish of Crawford and service reservoirs in the parishes of Lesmahagow and Shotts, together with the necessary road and other works; to abandon the construction of the Glengavel reservoir authorised by the Act of 1896; to extend the area within which the committee is authorised to supply water so as to include part of the parish of Rutherglen; and to acquire by agreement such works as exist within the limits of supply of the committee as extended by the Order.

Nuneaton T.C.—For the purpose of an improved water supply it has been decided to complete a scheme at Griff, a point at the southern extremity of the borough, where a pit was sunk about twenty years ago. The project involves a capital expenditure of £15,000. It is to be taken in hand almost immediately, with the object of being sufficiently advanced by the coming summer to reinforce the old works.

Salford T.C.—It has been decided to purchase a plot of land in Liverpool-street, containing 38,790 sq. yds., for gasworks purposes, at a total cost, including payments for paving charges, buildings, and plant upon the land, cost of new roadway and boundary walls, &c., of £53,000.

Sleaford R.D.C.—A scheme is under consideration for improving the water supply of Little Hale, at an estimated cost of £950.

Torquay T.C.—In connection with the new water main scheme, a reservoir is to be constructed on the highest elevation obtainable for the purpose of a supply for Warberry Hill.

York T.C.—The council on Monday night resolved to promote a Bill for the purchase of the undertaking of the York United Gas Company, at a cost of £435,000.

MISCELLANEOUS.

Nottingham T.C.—The council have decided to promote a Parliamentary Bill empowering them to run motor 'buses or trackless trolley vehicles, and also to extend the existing tramways.

Cuckfield R.D.C. On condition that he provides himself with a motor cycle, Mr. A. McArthur, highways-surveyor, is to be allowed £12 per annum for depreciation and £14 per annum for upkeep.

PERSONAL.

Mr. Walter Butler, surveyor to the Fareham Urban District Council, has had his salary increased by £25 per annum.

Mr. W. Harpur, city engineer of Cardiff, has been appointed to act as consulting engineer in connection with the Pontypridd Urban District Council's new sewerage scheme.

Mr. A. Edwards, chief assistant to Mr. Henry Silcock, engineer and surveyor to the Blackwell Rural District Council, has been unanimously appointed surveyor of the Northern Highway District of the Southwell Rural District Council.

Mr. John Gibson, assistant in the department, is vacating rates for appointment as inspector of cleansing and lighting to the Corporation of Edinburgh in succession to Mr. George A. D. Mackay, retired. It is understood that opportunity will be taken to reorganise the department to some extent.

Mr. John Stanley Sawdon, assistant surveyor, Margate, has been elected by examination an associate member of the Institution of Civil Engineers. Mr. Sawdon is also a member and holds the diploma of the Institution of Municipal and County Engineers, and has held appointments at Cheltenham, Kettering, Uxbridge, Staines, Northwood, Chertsey and Hayes.

Mr. H. Knowler, of the borough engineer and surveyor's department, Wimbledon, has achieved a notable success at the examination for associate members of the Institution of Civil Engineers, held last October. The council of the institution have, as noted elsewhere in this issue, awarded him the Bayliss Prize, a distinction given to the student of the institution who obtains the highest marks at the examination. There were upwards of 150 candidates, many of them from universities. Mr. Knowler read for the examination with Mr. Harold B. Hayes, ASSOC.M.INST.C.E., also of the borough surveyor's department, Wimbledon, and late lecturer on surveying at the Hackney Technical Institute.

Messrs. William W. Newman, ASSOC.M.INST.C.E., deputy-engineer, Watford; J. Cecil L. Verley, ASSOC.M.INST.C.E., senior engineering assistant, Manchester Corporation; R. N. Montgomery, ASSOC.M.INST.C.E., B.A., assistant engineer, Dublin; W. R. Jenkins, ASSOC.M.INST.C.E., B.SC., Swansea; and James Hassall, ASSOC.M.INST.C.E., assistant chief engineer, Sheffield, have been selected for interview in London in connection with the appointment of engineer as assistant to the chief engineer to the Karachi Municipality. Mr. Measham Lea, ASSOC.M.INST.C.E. For the appointment of assistant chief officer to the municipality over 300 applications have been received, and the following six candidates have been selected for interview in London: Messrs. George Funnell, chief clerk, town hall, Chiswick; George Wesley Lewis, assistant secretary, Birmingham Corporation; John Chaston, chief clerk, Kettering Corporation; C. Hamilton McGuinness, assistant secretary, His Majesty's Road Board, London; Richard Moore, assistant solicitor, Bury Corporation; and Arthur Coomber, head clerk, metropolitan borough of Battersea.

The Chingford Reservoir. It is announced that the King will open the Chingford reservoir in February next. The reservoir will rank as one of the largest of its kind in this country. A difficult feature of the undertaking has been the diversion of the river Lea and [illegible] through the site of the reservoir, and the substitution of a new channel for the old river-course. Again, the puddle had to excavate below the bottom of the valley to enable a perfectly watertight wall of puddle clay to be joined to the impervious stratum. The reservoir covers an area of 116 acres, has a capacity of 300,000,000 gallons, and is protected by 4½ miles of embankment. The embankment has been formed of material excavated from within the reservoir, and contains 2,060,000 cub. yds. of earthwork and 253,000 cub. yds. of puddle. The summit is 15 ft. wide and 5 ft. above top water.

Birmingham and Midland Institute Scientific Society. The seventeenth annual soiree of this society will be held at the institute on Wednesday, January 8th, commencing at 7.15 p.m.

The Contour Survey of Bushey.—Mr. A. J. Laing writes: With reference to my article on "The Contour Survey of Bushey" in the issue of THE SURVEYOR for December 6th, I have to draw your attention to a misprint at the bottom of the first column on p. 773, in which a plus sign instead of a multiplication sign is printed. The last line reads: From the formula, generating number + $\cos^2$ vertical angle; it should read: From the formula, generating number × $\cos^2$ vertical angle.

Birmingham Electricity Supply: New Generating Station.—The Electric Supply Committee of the Birmingham City Council on Wednesday generally approved of a scheme for the construction of a new generating station on land acquired from the Drainage Board at Saltley. The ultimate desire is to lay down plant for the production of 100,000 kilowatts, but the work will be done in sections. The first section will be for 25,000 kilowatts, and the work will be finished in about four years' time. The cost of that section will be about £250,000. The other sections will be carried out as required.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED—second-hand oil engine, 10 to 20 h.p., with or without plunger pumps, preferably three-throw.—Surveyor, Town Hall, Alton, Hants.

A VACANCY occurs for a well-educated youth as Pupil in the office of a Water Engineer to an Urban District Council on the South Coast.—Box No. 1,207, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

CITY OF MANCHESTER.

The Rivers Committee require the services of a competent Clerk of Works immediately on the Main Drainage Works. Salary £3 3s. per week. Applicants must be prepared to work night duty if required. Applications, stating full particulars as to experience, &c., accompanied by copies of three recent testimonials, to be addressed to the Chairman of the Rivers Committee not later than 10 a.m. on Monday, December 30th.

Canvassing, directly or indirectly, will disqualify.

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester.

THE MALDENS AND COOMBE URBAN DISTRICT COUNCIL.

DIESEL OIL ENGINE AND PUMPING MACHINERY FOR SEWAGE DISPOSAL WORKS.

The Council invite Tenders from Engineers and Builders for

(1) Supplying and fixing 50 B.H.P. Diesel Oil Engine;
(2) New Skylights, Engine Foundations and General Builder's Work;
(3) 8-in. Centrifugal Pump, Feed Pump, Shafting and Pulleys, Belting, and repairs to existing Pump.

The Plans may be inspected, and Specifications, Bills of Quantities, and Forms of Tender obtained, on application to the Engineer and Surveyor (Mr. Reginald H. Jeffes, A.M.I.C.E.), at the Municipal Offices, New Malden, between the hours of 9 a.m. and 5 p.m. (Saturdays, 9 a.m. and 1 p.m.), upon payment of a deposit of £2 2s. in each case, which shall be by cheque made payable to the Council.

The deposit will only be returned on receipt of a *bonâ-fide* Tender accompanied by the Bill of Quantities attached, duly priced in; and in the case of the accepted Tender the deposit will be retained until a contract and bond have been entered into with the Council, and in the event of a withdrawal such sum will be forfeited.

Sealed Tenders, in official envelopes, must be received by the undersigned by not later than the first post on Tuesday, 14th January, 1913.

The Council do not bind themselves to accept the lowest or any Tender.

JAMES WM. JOHNSON,
Clerk to the Council.

Municipal Offices,
New Malden, Surrey.
11th December, 1912.

CALCUTTA IMPROVEMENT TRUST.

CHIEF ENGINEER'S PRELIMINARY REPORT.

In a preliminary report to the trustees of the Calcutta Improvement Trust, Mr. E. P. Richards, M.INST.C.E., chief engineer of the trust, draws attention to some of the more important matters of principle which must be taken into consideration in town improvement work, and briefly discusses some of the "local schemes" with regard to the way in which they may fit in with a general scheme on broad lines. Mr. Richards advises that no more local schemes shall be taken up until the general scheme has been drawn up, since these local schemes require much attention, and would prevent the chief engineer and his deputy from devoting their time to the main problems.

A COMPREHENSIVE VIEW.

The smaller works of a city, Mr. Richards points out, must always be subject to the greater works, especially as regards town planning, and this applies with special force to Calcutta. The present and future main traffic routes should be fixed and the suburbs laid out as the first and most important problems.

The square meshes made by the existing network of Calcutta streets are of great size, the meshes containing no secondary network of streets, but being filled with a tangle of lanes, alleys, passages and footpaths, the proportion of real streets per square mile being abnormally low. The narrow streets of the main network of Central and Northern Calcutta are, however, remarkably well placed as regards their general position; they are straight, and run mostly north and south and east and west. The lack of diagonal roads is striking, there being only three real diagonal roads in the city.

The main traffic routes in Calcutta are, then, narrow streets, but, "by means of judicious widenings," writes Mr. Richards, "new parallels, new diagonals, new bridges, new city inlets and outlets, and the improvement, opening up and beautification of main-road junctions and traffic centres, I believe the present main-road plan of Calcutta can be converted into one quite exceptionally fine."

THE POSITION AS REGARDS LOCAL SCHEMES.

In every great city there are certain improvements which must be done, and it is often expedient to proceed with one or more of these while the general planning scheme is being formulated, and, accordingly, the chief engineer has examined the local schemes already planned, and makes the following recommendations:—

Local Scheme No. 1.—Regarded as the worst of four groupings of insanitary areas, practically all the property here is hopelessly bad, and an almost complete sweep is required. There seems to be little or no risk in dealing with the area as now planned. By the time the work has been done the main traffic routes will have been laid down, and the only large road likely to affect the scheme can be aligned by the time the area involved has been cleared for action.

Local Scheme No. 2.—The area is small, and the present and future main traffic lines which bound it being definite, the risk of any later alteration of the preliminary plan is not great. About 90 per cent of the area is covered by "bustee," insanitary property, or vacant land. The scheme may be recommended pending settlement of the final scheme. Sham Bazar Park local scheme may, from the engineering point of view, be commenced as soon as possible.

Local Scheme No. 3.—Acquisition, clearing, filling and levelling can all go on, and by the time the street lines are planned the main scheme will be sufficiently advanced to allow of alterations being made in the local scheme should this be necessary.

Local Scheme No. 4.—There is no engineering objection to continuing this scheme. The proposed width of 100 ft. for the main traffic artery is about what it should be. There is some danger that property which will not be needed may be acquired in this area under the scheme as it stands at present.

Mr. Richards hopes to submit by next January or February a general outline city scheme dealing with all great roads, chief foci, main traffic roads and suburban expansion.

"INDIAN ENGINEERING" ON THE IMPORTANCE OF THE WORK.

The importance which our contemporary *Indian Engineering* attaches to the work of town improvement in Calcutta may be judged from the following passages, which are taken from an editorial article in the issue of August 31, 1912:—

"In almost every outlook on the desolation of large cities and their slums taken by any professional authority of any note, in almost every scheme of reform planned by any statesmanlike city authority for ameliorating the moral atmosphere of slums, the first point on which the mind has been focussed is the cleansing of human hovels, hotbeds of disease and immorality, and their conversion into homes."

After expressing regret that the Calcutta Corporation were not taking the right course in the matter of the improvement of the city in this respect, our contemporary proceeds:—

"It is melancholy work reading the story of Calcutta hovel reform from the model 'kintal' effort of 1884 down to the corporation poor housing scheme of two years ago. In both, as in all similar local effort, some individual enthusiasm has started the one great reform needed in Calcutta, only in time to beat against the dense conventional traditionary respectability which, by natural selection, prefers—how not to do it. In these reflections no shaft is aimed at the Calcutta Improvement Trust, to which, under special legislation, a particular task has been assigned, and which, under a fairly able and energetic chairman, is fulfilling it as well as may be expected in a local experiment which has been inaugurated without special experiences. . . . The Calcutta Improvement Trust is apparently sailing in the right direction in reconstructing the city of Calcutta. So far as its realignment of roads and revolution of 'bustees' provide space and atmosphere for better homes for the poor, it does well, but it cannot be expected to turn aside from its paramount task to undertake what is rather the work of the corporation. . . ."

Reference is then made to the rejection by the corporation of a scheme on which the Improvement Trust had spent much time and labour:—

"Hours of thought and labour were flung into the cesspool of the corporation's neglected duties, just when it needed only a little moral earnestness and that mixture of insight and foresight which is the mark of statesmanship to bring it to fruition. Some day! And so, instead of seeing to-day, as Calcutta might have seen, the first monument to its altruistic zeal for the amelioration of the dwellings of the poor, there is nothing to bear witness to its fit of temporary philanthropy, which has melted into thin air like the morning mist, while the Improvement Trust, as might have been expected, and was indeed foretold, is pursuing its own proper course, clearing up congested localities and placing decent roads, leaving the construction of dwellings for the poor, not perhaps for the Greek Kalends, but at any rate for some other time, which may be two or ten years' distant from to-day, when the first great reform of Calcutta might have been realised, if there had been moral strength enough in the corporation to resist the dulness which baulked it."

Motor-omnibus Traffic: Conference of Local Authorities. The Lord Mayor of London has convened, and will preside over, a united conference of all the local and highway authorities in the Metropolitan Police area, to be held at the Guildhall on Tuesday next, at 2.45 p.m., to decide what concerted action should be taken in the interests of the public with regard to the motor-'bus traffic of London. Each local authority is being invited to send two delegates to the conference.

The English Bridge, Shrewsbury.—The scheme for the widening of the English Bridge at Shrewsbury, which a short while ago, despite numerous difficulties and disappointments, seemed to have arrived at the stage of fruition, has had another set-back. This has been due to the action of the Local Government Board in declining to allow the repayment of principal and interest on the loan to extend over a longer space of time than thirty years, whereas the borough council had been hoping to get the period lengthened to fifty years—on the ground presumably that posterity would benefit from the work to as great a degree as the present generation. The board's decision, of course, means that a much larger sum will have to be raised by the borough rates each year to repay the borrowed money, and this at the present juncture—something which (the *Wellington Journal* states) is not regarded with equanimity by the ratepayers generally.

Institution of Municipal Engineers.

JOINT WESTERN AND SOUTH-WESTERN DISTRICT MEETING.

A joint meeting of the two districts was held at Gloucester and Exeter on Friday and Saturday, November 29th and 30th. The chair was in both cases occupied by Mr. Frank Latham, the president of the institution, and among the members present were Messrs. Henry Hulse, chairman of the Western District of the institution, W. Whitehouse (Cinderford), G. J. Elliott (Lydney), F. G. Church (Gloucester), T. Orchard (Clutton), C. F. Sanderson (Martley), A. W. Humphreson (Bewdley), Robert Ellis (Tiverton), S. Algar (Exeter), C. Durie (Williton), A. Tillotson (Honiton), A. J. Redfern (Honiton), Thomas Jones (Crediton), and Richard Lake (Sidmouth). The visitors included G. S. Clarke (Exeter), A. Eastwood (Exeter), T. G. Taylor (Plymouth), F. P. Ivey (Bristol), Councillor Algar (Exeter), and others. Also present were Messrs. John Brook and C. O. Baines, hon. secretaries of the respective districts, and B. Wyand, secretary of the institution.

Mr. WEAVER mentioned a little omission that was made at the meeting of the branch in Dean Forest, in June, in neglecting to thank Mr. Whitehouse for the very valuable paper he read on that occasion. He now moved that the best thanks of the meeting be given to Mr. Whitehouse for his excellent paper and for the able manner in which he conducted and arranged the meeting.

Mr. ELLIOTT seconded, and Mr. HULSE and the CHAIRMAN supported the proposition, which was carried with acclamation, and Mr. WHITEHOUSE briefly replied, saying that if he did anything on the occasion in question calculated to be at all useful to the institution he was more than repaid for the trouble he took.

The minutes of the last meeting were read by Mr. Brook and confirmed.

THE PRESIDENT'S ADDRESS.

The president opened the proceedings with the following address:

It is my privilege to be with you to-day in my capacity as president, and I can assure you that the best welfare of the members of the Institution of Municipal Engineers appeals to me to no small extent. The council have serious questions affecting the interests of the profession constantly under their consideration, and my visit here to-day is to endeavour to enlist the hearty support and co-operation of these districts in the furtherance of the council's schemes for placing the profession on a basis of proficiency, supported by security, protection and superannuation.

Those who constitute the profession of municipal engineering are necessarily dispersed over a very wide area, which at one time militated against their opportunities for meeting together. This hindrance, however, has now been removed. One of the objects of the institution was to divide the country into districts, and for each district to have its own chairman, secretary and committee; in fact, each district was to have "Home Rule." This progressive and original scheme has been achieved, with the result that the members have regular opportunities of meeting together in their respective districts to discuss topics for the acquirement of knowledge and for the advancement of the profession. This successful organisation is now working throughout the country, and engineers will undoubtedly benefit thereby. The general activity and union which have been manifested prove that the time was ripe for such an organisation.

The work which has been set on foot by officials for officials, and carried forward with one common cause and on one common level must ultimately benefit the profession permanently. A great deal has been done and the council have important measures under consideration, by which the interest of the younger members entering the profession may be increased and their status promoted. The council realise that the younger men to-day must form the basis by which the status of the coming municipal officers must be set in the future. They further realise the importance attached to the condition under which the municipal engineer at present holds his office.

To pass through a sufficient course of training, to enter on the multifarious duties of a responsible engineer, is not only a very costly process, but occupies the primary years of one's life. The worth of energetic and trustworthy officials who have accumulated knowledge by their genuine interest is unfortunately often treated lightly as compared with personal influences and congenial circumstances.

The calling of the municipal engineer is a high one, and contributes much to the welfare and economy of every country. He must be capable of applying his experience to difficult problems, and of using his mental powers for the purpose of inventing a means to a successful end. The duties for which he is responsible demand strenuous attention, and his mental faculties must be kept particularly active. His interest must be centred first and foremost on the success of his undertakings. It is much more fatiguing to the body to exercise one's mind over problems which entail stress of brain power and nervous energy than to execute mechanically.

It is said that the craftsman lives by the sweat of his brow, but in reality this is more a truism in the case of the hard thinker. Those who do not witness the strenuous hard study exercised by the capable officer behind the scenes, but merely see the comparative ease with which he utilises the materials at his disposal, can have no conception of the amount of brain-energy and long hours spent in acquiring that confidence displayed in the execution of successful works.

The high and onerous position which the modern engineer holds is controlled by the Public Health Act, 1875. In that Act he is referred to as "surveyor." The Towns Improvement Clauses Act, 1847, imposed the duty on local authorities to appoint a local surveyor, and this appellation was re-enacted in the Public Health Act, 1875. The duties, however, of the "surveyor" had considerably advanced between 1847 and 1875, and instead of his being merely an overseer of very indifferent highways, as was previously the case, the scope for his mental activities was developing in due ratio with the evolution of the country from the transition state of 1847. While this was the case, the Public Health Act, 1875, besides re-enacting the old misnomer "surveyor" as applying to the engineer who is responsible for carrying out town improvements, deprived him of the protective measures contained in the earlier Act of 1847, such expressions as the following having been omitted entirely—"Prescribed approval," "subject to approval by one of Her Majesty's principal Secretaries of State," "with the like approval, may remove any such surveyor."

When the Public Health Act, 1875, was enacted, the term "surveyor" was intended to signify a supervisor, but time and circumstances have changed the definition of the term. The profession of "surveyor" is restricted to those branches contained in the curriculum of the Surveyor's Institution, which omits the engineering, architecture, and multifarious duties which go to constitute the profession of a municipal engineer. The prodigious advance in municipal work, which has been brought about by Acts of Parliament, together with the entirely altered conditions under which the population live and travel, render it necessary that the legal title be changed. To be strictly correct the officer referred to should be designated a "public health engineer."

With reference to the question of superannuation and security of tenure for the municipal officer, I must say that every possible effort has been made in the past by this institution. The profession has a strong federation in that wonderfully successful organisation the National Association of Local Government Officers, whose membership will exceed 30,000, and with which this body is affiliated. That association devotes its attention entirely to matters affecting the best welfare of municipal officers, including superannuation and security of tenure, besides rendering legal assistance to its members in cases where the National Council shall deem it necessary. Our institution is privileged in being represented by three delegates, nominated by our council, while our genial assistant secretary, Mr. A. Winter Gray, is a member of the National Association's council.

The National Association is pressing its object with untiring enthusiasm. It is fully alive to the fact that legislation in the past has turned a deaf ear to the needs of the municipal engineer, who is more responsible than any other person for turning the Govern-

ment's sanitary laws and measures for promoting healthy conditions and for the prosperity of the community to practical account.

On the other hand, Parliament has listened very attentively, and granted superannuation to Civil servants, poor-law officers, and school teachers, while medical officers and sanitary inspectors are granted protection. Besides all this, Parliament has enforced measures for compensation and insurance for every class of workpeople, who become entitled also to the Old-age Pension. Surely, what is good for one section of the working community is good for the other, and no branch has a greater claim than the public health engineer.

For many years the question of superannuation and security of tenure has been a serious bone of contention between municipal engineers and the Government. There seems to be antipathy against it which is a very difficult obstacle to overcome. However, an assurance one way or the other is absolutely necessary, as at the present time of uncertainty it is difficult to advise what steps it would be best to take in formulating a scheme to take its place.

I can only impress on the minds of the members how important it is for each and every one to do all within his power to demonstrate to the members of Parliament of each district the necessity for steps to remedy the oversight of the past. Whatever may be the ultimate future of the profession so far as protective measures are concerned, I am of opinion that it is advisable for the institution to have a fund of its own, devoted especially to this and other allied objects for the mutual benefit of its members. Cases have come before the institution from time to time deserving of the most strenuous efforts of the fund. The severity of some cases have been ameliorated by the tact which has been brought to bear, and by voluntary subscriptions in aiding the disabled.

If we had a protection fund much would be achieved to the advantage of the members of the profession generally. This fund would be free of working expenses, so that the whole of the sum raised would be available for the purpose named. Contributions might be raised among the members at the district and other meetings, while a small annual sum subscribed by each member annually would meet all expenses.

In conclusion, I would refer to a matter of recent legislation, in which the Institution is interesting itself. At the passing of the Finance (1909-10) Act medical practitioners were granted certain remissions in respect to the duty on motor spirit, to the licence on motor cars, in the case of motor cars used by them for the purposes of the profession." Seeing that there are some hundreds of engineers and surveyors to local authorities who have charge of highways and who have, upon quite a moderate salary, to find their own means of locomotion in the discharge of their duties to the Road Board with a view to obtaining the same remissions in respect of duty and licence for municipal surveyors as is provided for the medical profession. The institution have pointed out that many of these officers are practically compelled to provide and maintain a motor vehicle of some kind or another, and the expense of annual licence and of petrol for running purposes presses heavily upon their income.

The PRESIDENT said he had raised a good many points in his address of interest to the district branches, and it was with the object of hearing the views of members on the important questions of superannuation and security of tenure that they had met there that afternoon. There might be advantage to the profession in the proposals, and he could foresee that the question might arise in the minds of some members whether they were not better off as they were. As a Vice-President of the National Association of Local Government Officers, when he attended their meetings he wanted to be able to tell them exactly the feeling which existed throughout the country on these very important topics. No one wished to take a false step, or press for conditions which might not be an advantage. They wanted to clear the air, and to get the best advice and fullest information possible on the matters in question. No one wished to press for security of tenure simply so that a council should not be able to dispense with their services. They did not desire that, but they did want to be recognised as they were in 1847, and that it should not be possible for a man to be dismissed simply for doing his duty. (Hear, hear.) Within the last few years several cases had come before the institution, and with the exception of one, the dismissals had been because the men had carried out their duties straightforwardly and honourably, but in so doing had rendered themselves unpopular. Was it right that a man should be discharged for doing his duty, simply, perhaps, because a ratepayers' association had been started in his district—started perhaps because some man had been interfered with who wanted to carry out certain buildings not in accordance with the by-laws? The surveyor had, of course, to interfere, and that had led to the formation of a ratepayers' association. The aggrieved person got together a lot of his own kind, and succeeded in getting elected as many members of his way of thinking as possible, who never rested satisfied until they had secured the dismissal of the surveyor. It was in order to make such an injustice as that impossible that they wanted protection; that they should be able to do their work honorably and straightforwardly. They wanted to have safeguards that would enable them to carry out their duties in the best possible manner to the satisfaction of the ratepayers and the community generally. (Hear, hear). They had very important matters before them. Parliament was always bringing forward some new Act of Parliament which thrust new duties upon the municipal engineer. They were constantly having these duties increased, and with different Parliaments they got different views, to which they had to conform. Within the last year they had had the Town Planning Act placed upon their shoulders, and there was no Act in existence which raised the dander of a certain class of people more than that Act did, and men from whom they had had sympathy in the past they were now going to call their enemies. In most councils there was a section of the members who had been very kind and considerate towards their officers, but these recent Acts of Parliament affected this class more than anyone else, and they would be sure to "have a go" to make the life of the municipal engineer very unpleasant at times. In the future they would be almost bound to tread on the toes of a certain section of the public, who had very considerable influence, in saying whether a man was doing his duty or not. Therefore he (the speaker) thought they ought to have protective measures, so that it should not be entirely in the hands of a council to say whether they should be dismissed or not. (Hear, hear.) The Town Planning Act was in itself a very excellent one, and one of the most common-sense and rational Acts that had been passed for many years, because it consolidated the whole of the Housing Acts into the one comprehensive Act of 1909, and they now had facilities for carrying out their work such as they had never had before, and in time to come England would become practically a garden city. What a transformation would come about by the efforts of the municipal engineers and surveyors of councils, both rural and urban, he thought the time had come that, as their duties and responsibilities were increased, they should be backed up by Parliament who gave them this work to do, and had thrust these duties upon them. (Hear, hear.) How could the Government expect them to carry out these new duties unless they backed them up? (Hear, hear.) They did not ask for anything excessive, or for anything which militated against the councils—they had the same power as before, but they simply wanted the protection they possessed in 1847, and to show that some respect was due to the surveyor for all the work he had to do. (Hear, hear.) So far as superannuation was concerned, that was a very important matter, but he did not think they ought to have any difficulty in getting it. Steps had been taken which were calculated to get this secured in the near future. The feeling of the council was that they were on the verge of getting it. (Hear, hear.) Returning to the subject of security of tenure, the chairman said he thought the words used were unfortunate, because it gave people the impression that when once a man was appointed nobody could get rid of him. But, of course, it did not mean that at all. It was really a protective clause they wanted, so that they might have some other tribunal to apply to if they got badly used by the local authority. (Hear, hear.)

Mr. H. J. WEAVER (Gloucester) said it appeared to him that what they really wanted was nothing more nor less than the advantages which were enjoyed by the sanitary inspector, who was in the happy position of having part of his salary contributed to by the Local Government Board. If a sanitary inspector were prosecuted for having carried out his duties honourably, and without fear or favour, he had as a second Court of Appeal, as a higher Court, the Local Government Board. The efforts the chairman was prepared to put forward, as mentioned in his paper,

not only for security of tenure but for security from persecution, were efforts in which they were all prepared to assist him in carrying through, and it did not seem to him (Mr. Weaver) a very difficult thing to bring about. If it were necessary for the sanitary inspector of a town to have protection in the way suggested, surely a municipal engineer whose training was superior and cost more ought to have the same protection. (Hear, hear.) With regard to the question of superannuation, that undoubtedly would follow if only they could get a Bill prepared in some form which would satisfy them. But it seemed to him that the only manner in which they could hope to get the matter through was the way foreshadowed by the chairman. They must formulate some scheme and secure united action.

Mr. Henry Hulse (Droitwich) asked whether the N.A.L.G.O. had district associations or committees similar to their own, because, if not, it struck him something in the way of county associations might very reasonably be formed.

Mr. G. J. Elliott (Lydney) said he took it that what Mr. Latham meant when he said: "Parliament has listened very attentively, and granted superannuation to Civil servants, Poor-law officers and school teachers, while medical officers and sanitary inspectors are granted protection," was that these were granted protection by the part salary they were paid. In rural and small urban districts the engineer frequently had to be the sanitary inspector as well.

The President replied that Mr. Weaver had practically answered that question. With regard to sanitary inspectors, the protection they received was practically what surveyors had in 1847—*viz.*, that before the service of a surveyor could be dispensed with the local authority had to obtain the sanction of a higher authority, and that was the case now with sanitary inspectors. In the case of a council wishing to dispense with the services of an officer of that kind, the approval of the Local Government Board must be obtained; and, of course, they made an inquiry into the circumstances, and if the dismissal was unfair he was reinstated, or his services not dispensed with; and that was what surveyors wanted, because if a man did not work the joint office of surveyor and sanitary inspector, he had to superintend a great deal of the latter's work, and also that of the medical officer of health, and it seemed to them, as municipal engineers, very absurd that protected men should be in a position to draw a surveyor into their difficulties, with the result that he might get into hot water while they escaped. It would be very much to the advantage of local authorities if their surveyors had the same privilege as that enjoyed by medical officers and sanitary inspectors. (Hear, hear.)

Mr. Elliott questioned whether from some standpoints the duties of the municipal engineer were as distasteful as those of the sanitary inspector.

Mr. Weaver thought they were. Both the sanitary inspector and the surveyor had to tackle property owners, and, although he agreed that the sanitary inspector was the more often offending someone, yet the surveyor of a town was also a man who was not infrequently treading on somebody's toes, and for the same reason.

Mr. W. Whitehouse (Cinderford) agreed that there were plenty of cases where the two officers had to work together—as, for instance, in the laying of new sewers or water mains—and the surveyor was treading upon the corns of someone almost as often as the sanitary inspector.

The President said that scarcely a day passed but what friction arose between a surveyor and somebody—owners of estates or builders, perhaps—engaged in carrying out extensive alterations, involving considerable expense. Or, again, buildings might be in course of being "rushed up," and there were infringements of the building by-laws, a condition of things which a surveyor was bound to object to, and this got him into "terrible hot water."

Mr. Weaver mentioned a hypothetical case of a man occupying the joint offices of sanitary inspector and surveyor, each office being worth £100 a year. If in the course of his inspectorial duties he trod upon the corns of some speculating builder on his council, he was all right, being protected, but in his capacity as surveyor, and as one who had to see that complaints were remedied, he stood in an entirely different position, and, being unprotected, might have £100 knocked off his salary, and without the opportunity of going to any higher court of appeal.

SUPERANNUATION AND SECURITY OF TENURE.

The meeting next proceeded to discuss Mr. A. Winter Gray's paper on "Superannuation and Security of Tenure," the text of which has already appeared in our columns.

The President said if they could mature a scheme showing how the granting of their demands would benefit the community as well as the municipal engineer, they ought to secure general support. The municipal corporations would naturally oppose it unless they could be shown that it was to the advantage of the community to adopt such a scheme. With regard to superannuation, continued the president, they had certain officers who received superannuation, but the surveyor did not, neither did the sanitary inspector—he had only protection. But the surveyor's duties might be very much more onerous, and would take a great many more years off a man's life than those of a superintendent of the police, who had superannuation as well as protection. It was not so much a question of what a man received in the form of salary while he was in office, as what he would get in the shape of superannuation. If a man served twenty years, and then, perhaps, received two-thirds of his salary by way of superannuation for life, that was equal to several thousands of pounds invested.

Mr. John Brook (Stratford-on-Avon) said in his district members of the rural district council also constituted the board of guardians, and they administered the Poor-law of the district. They had recently pensioned off two of their officers. He thought their pensions amounted to about four-fifths of their salary. A new man was to be appointed to one of the positions with a salary amounting to nearly £300, and he would be entitled to a pension, based upon this £300 a year, directly he completed his term of office. But he (Mr. Brook) had served the same body for over twenty years, and when his time expired there would be no allowance or gratuity to him for his services. Why should that be? He had served the same board of gentlemen faithfully, and had received the same consideration at their hands as the other officers he had referred to, with this one exception, that he would receive no pension. He was sure this body of gentlemen felt very keenly the fact that they were unable to treat all their officers alike. The clerk to the guardians would receive a pension, but as clerk to the rural district council nothing. The medical officer of health to the union would also receive a pension, but as medical officer of health to the rural authority nothing, and he (Mr. Brook) as surveyor got nothing. He strongly appealed to all road surveyors to bring this anomaly to the serious notice of their councils. (Hear, hear.) Their attention ought to be directed to the fact that surveyors were placed in a very different position to other officers who served them under the Poor-law, and he thought it was grossly unfair that they should be expected to do duty on equal lines with Poor-law officers, and yet receive no compensation at the finish. (Hear, hear.)

Mr. Hulse (as chairman of the district), on behalf of the Western District, welcomed the members present. They had met, as the chairman had stated, to discuss a very important subject to members of their profession, and it was one that could be brought to a successful issue by all those who wished to participate in its prospective benefits laying aside—should he say apathy and sluggishness?—and giving every help they could. There were many members of the profession who were content to jog along in their own little circles. Those were the people they wanted to reach, and they cordially invited them to come and join them in this and other good causes they had under consideration for the benefit of the profession. (Hear, hear.) What they were asking for was only their just due, and the reward every one of them had earned in the work they had to do. The president had mentioned that he had personally run the risk of physical danger and death in the undertaking of his duties, and every one of them had had similar experiences, which went to show that the time had arrived when it was really necessary that every effort should be made to secure the protection that was required. (Hear, hear.) He agreed with the president that it was unfortunate that this subject had been started under the name of "security of tenure," because it appeared to the ordinary member of a council that it was too much like asking for a permanency and the right to hold an office under any circumstances contrary to the wish of the council. That, of course, was not the idea, and no member of the profession thought of such a thing for

a moment. It was only, as had been brought out in the discussion, that they might be put in an equal position with those members of other professions connected with other branches of municipal affairs who already enjoyed those advantages. (Hear, hear.) One brother officer had superannuation and security of tenure, and the other had not these benefits. This was not the fault of the council, but simply because they had not the power to grant these privileges, and it was really this they were aiming to achieve, that the councils should be in the happy position of putting all their officers on an absolutely equal footing, so that they could go about their duties feeling that they could carry them out without worrying to think whether they were treading on the toes of some interested party likely to have influence to make things unpleasant for them. (Hear, hear.) It behoved them all to do what they could to help along this question, and it appeared to him that the quickest way to do this was to increase their membership, and also to increase the number of their meetings throughout the Western District. It was true their area was a wide one, but there was no reason why they should not have meetings more frequently, and Mr. Brook and himself would be very happy to receive any assistance members could give them. (Hear, hear.)

The PRESIDENT said he thought the question of superannuation in regard to municipal officers ought to be done from one general fund, to which all corporations should subscribe in proportion to the salaries paid. If such a fund were established councils would not be so anxious to change their officers who were approaching their time for superannuation as they might be if they had to pay superannuation themselves. He did not think a superannuation fund would be satisfactory unless worked in that way—similar to an insurance company. (Hear, hear.)

Mr. HULSE agreed with the president, and said if the fund were not national there would be created a very large number of small funds which in the long run would not prove at all satisfactory; whereas if they had a National Fund they would average the lives in the same way as an insurance company.

Mr. BROOK said, as they were aware, various public bodies had gone in for superannuation, and their funds were practically self-supporting. He believed that 2½ per cent from the salaries of the several officers connected with the Poor-law practically paid the amount of the pension. Therefore, if they could prove that they ought to have very little difficulty in bringing this matter to a satisfactory issue. A contribution of 2½ per cent from the salaries of all officers belonging to the fund would very much improve it, and the fund would be gradually increased as the older members of the profession passed away and young members joined on appointment to office. Therefore, as years went on the fund would be very much stronger financially than at the commencement. Mr. Gray's paper was so thorough that it left very little to discuss. It was one of the finest papers he had ever had the pleasure to read, and it was worth studying by any member present who had already read it. In dealing with the subject of superannuation and security of tenure, the writer of the paper said it was difficult to understand how indifferent members of the profession were to their position to-day. But he (Mr. Brook) did not think, speaking generally, that that could be said of municipal engineers—that they appeared to take little or no interest in the movement. (Hear, hear.) He sincerely hoped every member of the Western District branch would become a member of the N.A.L.G.O., but he hoped at the same time he would not forget their own institution for the sake of becoming a member of that association. He thought for this purpose alone they ought to become members of the N.A.L.G.O., but when they had achieved this point he thought there was little else they could do for them. Beyond generally watching the interests of municipal officers there would not be much left for them to do. One could almost wish they could impart to their members a little of that enthusiasm and energy displayed by the Suffragettes, only they would like them to tone their action with a little more discretion. (Laughter, and Hear, hear.) He was fully in sympathy with the writer of the paper as to the uselessness of any section of the municipal service taking up this movement on their own. It must be done by a joint action, and that joint action could only be taken up by the body who had rightly taken charge of it—namely, the N.A.L.G.O. (Hear, hear.) But it was necessary for that association to have funds to work upon, and they could only be obtained by every municipal officer becoming a member and contributing his quota. It was too bad to think there were men to-day who were prepared to sit down and take any advantage to be derived from a movement of this kind, but they would do nothing themselves to assist it. (Hear, hear.) Some reference had been made to the duties of sanitary inspectors, and he was afraid that many of them to-day held their position only from year to year. Fortunately, however, the Local Government Board had now passed a resolution whereby, he believed, eventually all sanitary inspectors would become permanent officers, but notwithstanding this fact, he thought it behoved all sanitary inspectors to watch their own interests, and, if necessary, to appeal to the Local Government Board to get them to agree to their permanent appointment. The duties of a sanitary inspector were very peculiar. He was constantly asking people to put their hands in their pockets to spend money on their property who were reluctant to do it. It seemed to him that one great weapon with which to fight was tact. If a sanitary inspector displayed tact it helped him immensely in getting through difficulties. (Hear, hear.)

A MUTUAL DEFENCE FUND.

Mr. WHITEHOUSE said the municipal engineer had to manage large spending departments—waterworks, drainage works, &c.—matters which must go on; but it seemed to him that councils did not realise the importance of the work surveyors had to do, and if they were to administer this work without fear or favour they must have something to protect them in the form of security of tenure. (Hear, hear.) With regard to superannuation, he did not see why it was not quite fair to ask for it. Councils tied them down, and would not allow them to earn any more money than their small salary. It seemed to him in these days of National Insurance and Trade Unions, and the like, a man was in a fortunate position if he got £160 or £170 a year, and as they knew there was the greatest difficulty nowadays in getting an increase, notwithstanding they were able to show a fair and reasonable cause for it. (Hear, hear.) He did hope they would not go from that meeting without doing something of a concrete form. One matter Mr. Winter Gray mentioned was that of a mutual defence fund, the object of which would be to enable them to take action against any person who treated them unfairly or who libelled them, either inside or outside a council. He thought such a fund would be found to be very useful. If they could not raise such a fund themselves, they were affiliated with the N.A.L.G.O., and they might see what they were doing. It would certainly be to their advantage, and it would not be necessary for them to pay any further subscription.

Mr. WEAVER said the new point which had been raised by Mr. Whitehouse was a most important one, although he could not see how they could very well apply monies which they might have for this particular purpose. He suggested that they might make a call upon the members. With such a membership as they had, £200 or £300 could easily be got together. He thought it would be such an advantage to the institution that, if put properly before it, he felt sure they would get a ready response. (Hear, hear.)

Mr. BROOK said that the Sanitary Inspectors' Association had a defence fund, and each member who joined it paid 2s. 6d. per year. He suggested they should adopt a similar plan. He was sure the secretary (Mr. Wyand) would give them all particulars. He thought if they worked their fund on the same lines as that of the sanitary inspectors it would be to their advantage. He was told that the teachers' association—the N.U.T.—had a defence fund, and they immediately took up anything to be dealt with on behalf of any member.

Mr. WHITEHOUSE thought people would hesitate to attack them if they knew they had something in the nature of a defence fund behind them. (Hear, hear.)

The PRESIDENT said this matter of a defence fund had been before the council recently, and he thought if they had power in their by-laws to call upon members to pay, say, 3s. or 2s. 6d. a year during the time they were engaged in accumulating a fund until it got up to £400 or £500, then they could drop it again, and at any time could take it up again, and that fund would be used for defending the characters of officers whenever necessity arose. It might also be possible to draw upon the fund should cases of sickness or necessity arise among members.

Mr. BROOK moved: "That this meeting of the

Western Branch of the Institution of Municipal Engineers recommends the council of the institution to take immediate action to form a Mutual Aid Defence Fund, and to make it compulsory upon members of the institution to contribute towards the fund." He said he mentioned "mutual aid" because the president had suggested that they might be able to help members from it in time of distress.

Mr. WHITEHOUSE seconded, and it was carried unanimously.

COUNTY OR DISTRICT ASSOCIATIONS.

Mr. HULSE moved: "That this meeting of the Western branch of the institution is of opinion that the time is ripe for forming county or district associations of the N.A.L.G.O., and requests all members present to use their best endeavours in their respective districts and counties to formulate and carry through schemes with the assistance of the N.A.L.G.O."

Mr. T. ORCHARD (Clutton) seconded, and said he would do all he could to forward the movement in his county; and Mr. C. F. SANDERSON (Martley) said he would do the same in Worcester.

The proposition was carried unanimously.

Mr. BROOK mentioned that arrangements had been made for the next meeting of the branch to take place in Birmingham.

On the proposition of Mr. WHITEHOUSE, seconded by Mr. WEAVER, a hearty vote of thanks was accorded to the president for his conduct in the chair and for his able address.

The PRESIDENT having briefly replied, the members adjourned to another room to tea, at the kind invitation of Mr. Latham.

Tea over, the remainder of the evening was pleasantly passed in social intercourse.

THE EXETER MEETING.

A much fuller programme had been arranged for Exeter, and here also Mr. Winter Gray's paper was presented for discussion, which was again well sustained, and the president delivered a further address, taking housing as his main topic.

PRESIDENT'S ADDRESS.

It is with a great deal of pleasure that I am able to meet the members of the Western and South-Western Districts of the Institution of Municipal Engineers here to-day in my double capacity of president and chairman of the South-Western District.

In being elected president of so important and energetic an institution I feel that a compliment has been paid not only to myself, but to the West Country members, over whose meetings I have had the honour of presiding during the last four years. It signifies to no small degree that the keen interest in municipal matters is shared equally by members of the profession, whether they be situated near or far from the great Metropolis.

How much of this healthy vitality is due to the fact that we have an institution which keeps us in touch with modern progress it would be difficult to say, but we must admit that we cannot overestimate the advantage we all gain in being able to confer together in all parts of the country, either in our respective districts or at the general meetings, and thus gain a well sifted and matured knowledge of the best methods of modern construction and principles. The popularity of the useful work of the institution is evinced by the fact that we have members in all parts of the world, including Africa, South Africa, North and South America, Australia, Canada, China, Egypt, India, and Straits Settlements, while we are well represented in both Scotland and Ireland. Thus we are kept in touch with the achievements of our most distant colleagues, and their knowledge, gained in similar capacities to our own under municipalities across the seas, is brought home to us, while our deliberations are equally shared by them.

I am keenly alive to the great responsibilities which devolve on me as official head of so important a body. I am assured of the heartiest co-operation of not only the council, but of the members in dealing with the affairs which affect the best interest of the profession. That I shall endeavour to increase the usefulness and vitality of this already energetic institution, and zealously watch over its best interests, need scarcely be questioned.

In the course of my presidential address delivered in London last month I endeavoured to impress upon the minds of the members of the institution that a municipal engineer must acquire a sufficient knowledge of architecture, as well as engineering, before he can be considered fully qualified to cope with the business of his profession. He must cultivate the artistic side and avoid the tendency of becoming too mechanical. I endeavoured further to show that civilisation goes hand in hand with the effort of the engineer in bringing about such [illegible] improved means of intercourse and transit as [illegible]

Never in the history of the world have [illegible] artistic and scientific interest of the engineer been called into greater evidence than at the present time. It is these efforts in the betterment of our country which [illegible] and the health of the nation is to be advanced by taking in hand a great and comprehensive scheme for the better housing of the people.

A greater and more enlightened policy has never before been put into operation than that incorporated in the Housing and Town Planning Act as affecting the health of the nation. It must be acknowledged that in every inhabited town there is an artificial existence. The inhabitants are brought into contact one with the other, and by the building of cities and towns thousands of human beings are caused to congregate and share in one another's prosperity. But there is ever a tendency among us to fall into the habits of those around us, and if unfortunately the influence be unclean and neglectful the general health of the neighbourhood must suffer in consequence.

The housing of the wage-earning working class in well lighted, well ventilated dwellings abutting on cleanly streets must have an extremely beneficial effect on the character of those classes. The conditions under which people are housed plays an important part in their lives and has a strong influence on their habits. A familiarity with their surroundings becomes part of their lives, and these conditions—as to whether they be dilapidated, dirty and uncared for, or, on the other hand, sunny and healthy—are reflected in equal relative proportions in both the character and the health of the inhabitants.

It is equally as important to preserve the health of the poor as of the rich in every community, as, if disease breaks out among the poor, it will probably spread through every class of the inhabitants. Besides the poor man's wealth is his health. It must be acknowledged that a physically unfit man is a burden. Health forms the basis of a man's value, and therefore it is most economical for all concerned that the labouring and working classes should be well and healthily housed. Such a course must needs decrease sickness, and in so doing pauperism, crime and mortality will be reduced, and as a corollary the charge on the rates must also be reduced; in fact, the money value of the lives saved, and the sickness averted throughout the country would be incalculable.

It must be remembered that sanitary laws are enacted for the purpose of giving sanitary authorities powers to promote measures to secure improvements in the public health. In the instance of housing these laws are not permissive; they are rigidly enforced on communities.

The necessity of the Town Planning Act proper was brought about by the rapid growth of towns. The advent of mechanical traction, which has done so much to afford rapid means of transit, has rendered it possible to dispense the population over wider areas than was previously the case. By this means the further overcrowding of towns could, to an extent, be avoided. The more rapid means of transit opened out a demand for residences on the outskirts of towns, and so rapidly were suburbs springing into existence that it was found necessary to establish laws to regulate the laying out and development of estates and so prevent the overcrowding of areas and the erection of unsuitable houses. As demand controls the market, so it set the price for land. Land which could be had for agricultural purposes at comparatively low rents was being developed for building purposes, and abnormal ground rents demanded, so much so that it became necessary to empower the community [illegible] to control the ownership in their own hands.

The community could acquire the land and prepare its own plan by which it should be laid out, providing where necessary open spaces, wide thoroughfares, and other advantages for the public benefit.

besides having the distribution and class of buildings to be erected thereon under their own control and jurisdiction. By its powers the public are protected against being unduly burdened by excessive ground rents, &c. The people get greater advantages, live in better houses and streets than their means would otherwise allow. But, apart from all this, the district is once and for all laid out to the best advantage of the community.

This Act takes a step far in advance of anything previously enacted in this respect, that it must be heartily welcomed by municipal authorities, the officers and the community generally. Municipal engineers who have experienced the laying out of private estates under the Public Health Acts and local by-laws—by which the majority of matters affecting the best welfare of the town and the inhabitants were settled by the owners of the land—know fully well that no authority could under their by-laws even insist on a plan showing the whole of an estate, and how it was intended to be laid out.

Every surveyor has at one time or another been faced with the question "What constitutes a street?" and "When does a street become a street within the meaning of the Act?" In the future, however, developments will be carried out in quite a different manner. Plans can now be enforced for schemes for "any land likely to be used for building purposes, and of any neighbouring land," and in those schemes, whether put forward by the council or by private enterprise, provision shall be made for open spaces, roads, streets, pleasure grounds, public buildings, &c., while provision is made by which any original plan can be modified or extended at any future time.

As I have previously stated, the Act applies rather to extensive than to restricted areas; the latter cases come under the term "site planning," which deals with the planning of specific areas of land within existing towns

Before a plan can be enforced it is necessary to obtain the sanction of the Local Government Board, after which the fact is published in the *London Gazette*. If any objections are lodged against the plan within twenty-one days a draft order confirming the scheme is laid before both Houses of Parliament for thirty days, and should no address against the draft be presented by either House, then the scheme becomes finally approved. In formulating a scheme for town planning in any district, the knowledge of the local surveyor in matters appertaining to the conditions and requirements of his district is indispensable. He will be acquainted with the prospects of future developments in one direction and another, and be best able to advise as to the width of roads necessary, taking into consideration the question as to whether there is or is not a probability of considerable future extensions beyond the area to be at once treated. He will give attention to the advisability of improving the direction of existing thoroughfares, for which purpose powers are given under the Act.

The municipal engineer must determine also the size of sewers to be laid, taking into full consideration all future developments. The owner of a private estate would be content with sewers of sufficient capacity to drain only that area in which he is personally interested, but in town planning the engineer must calculate the capacity from the point of view of the entire district, and allow for the development of land beyond. The same remarks equally apply to water mains, gas mains, &c.

In the planning of streets it is most important to allow for direct communication between industrial centres and the chief places of business—such as railways, docks, &c. The chief routes should be laid down, and these main thoroughfares should be sufficiently wide and well constructed to carry the heavy traffic. The residential areas should be laid out radial in plan, taking into consideration the best and healthiest aspects. For this purpose the engineer must give his attention to light and air, the geological formation of the district, and the question of subsoil water and land drainage. These matters are of vital importance to the healthiness of a district. Such conditions may exist as would be unforeseen by the casual observer, but which would influence the engineer in laying down a plan to take advantage of the healthiest aspects in formulating his scheme.

It should be observed that any area reserved for the erection of workmen's dwellings should be fully considered on all points, and perhaps first and foremost from a health point of view. My opinion is that the buildings should be constructed on an area as near as possible to the main street, which will afford the shortest route to the busy centres of industry along which trams will run, and that they be situated in a healthy housing area, not necessarily near to the factories and works. Health must be the first consideration, and in reality workpeople will prefer to live in a different atmosphere and neighbourhood to that of their place of daily toil.

The engineer must appreciate the fact that in the Town Planning Act he has scope for exercising his all-important talents of common sense and tact. He will have a variety of conflicting interests to overcome, and it is only by patient plodding and careful persuasion that his work can be achieved. Landowners will welcome the adoption of the Act as time goes on, and they will readily fall in line with the ideas of authorities. It is to their advantage that their land should be developed, and it is evident that those landlords whose land is treated under the Act will be the first to see their land built upon. It behoves every municipality to take advantage of the opportunities afforded them to extend their town on modern lines, and for those towns whose boundaries are limited to extend them and so bring in lands on the outskirts over which they at present have no jurisdiction. These outskirts may be under the province of perhaps a rural authority who may have little or no interest in the development of the adjacent town, and will take no measures to provide for a planning scheme, which will enable a town to be extended in future years to its best advantages.

An important feature of the Town Planning Act is that part relating to the housing of the working classes. The Housing of the Working Classes Act, 1890, with the subsequent amendment Acts of 1893, 1894, 1896, 1900 and 1903, empower urban authorities to condemn and re-plan insanitary areas, to obtain powers to erect houses for re-housing the classes displaced, and to maintain existing dwellings in a sanitary and healthy state of repair.

Up to as recent a date as 1909, when the whole of the Housing Acts were consolidated into one practical measure, the housing question, especially in rural districts, was beset with many difficulties, but with the passing of the Housing and Town Planning Act these difficulties were removed, and extreme activity is being manifested in every part of the country, in taking advantage of the powers given to communities, to see their working classes better housed.

In the past the question of housing has been much hampered by the law bearing on the subject, and many schemes have been abandoned on account of their likelihood to be a burden on the rates. Although such a condition may have existed up to quite recently, these arguments can no longer be put forward in sincerity, either in urban or rural districts. Authorities are now enabled to obtain great facilities for carrying out schemes of houses for the working classes. Land can be obtained either by compulsory purchase or by agreement, and the Local Government Board do not necessarily enforce that the land shall be immediately built upon. The course by which land can be obtained by compulsory purchase has been considerably simplified. In the past it has been necessary to obtain a Provisional Order which had to receive the confirmation of Parliament.

In the place of the costly procedure the new Act provides that an Order shall be made and advertised and served on the owner of the land, this Order being in due course submitted to the Local Government Board. If within the stipulated time the owner does not object the Local Government Board confirm the Order without any further enquiry. But in the event of an objection being raised then the Local Government Board will hold a public enquiry into the circumstances. This excellent course is sufficient to protect all parties, and economical expeditious and advantageous in every respect.

With reference to rural housing, there has been little or no activity under the old Housing Acts. The high rate of interest, the short period allowed for repayment, together with the costly procedure in acquiring land, causing the annual amounts for repayment to be so great that it became practically impossible for the houses to be self-supporting.

The period recently allowed for repayment of capital is fifty to sixty years for buildings, and eighty years for land, while the rate of interest at which money can be obtained from the Public Works Loan Commissioners is at the minimum rate allowed for the time being.

On account of the attention which is being given

to this important question by all progressive communities, it has been found in some instances that the building by-laws in force are too binding and severe when applied to the carrying out of streets and buildings of this description. The result of this has been that the Local Government Board has authorised local authorities to amend their by-laws.

Opinions are hazarded as to whether workmen's dwellings can be made to pay. As a matter of fact, workmen's dwellings, including repayment of capital, can be made self-supporting; but supposing that the whole or part of the sinking funds were contributed from the rates, it would only mean that the community were purchasing a right to the property, and at the same time their workpeople would have healthier homes, and much distress, sickness and pauperism would be averted thereby.

As my address at the joint meeting held at Gloucester yesterday treated on the subject of "Superannuation and Security of Tenure," it is scarcely necessary for me to traverse that ground over again at this meeting. Suffice it to say that the institution's council are fully alive to the best interests of the profession in this respect, and, in conjunction with that wonderfully successful society the National Association of Local Government Officers, whose membership roll exceeds 30,000, and with which this institution is affiliated, every possible effort is being made to bring about in the near future a satisfactory solution of this all-important question.

(To be concluded.)

NORTH-WESTERN DISTRICT.

At the dinner which was held by this district of the institution at the Mitre Hotel, Manchester, on Saturday last there was an attendance of some thirty members and friends. The chair was taken by Mr. A. R. Bleazard, the district chairman, who was supported by Mr. Arthur Bowes, ASSOC.M.INST.C.E., vice-president of the institution. The dinner was followed by a "social," to which a number of excellent musical items were contributed by members and others. Especially encored were the pianoforte and violin duets of Messrs. Bleazard and Shaw, and the songs rendered by Mr. Tom Fogg. Mr. Patterson contributed to the humorous portion of the programme, and his powers as a raconteur were at their best in his "North Country" dialogues and anecdotes.

The toasts of the evening included "The Institution," "The Council," and the "North-Western District," proposed and seconded respectively by Messrs. Arthur Bowes and B. Wyand, F. W. Platt and A. R. Bleazard, and Edward Walker and J. W. Cleave. The strike on the North-Eastern Railway was responsible for quite a number of non-attendances.

Sao Paulo's Town Planning Scheme.—In Sao Paulo, the capital of the Brazilian State of that name, a vast scheme of city improvements has been inaugurated, under the advice of M. Bonvard, architect for the City of Paris. It will include splendid boulevards and viaducts, asphalted streets, and a public garden, the estimated total cost being £4,000,000, towards which the State Government has already appropriated £700,000. The city has an estimated population of 380,000, and 4,000 new houses were erected in it last year.

Merryweather Fire Engine for Newport Pagnell.—The Newport Pagnell Fire Brigade are now the possessors of an up-to-date steam fire engine, the cost of which has been met chiefly by public subscription. The new machine is of the Merryweather "Gem" pattern, as extensively adopted by fire brigades in all parts of the kingdom, but with latest improvements, by which the weight has been reduced without in any way impairing the strength. It has a pumping capacity of 250 gallons per minute, and can be readily drawn at a gallop by a pair of horses. The fire door is situated at the rear of the boiler, thus permitting stoking to be carried out *en route*, a very serviceable feature in the case of a country brigade, which may frequently have to travel long distances. The trial of the engine at Newport Pagnell took place by the banks of the river Lovat, when it satisfactorily answered every test, sending jets of water to heights of 120 ft., 140 ft. and 160 ft. It was stated by the superintendent that the engine was absolutely satisfactory in all respects, and answered all the conditions and specification of the makers.

ROAD IMPROVEMENTS IN THE METROPOLITAN AREA.

ACTION BY THE ROAD BOARD.

The Road Board have addressed to the highway authorities of Greater London a circular letter stating that they are prepared to consider applications from those bodies for grants, or short loans, for terms not exceeding five years, towards works of road improvement.

In order to assist the highway authorities in the selection of the proposals to be put forward, the Board think it is desirable to give the following indication of their views as to the character of works to which they will be disposed to give most favourable consideration:—

(1) They do not encourage proposals relating to the widening of streets in fully built areas which are crowded and congested mainly with local traffic, as they do not consider that such works are fairly within the scope of the Road Improvement Fund.

(2) They will give special consideration to proposals for the reconstruction of road crusts, especially in cases where these require immediate reconstruction owing to injury caused by motor omnibuses and heavy motors. But they are of opinion that grants should not be sought from them for the more expensive forms of road construction for which it is customary to borrow the initial cost on long-term loans. The money available for grants can, they suggest, be spent more usefully and more beneficially in the interest of existing ratepayers on reconstruction work, for which there is an immediate need, but for which the highway authority cannot get sanction to borrow for a term which would spread the initial cost over a large number of years.

(3) In selecting the roads the reconstruction of which they will assist they will give prior consideration to those roads which form part of important through routes, carrying a considerable volume of long distance traffic, and also those roads which, although not strong enough for the purpose, are now being used for regular motor-omnibus services.

(4) They will favourably consider proposals which will facilitate the execution of town planning schemes, so far as these contain provision for the improvement of through road communications.

(5) They will give special consideration to proposals for the acquisition of vacant land required, or likely to be required, for widenings of important roads in cases where it can be shown that the prospect of building is imminent.

(6) Having regard to the amount available for grants and the amount for which applications are likely to be made by highway authorities on which the burden of road expenditure is exceptionally heavy in relation to assessable value, the grants will probably, in most cases, range from 10 to 50 per cent of the cost of works proposed.

(7) The works selected for applications to the board should not include any that have been commenced, or for which financial provision has been made.

The aggregate amount which the board are prepared to treat as available at the present time for grants or short loans to highway authorities in the Metropolitan Police area is £250 000.

Applications should be accompanied by—

(1) Statistics of the expenditure of the authority on the maintenance and improvement of roads and bridges during the past ten years on form marked "A."

(2) A map of the district marked to show—

(1) Roads on which there is a regular service of motor omnibuses.

(2) The road or roads in respect of which an application for a grant or a short-term loan is made.

(3) Statistics of traffic taken for seven consecutive days between the hours of 6 a.m. and 10 p.m.

(4) A brief description of the proposed work of road improvement, accompanied where necessary by plans and estimates. Form No. 11 should be used, where applicable, in the case of applications for grants to road crust improvement work.

Roads Improvement Association: New Headquarters. On and after December 20th the headquarters of the Roads Improvement Association (Incorporated) will be transferred to 15 Dartmouth-street, Westminster, London, S.W.

Some Recent Publications.*

The Properties and Design of Reinforced Concrete. Translated and abridged by N. Martin, B.Sc., Assoc.M.Inst.C.E., &c. Price 8s. nett. London: Constable & Co., Limited.

The present work is founded upon the report of the Commission appointed in 1900 by the French Minister of Public Works to study the question of reinforced concrete construction from the point of view of his administration. It is common knowledge that the French engineers were pioneers in this class of work, and the members of the commission comprised a group of men whose experience was unrivalled. Their labours extended over a period of six years, and their report, which is unique in the literature of the subject, contains the results of various important tests and experiments, together with much other valuable matter. Mr. Martin has rendered a real service to British engineers by his abridged translation of the report, which contains all the important results, and forms an admirable guide to the work of the commission. The work is specially commended to those who wish to make a systematic study of the properties and applications of reinforced concrete.

A Primer of Scientific Management. By Frank B. Gilbreth. Price 4s. nett. London: Constable & Co., Limited.

The author of this interesting little book has devoted his life to the problem of the elimination of unnecessary waste and fatigue in the operations of human labour. Scientific management may be defined as that management which secures the greatest production with the least effort. It is evident, therefore, that a study of its main principles will enable the engineer who is responsible for the management of works of any magnitude to effect considerable economies. Such a study may be made from Mr. Gilbreth's primer, which consists of a collection of questions and answers which followed upon a series of articles which recently appeared in the *American Magazine*. A good knowledge of the rudiments of the science of management can be easily obtained from the clear and simple instructions contained in these answers, and the perusal of Mr. Gilbreth's work can hardly fail to prove of direct profit to the reader.

The Practical Mechanic's Hand-book. By Franklin E. Smith. Price 4s. 6d. nett. London: Constable & Co., Limited.

It should be carefully observed that this is a hand-book for the mechanic, and not a hand-book on mechanics, a point which the printed title page (which omits the necessary apostrophe) leaves rather in doubt. The author has kept in view the requirements of the artisan who has not had educational advantages, but who needs a clear explanation of the more ordinary technical calculations. The subjects dealt with include arithmetic, formulæ, mensuration, weight and specific gravity, simple machines, and stresses in materials. These matters receive fuller consideration than in the ordinary text-book with a view to rendering them absolutely clear to the reader of limited attainments, no previous mathematical knowledge being assumed.

DIARIES AND YEAR-BOOKS

Messrs. Charles Letts & Co., of Southwark Bridge Buildings, London, S.E., and 3 Royal Exchange, E.C., issue a most appealing series of diaries for 1913, and it is difficult to imagine that it does not include something to suit not only all tastes, but all pockets. Several new editions have been added to their "specialised" diaries of last season, and this acceptable section now includes the "Poultry Keepers' Diary" (price 1s.) and the "Girl Guides' Diary" (price 6d.). "Christmas-card Diaries" are another distinctly happy innovation, and we have no doubt they would be infinitely more appreciated by the adult recipient than the customary conventional Christmas card. As usual, all the diaries of this world-known firm are distinguished by their "self-opening" tablet, and by the insurance coupon for £1,000, which each contains, and in this connection we note that on these coupons no less than £20,000 has been paid in claims, two of them arising from the last two railway accidents—those at Ditton Junction and Preston Station. Among the firm's publications which we have had an opportunity of inspecting personally we might instance "The Boy Scouts' Note-book and Diary," bound in khaki cloth, and "The Scribbling Diary and Memorandum-book" (No. 103), with a page for a week's notes, and interleaved with good blotting paper, which cost only 6d. each; the "Post-octavo Diary" (No. 84), with three days to a page (price 8d.); and the "Self-opening Pocket Diary and Cash-book" (No. 9), bound in "pluviusin," a new and perfect imitation of leather, which looks well and wears excellently (price 9d.). Among the shilling publications there are an "Office Diary," a remarkably cheap and practical octavo volume, bound in cloth and interleaved with blotting paper; the "Waistcoat Pocket" diary, No. 25 T; the "School Boy's" pocket diary, bound in art linen, and with a back-loop pencil; the "'R. H. S.' Gardeners'" pocket diary, edited by the Rev. W. Wilks, M.A., late vicar of Shirley; the "Pocket Diary," No. 24, bound in leather; the "Waistcoat Pocket" diary, No. 25, daintily cased in red leather; the little oblong "Thumb Diary" (No. 28), in leather; the "Small Octavo" diary (No. 384), in cloth, gilt lettered; and the "Popular Shilling Diary" (No. 64), with a week in each opening, and interleaved with blotting paper—a most serviceable book for the office desk. At 1s. 6d. there are the "Peerless Pocket Diary" (No. 600 F), bound in French morocco, beautifully finished and fitted with a metal-capped back-loop pencil, and enclosed in a box; the "Self- opening" diaries, Nos. 1 and 29, the former a roomy note-book, with cash-ruled pages, one of each of which is allotted to a single day; and the "Popular One-day Diary," of the handy size for desk use of 12¼ in. by 4⅝ in. At 2s. there are "The Peerless" pocket diary, handsomely bound in green padded-roan and fitted with a dainty back-loop pencil; and the "Self-opening" diary, No. 22, leather bound. Finally, we take space to note briefly "The *Daily Mirror* Ladies' Year-book for 1913," also published by Messrs. Letts, a cheap volume at 1s., which has already attained unbounded popularity. It combines in one volume a diary, cash-book, house-keeping account-book, and a register of addresses, servants, books, letters and other things.

Messrs. Thomas de la Rue & Co., Limited, issue, as usual, a delightful series of diaries, date cases, and other dainty and practical reminders of engagements and notable days for 1913. Perhaps their name recalls particularly the "Onoto" diary, now as familiar as the proverbial "household word." It is even better than in previous years, and now includes the times of sunrise and sunset for each day, the changes of the moon as they occur, and extended general information, though the last-mentioned is still limited to that which is of real use. The outstanding feature is the provision of two indexes, one enabling the user to turn immediately to any month, the other alphabetically arranged for recording or reference to addresses and other notanda. The prices range from 6d. for the waistcoat-pocket size, to 18s. 6d. for more elaborate diaries. De la Rue date cases, for standing on a desk at home or office, are also admirable in their tasteful execution, and can be bought at from 1s. up to (in leather cases) 3s. 6d. each.

The "Mechanical World" Pocket Diary and Year-book for 1913 (Manchester: Emmott & Co., Limited; price 6d. nett) is a wonderful compilation at the price, containing not only a diary, showing two weeks at an opening, but also a complete pocket-book of formulæ, &c., for mechanical engineers, which runs to upwards of 300 pages. The large mass of information is very easy of reference, being well arranged and provided with a copious index. The book will prove to be an excellent investment for every mechanical engineer.

The "Mechanical World" Electrical Pocket-book for 1913 has been enlarged by the addition of sixteen pages, and some of the sections have been re-written and expanded. In particular is this the case with the sections dealing with dynamos and motors, and with electrical measuring instruments. The book generally has been thoroughly revised and many new illustrations introduced. Its price is 6d.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

SCHOOL BUILDINGS.

QUESTIONS OF COST AND EQUIPMENT.

In the rolling village of Maltby, near Doncaster, in the area under the West Riding Education Committee, a new elementary school has been erected which seems to possess all possible amenities both for teachers and taught. The building, which gives accommodation for over 1,000 children, has been built round four sides of a square, with a large central plot of lawn which will be used for open-air classes. All the class-rooms open on to the quadrangle, and flat roofs to be used also for open-air instruction are a feature of the building. The school is fitted with an excellent system of ventilation, and the class-rooms are provided with heating apparatus to enable the children to be there in wet weather. The building is to serve as a model for others to be erected in neighbouring villages, and the West Riding may be congratulated on having built a fine school. At the same time due regard has been had for economy, as the cost works out at £10 2s. per head, exclusive of the site of £11 3s., inclusive of the site.

A NEW BRIGHTON SCHOOL.

Another new school on modern lines which has lately been opened is one built by the Brighton Education Committee, with accommodation for 310 boys and 310 girls. The class-rooms are arranged to accommodate fifty children only, instead of sixty, as has hitherto been the rule, in accordance with the new regulations on lessening the size of classes. A special feature has been made of the ventilation and lighting; each class-room has an external wall and windows on either side, so that there is an abundance of fresh air and light. There are no internal corridors, but open verandahs connect the class-rooms. The playgrounds have been made as attractive as possible, and classes will be held out of doors wherever the weather permits. The building contains a large hall, 45 ft. by 26 ft., and there are shower baths supplied with hot and cold water, and rooms for the medical inspection of the children. The school is warmed by means of a low-pressure hot water system, and it is lighted throughout by electricity. The cost of the building was £8,732, which works out at £14 1s. 8d. per head, exclusive of the site of 7,200 sq. yds. It is the first school of this type to be built in the South of England.

THE COST IN OTHER DISTRICTS.

The cost of these better and more elaborate schools compares favourably with that of buildings of older types. For instance, in Bedfordshire the schools recently erected have cost from £9 5s. to £14 per head, with accommodation for 176 and 80 children respectively, exclusive of site, or £13 to £21 10s. including site. In West Hartlepool the newest schools, which have accommodation for 1,508 children, cost £23 4s. 7d. per head including, and £21 10s. excluding site. In Middlesex the cost ranges from £11 4s. 7d. per head for a school for 160 children to £16 10s. per head for one with accommodation for 1,143, both exclusive of site. Of the schools opened in Durham during the years 1910 and 1911 one built for 900 children cost £10 5s. 3d. per head and another for 950 children £17 0s. 7d. per head, while the average cost per head of all schools built in this county during the last few years has been £12 13s. 10d., the cost of the site being included. Thus it is evident that the schools built on more hygienic modern plans need not necessarily involve any additional expense, while a considerable increase in efficiency, both on the part of teachers and taught, may reasonably be expected. From the *Times Educational Supplement* of December 3rd.

SEA-COAST EROSION. For a very complete and inexpensive library on the cause, prevention and repair of coast erosion the following three works are recommended: "Coast Erosion and Foreshore Protection," by John S. Owens, M.D., Assoc.M.Inst.C.E., F.R.G.S., and Gerald O. Case (price 7s. 6d., post free 7s. 10d.), with numerous illustrations and diagrams; "Sea-Coast Erosion and Remedial Works," by R. C. Allanson-Winn, M.Inst.C.E.I. (price 1s., post free 1s. 1d.); and "Erosion of the Coast and its Prevention," by F. W. S. Stanton, Assoc.M.Inst.C.E., F.S.I. (price 3s., post free 3s. 2d.), with numerous maps and other illustrations. The publishers are the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

SEWAGE DISPOSAL IN SHEFFIELD.

RESULTS OF BACTERIAL WORKING.

The effect upon the river Don as the result of the gradual bringing into operation of the new works of sewage disposal on bacterial lines in place of the lime precipitation process at Sheffield is referred to in the report of the city engineer, Mr. C. F. Wike, M.INST.C.E., for the year ended March 31st last. An improvement had, at the time the report was compiled, already become apparent.

Treatment under the new scheme is by means of detritus and screening chambers, followed by sedimentation tanks and contact beds. As originally designed, the works were estimated to cost £270,000, but, later, owing to economies in carrying out the undertaking, it was found that £250,370 would probably meet the cost, and the estimates were revised to this extent. Although the latter sum may eventually be slightly exceeded, the original estimated cost will not be reached.

Shortly, the scheme provides for a new main valve chamber to receive an existing 5 ft. and a new 7 ft. barrel sewers, fitted with new storm-water overflow; two new catchpits and the remodelling of the existing catchpits; nine new settling tanks and the conversion of the present tank area into eight additional tanks, having a total capacity of approximately 15,000,000 gallons; deepening the existing sludge wells and remodelling the pumping plant; sixty contact beds, each half an acre in area; sixteen storm beds, each approximately one acre in area; a bridge and four syphon tubes across the river Don; and roads and railways, including the diversion of a public footpath which divided the site and a footpath over the Great Central Railway.

The firm of Logan & Hemingway have been responsible for the carrying out of a large portion of the work, but it appears from the report that many important sections have been executed by men directly employed by the corporation. During the year a volume of sewage averaging 15,888,000 gallons per day has been treated on contact beds, and, in addition, storm water has received tank treatment. The average flow of sewage treated has been 21,110,000 gallons per day, the total volume treated during the year being 7,726,567,000 gallons. Notwithstanding the increased flow of sewage which has been dealt with, and the large extension of the sewage, the capacity having been increased from 10,000,000 to 64,400,000 gallons per day, no addition to the working costs has yet been necessary, and it is not anticipated that any very large increase in this respect will occur, apart from capital charges. Including the district of Tinsley and outside areas drained under agreements, a total population of approximately 470,000 are served by the works.

As regards sludge, the quantity produced during the year with which the report deals was 54,045 tons, or 6·99 tons per 1,000,000 gallons. It is mentioned that the strength of the sewage delivered at the works shows signs of increasing, owing to the addition of water-closets and an increase in trade wastes; likewise the quantity of road detritus and other solid matters passing to the works is stated to be growing larger.

The Henley Wiring System.—The W. T. Henley's Telegraph Works Company, Limited, Bloomfield-street, London Wall, E.C., have issued a booklet descriptive of their new wiring system and its possibilities. The essential feature of the system is the outer metal covering. This is composed of a special alloy, which is the outcome of experiments carried out to devise a sheathing possessing all the good qualities of lead sheathing, but without the advantages incidental to its use. This sheathing is formed on the cable in a seamless tube, it is impervious to moisture, and there is no danger of trouble due to condensation. It is mechanically strong without being hard or stiff, so that any bends that are required can be made by hand as the wire is erected, no special tools being required. The letterpress of the booklet is free from technical phrases, and is written so as to be of interest to the layman as well as the electrical engineer. It fully describes the system, and is illustrated with interior and exterior photographs of installations recently carried out. The system is now well established, and reported to be an unqualified success. It has been taken up by many of the largest contractors in the country, and is accepted by the leading fire offices. Copies of the booklet can be obtained on application to the company.

SELF-STARTERS FOR MOTORS.

CHISWICK SURVEYOR'S REPORT.

In view of the number of motor appliances now being employed in connection with municipal work, a report which Mr. Edward Willis, ASSOC.M.INST.C.E., F.S.I., A.M.I.MECH.E., engineer and surveyor to the Chiswick Urban District Council, has presented to a committee of that authority is of considerable interest. The report was called for owing to a 60-horse power fire escape chassis being occasionally somewhat slow in starting during very cold weather.

After detailing the principle which obtains in the starting of motors, and explaining how self-starters assist the operation, Mr. Willis follows with descriptions of a number of the latter devices which he has recently examined. After a full consideration of the merits of these, however, he finds himself unable to recommend the adoption of any of them. He adds:—

"If the desire still exists in the committee for some device to be employed in starting up the engine at night and other times, especially during cold weather, I would suggest that a small electric motor be attached to the chassis and be connected by means of a portable plug with the electric lighting wires at the fire station. This would avoid the use of batteries, which are always liable to run down and fail at the crucial moment, or be inefficient when most required, while the electricity supply for the district must be maintained by law in an efficient state, and a portable connection thereto might be considered as always reliable. When the appliance is actually at the scene of a fire and is about to return to the fire station, it really does not matter in practice if, through any unforeseen cause, the starting of the motor should take a few seconds longer than usual. The rapid starting at the station should be considered a *sine qua non*, and it is with a view of improving, if possible, the facilities which already exist that I make the above suggestion. I believe on only one occasion that the motor escape has been in use has there been any material delay in starting the engine, and there is no question that, even though this appliance was never built for the purpose to which it has been applied, it has been obtained at a very reasonable price, including the necessary alterations, and is cheaper in respect of maintenance than a pair of horses, which were contemplated in lieu of it. I am also of opinion that in every case, with the one exception mentioned, the motor escape has been at the scene of the fire before the steam fire engine, which is drawn by two of the best horses available."

REPAIR OF MACADAMISED ROADS.

USE OF "ROCMAC" IN GLASGOW.

In his report for the year ended May 31st last, Mr. Thos. Nisbet, Master of Works, Glasgow, refers to the treatment with "Rocmac" solution of a number of macadamised roads in that city during the previous year.

"This method of repairing ordinary macadamised roads," he says, "has been found to be a big improvement over the old system of water-bound road. The amount of mud during wet weather has been considerably reduced, and there has been a corresponding decrease in dust during the summer months. The roads so treated will last a longer period without requiring to be repaired. This will make up for the extra first cost of this system, which is about from 6d. to 8d. per square yard over the cost of ordinary macadamising. One of the great advantages of the 'Rocmac' method is that the work can be carried out during wet weather."

Mr. Nisbet adds that the system has since been greatly extended.

SURVEYORS' INSTITUTION.

AFTERNOON MEETING.

The next ordinary general meeting, the first of the two afternoon meetings arranged for the convenience of country members, will be held in the lecture hall of the institution on Monday next, when a paper, entitled "The Value and Marketing of English Timber," will be read by Mr. M. C. Duchesne (Fellow). The chair will be taken at five o'clock.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. THOMAS, M.INST.C.E., County Surveyor, Buckinghamshire.

SCOTTISH DISTRICT MEETING.

A meeting of the Scottish District will be held at Falkirk on Saturday, December 21st.

SOUTH-EASTERN DISTRICT.

A meeting of members of the above district will take place at Sidcup at 2.30 p.m. on Wednesday, January 8th, when the road sections will be inspected.

Mr. Maybury has kindly consented to supply the revised cost of the trial lengths up to December 31st; the meeting will be followed by a dinner at Frascati's Restaurant, Oxford-street, at 6.30 p.m.

MEETING AT SWANSEA.

A meeting of the institution will be held at Swansea on Saturday, January 11, 1913.

THOMAS COLE,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. FRANK LATHAM, M.INST.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

NORTHERN DISTRICT.

A meeting of the above will be held in the Town Hall, Newcastle-on-Tyne, to-morrow (Saturday), at 3 o'clock, when a paper on "Light Mechanical Haulage," by the hon. district secretary, will be read.

Arrangements have been made at the Turk's Head Hotel, Newcastle-on-Tyne, to hold the third annual dinner, following the above meeting, at 6.30 o'clock. Tickets, 4s. each.

JOHN ROBINSON,
Union Offices, *Hon. District Secretary.*
Darlington.
December 3, 1912.

INSTITUTION OF WATER ENGINEERS.

President—Mr. J. S. PICKERING, M.INST.C.E., borough surveyor and water engineer, Cheltenham.

WINTER GENERAL MEETING.

The seventeenth Winter General Meeting of the Institution of Water Engineers will be held at the apartments of the Geological Society, Burlington House, W., to-morrow (Saturday). The proceedings will commence at 10.30 a.m., or as soon as the business of the special general meeting called for 10 o'clock is completed. The usual informal dinner will be held this (Friday) evening.

The following papers have been promised for reading and discussion:—

(1) "Some Recent Examples of Pollution of Public Water Supplies," by J. C. Thresh, D.SC., M.D., &c.

(2) "The Valuation of Water Undertakings on Transfer to Local Authorities," by E. J. Silcock, M.INST.C.E., F.S.I.

(3) "Recent Advances in the Science of Water Purification," by Adolph Kemna, D.SC.

PROGRAMME.

10.30 a.m.—The minutes of the seventeenth ordinary general meeting and of the special general meeting will be read and submitted for confirmation; ballots will be taken for council for the year 1913-14, and for new members; reading of papers and discussions thereon.

The meeting will be adjourned for luncheon or otherwise as circumstances may require.

PERCY GRIFFITH,
20 Victoria-street, S.W. *Secretary.*

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

OUTDOOR ENGINEERING ASSISTANT.—December 14th.—Rivers Committee of the Manchester Corporation. £200 per annum.—Mr. Thomas Hudson, town clerk.

INSPECTOR OF NUISANCES AND SURVEYOR.—December 16th.—Thurnscoe Urban District Council. £140.—Mr. J. Ledger Hawksworth, clerk.

SANITARY INSPECTOR. — December 16th.—Corporation of Merthyr. £100—£120.—Mr. T. A. Rees, town clerk.

SURVEYOR'S ASSISTANT. — December 17th. — Bridgwater Rural District Council. £50—£60.—Mr. W. Alexr. Collins, engineer and surveyor. Applications to be endorsed "Assistant."

BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—December 21st.—Corporation of Ludlow. £200 per annum.—Mr. John H. Williams, town clerk.

SURVEYOR.—December 21st.—St. Bartholomew's Hospital.—Mr. Thomas Hayes, clerk to the governors.

CLERK OF WORKS.—December 21st.—East Suffolk County Council. — Mr. W. Jervis, chief surveyor of main roads, County Hall, Ipswich.

TEMPORARY ASSISTANT.—December 21st.—Corporation of Rotherham. £2 10s. per week.—Mr. Ernest B. Martin, borough engineer.

DEPUTY BOROUGH ENGINEER AND SURVEYOR.—December 23rd.—Corporation of Warrington. £200 per annum.—Mr. Andrew M. Ker, borough engineer and surveyor.

SURVEYOR.—December 27th.—Consett Urban District Council. £175—£205.—Mr. H. Jackson, clerk.

SURVEYOR'S ASSISTANT.—December 27th.—Consett Urban District Council. £52—£67.—Mr. H. Jackson, clerk.

ENGINEER-IN-CHIEF.—December 31st.—Mersey Docks and Harbour Board.—Mr. Alfred Chandler, general manager and secretary.

SECOND ASSISTANT SURVEYOR.—January 3rd. —Cannock Urban District Council. £52 per annum.—Mr. C. A. Loxton, clerk.

ASSISTANT IN SURVEYOR'S OFFICE.—Blackwell Rural District Council. £75 per annum.—Mr. Henry Silcock, surveyor.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

BELFAST.—January 1st.—Designs for 126 houses of two apartments each, and 126 houses of three apartments each, for the corporation. Premiums are offered of £25, £15, and £10.—Mr. R. Meyer, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

HARROGATE.—February 3rd.—Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

DUBLIN.—February 6th.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A. —The Town Clerk.

RANGOON.—March 1st.—Designs for municipal buildings. Premiums are offered of £300, £200, and £100.—The Clerk to the Rangoon Municipality.

WINNIPEG.—March 1st.—Designs for city hall. Limited to British architects in Canada. Premiums are offered of 5000 dols., 3000 dols., and 2000 dols. The Clerk.

DURSLEY.—(No date.)—Designs for thirty workmen's dwellings, for the rural district council.—The Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

DOVER.—December 14th.—For additions and alterations to a school, for the corporation. — Mr. R. E. Knocker, town clerk.

ABERAVON.—December 14th.—For the construction of offices and boundary wall, for the corporation.—Mr. James Roderick, borough surveyor.

BLACKBURN.—December 14th.—For alterations to public baths, for the corporation.—Mr. W. Stubbs, borough engineer.

KENT.—December 16th.—For alterations at the Beckenham Technical Institute, for the Education Committee.—Mr. F. Stevens, Urban Council Offices, Beckenham.

CHELMSFORD.—December 16th.—For sinking a borehole, for the corporation.—Mr. George Melvin, town clerk.

ABERDARE.—December 16th.—For the erection of twenty-three playsheds at council schools, for the Education Committee.—Mr. T. Botting, Education Offices, Aberdare.

STOCKPORT.—December 16th.—For extensions to technical school, for the Education Committee.—Mr. A. Lawton, secretary, Town Hall.

MONMOUTHSHIRE. — December 16th. — For the erection of a higher elementary school, for the Education Committee.—Mr. C. Dauncey, secretary, County Council Offices, Newport.

ABERTILLERY.—December 16th.—For extensions to the generating station, for the urban district council.—Mr. W. Gait, clerk.

FELIXSTOWE.—December 16th.—For the enlargement of a public convenience, for the urban district council.—Mr. H. Clegg, surveyor.

BIRKENHEAD.—December 16th.—For the construction of a roof at the abattoirs, for the corporation.—Mr. J. Fearnley, town clerk.

WILTS.—December 16th.—For alterations and repairs to a school, for the Education Committee.—Mr. J. G. Powell, county surveyor, Trowbridge.

GLOUCESTERSHIRE.—December 17th — January 17th.—For alterations to a school, for the Education Committee. Applications for particulars must be made not later than December 17th.—Mr. R. S. Phillips, architect, Shire Hall, Gloucester.

FARNHAM.—December 17th.—For the erection of five cottages, for the urban district council.—Mr. J. W. Wright, clerk.

WELLINGBOROUGH.—December 17th.—For the erection of a cart shed, for the urban district council. —Mr. E. Y. Harrison, surveyor.

WEST RIDING.—December 18th.—For the removal of temporary buildings, for the Education Committee. —Clerk to the County Council, County Hall, Wakefield.

KENT.—December 19th.—For the erection of a school at Tonbridge, for the Education Committee.—Mr. F. W. Crook, secretary, Caxton House, Westminster.

DERBYSHIRE.—December 19th.—For the erection of lock-up court-house and deputy chief constable's residence, for the Standing Joint Committee.—Mr. N. J. Hughes-Hallett, clerk, County Offices, Derby.

NORFOLK.—December 20th—January 8th. — For the erection of a school, for the Education Committee. Names to be sent by December 20th.—Mr. T. A. Cox, Education Office, Shire Hall, Norwich.

BRAINTREE.—December 21st.—For the erection of caretaker's lodge, and dressing boxes at public baths, for the urban district council.—Mr. H. H. Nankivell, surveyor.

STAFFS.—December 21st.—For the erection of an institute, for the Education Committee.—Mr. G. Balfour, director of education, County Education Offices, Stafford.

EXETER.—December 23rd.—For the extension of the isolation hospital, for the corporation.—Mr. H. Lloyd Parry, town clerk.

PRESTWICH.—December 23rd.—For the erection of buildings and walls in connection with the extension of the town's yard, for the urban district council. —Mr. Lewis A. Orford, clerk.

HAMBLEDON.—December 23rd.—For the construction of a reservoir, for the rural district council.—Mr. F. Smallpiece, clerk, 138 High-street, Guildford.

TWICKENHAM.—December 27th.—For the construction of a stone-pitched inclined embankment along the river frontage, for the urban district council. —Mr. H. Jason Sanders, clerk.

SOUTHAMPTON.—December 30th.—For the reconstruction of Fore Bridge, for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

ALTRINCHAM.—December 30th.—For the erection of a shelter and conveniences, for the urban district council.—Mr. H. E. Brown, surveyor.

Iron and Steel.

LONDON.—December 16th.—For the supply of fencing, for the county council.—The Parks Department, 11 Regent-street, S.W.

HARROGATE.—December 17th.—For the supply of 85 tons of 3-in. diameter cast-iron pipes and special castings, for the corporation.—Mr. A. S. West, waterworks engineer and manager.

GUILDFORD.—December 18th.—For the construction of surface-water drain, manholes, gullies and connections, for the corporation.—Mr. A. D. Jenkins, town clerk.

BRADFIELD.—December 21st.—For the supply of engines and pumps for waterworks at Stratfield Mortimer, near Reading, for the rural district council.—Mr. R. E. Rawstorne, clerk, 4 Bridge-street, Caversham, Reading.

Roads.

GODSTONE.—December 14th.—For tar-washing the surface of certain highways, for the rural district council.—Mr. Geo. E. Crowter, surveyor of highways.

FINCHLEY.—December 14th.—For the coating of 2,000 super. yds. of carriage way with bituminised macadam, asphalt or concrete, and creosoted deal blocks on concrete, for the urban district council.—Mr. E. H. Lister, clerk.

MAIDENHEAD.—December 16th.—For work of making up, for the corporation.—Mr. P. Johns, borough surveyor.

PLYMOUTH.—December 16th.—For making up certain streets, for the corporation.—Mr. J. Paton, borough surveyor.

WILLESDEN.—December 17th.—For road making and paving works, for the urban district council.—Mr. O. C. Robson, engineer, Municipal Offices, Dyne-road, Kilburn.

MARGATE.—December 18th.—For making up certain highways, for the corporation.—Mr. E. Brooks, town clerk.

LUTON.—December 19th.—For private street improvement works, for the corporation.—Mr. W. Smith, town clerk.

CROYDON.—December 19th.—For making up part of a road, for the rural district council.—Mr. R. M. Chart, surveyor.

SOUTHAMPTON.—December 20th.—For the supply of tools for use on the main roads, for the county council.—Mr. H. Barber, clerk.

SOUTHAMPTON.—December 20th.—For the supply of surface-tarring machines, for the county council.—Mr. H. Barber, clerk.

HAMPSHIRE.—December 23rd.—For the formation of a gravelled footway, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

SOUTHALL-NORWOOD.—December 24th.—For making up and channelling work, for the urban district council.—Mr. R. Brown, engineer and surveyor.

ELGIN.—December 24th.—For the supply of road metal for the county council.—Mr. A. Hogg, county road surveyor, 24 Academy-street, Elgin.

MERTON.—December 27th.—For making up a road, for the urban district council.—Mr. G. Jerram, surveyor.

EXMOUTH.—December 28th.—For excavation, sand filling making concrete footpaths, foundations of carriageways, and supply of tar-macadam for finishing coat of carriageways, for the urban district council. —Mr. Samuel Hutton, engineer.

DERBYSHIRE.—December 30th.—For the supply of granite, basalt, slag, limestone, tarred macadam, and tarred chippings, for the county council.—Mr. J. W. Horton, county surveyor, St. Mary's Gate, Derby.

LLANTRISANT AND LLANTWIT FARDRE.—January 1st.—For the completion of the new Ely Valley-road, and branch roads, about 3 miles in length, for the rural district council.—Messrs. Gomer S. Morgan & Thomas Saunders, engineers, School-street, Pontyclun, Glam.

SEVENOAKS.—January 1st.—For the supply of chert, flints and ragstone, granite, quartz, basalt, steam rolling, team labour, cartage and hauling, for the rural district council.—Mr. F. H. Vibert, clerk.

DORSET.—January 4th.—For steam rolling on 458 miles of main roads for three years, for the county council.—Mr. W. Townshend Fletcher, county surveyor, Dorchester.

DORSET.—January 4th.—For the supply of granites, basalts, quartzites, limestones and tar-macadam, for the county council.—Mr. W. Townshend Fletcher, county surveyor, Dorchester.

SUNBURY-ON-THAMES.—January 6th.—For the supply of 4,000 gallons of refined tar, for the urban district council.—Mr. H. F. Coales, surveyor.

EASTHAMPSTEAD.—January 7th.—For the supply of broken or unbroken granite, slag, limestone and flints, for the rural district council.—Mr. C. B. Wilson, clerk.

EAST GRINSTEAD.—January 8th.—For the supply of 20,000 gallons of tar, prepared in accordance with the Road Board's specification for tar No. 1, for the rural district council.—Mr. Francis S. White, clerk.

Sanitary.

NANTWICH.—December 14th.—For the construction of sewage disposal works, comprising detritus, settling, storm-water and stand-by tanks, filter-beds, humus tanks, and laying sewers and manholes, for the rural district council.—Mr. Charles E. Davenport, engineer.

YEOVIL.—December 14th.—For laying stoneware-pipe sewer, and constructing manholes, tanks, and sludge well, and digging irrigation channels, for the rural district council.—Mr. J. E. Rodber, clerk.

RUNCORN.—December 14th.—For the conversion of privies into water-closets, for the urban district council.—Mr. James Wilding, surveyor.

MANCHESTER.—December 16th.—For the construction of new intercepting sewer from Winslow-road to Crowcroft Park, for the corporation.—Mr. Thomas Hudson, town clerk.

ABERGELE.—December 16th.—For carrying out sewerage work, for the urban district council.—Mr. Edward A. Crabbe, clerk.

DENTON.—December 17th.—For alterations to existing tanks, construction of new sludge tanks, and erection of engine and sludge-pressing house, for the urban district council.—Mr. W. Richards, clerk, Town Hall, Denton, near Manchester.

EPSOM.—December 17th.—For the collection of house refuse, for the rural district council.—Mr. Arthur R. Cotton, clerk.

GUILDFORD.—December 18th.—For the construction of 972 yds. of 18-in. and 12-in. surface-water drain, manholes, gullies, and connections, for the corporation.—Mr. A. D. Jenkins, town clerk.

SOYLAND.—December 18th.—For the construction of stoneware pipe sewers, manholes and ventilators, for the urban district council.—Mr. L. H. Longbotham, clerk, Carlton-street, Halifax.

KNARESBOROUGH.—December 18th.—For the removal of house refuse, for the rural district council.—Mr. J. Smith, clerk.

BARNSTAPLE.—December 18th.—For draining Loxhore glebe quarry, for the rural district council.—Mr. E. E. C. Balsdon, clerk.

PRESTWICH.—December 18th. For work of sewering, for the urban district council.—Mr. Lewis A. Ortord, clerk.

EASTHAMPSTEAD.—December 18th. For work of scavenging, for the rural district council.—Mr. C. B. Wilson, clerk, Council Offices, Bracknell.

RADCLIFFE.—December 19th.—For the construction of sewerage works, for the urban district council. —Mr. S. Mills, clerk.

LLANTRISANT AND LLANTWIT FARDRE.—December 19th.—For laying stoneware sewers, for the rural district council.—Mr. W. Spickett, clerk, Pontypridd.

HARROGATE.—December 21st.—For the supply of disinfectants, for the corporation.—Mr. James Mair, medical officer of health, 33 Swan-road, Harrogate.

MIDHURST.—December 23rd.—For the removal of house refuse and street scavenging, for the rural district council.—The Clerk.

BOSMERE AND CLAYDON.—December 26th.—For scavenging work, for the rural district council. Mr. R. M. Cook, clerk, 6 Providence-street, Ipswich.

FRIMLEY.—December 28th.—For the removal of house refuse for three years, for the urban district council.—Mr. F. T. S. Marsh, clerk, Municipal Buildings, Camberley.

WOKING.—December 30th.—For the construction of sewers and manholes, for the urban district council.—The Clerk.

LEYTON.—December 31st.—For laying stoneware sewers, for the urban district council.—Mr. E. H. Essex, Town Hall.

Stores.

WILLESDEN.—December 17th. For the supply of jobbing works in sewer construction, mason's and pavior's work, artificial slab paving, tar paving and execution of tar-paving works, gravel, flints, burnt ballast, broken granite, lime, cement, stoneware pipes, lamp columns and fittings, oils, chandlery, coal, coke, barging of road slop, horse provender, ironmongery, tools, timber, maintenance of telephones and wires, and wood-paving works, for the urban district council. —Mr. Stanley W. Ball, clerk.

MANCHESTER.—December 17th.—For the supply of Portland cement, steel bolts, and nuts for fishplates, self-acting sliding lathe, and cleaning and dyeing of car curtains, for the Tramways Committee. —Mr. Thomas Hudson, town clerk.

GILLINGHAM.—December 19th.—For the supply of road materials, Portland cement and lime, requisites for precipitation works, stoneware pipes, timber, sewer ironwork, coal and coke, bricks, paints, oils, varnish, general stores, ironmongery and disinfectants, for the corporation.—Mr. F. C. Boucher, town clerk.

Miscellaneous.

BIRKENHEAD.—December 16th. For forming paths, fixing entrance gates, and erection of convenience and shelter in recreation ground, for the corporation. Mr. James Beardsley, town clerk.

CHORLEY.—December 18th.—For the supply of galvanised steel ashbins, for the corporation.—Mr. J. Mills, town clerk.

CLACTON.—December 18th.—For the construction of a 9-in. lined deep well, for the urban district council. Mr. G. T. L. Wix, clerk.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

ALDENSHAW.—Accepted for the removal of night-soil, for the urban district council.—

W. Phillips, Aldenshaw.

CLACTON.—Accepted for the supply of Ernest Ward granite for the urban district council.—Mr. D. J. Bowe, surveyor:—

Granite.—John Hall Granite Company, Markfield, 14s. 6d. per ton.
Facers.—E. R. Antoft, Wymondham, 6s. 9d. per ton.

GREENWICH.—For building work at Rangehill-place School, Greenwich, for the London County Council:—

G. Parker & Sons, Peckham	£17,887
J. Appleton, Sons, Son & Neave, Ltd.	16,886
Thomas & Edge, Woolwich	16,742
F. & H. E. Burge, Herne-hill	16,447
G. E. Wallis & Sons, Limited, Maidstone	16,242
J. Scott, Bowyer, Limited, Upper Norwood	16,227
T. D. Long, Deptford	16,136
W. Johnson & Son, Limited, Wandsworth-common †	16,097

Architect's estimate, £18,000.

ISLINGTON.—For the erection of a school for physically defective children at Elthorne road, for the London County Council:—

W. E. Blake, Limited, Bloomsbury	£5,501
A. E. Symes, Stratford	5,491
Lole & Co., Chelsea	5,475
McLaughlin & Harvey, Limited, Brecknock-road	5,377
C. P. Roberts & Co., Limited, Dalston	5,377
L. H. & R. Roberts, Islington	5,259
W. Lawrence & Son, Finsbury-circus	5,234
Patman & Fotheringham, Limited, Islington	5,233
Brand, Pettit & Co., Tottenham	5,219
McCormick & Sons, Limited, Essex-road	5,197
J. Chessum & Sons, South-place	5,182
E. Lawrance & Sons, Limited, City-road	5,107
J. Willmott & Sons, Hornsey and Hitchin †	4,950

Architect's estimate, £5,300.

LONDON.—For the supply of centrifugal pumps required in connection with the enlargement of the Crossness pumping station, for the London County Council:—

Thames Iron Works, Shipbuilding and Engineering Company, Limited, Greenwich	£6,640
Rees Roturbo Manufacturing Company, Limited, Wolverhampton	5,820
Fullerton, Hodgart & Barclay, Limited, Paisley	5,700
Marshall, Osborne & Co., Birmingham	5,416
Boving & Co., Limited, Union-court	5,250
J. Cochrane, Barrhead	5,050
Hathorn, Davey & Co., Limited, Leeds	4,770
Vauxhall and West Hydraulic Engineering Company, Limited, Leadenhall street	4,737

The tender of Boving & Co., Limited, included the cost of a small condenser, which was not specified, and the reduction on this account is £70, bringing the amount of this tender to £5,180. The first three firms on the list tendered for pumps built to the council's designs, but the fourth, Boving & Co., Limited, have offered, provided that they are allowed to alter the design of certain parts, to supply pumps with a guaranteed efficiency of 75 per cent plus or minus 1 per cent to allow for errors in measurements. The proposed standard of efficiency is considered to be above that of pumps made to the council's design, which without these alterations would, it is estimated, not exceed 67 per cent.

SEAFORD.—For the supply of granite flake and broken granite, for the urban district council:—

	Flake.	Broken.
	s. d.	*s. d.*
Croft Granite Company, Leicester	9 9	12 3
Manuelle, London	9 6	14 6
Penlee, Bristol	8 6	12 0
Granite Company, London	11 0	15 0
Johnstone Brothers, London	11 2	13 3
Griffiths & Co., London	9 8	14 2
White & Co., London	11 2	12 2
Rowe & Mitchell, London	10 0	15 0
Fry Brothers, Greenwich	9 11	14 8
Brooks, Limited, London	—	14 3
J. Mowlem & Co., London	9 2	13 11
United Stone Firms, Bristol	10 3	12 9

SOUTHAMPTON.—For the erection of Regent's park school, for the corporation:—

Playfair & Toole, Southampton	£15,898
H. Stevens & Co., Southampton	15,561
Jenkins & Sons, Limited, Southampton	15,164
C. J. Lear & Son, Alverstoke *	14,576

Borough engineer's estimate, £15,500.

STAFFORD.—For making up portions of two streets, for the corporation:—

Espley & Sons, Stafford	£360
R. Thorpe, Birmingham	364
C. J. Nevitt, Limited, Stafford *	298

TAUNTON.—For making up Gordon road, for the corporation.—Mr. D. Edwards, borough surveyor:—

F. & E. Small, Taunton	£121
E. G. Coles, Taunton	119
Pollard & Co., Taunton	106
J. V. Coles & Sons, Taunton	98

TIPTON.—Accepted for the supply of 13,500 tons of Welsh granite setts and two traction wagons, for the urban district council:—

Granite Setts.—Penmaenmawr and Welsh Granite Company, Limited, Penmaenmawr.
Traction Wagons.—W. Smith & Sons, Wolverhampton.

TWICKENHAM.—The following tenders have been accepted by the urban council:—

Supply and delivery of 5,000 creosoted deal paving blocks.—T. Gabriel & Sons, and Barton, at £5 9s. 8d. per 1,000.
Supply and delivery at the sewage disposal works of 70 tons of Tamworth slack coal.—S. Bowyer, at 13s. 6d. per ton.
Repairs to six street watering vans.—G. & T. Gravestock, £9 15s. 6d.
Repairs to seven street watering vans.—W. Stops & Sons, £9 0s. 6d.
Repairs to five street watering vans.—C. H. Palmer, £10 8s. 6d.

WALTON UPON THAMES.—Accepted for the supply of broken granite and broken flints, for the urban district council.—Mr. R. Wilds, surveyor:—

Broken Granite.—J. Mowlem & Co., Westminster, 11s. 11d. and 12s. 11d.; London Granite Company, Great Tower street, 15s. and 14s. 1d.
Flints.—Wills & Packham, Sittingbourne, 6s.

YORK.—For the erection of thirty cottages, for the corporation.—Mr. F. W. Spurr, city engineer:—

G. Lough & Co., Blyth, £6,[illegible].

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

DECEMBER.

13.—Institution of Municipal Engineers: Northern District Meeting and Annual Dinner, Turk's Head Hotel, Newcastle-on-Tyne.
14. Institution of Water Engineers: Seventeenth Winter General Meeting, Burlington House, W. 10.30 p.m.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. DECEMBER 20, 1912. No. 1,092.

Minutes of Proceedings.

To our Readers.

To wish at this period of the year all friends of THE SURVEYOR the compliments of the season may be conventional, but it is none the less cordial and sincere. Success in a world of competition is not attained without outside goodwill and assistance, and the more helpers one can rally to one's cause the sooner a measure of success is achieved, and the more lasting is its character. We acknowledge, with the keenest appreciation, that we have many and willing helpers whose only reward has been the knowledge that they have made our journal of real use to those concerned with the practice of municipal engineering. To all such we wish a sanely merry Christmas time, and a New Year of satisfactory health, happiness, and prosperity.

* * *

Tanks and other Matters.

A paper announced under this title was read by Mr. A. J. Martin, M.INST.C.E., president of the Institute of Sanitary Engineers, at the annual general meeting of the Association of Managers of Sewage Disposal Works on December 11th, and although the paper was cut short after dealing with "Tanks," the "other matters," in the shape of filters and standards, were brought before the meeting in two other papers by Lt.-Col. Jones, V.C., and Mr. W. H. Makepeace respectively. It will thus be seen that the whole process of sewage purification in its modern form, from preliminary treatment to final effluent, was considered by this meeting of practical men. In discussing the question of tanks, their relative efficiency as regards shape and form, the tendency of the sludge from different types of tanks to cause a nuisance, and the desirability of providing additional tanks of special construction, or upward filters, for the purpose of settling out the finely divided matters in suspension which frequently come away in tank effluents, were all dwelt upon. In fact everyone appeared to be desirous of reducing the suspended matters in the tank effluent to the minimum before distributing it upon the filters. Now this is very praiseworthy, and in some cases necessary, but it is obvious that the greater the amount of suspended solids removed from sewage in tanks the greater the amount of sludge which has to be dealt with, and all these efforts to produce a clear liquid for discharge to the filters must naturally increase the difficulties of solving the sludge problem. It was possible to gather from the discussion and from members of the association at the meeting that many are still in the fortunate position of being able to get rid of their sludge without much difficulty; but while the facilities for doing this must become less from year to year, the amount of sludge will become greater and greater as the population increases, and if we continue to work on these lines, the possibility of solving the sludge problem would appear to become more and more remote as time passes.

There appear to be two possible alternative methods of procedure in dealing with sewage. One is to endeavour to *make the sewage suit the process of purification* and the other is to *make the process of purification suit the sewage*. Anyone having experience of the difficulties which are encountered in carrying out the first alternative would think that greater efforts would have been made in the past to adopt the second; but as a matter of fact, when the original coarse contact bed was found to become choked when fed with crude sewage, nearly everyone adopted the first of the two alternatives mentioned above, and instead of attempting to modify the contact bed to suit the sewage, all efforts were directed to devising means by which the sewage would be made suitable for the contact bed. At first the septic tank was hailed as the saviour of the situation, then recourse was had to a modified form of septic tank in which the process of septicisation was largely reduced, and later still the hydrolytic tank, the Emscher tank and numerous other types were brought forward—even the old Dortmund type of tank came into vogue again—until at present the number of different types of tanks used in the preliminary treatment of sewage is legion. As these came into use the sludge problem became more and more difficult, particularly after percolating filters came into general use, as it was found that these required an exceptionally clear tank effluent if trouble with distributors and fine material was to be avoided. Another factor in the devotion of so much energy to the design of improved types of tanks was the generally accepted idea that preliminary treatment of sewage involving putrefaction under anaërobic conditions was a *sine quâ non*. It is now some years since we first raised this point in these columns and ventured to express a doubt as to the correctness of this contention. Since then others, better qualified than ourselves to express an opinion, have definitely stated that preliminary putrefaction under anaërobic conditions is not necessarily essential to the proper purification of sewage, but in spite of this there is evidence from all quarters that much energy is still being spent in devising new or improved forms of tanks; latterly even additional tanks of various kinds are being proposed for arresting the fine suspended solids which come away in the effluent from the first tanks. As a natural consequence the disposal of sludge has become more and more difficult, and numerous new methods of treating or disposing of this troublesome by-product are being introduced from time to time.

In our opinion the solution of these problems on the lines generally adopted in the past seems to be as far off as ever, and the time has come when some of the energy devoted to the subject might usefully be turned in the direction of endeavouring to ascertain whether more satisfactory results could not be secured by adopting our second alternative and attempting to *make the process of purification suit the sewage*. It is only fair to those concerned to add here that one man, at least, has followed this method of procedure consistently ever since the first coarse contact beds were constructed, with the result that this process has developed into the Dibdin

slate bed as the result of gradually modifying the original coarse contact bed to suit the sewage. We have described the slate-bed system and the results obtained by its use on various occasions during the past few years, so that there is no need to give details on the present occasion; but it has been recognised by a number of engineers privately and by the Royal Commission on Sewage Disposal officially, that as compared with preliminary treatment in tanks the slate-bed system has solved the sludge problem so far as the question of nuisance is concerned, and has certainly minimised the difficulties very considerably so far as quantity and ease of handling is concerned. The material in the original coarse contact bed rapidly choked and retained its humus and sooner or later became disintegrated, but by utilising experience to adapt it to suit the sewage instead of introducing elaborate means to make the sewage suit the contact bed, we now have the slate bed in which the material does not choke or disintegrate, but unloads its humus and all without creating a nuisance. It would be rash to assume that finality has been reached even with the slate bed in its present form, but we believe that greater success will attend future efforts at improvement in methods of sewage (and sludge) disposal if they are carried out in the direction laid down in our second alternative method of procedure.

The Pitting of Steel Pipes.

A paper read before the Eighth International Congress of Applied Chemistry by Messrs. George and Melville C. Whipple, of New York, is dealt with elsewhere in these pages. It describes a series of valuable experiments made in order to ascertain the causes of pitting in steel pipes. As is well known, there have been some very serious cases where large pipe lines have become unsound through the metal corroding at many small points. Unlike the cast-iron main, the steel pipe does not break or burst, but fails by leaking at a number of points where pits occur. The fear that this form of corrosion may take place has prevented the steel pipe from being used to the extent that would otherwise have been the case, seeing that for large mains steel pipe is cheaper and more easily handled than the cast-iron pipe, and possesses other advantages. Any information, therefore, that may lead to the discovery of the causes leading to this trouble and to their prevention is likely to be of great value to the engineer, and particularly to the manufacturer. The wrought-iron main, unlike the steel pipe, is found to rust generally over its entire surface, and it is not altogether clear from what is said in the paper why this difference should exist. The ordinary tests made with plates of iron or steel in water or in a dilute acid solution were too slow to be useful, while those made with stronger solutions were not comparable with ordinary working conditions. The experimenters therefore induced corrosion, by passing an electric current through water between two plates of iron or steel, without the use of strong acids. The manner of this electrolytic corrosion as distinguished from its rate is similar to that likely to take place under ordinary working conditions. It is no new theory that the corrosion of steel is due largely to electrolytic action set up owing to the differences in potential of the particles of the material at different points, but the idea that the difference in potential between the scale covering the steel and the metal underneath may set up an electrolytic action does not appear to have been seriously considered hitherto. The authors of the paper prove conclusively that if a wire is attached to the mill scale and a second wire is attached to the metal beneath the mill scale, and that if these two wires are coupled to a galvanometer an appreciable current can generally be measured, and thus they have shown that there is every likelihood of electrolytic corrosion taking place when the water comes in contact with the metal and with the scale. Further, seeing that the scale is full of cracks and is liable to be chipped off in the course of handling, the possibility of corrosion is greatly increased. These tests, however, would not be convincing were it not for the fact that the authors have proved that where all scale has been removed from the steel plate by grinding on an emery wheel absolutely no pitting takes place. We are told that there was not a single instance of pitting when the scale had been removed from the samples before testing, which seems to do away with the idea that this particular form of corrosion is due to lack of uniformity in the composition of the steel. It seems that the lack of uniformity in particles producing electrolytic action exists between the scale and the metal solely, or did so in the samples, and that this is the whole cause of the pitting of steel pipes. This being so, it remains for the metal urgist and manufacturer to find some way of producing steel plates so as to alter the character of the scale in making it of better electrical condition or of removing it entirely. The present methods of removing mill scale from pipes are probably too costly to be practicable, and in the immediate present we can do little, if anything, more than see that the pipes are thoroughly coated with some material that will prevent corrosion taking place; but it is to be hoped that in the future the difficulty will be overcome by some better means in the ordinary process of manufacture.

* * *

The Chlorine Method of Water Sterilisation.

The papers read respectively by Dr. Adolph Kemna and by Dr Thresh before the Institution of Water Engineers in London on Saturday last have one point in common—they both show how extremely important is the chlorine method of water sterilisation. Dr. Kemna's words are: "There is not the slightest doubt that the chloride of lime process constitutes the greatest advance which has been made in water purification during recent years. The proofs of its hygienical efficiency are overwhelming." Elsewhere he tells us that the efficiency of the process has been "effectively demonstrated by the fact of its having stopped epidemics of typhoid. In one case, exactly ten days after starting the application of chloride, an epidemic was suddenly arrested and the diagram showing the number of new cases fell abruptly to zero." Dr. Thresh, on the other hand, gives two instances in which chlorine sterilisation was recommended and adopted at his suggestion. In one case a stream badly fouled by cattle was the source of a polluted supply. The "De Chlor" method was adopted, since when coli have been absent from 100 c.c. at all tests. Still more remarkable is the second case, in which water was drawn for a town supply from a river into which another town discharged its crude sewage ten miles above the intake. When an epidemic of typhoid of some magnitude occurred in the town above the intake, the Local Government Board called on the water authority to take immediate steps to improve the condition of the supply. Dr. Thresh tells us that he "was able so to improve the filtering arrangements that within a period of two days the authority was supplying a perfectly safe water." One of the existing sand filters was made into a chlorinating chamber, and the water was dosed with 1 part of chlorine per million. "The water has been absolutely free from the bacillus coli since the chlorination commenced, and the town has not had a single case of typhoid fever."

Again, to refer to Dr. Kemna's paper, "the application of chloride of lime is simplicity itself: a solution of the required quantities is made and regularly run into the water, and the plant can be started in a few hours." It is to be observed how closely this agrees with the facts recorded by Dr. Thresh. There is nothing in the opinions of the two authors of the papers referred to as regards the merits of hypochlorite sterilisation of water which has not been enforced in these pages for years past. It is, however, gratifying to note that even in this country the great merits of this simple,

economical and valuable process are at last being recognised. The case with which the worst polluted waters, including even sewage effluents, can be sterilised by means of hypochlorite ought to be better understood, and the remarks made by Dr. Kemna and Dr. Thresh are therefore extremely valuable. There are in these papers many other matters of interest which will be dealt with in a later issue.

* * *

The Training of Engineers.

The list of past presidents of the Junior Institution of Engineers contains the names of many distinguished men, and the council and members are to be congratulated on the readiness with which men of great scientific attainment are willing to serve them in that capacity. This year the position is occupied by Sir A. Trevor Dawson, R.N., M.INST. C.E., who delivered his presidential address last week, taking as his subject "Staff Officers in Industrial Works: their Scientific and Practical Training and Duties." Although such a topic may at first sight appear to be rather outside the sphere of the municipal engineer, Sir Trevor Dawson's treatment of it included much that was of general application in regard to the importance of associating scientific knowledge with practical experience in engineering training, and we are therefore led to make a few observations on his address. He pointed out the very wide nature of the training which is required by the engineer who is to be fit to occupy a position of responsibility, and drew as a lesson the wisdom of placing experience before salary in early years. There can be no doubt as to the soundness of this advice in the realm of municipal engineering. The highly-paid posts of to-morrow will be reserved for the men who are acquiring a wide and varied experience of the work of to-day. Another matter emphasised by Sir Trevor Dawson was the necessity for the development of the creative faculty by engineers. The danger of getting into a rut should be avoided at all costs, as nothing is so effective in barring the path of progress as the type of mind which is always content to accept that which exists because it has been considered satisfactory hitherto. The address concluded with a plea for some assistance by the State in providing facilities for the kind of training indicated in the case of men who may have great ability, but no means to enable them to turn their faculties to the best economic advantage. The president in making this appeal was considering only the interest of commercial engineering from the national point of view. As pointed out above, however, the earlier part of his address was in many respects applicable to municipal engineers, who well merit his support.

Ex-Pupils and Assistants Advertisements

A correspondent has drawn our attention to the fact that he replied last month to three advertisements in the "Ex-pupils and Assistants" section of our advertising pages. To one of his letters, addressed to "R. W.," he received a reply informing him that the advertiser had obtained an appointment; to the other two of his letters, addressed to "Desideratum" and "Solicitus" respectively, he did not receive even the courtesy of an acknowledgment. At the date (December 2nd) of the communication to us of our correspondent, the engineer and surveyor to an urban district council, the three advertisements were still appearing in THE SURVEYOR, and our correspondent adds: "I think these men might have replied to my letters. Also, if they have got appointments they should have instructed you to discontinue their advertisements." We cordially agree, and think that the advertisers have acted with grave discourtesy to our correspondent, and with a remarkable lack of consideration to ourselves in view of the fact that we instituted the section of announcements referred to solely in the interest of juniors seeking appointments. On December 2nd the vacancy our correspondent was seeking to fill was still open, a circumstance which is difficult to reconcile with the periodical outcries one hears as to the difficulty of getting berths in the municipal-engineering world. Apparently the more real difficulty is that of helping those who will not help themselves.

The Institution of Municipal and County Engineers.

At a Metropolitan District meeting of this Institution, which was held last week, a very interesting debate on "The Influence of Motor Traffic on Metropolitan Roads" was inaugurated by Mr. J. Patten Barber. The readiness of the members present to take part in the discussion was sufficient indication of the great interest which this subject arouses at the present time. A variety of points were raised, and ultimately the discussion had to be adjourned, to be resumed at the next meeting of the District.

A meeting of the Council of the Institution was held on December 7th, when twenty new members, eight associate members, and seven students were elected. Among the matters considered was a report of the New Offices Committee recommending the acquisition of a suite of offices in Victoria-street, which, it was stated, would provide the accommodation rendered necessary by the extension of the work and growth of the Institution. This recommendation was adopted. Among other matters which were discussed were the affiliation of the Association of County Surveyors of Ireland, and the mutual defence fund. A report of the proceedings will be found in another column.

A Building Line Dispute.

In a case recently heard by Mr. Justice Joyce, the Attorney-General, at the relation of the Lye and Wollescote Urban District Council, sought an injunction against a building owner, requiring him to pull down and remove so much of his house as was in front of a building line which the Council had prescribed. The street in which the house in question was situated was not a new one, and two questions of interest to local authorities were discussed in the course of the hearing. The first was as to the power of the Council to prescribe a building line at all, and the other was as to the necessity of their offering compensation to the building owner for the land he was called upon to give up before they could successfully proceed against him. It was contended for the local authority that the correspondence that had passed between the parties showed that the defendant regarded the requirements of the Council as well founded except as regards the building line. He continued to build because he believed that under the Act the Council had no right to prescribe the building line, and that even if they had such a right compensation should have been paid. His lordship said that he would have to consider his judgment.

Works Projected for 1913.

Those of our readers who propose to comply with our request for particulars of works projected in their districts during the coming year will greatly oblige us and facilitate the production of the forthcoming special annual issue of THE SURVEYOR by forwarding their returns without delay. The form which these should take is now generally understood, but the exact nature of the information sought can be seen by reference to our previous special issue (January 26th last), some thirty-two pages of which were devoted to the publication of these official forecasts. We would repeat what we said last year—that any other material which readers may consider sufficiently interesting for inclusion in the issue will be welcomed; but this matter also—particularly if its use involves the reproduction of drawings or photographs—should likewise reach us at the earliest possible moment.

New Central Fire Station at Barrow-in-Furness.

NEW CENTRAL FIRE STATION, BARROW-IN-FURNESS.

The opening ceremony in connection with a new central fire station which has been erected at Barrow-in-Furness, designed and carried out by the borough engineer and surveyor's department, under the superintendence of Mr. Arthur Rees, was performed on Thursday of last week by Mr. T. F. Butler, wife of the chairman of the Watch Committee.

It was in May, 1910, that the proposal was decided, owing to the unsatisfactory and dangerous condition of the temporary buildings used by the brigade, to take steps to provide a new station. Several pro-

MR. ARTHUR REES,
Borough Engineer and Surveyor, Barrow-in-Furness.

posed sites were considered, and ultimately land was purchased from the Furness Railway Company, at a cost of 17s. 6d. per square yard. The position is central, abutting on an 80 ft. street at a point where there is comparatively little traffic and the surrounding streets are practically level. The area of the land utilised is 1,653 sq. yds., and 1,030 sq. yds. at the northern end are still available for future requirements.

Before the preparation of plans for the new building was commenced the council decided to send a deputation to visit the towns of Bolton, Blackpool, Stockport, Salford and Lancaster, where there are fire stations of comparatively recent erection. As a result of the information furnished by the fire authorities of the towns named, plans were prepared by the borough engineer and surveyor's department, and were subsequently approved by the council in December, 1910. When preparing the plans for the new buildings, it was felt that, while they should be compact for economic and administrative purposes, the situation and the purpose for which they were intended—viz., the housing of men and appliances for the saving of life and property—demanded buildings of some architectural pretensions. In view of the probability that all future fire appliances would be self-propelled—one vehicle comprising several appliances—it was not thought necessary to include stables, but greater width and length in the engine-house than is usually provided.

The accommodation provided, as illustrated by the plans and photographs, is as follows: An engine-house, 65 ft. by 35 ft., with accommodation for four engines, fire escape, hose carrier and ambulance van, the external doors to the engine house being arranged to open and fold back automatically. Behind the engine-house is provided a washing space 48 ft. by 15 ft., covered with a glass roof, supported by cantilever brackets, thus dispensing with the necessity for pillars. Conveniently arranged on the west side of the engine-house, and with separate access from the street, is a duty-room, 14 ft. by 12 ft., in which the telephonic apparatus is placed, this room being arranged so as to overlook the engine-house and to be adjacent to the superintendent's office, 18 ft. by 12 ft. A work-shop, 22 ft. 6 in. by 18 ft., and a store-room are also provided. On the east side of the engine-house is the hose tower, a bath-room, and lavatory accommodation. The whole forms a square and compact block. Without increasing the height of the buildings a comfortable recreation-room has been ingeniously and economically provided in the roof, this room being entered from a separate staircase having access from the street and engine-house. This feature commended itself favourably to the Local Government Board inspector at the public inquiry. Automatic opening manhole doors are fitted in the

floor of the recreation-room, and sliding poles connect this room and the engine-house.

Detached from the station, but connected by a covered passage, there is a house for the superintendent, containing sitting-room, dining-room, kitchen, pantry, bath-room and three bedrooms, and fronting upon the side street are two cottages for the whole-time engineers. Another house has been purchased for the motor driver, in Clifford-street, which abuts upon the rear of the station. The apparatus which has been installed in the telephone-room has had considerable attention, with a view to obtaining an expeditious turn-out.

A switchboard has been constructed, upon which are placed eleven telephone callbells from the various works in the town that have been connected, and from all licensed places of amusement. Upon receipt of a call the officer on duty can instantaneously ring up the whole of the men at their houses, and

blacksmith's hearth, lathe and drilling machine, for

efficient undertaking with reduced maintenance charges, rather than cheapness in the original cost, as the deputation found when visiting other stations that cheap methods of construction proved ultimately to be far from satisfactory. The endeavour has been to put up a building that would adequately serve the purpose for which it is intended, and be a credit to the town, at the same time studiously avoiding anything in the nature of extravagance.

drainer, concretor, bricklayer and terra-cotta setter—

slater and plasterer—Mr. W. H. Paul; ironfounder—Messrs. T. Blackburn & Sons, Preston; plumber, painter and glazier—Mr. M. A. Ross; mason—Mr. G. Varley; heating installation—Messrs. J. Birrell, Son & Co.; electrical work, under control and supervision of Mr. H. R. Burnett, borough electrical engineer—Mr. C. Armstrong-Lamb, Carlisle. The terra-cotta work was supplied by Messrs. Burmantofts, of Leeds. Mr. T. P. Tyson acted as clerk of works.

"The Surveyor" Book Department.—A selected classified list of technical and scientific books has just been issued, and a copy will be forwarded post free to any applicant. Address the Manager, The Surveyor Book Department, 24 Bride-lane, Fleet-street, E.C.

Messrs. W. F. Stanley & Co., Limited.—Owing to the continued expansion of their business, Messrs. W. F. Stanley & Co., Limited, have been compelled to provide much larger office accommodation, and they will now occupy the whole of the upper part of the premises at 286 High Holborn, where their showrooms have been on the ground floor for some time, retaining their old premises at 4 and 5 Great Turnstile for export only.

DEVON COUNTY COUNCIL.

A THIRD SURVEYOR TO BE APPOINTED.

The Bridges and Main Roads Committee of the Devon County Council presented a report at the council meeting last week recommending that an additional surveyor be appointed, and that the county be divided into three divisions; that the salary and allowances of the additional officer be the same as that of each of the other surveyors; and that the annual allowance for travelling of each surveyor be increased from £160 to £200 each officer to use a motor car in the discharge of his duties. The committee asked that they be delegated the power to make the appointment.

Though some objection was taken to the proposal to increase the annual allowance for travelling, the recommendation was carried by a majority of ten.

A Canadian Concrete Bridge.—The city of Calgary proposes to provide nearly £250,000 for erecting a high-level concrete bridge over the Bow River and two smaller concrete bridges.

Institution of Water Engineers.

WINTER GENERAL MEETING IN LONDON.

Mr. J. S. Pickering, M.Inst.C.E., borough and water engineer of Cheltenham (president), took the chair on Saturday last at the seventeenth winter general meeting of the Institution of Water Engineers, held, as usual, at the apartments of the Geological Society, Burlington House, W., the attendance including: Messrs. H. C. Adams (Westminster), A. Andrew (Oldham), R. Ashworth (Wolsingham-on-Wear), N. McBarron (Lincoln), W. F. Bird (Midsomer Norton), A. B. E. Blackburn (Sunderland), A. Blakiston (Weybridge), R. Blakiston (Liverpool), F. H. Brunt (Rochdale), W. T. Burgess (London), F. Pullen Candy (Westminster), S. Chapman (Torquay), C. Clegg (Westminster), A. H. Cooper (Farnham), J. Dewhirst (Chelmsford), F. J. Dixon (Ashton-under-Lyne), Percy Griffith (Westminster), secretary, G. Greenslade (Southampton), E. Y. Harrison (Wellingborough), P. T. Harrison (Chelmsford), H. C. Head (Winchester), F. W. Hodson (Loughborough), F. E. Howard (London), W. H. Humphreys (York), J. A. Hutchinson (Paignton), Ad. Kemna (Antwerp), C. P. King (Bexhill-on-Sea), D. Kitchingman (Southampton), G. O. H. Klopp (London), H. Lapworth (Westminster), W. R. Locke (Hemel Hempstead), F. W. McCullough (Belfast), W. Matthews (Westminster), W. Millhouse (Scarborough), T. Molyneux (Stockport), C. B. Newton (Hull), W. G. Peirce (Richmond, Surrey), H. Preston (Grantham), C. H. Priestley (Cardiff), J. Richardson (Birkenhead), R. B. Rigby (Bury), H. Robinson (London), C. Sainty (Windsor), E. Sandeman (Westminster), J. H. Secker (London), E. J. Silcock (Westminster), C. Clemesha Smith (Wakefield), T. Smith (Newcastle-on-Tyne), C. G. Stewart (Westminster), W. Osborne Thorp (Malvern), J. C. Thresh (London), A. Towler (Leeds), L. C. Walker (Reading), W. Whitaker (Croydon), R. H. Wyrill (Swansea), and G. N. Yourdi (Westminster).

The meeting was preceded by a special meeting, at which a number of alterations in the Articles of Association were agreed to, and at the close of the discussion of papers Mr. C. Clemesha Smith (Wakefield) was elected to succeed Mr. Pickering as president of the institution. Messrs. T. Molyneux (Stockport) and F. W. McCullough (Belfast) were elected vice-presidents, and the following as ordinary members of council: Messrs. F. J. Bancroft (Barnet), A. B. E. Blackburn (Sunderland), S. C. Chapman (Torquay), W. Matthews (Westminster), H. Preston (Grantham), C. H. Priestley (Cardiff), H. W. Woodall (Bournemouth), R. H. Wyrill (Swansea), F. J. Dixon (Ashton-under-Lyne), and F. W. Davies (Nottingham).

Two papers, "Some Recent Examples of Pollution of Public Water Supplies," by J. C. Thresh, D.Sc., M.D., and "Recent Advances in the Science of Water Purification," by Adolph Kemna, D.Sc., came before the meeting for consideration, and it was agreed that the two contributions should be discussed together.

SOME RECENT EXAMPLES OF THE POLLUTION OF PUBLIC WATER SUPPLIES.

By John C. Thresh, D.Sc., M.D.,
Lecturer on Public Health, London Hospital Medical College.

During the past year the author has met with an unusual number of cases in which water authorities have required assistance to elucidate the causes of contamination of their water supplies; in some cases advice has been sought on account of the complaints of consumers of the water, and in others on account of analysts having detected the bacillus coli in the water supply, and consequently giving more or less unfavourable reports. Such complaints and reports are not invariably substantiated, and in the cases mentioned in this paper the allegations were not always well founded.

CASE 1. POLLUTION OF DEEP WELL WATER.

The water from a deep well in the new red sandstone began to show signs of contamination, the bacillus coli being found in about 10 c.c. of the water, whereas previously it had not been found in much larger quantities.

The directors were certain that no contamination could arise at the works, and the author, contrary to his usual custom, commenced by examining the neighbourhood around the outcrop of the sandstone, but found nothing which in his opinion could affect the well. This was a great relief to the directors, some of whom held curious views on how well water could become contaminated. On inspecting the works, however, the author found that the water was first raised to an iron tank, of 2,000 or 3,000 gallons capacity, under the engine-house floor, and was then forced to the service reservoirs some distance away. The water in this tank was covered with dust and appeared greasy, and the sides were decidedly slimy, and the author naturally concluded that this was the most likely source of contamination. The engines were stopped, and, the tank being emptied, the sides and bottom were found to be in a very offensive condition. The slime was afterwards examined bacteriologically, and had its source not been known one would have concluded that it had been taken from a tank at some sewage works. It was a mass of bacteria of objectionable type, and contained myriads of bacillus coli. The tank was thoroughly cleaned and properly covered in, and the water at once regained its pristine purity.

CASE 2. CONTAMINATION OF A SPRING SUPPLY.

The spring water supplied a population of about 5,000. The periodical analyses made by the county analyst showed that it was of excellent quality until early this year, when a sample was found to contain the bacillus coli. Another sample was taken and the result confirmed. As another source was available, the spring supply was cut off, and the author was asked to investigate. The corporation owned only a few yards of land around the spring, so that there was really no protective area, but the water came from a bed of sand under a layer of boulder-clay, and this boulder-clay apparently sufficed to prevent pollution, although there were many houses near and above the spring. There had been no known change in the drainage of these houses to account for the pollution of the water; moreover, the water was always beautifully bright, and even when containing the bacillus coli the chemical quality had remained unchanged. The spring and its immediate surroundings were then examined. The spring arises at the bottom of a large reservoir having a semi-circular galvanised-iron roof. The water boils up in three different places, but a little oozing was found near a side wall, where the sand was mixed with a little clay, and appeared to be discoloured. Samples were taken from these different points, and were all found to be of the greatest purity, except that from the point near the side wall. This sample was grossly polluted and contained the bacillus coli in abundance. Round the outside of the reservoir or collecting tank the earth was soft, especially near where the polluted water entered, and a sample was found on examination to be contaminated with manurial matter. Inquiry elicited the fact that during a long spell of dry weather the roof of the reservoir had become almost covered with bird droppings from the trees which surrounded the reservoir, and that the water was first found to be contaminated two or three days after a heavy rainfall, which, as the roof had no gutters or spouting, had washed all the filth from the roof on to the ground around. At the point where the ground was soft, near the source of pollution, the author made a hole with a walking-stick, poured in a little strong solution of fluorescin, and then added two or three pails of water. Within an hour the fluorescin was visible in the reservoir, the coloured water entering at the point of discoloration. There was no doubt, therefore, that the filth from the roof had gained access to the reservoir and given rise to the bacillus coli found in the water.

The soft earth around the reservoir was removed and a broad concrete channel constructed; the discoloured sandy clay at the bottom of the reservoir was also removed, and a load or two of clean sand substituted for it. The reservoir was then allowed to fill again, and the water being found to be quite free from any signs of contamination, its use for the purposes of a public supply was then resumed.

CASE 3. CONTAMINATION OF ANOTHER SPRING SUPPLY.

In another county a spring water went wrong exactly as in the preceding case, but here the spring was in the centre of a huge meadow, in a depression, with a wire fence round the reservoir, which was covered. The fence was only a few yards from the spring and from the fence at the top of the slope were quantities

of cow-dung. Apparently the cows were attracted to this spot by the shelter afforded by a few trees. With every rainfall some of the manure must have been washed down the slope, and as the difference between the level of the water in the reservoir and of the ground outside was only a few inches, there was no doubt that the bacillus coli got washed through the soil and entered the spring. The author recommended the construction of a concrete channel round the reservoir, and the pushing back of the fencing so as to keep the cattle a greater distance away. When this is done the water will no doubt be perfectly satisfactory.

CASE 4.—WORMS IN A PUBLIC WATER SUPPLY.

During last summer a water authority began to receive complaints about worms appearing in the water at the house-taps, and their meter examiner reported the finding of worms in the water meters. Specimens were submitted to the author and proved to be the lava of a fly. Flushing the mains not having ridded the district of the pest, the author was asked to investigate the whole matter. The water entering the reservoir was found to be free from "worms," and there were none in the water leaving the reservoir. The author, however, ascertained that on certain lengths of main there were no complaints, and that on one long main all the complaints came from consumers living beyond a certain point. Samples were drawn from taps throughout the area which confirmed these statements, and the author came to the conclusion that the larvæ or the ova were gaining access to the mains at the ball-hydrants. These were said to be well looked after and to be kept clean, but the first visited, situated just below where the complaints commenced, showed that they were anything but clean. This and others contained quantities of road scrapings and washings. The author, of course, recommended the thorough cleansing of all the boxes and the thorough flushing of all the infected mains, and after this was done the "worms" disappeared. The author would strongly urge the necessity for a new statute or clause in the Public Health Acts forbidding the use of these old-fashioned ball-hydrants; they are a constant source of danger to water supplies.

CASE 5.—ALLEGED POLLUTION OF A SUBSOIL SUPPLY.

A sample of water taken from a house tap was submitted to an analyst and condemned by him, causing great alarm and excitement. After examining the works and taking samples of water for examination, the author was satisfied that no source of supply could be less liable to pollution, and found that the samples of water examined were of excellent quality. Subsequent inquiry indicated that a portion of the mains had not been efficiently flushed, and that the sample of water condemned was taken from this piece of main. To condemn a whole water supply and create a panic merely because of such an incident as this is, in the author's opinion, entirely unjustifiable, but it is not at all an uncommon occurrence. Not long ago such a sample taken from the mains of an important water company was submitted to the author, who, after inquiries, found that the inspector had gone to a fire hydrant, turned on the tap gently and filled the bottle with the water as it escaped. Another sample was taken from the same spot after opening the valve and allowing the water which had stagnated in the pipe to escape, and this was of unexceptional quality. Sufficient care is not taken, as a rule, in collecting samples for analysis. The following experience is a further confirmation of this statement.

CASE 6.—ALLEGED POLLUTION OF A TOWN SUPPLY.

A case of typhoid fever having occurred in a large house connected with the public supply, the owner sent a sample of water for analysis. It proved to contain far too many bacteria, including the bacillus coli. The owner was informed of the results of the examination, but was warned that it would be unsafe for him to accuse the sanitary authority of supplying a contaminated water unless he could prove (1) that the water came direct from the main, and (2) that the sample had been properly taken. On visiting the house, the author found that the pipe from which the sample had been taken terminated at a tap over the kitchen sink, and was undoubtedly a branch direct from the main. The tap was a large one, and upon inserting the little finger into the nozzle it brought away a slimy mass of filth, resembling dirty boiled sago. This proved to consist almost entirely of bacteria, and the water taken after the tap had been cleaned and flamed was perfectly satisfactory in character.

CASE 7.—INTERMITTENT POLLUTION OF A TOWN SUPPLY.

The water supplied to this town was very variable in character, sometimes excellent, at others showing undoubted signs of contamination, notwithstanding that it was sand-filtered. On examining the works, the author found the whole supply drained from a brook, the water from which was passed through small sand filters and then pumped to a reservoir supplying the town. The houses near the brook were kept under supervision, but upon tracing up the stream it was found to run across a road where it was forded by every vehicle which passed. It also drained meadows in which cows were pastured, and there was no difficulty in finding places in which the cows stood in the water and defecated and micturated as nature demanded. To obtain another source of supply was impracticable, and the directors, on learning the facts, were ready to acknowledge that some system of purification was absolutely necessary. Having speedily made up their minds, a chlorination system was adopted, the sand-filtered water being passed through a "De Chlor" apparatus. The arrangement has been installed over six months, and the water is examined twice and sometimes three times a month, and invariably with satisfactory results. Whereas previously the water often contained hundreds of bacteria per c.c., and the bacillus coli in 1 to 5 c.c., it now contains on an average about 4 bacteria per c.c., and no bacillus coli has ever been found in 100 c.c.

CASE 8.—INTERMITTENT POLLUTION OF ANOTHER TOWN SUPPLY.

This town derives water from a river, which, after sand filtration, is supplied to the town. Upon occasions the water had been unsatisfactory, and when an outbreak of typhoid fever of some magnitude occurred in a small town about 10 miles above which discharged all its sewage in an absolutely crude state into the river, the condition became so alarming that the Local Government Board called upon the water authority to take immediate steps to improve the condition of the supply. The author was able to so improve the filtering arrangements that within a period of two days the authority was supplying a perfectly safe water. One of the small sand filters was emptied of its content and made into a chlorinating chamber and an adjoining tank was filled with layers of sand and charcoal. A smaller tank was used for making the solution of chlorine and a man superintended the flow, dosing the filtered water with 1 part of chlorine per 1,000,000. The treated water takes about half an hour to traverse the chlorinating tank, and then passes through the sand and charcoal filters direct into the mains. The water has been absolutely free from the bacillus coli since the chlorination commenced, and the town has not had a single case of typhoid fever. Why in the twentieth century a town should be permitted to cast its raw sewage into a river which, a few miles below, supplies many thousands of people with water passes the author's comprehension. The fact that it is possible is a disgrace to our boasted civilisation.

CASE 9.—CONTAMINATION OF A LARGE PUBLIC SUPPLY DERIVED FROM DEEP WELLS.

The water from this supply acquired a peculiar and very faint odour which was especially observable when a large quantity was drawn to fill a bath, and complaints began to be received. The water was examined and, comparing it with waters from similar wells in the locality, it was found that it differed from them in containing more free ammonia and sulphates and in absorbing more iodine. Upon going down the well to investigate, a smell of coal gas was noted and as there was a gas-works about 100 yds. away, some connection between these works and the well was suggested. A sample of water obtained from a large gasholder was found to contain not only a quantity of free ammonia, but also millions of bacteria per c.c., one of which proved to be the same as one isolated from the well water. There was no doubt about the connection, and the gasholder was thrown out of use; on the tank being examined, it was found to leak badly. After the use of the gasholder had been abandoned the ammonia gradually disappeared from the well water, the sulphates decreased, and the water became practically normal.

CASE 10.—ALLEGED POLLUTION OF A WATER SUPPLY FROM THE HASTINGS SANDS.

Quite recently the author was called upon to examine a public water supply on account of the bacillus coli being found in the water taken from the mains. The inhabitants of the district had been

advised to boil the water before using, though the local officials declared that they could not see how the water could become polluted. The well is shallow, and situated in the centre of a level area of uncultivated land, of which about 12 acres are fenced off for protective purposes. There is only about one house in the area fenced, that occupied by the waterworks engine driver, where the closet is provided with a pan, and all excremental matter is mixed with combustible material and burnt in the furnace. The soil around is very light sand, and it was noted that rabbits abounded and burrowed near the well. Pollution from any dangerous source is impossible, and the author, having concluded that the occasional bacillus coli come from the excrement of these small animals, has advised that steps be taken to keep them at a respectful distance.

CASE II.—POLLUTION OF A SPRING SUPPLY.

In this case the water supplies a population of about 5,000, and is derived from a spring in superficial gravel. The surroundings are unfavourable, there being quite a large population on the gravel above the spring. Notwithstanding this, the water is always absolutely bright and of excellent quality chemically. It is also most satisfactory bacteriologically save after a heavy rainfall. Within twenty-four hours of such a rainfall the B. coli could be found in the water, but in a very short time the water was found to regain its purity. The source of the contamination took many months to discover. Fluorescin tests made at a number of trial holes above the spring all gave negative results, and many had been put down when it showed that the water came from below a bed of clay intercalated in the bed of gravel, and that this bed [illegible] in the adjoining field on the side from which the water flowed, the water was not affected until the lip of the bed of clay was pierced. When the fluorescin got into the gravel below the clay the water entering the reservoir was coloured within twenty-four hours, and remained so for two or three days. Fortunately [illegible] otherwise it would have been impossible to make such [illegible] trol of this field was obtained, and a careful watch has been kept upon the water since. Heavy rainfalls still increase the number of bacteria, but the bacillus [illegible] not an ideal source from which to obtain a public [illegible] ing and guarding if they must continue to be used.

CASE 12.—ALLEGED POLLUTION OF RESERVOIR WATER.

As many of you are doubtless aware, the presence of nitrites in potable waters causes such a water to be regarded with suspicion, and on occasions has led analysts to condemn a water as being sewage polluted. The author has known more than one undoubtedly good water condemned for this reason. There is, however, a possibility of water being said to be contaminated on the ground of its containing nitrites when it is absolutely free from nitrites, the reaction causing the mistake being due to something entirely different and of no significance.

Recently the water supplied by a large public company was adversely reported upon by a chemist, owing to the alleged presence of nitrites. The company's analyst found no nitrites in the water, and I was called in to investigate. The springs and reservoirs were examined, and a large number of samples taken. Employing one test the nitrite reaction was obtained with all, but it was particularly marked in [illegible] the reservoirs, and which was covered with an active confervoid growth. When these waters were filtered, only the pool water gave the reaction, and when confirmatory tests were applied it was found that the pool water alone contained nitrites. Evidently they were being formed by the reducing action of the confervoid growth on the nitrates present. A further investigation showed that the reaction first obtained (with acid and potassium iodide) was due to a trace [illegible] and that a little [illegible] part of manganous [illegible] is sufficient to give the [illegible] in a few minutes. The [illegible] grain of manganese made it 900 gallons of water. Upon testing the water residues, all were found to contain more than this quantity. This [illegible] nitrites [illegible] mistaken for nitrites. The water was of the highest degree of purity.

I obtained a little of the confervoid growth and put it in some of the company's water and exposed it to bright sunlight, but no nitrites were found. I then added a little of Warrington's solution (solution of ammonium phosphate, &c.), and again exposed it to the sunlight. In a few hours nitrites were easily detected. There can be no doubt, therefore, that nitrites may occur in stored waters which are not sewage polluted.

It should be remembered also that nitrites are given off in smoke from burning fuel, and that traces are found in the products of the combustion of gas and in tobacco smoke. Distilled water in laboratories often contains traces of nitrites due to these causes, and I have known traces found in reservoir water attributed to the smoke from the pumping station, but I was unable to confirm this.

The author sincerely hopes that these notes may not only prove of interest, but also be useful. The mere analysis of a water is without interest unless the results can be correctly interpreted, and by studying examples of this kind we gain experience which enables us to interpret other results more or less correctly.

TESTING ELECTRICAL CONDUCTIVITY OF WATER AS A GAUGE OF PURITY.

It will no doubt have been noticed that most of the cases of contamination noted above were discovered by the results of one analysis differing from those of previous analyses, thus showing that some change had occurred in the water. In some instances it is possible to obtain indications of such a change without resorting to either a chemical or bacteriological examination, and at the conclusion of the meeting the author will demonstrate to the members present a method of determining the electrical conductivity of a water. This process is especially delicate with certain waters of low conductivity, a very slight change in character affecting the reading on the index of the machine when a current of electricity is being passed through the water.

SOFTENING BY "PERMUTIT."

The author will also exhibit a sample of artificial zeolite, called "Permutit," and will demonstrate its remarkable property of softening water by merely passing a hard water through it. This action is Nature's way of softening water. The Thanet sand under London and the adjacent counties possesses the same properties, hence the chalk water from Hertfordshire, for example, which is very hard, filters through the Thanet sand, and where pumped up in London is found to have become very soft and to contain [illegible] of soda instead of carbonate of lime. This system of softening is being installed by a large water company, and the author has recently had to go into the medical aspect of the question and give an opinion as to the effect of such a softened water upon health. Sooner or later, therefore, this subject will become of interest to waterworks engineers, hence my desire to make you practically acquainted with it.

ADVANCES IN THE SCIENCE OF WATER PURIFICATION.

The paper read by Dr. Adolph Kemna draws attention to the fact that although underground waters have been preferred to surface waters they are not always abundant, chemically pure, or fit for drinking purposes, and that there are many examples of springs which have become dangerous owing to contamination, and have caused epidemics of typhoid fever. A comparison between the health statistics of spring supplied and surface supplied towns in France showed that those towns which derived their supply from surface sources were the healthiest, with a result that in that country there has been a change of opinion as to the superiority of underground waters. In Germany, on the other hand, the belief in the greater purity of underground waters has been so strong that considerable trouble has been caused. For instance, Breslau, the capital of Silesia, which formerly used filtered water drawn from the river Oder, abandoned the supply and sank 300 wells in a district where there was believed to be an inexhaustible underground supply. Only two-thirds of the quantity expected was obtained and considerable trouble has been experienced.

Dr. Kemna is of the opinion that ordinary filtration is a sufficient safeguard against water-borne disease

the best proof being the health statistics of millions of human beings during the last three-quarters of a century. The author points out that, although ozone sterilisation has been adopted on the Continent, the English-speaking countries, which include more than half the civilised world, do not seem at all inclined to adopt the method. He points out that the ozone people at St. Petersburg felt so sure of being able to destroy the coli that they agreed to pay a fine of 1,000 roubles for each detection, with a result that in June last they had to pay 26,000 roubles. On the other hand, the author is greatly in favour of chlorine sterilisation, its efficiency having been demonstrated by the fact of its having stopped epidemics of typhoid. In one case, exactly ten days after starting the application of the chloride, an epidemic was suddenly stopped, the number of new cases falling abruptly to zero, and the author observes that in experimenting thus with a population of 300,000 persons the effect of any individual peculiarities, which might have obscured the results in the case of a small population, would be lost by being blended with a mass of normal cases.

Within a period of five years the use of this system has spread all over America, and its efficiency is no longer questioned. No trouble has been experienced in the matter of taste. The taste, if any, only exists just after the introduction of the reagent, and rapidly disappears. The author further states that there is not the slightest doubt that the chloride of lime process constitutes the greatest advance made in water purification during recent years, that the proofs of its hygienical efficiency are overwhelming.

The advantages of coagulation by means of sulphate of alumina are also dealt with at some length, especially in connection with the mechanical filter. The treatment is described as cheap and easily applied without being open to any reasonable objection whatever.

The method of maintaining the quantity of underground water in low-lying areas by means of irrigation on the surface is referred to. The method was adopted at Breslau, in order to increase the yield of the wells, but owing to the gradual choking up of the irrigation channels, the supply soon failed. Further, it appears that the quality of the water was adversely affected by the presence of iron and manganese sulphate. It is essential that the subsoil in such a case should be of a nature to facilitate the percolation of the water. Very fine sand is an obstacle to circulation, as has been often proved in the case of deep wells sunk into sand containing an abundance of water which is held back by capillarity due to the fineness of the sand.

Although Dr. Kemna considers that treatment by means of ultra-violet rays is suitable for waters such as those coming from chalk springs, he thinks that the process is not yet out of the experimental stage. Dr. Houston's proposal to use lime as a sterilising agent is also referred to, and the author states, in conclusion, that it is rather by the improvement of existing methods than by the introduction of new processes that the science of water purification should be advanced.

(To be continued.)

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

Deptford Municipal Dispensary.—The first municipal dispensary in London for the treatment of consumption was opened at Deptford on Monday. This institution, "Hilary House," in Amersham-vale, is situated practically in the centre of the borough. The freehold of the house and land have been presented to Deptford as a permanent memorial of his year of office as mayor by Mr. E. Mumford Preston, who has also fitted up the institution in the most modern and hygienic manner. It contains eight rooms, furnished as doctors', nurses', waiting and dressing rooms: there are also a laboratory and a dispensary. The institution will be maintained out of municipal funds.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister at Law, A.M.I.C.E., &c. London: St. Bride's Press, Ltd. Price 10s. 6d.

SOCIETY OF ENGINEERS.

ANNUAL GENERAL MEETING.

The third annual general meeting of the Society of Engineers (Incorporated) was held at the society's offices, 17 Victoria-street, Westminster, on Monday, the 9th inst., at 5.30 p.m., Mr. John Kennedy, president, being in the chair.

The report of the scrutineers of the postal ballot for the election of council and officers for 1912 showed that the following had been duly elected: President, Arthur Valon; vice-presidents, H. C. H. Shenton, Norman Scorgie, T. E. Bower; members of council, Henry Adams, C. T. Walrond, Percy Griffith, H. C. Adams, J. R. Bell, S. Cowper-Coles, H. P. Maybury, B. H. M. Hewett, F. H. Hummel, G. A. Becks; associate member of council, R J. Simpson; hon. secretary and treasurer, D. B. Butler.

It was announced that premiums for papers read at meetings and published in the *Journal* during 1912 had been awarded as follows:—

The President's Gold Medal to Mr. W. P. Durtnall, for his paper on "The Generation and Electrical Transmission of Power for Marine Transportation."

The Bessemer Premium, value £5 5s., to Prof Herbert Chatley, for his paper on "Resistance to Rolling."

The Clarke Premium, value £5 5s., to Mr. Gerald O. Case, for his paper on "Ligno-Concrete."

The Bernays Premium, value £2 2s., to Mr. J. P. Harris, for his paper on "The Construction of a London County Council Low Level Sewer from Battersea to Deptford."

A Society's Premium, value £2 2s., to Mr. P. J. Waldram, for his paper entitled "Test Deflections in Reinforced Concrete."

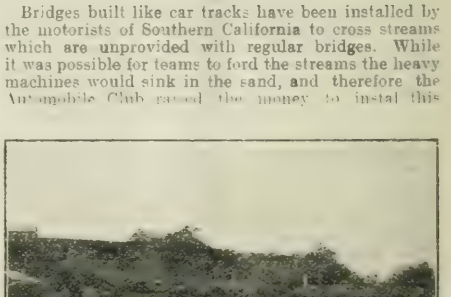
A resolution was passed thanking the other gentlemen who had presented papers during the year, some of whom, being members of the council, were not eligible to receive premiums.

Messrs. W. B. Keen & Co. were appointed as auditors to the society for the ensuing twelve months.

Votes of thanks were passed to the retiring council and officers, and to the scrutineers of the ballot papers for the election of council for their services.

SPECIAL BRIDGES FOR MOTOR VEHICLES.

Bridges built like car tracks have been installed by the motorists of Southern California to cross streams which are unprovided with regular bridges. While it was possible for teams to ford the streams the heavy machines would sink in the sand, and therefore the Automobile Club raised the money to instal this



Bridge for Motor Vehicles

unique type of bridge. As there is no roadway between the channels in which the wheels run, no horse-drawn vehicle can make use of the bridges; and this is just, inasmuch as the motorists paid the entire cost. The construction is light and inexpensive.—*Scientific American.*

THE CHRISTMAS HOLIDAYS.

Owing to the necessity for going to press earlier than usual, news and advertisement matter intended for insertion in the Christmas-week issue of "The Surveyor" must reach us not later than Tuesday morning, December 24th.

Tanks.*

By ARTHUR J. MARTIN, M.INST.C.E., F.G.S., F.R.SAN.I., M.CONS.E.

It is scarcely possible nowadays to speak on tanks without exposing oneself to the criticism which was pronounced on a well-known book. "It contains," said the reviewer, "a great deal that is new, and a great deal that is true. But the things that are true are not new; and the things that are new are not true." . . . What do we understand by a "tank," and what do we use it for? I propose to employ the word "tank" in its broadest sense, to indicate a receptacle through which sewage is passed for the purpose of preparing it for further treatment, whether by filtration, irrigation, dilution, or otherwise, such preparation consisting essentially in the removal of suspended, and in some cases of colloidal, matter, with or without the breaking down of the more complex organic substances in solution. This definition, it will be noted, covers coarse contact beds and slate beds, as well as the innumerable receptacles to which the term "tank" is more commonly applied. I lay stress on this primary function of a tank—namely, that of preparing sewage for further treatment, because it is so often lost sight of, attention being concentrated instead on other and less important sides of its work, more particularly the digestion of the sludge. Thus we hear of septic tanks which have been deliberately allowed to sludge up in an attempt to obtain a maximum amount of digestion, with the result of sending on to the filters an effluent heavily charged with suspended solids. In a case of the kind which came under my own notice some years ago, I called attention to what was going on, and urged that the tanks should be cleared out before the filters were ruined. Nothing, however, was done, and the works were allowed to drift, with the results which might have been expected.

An occurrence of this kind is often referred to as "a failure of the septic tank." It would be fairer to call it "a failure of the sewage works manager." I have heard it gravely argued that it is not fair to blame a manager who sits still and allows his tanks to sludge up. I am sure that members of this association take a higher view of their responsibilities, and will not condone the conduct of a man who shuts his eyes to what is going on in his works, or neglects to take timely precautions to safeguard their efficiency. Occurrences of this kind furnish a strong argument for the existence of such an association as this.

The engineer who is charged with the design of a sewage works has a bewildering variety of tanks to choose from—sedimentation and precipitation tanks (quiescent or continuous), septic tanks, Dortmund tanks, hydrolytic tanks, Emscher tanks, and, more recently, the Fieldhouse tank.

I am sorry that Mr. Dibdin will not allow me to add slate beds to the list, for no one who heard Mr. Tyndale's thoughtful speech to the Society of Chemical Industry last week can fail to recognise in the slate bed a sedimentation tank of a peculiarly attractive type. The distinctive features of the slate bed, viz., the reduction of the downward travel of the depositing solids from 6 ft. to 2 in., and the large increase in the area of the surface exposed to air, while undoubtedly important, involve no essential departure from the ordinary sedimentation tank, and the subjection of the sludge to biological action is not a novelty.

It would be superfluous in such a gathering as this to describe the various tanks which I have enumerated, so I will confine myself to a consideration of a few of the vexed questions in connection with the tank treatment of sewage.

The Hampton doctrine was very fully discussed at our last annual meeting, so I will not now reopen the controversy to which it has given rise.

It is interesting to note the successive views which have prevailed with regard to the utility of a preliminary anaërobic treatment. The scientific witnesses who testified before the Royal Commission on Sewage Disposal at its earlier sittings were on the whole strongly in favour of anaërobic treatment. In their fifth report, however, the commissioners take the opposite view, and characterise as unfounded the opinion that septic sewage is more amenable to filtration than fresh sewage. In this they are supported by Dr. Dunbar, of Hamburg, and many other authorities. The older belief in the value of anaërobic treatment finds strong support in two of the latest and most important papers on sewage disposal, the one by Dr. Fowler, read at this year's International Congress on Hygiene and Demography at Washington, and the other a most interesting description of the Birmingham sewage works by your president. Mr. Watson's experience of the extreme difficulty of filtering a merely sedimented sewage in cold weather, and the clogging of the bacteria beds receiving such sewage, is especially interesting, while his observations as to the risk of over-septicisation and consequent nuisance in warm weather bear out the experience of many sewage works managers. The practical conclusion at which he arrives is that the beds should be fed with septic sewage in the winter and non-septic sewage in the summer.

An important section of Dr. Fowler's paper is that dealing with the Emscher tank, which he finds very efficient for the rapid separation of the solid and liquid portions of the sewage, and free from offensive odours. He points out, however, certain difficulties inherent in the working of this tank, one of these (which is also referred to by Mr. Watson) being the absence of any considerable smoothing effect on the composition of the sewage, and another its failure to break down the organic matter in solution—in other words, the absence of septic action.

Dr. Fowler accounts for the conflict between the advocates of aërobic and anaërobic methods by pointing out that sewage which has travelled long distances in the sewers has generally undergone during its progress changes which render further anaërobic treatment superfluous, while a strong, fresh sewage, not having undergone these changes, requires anaërobic treatment at the outfall. In dealing with such sewage at Calcutta, Dr. Fowler and Mr. Clemesha found it desirable to keep the sewage in the septic tank for no less a period than three days.

The old controversy as to the relative merits of open and covered septic tanks has now died away, and Mr. Cameron's observation that either would give good results is now generally accepted.

As regards the amount of sludge which can be digested, it is remarkable, bearing in mind the wide variation which there is in the composition of different sewages, that Mr. Cameron's early experience at Exeter should have been so closely borne out by the findings of the Royal Commission. Mr. Cameron, in his evidence before the commission, accounted for the suspended solids in the St. Leonards sewage as follows:—

	Grains per gall.	Percentage of total.
Suspended particles in tank effluent ...	10·8	44.1
Residuum and scum in tank	4·5	18·4
Loss by treatment ...	9·2	37·5
Total	24·5	100·0

Mr. Cameron's digestion figure of 37·5 per cent may be compared with the following typical cases cited by the Royal Commission:—

Place.	Authority.	Suspended matter digested or converted into gas.
Huddersfield ...	Mr. Campbell ..	38%
Leeds ...	Mr. Harrison	about 30%
Manchester ..	Dr. Fowler ...	possibly about 25%
Sheffield	Mr. Haworth	32·9%
Birmingham	Messrs. Watson and O'Shaughnessy ...	not more than 16%

Very discordant accounts have been given of the final solid residuum from a septic tank. The impression is general, and it has been sedulously fostered by the advocates of rival processes, that septic sludge is extremely malodorous. On the other hand, a number of well-known authorities, including your president, Dr. Reid (of Staffordshire) and Dr. Calmotte (of Paris), have testified to its inoffensive character. Here, again, the conflict of evidence is explained, if we consider the facts. An imperfectly digested sludge, whether from a septic tank or any other form of tank or bed, is often extremely offensive, but the reverse

* Paper read on the 12th inst. at the Annual General Meeting of the Association of Managers of Sewage Disposal Works.

is the case where digestion has been carried to its utmost limit.

Much value is sometimes claimed for tanks of particular shapes, and so far as the retention of suspended matter is concerned, the form of the tank is doubtless important. But it is also stated that certain tanks are less liable than others to yield an offensive effluent. It is necessary to distinguish between effects which are due to the form of the tank, and those which merely arise from differences in the tank capacity. Given two tanks of equal capacity through which sewage passes in the same time, it is not easy to see how any difference in the form of the tank can so profoundly modify the conditions therein as materially to affect the changes undergone by the sewage, and if it is desired to avoid a septic condition of the effluent, it would seem to be more important to reduce the size of the tank than to change its form.

A somewhat extensive experience of the varying conditions met with in practice has led me to the conclusion that no one type of tank is the best in all cases. The situation of the works, and questions of fall, level, and nature of foundation, are generally far more important than the abstract merits of particular tanks. Where the fall is ample, quiescent sedimentation or precipitation tanks or slate beds may be used; but where this is not the case the advantages of any given tank will rarely be so great as to justify the cost of pumping the sewage in order to furnish the fall which the tank requires.

Near houses it will generally be advisable to subordinate the question of sludge digestion to that of the avoidance of smell.

Where the top-water level in the tanks is much above that of the ground, a deep circular tank will often be the most economical.

My own experience inclines me to the belief that in ordinary cases the best results may be obtained by carrying on the preliminary treatment in successive stages, corresponding to the different conditions in which the solid matter exists in the sewage. The works would then comprise:—

(1) Detritus chambers, for the interception of actual grit.

(2) Chambers for the reception of large and heavy sewage solids.

(3) Septic or sedimentation tanks.

(4) Means for the interception of colloidal matter, and the fine suspended matter which comes away from the tanks.

In small works, unless the sewage has to be pumped, or contains an exceptional amount of large or intractable solids, screening is of doubtful utility, and the chokage of the screens may easily give rise to serious trouble.

(1) Of the detritus chambers it is only necessary to say that they should be shallow, and that the minimum capacity recommended by the Royal Commission—viz., one-fiftieth part of the day's dry-weather flow—is more than ample in ordinary cases.

(2) For the interception of the larger sewage solids I prefer to use two superposed chambers, the upper one having a sloping floor, with an opening at the far end through which the deposited solids are drawn into the lower chamber by a circulation induced by the flow of sewage.

(3) The choice between sedimentation tanks and septic tanks will depend mainly upon the condition in which the sewage reaches the works, the facility for disposing of sludge, and the extent to which it is necessary to guard against smell. At the same time it should be borne in mind that, if the effluent is not unduly expected or sprinkled about, septic tanks may generally be operated without nuisance.

I cannot help thinking that the very general adoption of rectangular tanks is due rather to habit and the engineer's innate love of a right-angle than to any more substantial reason. In tanks in which the sewage is brought to complete rest the question of form is of minor importance, but where the sewage is allowed to pass through the tank continuously, with the object of depositing its solids, it is hard to justify the abrupt transition from the restricted area of the inlet pipe or pipes to the full cross-sectional area of the tank. Such an arrangement is bound to result in eddy currents which tend to destroy the velocity of the sewage for some distance from the inlet.

The detritus chambers in these circular tanks are fitted with scrapers to clear the sludge to the centre and discharge it through the outlet pipe, and where economy of space is of importance and where the sludge is to be dealt with frequently, the cost of such scrapers is not a serious matter.

There is no advantage, however, in allowing the tanks to occupy the whole area of a circle, and the same result may be obtained by making them wedge-shaped on plan, with an inlet at the pointed end and a weir outlet at the wide end.

(4) There are many works, in other respects well designed, in which no opportunity whatever is afforded for the settlement of the suspended matter in the tank effluent; in fact, had it been desired to send a maximum amount of suspended matter on to the filters, the works could not have been better arranged for the purpose. The natural result is to sludge up the filter, and the unfortunate tank has to bear the blame.

I have always made a point of putting in one or more small chambers for the deposition of the suspended matter which comes away from a tank with the effluent, and latterly I have provided also for arresting as much as possible of the colloidal matter. This two-fold purpose is served by what, for want of a better name, I have called a "cellular upward filter," consisting of a chamber, usually from 6 ft. to 8 ft. deep, fitted with octagonal pipes of ordinary brick earth, 2 in. in internal diameter, set on end. The tank effluent flows in an upward direction through these pipes, at a velocity so slow that the liquid is practically at rest. This gives the best facilities for the deposition of suspended particles, while the ample surface presented by the pipes, generally from ½ to 1 square foot per gallon of daily dry-weather flow, forms a base for the attachment of the colloidal matter which would otherwise settle out in the filter proper. The pipes can readily be flushed out, or rodded from the top. Where a dosing chamber is required, the upper part of the cellular filter can be used for the purpose, for which it has the advantage that any suspended matter which may be deposited from the effluent drops at once down the pipes out of the way. A number of these upward filters are now in course of construction, and the one which is already in use appears to serve its purpose. Where the liquid part of the sewage does not require septic treatment the combination of a small tank or tanks with one or more upward filters, or their equivalent, appears to offer advantages.

One frequently notices a tendency to restrict the number of tank units to the minimum recommended by the Royal Commission. In small installations the limitation of the number of units may perhaps be justified on the score of expense, but in larger works the cost of a few extra dividing walls and inlet and outlet valves is not a serious matter, and is far outweighed by the convenience of being able to cut out a small fraction of the tank capacity, instead of having to lose one-half of it, as must be done when only two tanks are provided.

It is impossible in so short a time to attempt to deal adequately with so large a subject. There are many interesting points in connection with tanks on which I have been unable to touch. In particular I have said nothing about the chemical treatment of sewage. This omission, however, is the less important seeing that Dr. Fowler, in his Washington paper already referred to, has indicated the conditions under which precipitation may be usefully employed.

Having dwelt so long on tanks, I can only deal briefly with the "other matters" referred to in the title of my paper as announced. On these I have only one observation to make—and I am sure it will fill you with the liveliest satisfaction—it is that I will defer what I have to say to some future occasion.

DISCUSSION OF MR. MARTIN'S PAPER.

Dr. Bostock Hill, county medical officer of health, Warwickshire, president, occupied the chair at the annual meeting of the Association of Managers of Sewage Disposal Works at which the foregoing paper was presented. The discussion on the contribution was opened by

Mr. T. Hennie Hampson, who said he agreed with practically everything which the author had said with regard to the use of tanks. At one time the treatment of sewage by septic tanks was considered to be very offensive. At the present time, however, there was a good deal to be said for treatment by septic action, because the sludge could be removed without nuisance and disposed of quite easily and cheaply.

Mr. J. Fairhouse (Walthamstow) stated that, from his observations of the working of septic tanks, the shape of the tanks was of considerable importance.

Mr. W. H. Makepeace (Stoke-on-Trent) said his experience was that the rectangular tank provided

with proper inlets and outlets, served its purpose better than any other form, chiefly for the reason that if the inlet of the tank were spread over the whole width of it, and the volume from the tank was withdrawn in a similar way, the velocity was easily controlled. With square tanks he had found that they got a very bad settlement of the sewage, entirely due to the arrangement of the inlet and outlet. The conical shape circular tank gave better results than the flat bottom circular tank, and he attributed that to the extra depth and the velocity with which the sewage was discharged. He was confident that some improvement was both necessary and possible of attainment, and his own impression was that improvement would come on the lines of the Emscher tank, to which allusion had been made in the paper.

Dr. GEORGE REID said he was unable to agree with the suggestion of Dr. Fowler—quoted in the paper—that it was desirable to have a septic action in dissolving organic matters prior to final treatment. It was possible to deal with an absolutely fresh sewage if the suspended solids were taken out of it, and by filtering to get nitrification as quickly as if the dissolved solids had been in a tank and undergone a certain amount of septic action.

Mr. W. H. DUCKWORTH (Salford) said he had always had a fear of anything in the way of upward filtration, and he would be glad if Mr. Martin could give any figures showing any reduction in suspended matter between his tank effluent and his filter effluent. They had at Salford some 2,000 yds. of roughing filters between the tank effluent and the ordinary aërating filters, and they obtained a tank effluent with 2·5 more of suspended matter per gallon after everything had gone through the filters. They found a total reduction in the solids, but the suspended matters were more.

Mr. C. TERRY (Canterbury) submitted that the value of septic tanks had been entirely disproved, and the proof of that lay in their total failure. Sewage should be dealt with without delay.

The PRESIDENT said he had long come to the opinion that the tendency of the majority of sewage works was to over-septicise. He strongly believed that, while under certain conditions septic action was valuable, one thing they wanted to do before they put sewage on their filters was to remove the suspended matters.

Mr. MARTIN, in the course of a brief reply, observed that if, after twenty years of biological treatment, they had not arrived at more definite views on such a matter, it showed that there was something wrong in their way of handling the question. One of the other matters which he should like to have dealt with was the need for definite scientific research work in regard to the treatment of sewage, his view being that they were spending far too much money in the absence of definite scientific fact.

STONEWARE PIPES WANTED.

AN IMPORTANT CONTRACT.

Mr. J. W. Madeley, M.A., M.INST.C.E., M.AM.SOC.C.E., special engineer to the Corporation of Madras, as will be seen in our advertisement columns, inviting tenders for the supply of about £50,000 worth of English stoneware pipes and specials, the second instalment required for the Madras main drainage scheme. Tenders must be delivered to the agents of the corporation, Messrs. James Mansergh & Sons, 5 Victoria-street, London, S.W., on or before noon of Wednesday, January 22, 1913. The total estimated cost of the drainage scheme is, it may be noted, about £800,000.

The Use of Waterways.—Mr. Neville Chamberlain presided at a meeting recently at Birmingham of the Waterways Association. Representatives were present from Hull, Nottingham, Derby, Stoke, Wolverhampton and Gloucester. The Secretary, Mr. Frank Impey, reported that he had not received any definite reply from the President of the Board of Trade since the deputation waited upon him in July, and a subcommittee was appointed to confer with various members of Parliament with the view of forming a non-political party in the House of Commons pledged to bring pressure on the Government to give effect by legislation to the recommendations of the Royal Commission.

WIMBLEDON COMMON EXTENSION.

PROPOSED LOAN OF £10,000.

A Local Government Board inquiry was held at Wimbledon on Tuesday by Mr. Edgar Dudley, F.S.I., one of the board's inspectors, with regard to an application for sanction to a loan of £10,000 for the extension of Wimbledon Common.

The great beauty of the common, which already has an area of over 1,000 acres, lies in the fact that, owing to the large expanse of woodland scenery comprised by Coombe Woods and Richmond Park, houses, over a considerable part of the area, form no part of the general view. Ground on the west of Beverley Brook, extending over some 2 miles, came into the market on the death of the Duke of Cambridge, and it occurred to Mr. Richardson Evans, the promoter of the scheme, and Dr. Longstaff, a member of the London County Council, who has been most active in securing additions to existing open spaces of the Metropolis, that the valley of the Beverley Brook should be secured so as to prevent it being built over and the view from the common destroyed. These gentlemen, with the aid of the John Evelyn Club, Wimbledon, having secured options for the purchase of the ground, set to work to collect funds for the object named, and they have been so far successful that 13 acres fronting the Portsmouth-road, opposite the entrance to Richmond Park, and having a length of ¾ mile along the Beverley Brook, have been secured, together with the remainder of the west bank of the brook to Coombe-lane, a total distance of 2 miles. The latter piece of ground has been vested in the Coombes and Malden Urban District Council, who subscribed £3,500.

The loan of £10,000 is required for the specific object of purchasing a section comprising 33 acres, the promoters being under promise that if this is acquired by Wimbledon they will purchase a further section of 39 acres. The promoters are confident that if the £10,000 asked is subscribed by Wimbledon, they will be able to obtain, principally from other local authorities, sufficient funds to secure a third section, having an area of 69 acres—*i.e.*, a total area to be added to the open spaces of Wimbledon Common of 154 acres, at a cost of £52,770, or, roughly, £340 an acre—which is considered very moderate, in view of the price that has been paid for land in the immediate neighbourhood.

The scheme was opposed by several members of the Wimbledon Council, but there were few opponents from the outside public. The great point of the opposition was that Wimbledon has, in addition to 600 acres of common within the borough, an area of 57½ acres of recreation grounds. The fact that Wimbledon has not lost by having these open spaces is shown by the financial state of the borough—during the past four years the general district rate having been maintained at an average of 3s. 4½d. in the £. The policy adopted, especially in Germany, of the acquisition by municipal authorities of large areas of open ground surrounding their towns is no doubt a sound one, and Wimbledon may fairly claim to have adopted such a policy.

It may be stated that the main arterial road, 100 ft. in width, suggested by the Traffic Board of the Board of Trade, will pass the entire length of the extension of Wimbledon Common.

Bridging the Mersey.—Before the Liverpool Engineering Society, on Wednesday, Mr. L. H. Chase, M.INST.C.E., read a paper on the subject of a bridge over the river Mersey, in the course of which he made several unusual proposals. The principle underlying the treatment of the approaches was distinctly novel. Instead of making these extend over a distance of 1 mile from each side of the river, Mr. Chase proposed a spiral roadway up which motors and trams would run by their own power to the level of the bridge, some 200 ft. above the high-water level of the river Mersey, and thus clear of such vessels as the "Mauretania." The spiral roadway was to be built in reinforced concrete, and would look not unlike the Roman Colosseum. The bridge would be of the suspension type, and its span of 2,700 ft. would make it easily the largest span in the world. The main towers would be placed near the Prince's Landing Stage on the Cheshire side, and would be 500 ft. high. The total cost, exclusive of land and legal expenses, was estimated at about £825,000. Mr. Chase (says the *Times*) also mentioned a new design for dealing with passenger traffic only on a similar bridge.

A Motor Vacuum Street Sweeper.

DEMONSTRATIONS AT SOUTHPORT.

The attention of municipal and other local governing authorities was, during Wednesday, Thursday and Friday of last week, directed to Southport, in which town were given the first public demonstrations in the United Kingdom of a machine which, it is claimed, will revolutionise the scavenging of streets and roads. The invention is the "Patent Motor Vacuum Road-cleaning Machine" (sweeper and gatherer), of which Messrs. J. & P. Hill, Ordnance Works, Sheffield, whose London office is Caxton House, Westminster, S.W., hold the exclusive patent rights. Representatives from some seventy authorities visited Southport to test the claims of the newcomer, among the municipalities which sent representatives being London, Manchester, Glasgow, Bristol, Derby, Oldham, Bolton and Blackburn.

From interviews with and speeches made by the engineers and representatives of sanitary authorities attending the working trials, there seemed to be a consensus of opinion that the machine had justified the claims made, and that a new era for street cleansing had been inaugurated. It is well known that one of the chief complaints of sanitary authorities has been directed to our past methods of sweeping streets as tending to the spread of disease through the dissominating of the germ-laden dust; the new vacuum cleaner allows no particle of dirt or dust to escape into the air. During the three days of the trials the streets and roads over which it worked were damp, and the "no escape of dust" claim could not be conclusively tested, but one could readily believe from the way it swept up fine sand and automatically deposited it in the bins attached to the machine that it would satisfactorily answer all tests in the driest of weather.

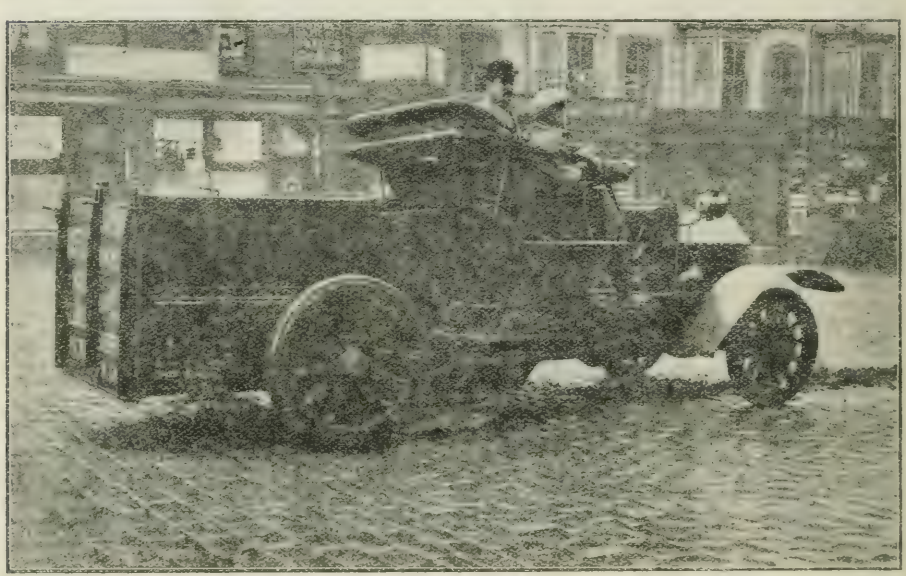
The first run was made over a wood-pavement road strewn with cinders and small stones. The machine picked up everything, including the small particles of slush, leaving a track thoroughly clean. Next a run was made over a road laid with sand, gravel, clay and stones, the latter as large as half-bricks, and all this was gathered up by the machine when travelling at a rate of about 5 miles an hour, and deposited in the steel bins, a speed of about 8 miles an hour being occasionally attained.

A run was also made over setts, where the results were equally satisfactory, the vacuum cleaner sweeping up the dirt, and even confetti, which lay adhesively in the crevices of the damp road.

On Friday a special test was made over a water-bound macadam road and over asphalt. Here also the working was considered eminently successful, sticky and greasy mud being swept up with almost amazing completeness.

The adoption of this sweeper would appear to render possible the solution of one of the most difficult problems which has so long confronted road authorities in large towns, for it would seem that the desired end can be achieved by the machine, no matter how crowded the streets are with vehicular traffic.

This new motor vacuum sweeper consists of the following three main components: (1) A complete 20-30 h.p. four-cylinder motor chassis; (2) a cylindrical sweeping roller and shell fitted to the chassis; and (3) a large receiver, fitted behind the sweeping cylinder, for collecting the sweepings.



From Photo by W. Rose, Ainsdale.

Messrs. J. & P. Hill's Patent Motor Vacuum Road Cleansing Machine.

(This view shows the machine at the Southport trials sweeping up very heavy materials laid on the road specially to test its power of lifting.)

The sweeping mechanism consists of a cylindrical brush, composed of a series of small brushes, which revolve in an airtight sheet-iron shell in the opposite direction from the wheels of the car. Running at a speed of 120 revolutions per minute, it raises the sweepings two-thirds of a revolution and passes them through a specially contrived opening into the receiver behind. This receiver contains two or three separate boxes, which can be easily and quickly emptied into a dustproof vehicle trailing behind.

The circumferential speed of the great brush is 4,950 ft. per minute, sufficient to throw the refuse into the receiver and compress it well. The speed at which the brush rotates creates sufficient draught to collect by suction all dust and to deposit it in the receiver. It may be mentioned that the machine, at each run sweeps a track of 5 ft., and, by means of a side-attached spiral brush, the refuse can be thrown from the channels in front of the great brush, and sucked up in the same way. Similarly, the mechanism can be applied to a tramcar for sweeping a snow-covered track.

THE COST OF SWEEPING COMPARED.

In the course of last week's proceedings it was stated by Alderman Trounson that the average cost of the patent vacuum cleaner per 100,000 sq. ft. was 7s. 8d., and that the average cost of a horse sweeper was 13s. 10d. for 33,000 sq. ft. Thus the increase in the area cleansed was 66 per cent, while the decrease in the cost of cleansing was 30 per cent. A London engineer who was among the company present said the size of the machine seemed to show that the petrol consumption would not be great, and another speaker pointed out that its use would obviate the necessity for Sunday labour by enabling the sweeping of streets to be done quickly on a Saturday night. A Scottish visitor added that he along with others from the North would take back to their corporations a very favourable account of the cleaner, and subsequent speakers eulogised the valuable hygienic properties of the machine, remarking particularly on its labour-saving possibilities.

It may be added that the machine, which is the invention of an Italian engineer, will shortly be seen in London. Messrs. Hill will turn out an "all-British" machine, with developments and improvements to meet the varying circumstances of different towns.

LIGHT AND POWER FROM LIGNITE.

Mr. R. O. Wynne-Roberts, M.Inst.C.E., has sent in to the Government his report on the question of developing at the lignite coal mines power for distribution in the Canadian province of Saskatchewan. The report will have a special interest and value, as it is the first publication in the English language on the subject of utilising lignite in the direction under consideration, and it has entailed many weeks of labour in collecting data from all parts of the world. We understand it covers over 223 pages.

We notice from the *Regina Evening Leader* of November 26th that a proposal has been submitted to the civic authorities by Mr. G. D. Casson, secretary-treasurer of the Estevan Board of Trade, for the purchase of a lignite coal mine in the vicinity of Estevan. He maintains that by the manufacture of lignite briquettes and the production of gas within the city twelve-thirteenths of the heating power of anthracite could be secured at about one-third the cost, and that the sale and use of the by-products would nearly cover the cost of manufacture, thus enabling the city to supply fuel and power at a very cheap rate. He states that 1 ton of lignite would produce 12,000 cub. ft. of gas and one-third of a ton of lignite briquettes. The resultant by-product would be about 15 lb. of sulphate ammonium, and the same quantity of first-class pitch. The latter, with the addition of wheat screenings or other material, could be used as a binder in the making of the briquettes.

Motor Vacuum Road Cleansing Machine, showing Bins Withdrawn.

Subway under St. Paul's.—The Highways Committee of the London County Council do not see their way to withdraw the tramway scheme involving a subway under St. Paul's Churchyard, but a conference is to be held between the Parliamentary and Highways Committees and the Dean and Chapter of St. Paul's. The Highways Committee state that they are advised that there is no ground for any fears of risk to the fabric of the cathedral.

Cesspool Emptying Plant.—The Poole Rural District Council has just purchased a new machine for the emptying of the cesspools in the parishes under its control. It is worked on the vacuum principle, and comprises a cylindrical tank to hold 350 gallons, mounted on a four-wheeled carriage for horse draught, which also carries an air pump. The air in the cylinder being exhausted by means of the air pump, the contents of the cesspool are forced through suction hose into the tank by atmospheric pressure, with an entire absence of nuisance. It is claimed that this improved plant, which has been made by Messrs. Merryweather & Sons, of London, enables cesspools to be emptied in a perfectly satisfactory manner, and a great consideration also is the economy of working, which is calculated to save 50 to 75 per cent. as compared with old methods.

Road Making in Egypt. Lord Kitchener some time ago ordered a road to be made between Cairo and Alexandria, and now it is announced that he is studying a plan for covering Egypt with a complete series of main roads. These will be undertaken by the Government itself, while the auxiliary ones will be laid by the Provincial Councils.

Explosion at York.—Corporation workmen were engaged in repairing the roadway at the approach to Layerthorpe Bridge, York, on Thursday of last week, when one of the men struck with his pickaxe an electric power cable. There was an immediate explosion, which scattered the party right and left, but fortunately caused no injury to the men. One result of the occurrence, however, was that the machinery at Messrs. Adams-Hydraulics, Limited, whose works are in the immediate vicinity, was brought to a stand-still until the necessary repairs were effected.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

292. Foundations.—Sheet piling is required round the foundations of a warehouse to hold in the soil, which is of a loose, sandy nature. Give neat sketches showing how this would be carried out. (T. R.)

293. Road Making.—State the advantages claimed for the parabolic camber over the circular camber in road construction, and give a sketch with figured dimensions of a camber which produces the best results. (A. S. C., *Hove.*)

294. Traction.—Compare the tractive force required for heavy vehicles over roads of various surfaces and grades, and show how this affects the cost of transport. (H. V. O., *West Bromwich.*)

295. Air Compressors and Ejectors.—Of what horse-power will an electric motor require to be to work an air compressing plant and ejectors to raise 100,000 gallons of sewage a height of 15 ft. in six hours? Show stages of calculations, and state the probable mechanical efficiency of air compressors and ejectors. (D. G. B., *Darlington.*)

296. Tides. Please explain clearly what is meant by "H.W. of ordinary spring tides" and "L.W. of ordinary spring tides." Also state how the height of ordinary spring tides is arrived at, and over what period the observations or calculations are made. In what respect does an ordinary spring tide differ from an equinoctial spring tide? (Perplexed.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

290. Design of Struts.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength. ("Designer.")

If a load P be applied at the end of a strut, the area at the mid point of which is a square inches. As long as the load remains axial, and the strut does not bend, the stress at the mid point will be $\frac{P}{a}$ lb. per square inch, so that the resistance of the strut will be proportional to the compressive strength of the material of which it is constructed.

But if for any reason the strut bends a little, so that the load acts x inches out of centre as regards the mid point, the section at the mid point will be subjected to a bending moment P.x, as well as a thrust P. The same condition could be obtained by means of a horizontal force at the mid point, so that in this case the strut will also be acting as a beam.

As is well known, the resistance of a beam depends not so much on the area of its cross section as on the arrangement of the section so as to give stiffness.

For instance, a solid circular beam is not so economical as an I beam of the same sectional area, because in the latter case the metal is arranged so as to give stiffness rather than purely tensile or compressive strength. Now, the longer the strut the more likely is it to become bent, either from unequal loading or lateral strains, so that it is therefore very important to arrange for stiffness, as well as to keep the compressive stress within proper limits.

As a matter of fact, in a long strut it will be found that if the value of the compressive stress is calculated it is very low indeed, as all the formulas in common use give a very high factor of safety, so as to prevent bending. (H. M. W., *Worcester.*)

In the theory of struts the majority of formulæ obtained do not hold true under natural conditions. An example is Euler's theorem, $W = \frac{\pi^2 EI}{L^2}$

Where E=elasticity. I=moment of inertia.
L=length of strut.

In this formula the load is presumed to be axial, and the base supposed to rest on knife edges. But in practice it is found that the load can never be completely axial, and consequently a great reduction in strength occurs due to bending; and as in all substances used as struts the resistance to compression is considerably greater than that due to bending, the stiffness of the material is more important than its strength.

It follows that the longer the strut the greater the stress due to bending, although the stress due to direct compression remains the same. Gordon's formula is the best for designing struts, being based upon both theory and practice:—

$$W = \frac{f A}{1 + n\frac{l^2}{d^2}}$$

Where W = safe load.
f = safe stress in material.
A = area of cross-section
a = constant (shown in table below)
l = length.
d = least dimension.
n = a constant (shown below).

Material.	f tons per square inch.	a.
Timber	$\frac{1}{2}$	$\frac{1}{750}$
Wrought iron L.T.I.	4	$\frac{1}{3600}$
Cast iron, circular solid... ...	8	$\frac{1}{1600}$
Cast iron, circular hollow ...	8	$\frac{1}{2400}$
Steel	$6\frac{1}{2}$	$\frac{1}{12000}$

When both ends of strut are fixed in position and direction $n=1$.

When one end only is fixed in direction and the other in position only $n=2$.

When both ends are only fixed in position $n=4$. (J. S., *Middlesex.*)

291. Hydrostatics.—Calculate the total and resultant pressures on the interior curved surface of a hemispherical bowl of radius r placed with its diametral plane horizontal and just filled with water. (W. H. B., *Bocking.*)

If the internal surface of the bowl be considered divided into a large number of very small areas, each small area will have a force acting perpendicularly upon it proportional to its depth below the surface. The sum of all these forces, irrespective of their effect upon one another, is the total pressure on the surface of the bowl.

Still considering the small areas, each force can be resolved into vertical and horizontal components, and, from the symmetry of the solid, each horizontal force will be balanced by the horizontal component on an area similarly situated on the opposite side of the bowl. This leaves as the resultant pressure the sum of all the vertical components.

Let r = radius of bowl.
w = weight of contents per unit volume.
p = intensity of pressure per unit area at a depth h.
a = any small area at a depth h.
A = total curved area of bowl.

$p = wh$, and

pressure acting on area $a = pa = wh.a$, and

total pressure on A is W.A × the average depth of the surface A from the top.

The superficial area of a hemisphere = $2\pi r^2$, and this is the same as that of the curved surface of a circumscribing cylinder. Also, a horizontal projection of any zone of the hemisphere has an equal superficies on the cylinder, so that the average dis-

force of the hemispherical surface from the top is the same as that of the cylinder—*i.e.*, $\frac{1}{2}r$.

$$\therefore \text{Total pressure} = w.2\pi r^2 \times \tfrac{1}{2}r$$
$$= \pi r^3 w.$$

The resultant pressure, due to the vertical components of the elements of the total pressure, is that due to a head equal to the average depth of the bowl on the horizontally projected area—*i.e.*,

$$w \cdot \tfrac{1}{2}r \cdot \pi r^2 = \tfrac{1}{2}\pi r^3 w.$$

The average depth of the bowl is not the same thing as the average distance from the top of the curved surface of the bowl.

The one is the volume divided by the base, or projected area—*i.e.*,

$$\frac{\frac{2}{3}\pi r^3}{\pi r^2} = \frac{2}{3}r,$$

while the other may be obtained as before, and is $\frac{1}{2}r$.

Without the above reasoning, the resultant pressure is obviously the weight of the contained fluid—

$$i.e., \ \pi r^3 w.$$

A mathematical treatment applicable to a general case is as follows:

Consider a narrow horizontal ring of the curved surface, of vertical width dh, at a depth h and radius r.

Slant side of ring $= \frac{r}{r_1}.dh.$

Circumference do. $= 2\pi r_1.$

$\therefore$ area do. $= 2\pi r_1 \cdot \frac{r}{r_1}.dh = 2\pi r.dh$

and total pressure do. $= w.h.2\pi r.dh.$

$\therefore$ total pressure on curved surface $= \int_{h=0}^{h=r} 2\pi w.h.r.h.dh$

$$= \pi r^3 w.$$

Similarly, the total vertical pressure on the elementary ring

$$= w.h.2\pi r.dh \times \frac{h}{r}$$
$$= 2\pi w.h^2.dh.$$

$\therefore$ resultant pressure on curved surface

$$= \int_{h=0}^{h=r} 2\pi w.h^2.dh$$
$$= \tfrac{2}{3}\pi r^3 w.$$

(H. E. L., *Islington.*)

Error a fault and truth discourteous.'
— GEO. HERBERT, "*The Temple.*"

BITUMINOUS MATERIALS.

To the Editor of THE SURVEYOR.

SIR, I have been greatly interested in the correspondence on the above subject appearing in your valued paper, and write to suggest that the misunderstanding which exists as to the correct meaning of the terms now applied to bituminous materials in road engineering would be easily cleared up by a close consideration of their original meaning and derivation. As an illustration of my argument, and for the sake of brevity, I will confine myself to the following questions which have arisen in the correspondence: (1) What is bitumen? (2) What is asphalt? (3) What is asphaltum?

(1) Bitumen is the chemical term which covers the hydro-carbon group or compounds of hydrogen and carbon. The word "bitumen" is derived from the Latin "tumesco," which means literally to swell up, and doubtless this has reference either to its occurrence in Nature or to its behaviour when heated. "Bitumen" in its many forms occurs all over the world, varying from a gaseous condition to solid structure. As found in Nature, bitumen is frequently combined with impurities, and just as iron, silver and other ore deposits are described as iron or silver, so bitumen is referred to without regard to its strict chemical purity. Only a certain series of the hydro-carbons enters into the questions of bitumen as applied to road engineering, and these are found both in Nature and in the artificial product obtained from the destructive distillation of coal, &c. Mr. Nathan's interpretation of the word "pure" as applied to natural asphalt or bitumen is altogether too loose, for his expression "unadulterated hydro-carbon," if meaning anything, would imply actual chemical purity, whereas it is agreed that bitumen seldom occurs in total chemical purity, and asphalt never. Purity in this connection should be taken to mean freedom from any admixture or adulterant beyond such as is strictly necessary to adapt the material to its particular process. For the engineer is concerned not so much in the natural occurrence of the material as the quality in which he obtains it for usage. For example, pure Trinidad bitumen does not imply chemical purity ("unadulterated hydro-carbon"), but freedom from adulteration.

Here it is necessary to explain that bitumen and asphalt are quite distinct substances. If the derivation of the latter word be followed up this difference will be apparent. Asphalt is derived from the Greek word $\sigma\phi\alpha\lambda\lambda\omega$, which means to break, &c. The prefix α in Greek is represented by the English "un," and so asphalt comes to mean "difficult to break," "unbreakable," and so "any hard substance." Asphalt is mentioned by the Latin writer Pliny as being used in the construction of the walls of Babylon, and was undoubtedly a mixture of materials (aggregate) with the bitumen which was in those days, and still is, found on the shores of the Dead Sea. I regard it, therefore, as due to the fact that bitumen was the only cementitious substance available for concrete purposes in those days that it has since come to be associated always with asphalt as now used in roadway work, &c.

Coming to later times, the word asphalte is used on the Continent to mean the hard, naturally impregnated limestones which were found when pulverised and heated to have the wonderfully durable properties as a material for roadways which we now see in the best class of this work in the City of London. So I come to this point, that asphalt means nothing more than a hard substance, of which bitumen, by early and subsequent usage, is the matrix or binding agent. In a word, there is no strictly literal connection between the two substances.

Still later we find asphalt used to describe the material obtained from artificially combining bitumen with an aggregate of sand, granite, &c., for street paving, roof and other applications. This use of the word appears to me a logical and fair one in view of my interpretation of the word "asphalt." It would, however, not be correct to class this latter group as natural asphalt.

In my opinion Mr. Hutchinson is right in saying that the only natural asphalt is that known as Seyssel, Val de Travers, &c., because this substance can be used for asphalt purposes as found in Nature. On the other hand, Trinidad asphalt means the asphalt

formed by the artificial admixture of sand, &c., with Trinidad bitumen, which is used for roadways, as in the case, for example, of the Victoria Embankment. And so, in answer to the three questions I began with, I would suggest a satisfactory grouping of bituminous materials as used for road purposes as under:

(1) Bitumen (solid or liquid).
  (a) Natural, as found in Nature. Trinidad, Bermudez, &c.
  (b) Artificial, as obtained from ordinary distillation or destructive distillation. Texas, Mexican, coal-tar, pitch, &c.
(2) Asphalt (solid always).
  (a) Natural. Rock asphalt.
  (b) Artificial. All compositions solid when set formed from artificial mixtures of aggregate with any form of bitumen, as in above examples.
(3) Asphaltum.

This, to my mind, is capable of the simplest explanation. While it is true that the use of this word has come to imply some special form of either of the two foregoing substances, bitumen and asphalt, it is in fact nothing more or less than the Latin of asphalt, and so, whether you spell it as in English "asphalt," or the French "asphalte," or Latin "asphaltuum," it is just the same in meaning—*i.e.*, a hard substance. If in reality there were a difference between "asphalt" and "asphaltum," we should have to find a difference in the meaning of residue and residuum, which is obviously impossible.

It is impossible to cover the ground of this discussion adequately in a letter, but I trust I have made myself clear on some of the points of this very important matter. Briefly, what I urge is this: Consider closely the derivation of these words, and the solution of their meaning is simple. "Asphalt" is, in fact, the concrete of bitumen, however you may spell the former word, and all asphalts and all bitumens are either natural or artificial. A distinction is easily drawn, and this should be done without delay in the interests of road engineering. In my opinion, great importance attaches to this question of nomenclature, as it is to the artificial asphalt made with a natural bitumen that engineers must look for a cheap and effective solution of the road problem.—Yours, &c.,

"Original."

December 17, 1912.

To the Editor of The Surveyor.

Sir,—Although the pamphlet I propose to issue may not, in Mr. Nathan's opinion, carry the same weight as one issued by or under the auspices of the Road Board, it will at least place at the service of surveyors and engineers the views of my copartners in the Dussek Bitumen Company, who have been connected with the manufacture of bitumen for nearly thirty years. I notice that Mr. Nathan, in reply to Mr. Bastian, enquires—(1) Where "pure" natural asphalt is found, (2) what difference there is between asphalt without an "e" and asphalte with an "e," (3) why asphaltum should be described as "the residuum obtained from the distillation of asphaltic or semi-asphaltic base petroleums"—does not give the explanations asked for. Mr. Nathan says that by "pure" asphalt he "meant the unadulterated natural article." The word "pure" is at present being applied to petroleum residuums; "pure" meaning here a material containing a high percentage of bituminous matter and practically no mineral matter. Seeing that natural bitumen contains more or less mineral matter, and is not "pure" in the same sense of the word, it is very misleading to describe both artificial and natural substances as "pure" when the word is used to express two different meanings. Neither will a claim to official "pedigree" on to make statements that are "meant to imply."

Mr. Nathan a little further on in his letter says gilsonite "is one of the purest forms of solid native bitumen" and as gilsonite certainly is a pure—meaning free from mineral matter—natural material, your correspondent is therefore using the word "pure" in two quite different ways. I am also opposed to Mr. Nathan's other definitions of asphaltum and asphalt with and without the "e," and his suggestions, in my opinion only help to make the matter more complicated. What if an engineer ordered asphalte with an "e" when he wanted asphalt without an "e"? I quite agree with Mr. Bastian that there is some mistake in the definitions and views that have been expressed. Asphaltum is, of course, pure hard bitumen—such as gilsonite and similar substances—and not an artificial product, as Mr. Nathan declares it to be.

This is the one point I think upon which Mr. Nathan joined issue with Mr. Hutchinson. Mr. Hutchinson stated that the words asphalt and asphaltum "were used in America to denote the solid form of natural bitumen." Mr. Nathan, in reply to this, said that asphaltum "was recognised throughout the world as the residuum obtained from distillation of asphaltic or semi-asphaltic base petroleums." I, like Mr. Bastian, am also "more than surprised" at this statement.—Yours, &c.,

A. E. H. Dussek.

THE INSTITUTE OF SANITARY ENGINEERS: ELECTION OF COUNCIL.

To the Editor of The Surveyor.

Sir,—As one who has for many years given of his best to this council, and to the interests of the institute generally, may I have the privilege of your columns to offer a few observations on the letter from "Fellow" appearing in your current issue?

First of all, "Fellow" is to be congratulated on his astuteness in timing his communication so that no reply to it could appear in your columns previous to the election to which he refers taking place. (Ballot lists are returnable by Thursday morning next, 19th inst.) That changes in the council are needed is a *sine quâ non* which members of the council, and especially old members, are not likely to dispute; but whether they are necessary for the reasons suggested by your correspondent is a matter of opinion. Some of us would welcome a change which would relieve us of the constant strain upon our time and resources which the apathy of the members generally has cast upon us. It was with the view of arousing the interest of the members and of getting good men to serve on the council that the system of election by postal ballot was introduced by the council, after some opposition, two years ago. There is no difficulty in getting men to become members of council of any society, as the position gives a certain status. To get men who will attend council and committees is quite another matter. If your correspondent's letter leads to the introduction of men of the latter class on the council I am sure they will be heartily welcomed. The "honoured posts" which it is necessary, in the best interests of the institute, to fill are the working positions. I am not quite sure that a reference to the membership lists of other institutions will assist in detecting the best and most qualified men in this respect.

Then "Fellow" appears to wish that the control of the institute should pass into the hands of municipal engineers. Are we then to have "another Richmond in the field"? It is extremely doubtful if the two already existing institutions would welcome such an addition, and, what is more important, there appears to be no need for it. Of course, much depends upon what is intended by the term used. The institute is largely composed of men in private practice as "municipal" or "sanitary" engineers, with a goodly number of engineers to public authorities, and other men engaged in sanitary work, and it forms a common ground upon which the man who designs and supervises the work, and he who executes it, can meet together in the interests of public health.

This ground is sufficiently wide, as I endeavoured to indicate in a paper on the "Status of the Modern Sanitary Engineer," read before the members of the institute some time ago, without encroaching upon that already covered; and it is in this direction that the members can, with advantage to themselves and to the community, devote their efforts in order to make the institute "of still greater value."—Yours, &c.,

Geo. W. Chilvers.

Chiswick.

INTERCEPTING TRAPS IN HOUSE DRAINS.

To the Editor of The Surveyor.

Sir,—In the letter of Mr. Richard Read in your issue of the 13th inst. it is to be observed that his adverse criticism of Jennings' closet of the century is based on theoretical opinion, seemingly due to his having been misled by the illustration in the adver-

usement, showing the closet at rest. When flushed a powerful jet of water is admitted to the top of the syphonic leg, which, in combination with the water expelled from the basin by syphonic discharge, scours and maintains the pipe in a perfectly clean condition, as is proven by examination of closets inspected after six years' constant use. Had Mr. Read been fully informed of the working of this closet, I venture to predict his opinion would have been favourable, and he would more likely have advocated a well-tried invention which, after most severe tests, secured the highest award of the Royal Sanitary Institute—a special Silver Medal of merit—as also other distinctions, and has, moreover, obtained a very considerable share of public favour, as is evident by the fact that over 20,000 are in use, and the demand is increasing.

These facts could be amplified, but that I fully recognise such a further trespass would be neither excusable nor permissible.—Yours, &c.,

WALTER JENNINGS.

Lambeth Palace-road,
Westminster Bridge,

THE PITTING OF STEEL PIPES.

MILL SCALE AS THE CAUSE.

The contention that the failure of steel pipes through pitting is largely due to the nature of the scale formed on the surface of the steel during the course of manufacture is the chief point in the paper read by Messrs. George and Melville C. Whipple, at New York, at the eighth International Congress of Applied Chemistry.

The authors state that for small pipes up to about 3 ft. diameter cast iron is the best and most economical material, while for larger sizes steel, being a stronger material, presents the advantage of a thinner pipe of greater strength, and thus the more costly metal becomes the cheapest. The use of steel pipes is increasing, but is hindered owing to the fear that the steel may corrode and shorten the life of the pipe to such a degree as to render its use uneconomical. Some wrought-iron pipes have lasted well. Steel has been used for a shorter period. The best pipes have generally retained their useful life, but in some cases, owing to exceptionally severe conditions, they have given trouble. These have developed leaks owing to corrosion in spots—that is, to pitting. The pitting does not appear to occur to the same degree in wrought-iron pipes, where the rusting is more uniform. Steel pipes do not fail completely by breakage as do cast-iron pipes, they merely leak through small holes or pits produced by corrosion and failure comes about as a gradual process.

In making experiments in order to ascertain the causes of this corrosion, samples of steel and iron were placed in jars of water and in jars containing various corrosive solutions, but it was found that the immersion tests in tap water and dilute solutions progressed too slowly, while the use of strong solutions failed to produce in the laboratory the conditions of actual practice. Finding these tests unsatisfactory, a new test was made, one in which corrosion was stimulated by a current of electricity—was used. By this electrolytic test corrosion was made to take place in ordinary water, and, though the ordinary conditions of service were not reproduced, it was unnecessary to use an acid solution. This test presented the manner of corrosion as distinguished from the rate of corrosion better than the acid tests inasmuch as the question at issue was one of pitting and not of general corrosion.

The results showed clearly that mill scale had a marked influence on the uniformity of corrosion in the formation of pits. With regard to this electrolytic test, it should be observed that when two plates of iron are immersed in water and connected with a battery in circuit, a current of electricity will pass through the water from one plate (the anode) to the other (the cathode), and iron will be dissolved from the anode—that is to say, corrosion will take place. If the plate forming the anode is uniform in composition, the corrosion will be uniform over its surface. If the anode is not uniform in composition, the corrosion will be greater at some spots than at others because the density of the current will not be uniform over the plate. Thus no corrosion will occur over areas where an insulating material has been spread. The mill scale on the surface of steel differs in chemical composition from the metal beneath it, also its thickness varies, and it exists commonly as a series of flakes; hence it was expected that the current density would vary and that the corrosion of the metal would occur in spots.

Plates of steel ingot iron and wrought iron were thus tested, with the result that the wrought iron rusted in streaks, which covered nearly the entire surface, while the steel and ingot iron rusted in spots, the pitting in the steel being the worst.

A second series of tests were made, but the mill scale was removed in each case by grinding on an emery wheel; these plates corroded uniformly without any sign of pitting.

Further experiments were made bearing in mind the fact that mill scale may exhibit marked differences of potential toward iron due to its varying composition and thickness. According to the electrolytic theory of corrosion a solution of iron is brought about by the action of current set up between different particles of the metal which have different electrical potentials. Uniformity of composition of the metal tends therefore to diminish corrosion; it is believed that pits in steel occur at points where the particles have greater differences of potential than that of the metallic iron and the mill scale. It is thought that these may result from segregation of the impurities during the cooling of the ingot, or may be due to the effect of rolling, cooling or other treatment. In order to study the potential differences between the mill scale and the raw metal beneath, the method was adopted of connecting the raw metal of a sample with its mill scale by means of wires and placing a very sensitive galvanometer on the circuit. It will be understood that one wire was connected to the metal and one wire to the mill scale. It is extremely interesting to note that when both poles were connected with the raw metal no current could be detected, but when one pole touched the raw metal and the other pole touched the scale a noticeable current was set up. On the steel plates the current sometimes differed greatly at points only 1 millimetre apart, and it was found that the current varied with the thickness of the scale generally, but not always. In order to compare the different samples, areas of 1 square centimetre were marked out in squares, and nine spots were tested in each square. The results are tabulated, and show a surprising difference in the intensity of the current at various points.

Microscopical examination of the scales showed in many instances the presence of minute cracks, through which water might enter and come in contact with the metal.

Experiments made with copper steels showed that, while the presence of small amounts of copper in steel may retard corrosion by strong acids, they do not serve to protect the steel against corrosion in weak acid solutions or in ordinary water. The presence of copper does not materially alter the electrical conditions of the scale, and does not therefore protect the metal against pitting.

American ingot iron plates, so far as failure by pitting is concerned, prove to be somewhat better than steel, but the difference was insufficient to justify any great difference in cost.

Wrought iron is much less likely to pit, and only under conditions of severe chemical corrosion sufficient to remove the mill scale and silicates, or under conditions of atmospheric corrosion where the electrolytic form of corrosion does not predominate, would the two metals be equal.

The effect of removing the mill scale is marked. A partial removal tends to increase corrosion, and thus where scale becomes chipped off in handling and in fabrication there is greater opportunity for electrolytic action between the scale and the raw metal. The complete removal of the mill scale appears to prevent pitting absolutely, and in the tests made after the removal of the scale there was not a single instance of pitting. The authors suggest that some method may be found to modify the mill scale during manufacture so as to make it more uniform, or to improve its electrical condition, or to make it more easily removable.

South London Tramways.—Bermondsey Borough Council have had under consideration the system of electric traction to be installed in place of the existing horse tramway from Tower Bridge-road to Rotherhithe New-road, and have decided to insist on the adoption of the conduit.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Cardiff T.C. (December 12th. Mr. R. H. Hooper).—£7,672 for services, transformers, and plant in connection with the electric light undertaking.—Evidence was given by Sir John Courtis (chairman of the Electrical Lighting and Tramways Committee), the town clerk (Mr. J. L. Wheatley), the city treasurer (Mr. J. Allcock), and the electrical engineer (Mr. A. Ellis). There was no opposition, and at the conclusion of the inquiry Mr. Hooper, in company with the electrical engineer, visited the Roath power station and the Hayes.

Desborough U.D.C. (December 5th. Mr. F. O. Stanford).—£3,457 for recreation grounds and sewage disposal works.—Evidence was given by Mr. G. E. Marlow (surveyor), Mr. C. W. Lane (clerk), and Mr. G. Luck, chairman of the Recreation Committee. Dr. Henry Gibbons said that as a medical officer of health he was bound to support the scheme, as an absolute necessity to the town.

Dublin T.C. (December 11th. Mr. P. C. Cowan).—This was an inquiry in support of petitions lodged by the corporation for Provisional Orders confirming improvement schemes under Part I. of the Working Classes Act in respect of the following areas: (1) Trinity Ward, (2) Beresford-street and Church-street, and (3) Ormond Market. Applications were made for loans to carry out these schemes, the amount applied for being respectively £17,940, £34,000 and £34,030. The portion of the scheme dealing with Trinity Ward was taken up.—Mr. Philip White, on behalf of the corporation, said the necessity for the proposed houses appeared from various facts, among which he mentioned that there were 8,000 tenements occupied by four persons and more—up to twelve persons each. Evidence was given in support of the Trinity Ward scheme. It was proposed to erect in this area forty-four cottages and forty-eight flats, at rents varying from 5s. to 3s. 6d. respectively. The inquiry was adjourned till Friday, January 3, 1913, when the scheme affecting the other areas will be considered.

Friern Barnet U.D.C. (November 25th. Mr. Courtenay Clifton).—£2,022 for making up part of Chandos-avenue.—The inspector then went into the specification, plans, sections, estimates and details as to the proposed work with the engineer and surveyor, Mr. E. J. Reynolds. The clerk of the council submitted various letters which had been received from frontagers in Chandos-avenue as to the proposed works, which the inspector considered.

Mid-Lothian C.C. (December 12th. Mr. J. Walker Smith).—This was an inquiry in connection with the application to the Local Government Board for Scotland by the local authority of the Suburban District of Mid-Lothian for authority to prepare a town planning scheme for Corstorphine district.—Mr. A. G. G. Asher, for the local authority, pointed out that the application was for authority to prepare a scheme, not for approval of one. The suggested area on the map shown was not intended to be a final decision of the local authority, but it would be put forward if permission was granted to prepare a scheme. Mr. Norman Macpherson, for the city of Edinburgh, said the city were in favour of a scheme for Corstorphine, and they had hoped that a joint application would be made. He had, however, got an undertaking from Mr. Asher that the county would consult and co-operate with the city regarding the preparation of a scheme, and this met the city's case meantime. Evidence was then led in four objections which had been held competent at this stage. Following upon this the commissioner closed the inquiry, and the interested parties paid a visit to the site of the proposed scheme.

North Bromsgrove U.D.C. (December 10th. Mr. R. G. Hetherington).—£10,018 for works of sewerage and sewage disposal at Rubery and Barnt Green. The clerk to the council stated that negotiations had taken place for several years with the adjoining district (now absorbed by the City Corporation of Birmingham) for the sewage to be conveyed through the Birmingham sewers to the works of the Tame and Rea District Drainage Board. The price asked and conditions were such as to make it financially impossible to make such arrangements, therefore the council had to embark on a scheme of sewage disposal at Rubery within their own district. The council's consulting engineer (Mr. Robert Green, M.INST.C.E.) explained the scheme in detail, which included a pumping installation, and necessitated the putting in force of the Land Clauses Act for the compulsory purchase of land. The total estimated population provided for was 2,000, the quantity of sewage to be dealt with at the rate of 18 to 25 gallons per head, dry-weather flow. Owing to the difficulty experienced in connection with purchasing the site for the pumping machinery, an alternative site had been provisionally arranged, which, with the addition of a cottage, necessitated the loan to be increased by practically £1,000.

Poole T.C. (December 5th. Mr. F. H. Tulloch).—£125 for additions and improvements to the two lodges in the park, and £63 for the purchase of land to give access on the south side to Alexandra Park.—At present there is no entrance from the Bournemouth-road, except by a circuitous route, and the only entrance is from Alexandra-road.—There was no opposition, and the inquiry was attended only by the town clerk and the borough surveyor, Mr. S. J. Newman, in addition to the inspector.

Walton-le-Dale U.D.C. (December 3rd. Mr. M. K. North).—£4,500 for works of water supply, and £350 for the provision of a new disinfecting apparatus.—The clerk, Mr. W. S. Woodcock, stated that at present water was obtained for the township from three sources, a well at Brindle, a supply from Thirlmere per the Manchester Corporation, and from a borehole in School-lane. The cost of the supply from Thirlmere up to 200 000 gallons per day was 7½d. per 1,000 gallons, and on all excess they had to pay 1s. per 1,000 gallons. They proposed to duplicate the present plant at School-lane, because they were confident there was an ample supply of water there. They asked that the period of repayment should be thirty years in respect of buildings and fifteen years in respect of machinery.

West Ward (Westmorland) R.D.C. (November 22nd. Mr. A. W. Brightmore).—£39,600 for a water scheme from Blea Water Tarn, a small lake about 2½ miles to the south-west of Mardale, for the supply of parishes in the West Ward's district.—Mr. Joseph Graham, the engineer, in his evidence, stated that there would be about 64 miles of mains, and three reservoirs—one capable of storing 200 000 gallons—from which the distributing mains would radiate. On account of the nature of the district, and the pressure required to obtain circulation over so large an area, he proposed to put in steel pipes for the greater part of the distance. A number of other witnesses gave evidence, both in support of and in opposition to the proposal.

APPLICATIONS FOR LOANS.

Castlebar R.D.C.—£2,610 for labourers' cottages.

Cheltenham T.C.—£5,464 for works of sewerage.

Grimsby T.C.—£14,870 for a new council school.

Salford T.C.—£53,000 for gasworks extensions.

Swansea T.C.—£10,000 for the payment of the cost of non-sanctioned sewerage works.

Wanstead U.D.C.—£1,250 for the erection and equipment of a new fire station.

LOANS SANCTIONED.

Aberavon T.C.—£12,675 for the erection of a town hall and municipal buildings.

Devonport T.C.—£2,000 for the purchase of an iron hopper barge.

Ellesmere R.D.C.—£2,500 for water supply works.

Cosforth U.D.C.—£710 for the purchase of a motor fire engine.

Hove T.C.—£659 for excavation and foundations, and £1,046 for wood paving.

Margate T.C.—£7,500 for the purchase of 6 acres of land at Westbrook for laying out roads and pleasure grounds.

New Mills U.D.C.—£10,000 for gas supply extensions.

FORTHCOMING INQUIRIES.

JANUARY.

2.—**Manchester.** For the purpose of including Heaton Norris in the city boundary (Mr. E. A. Sandford Fawcett).

2.—**Stockport.** For the purpose of including Heaton Norris in the borough boundary (Mr. E. A. Sandford Fawcett).

7 **Scarborough.** For authority to prepare a town planning scheme (Mr. Thomas Adams)

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below:—Buildings — Barnsley £15,000. Devon, Devonport £70,000, Glasgow, Lincoln, Northwich £9,580, Weston-super-Mare; housing and town planning, Richmond; roads and materials—Blackpool £50,000, Croydon £164,000, Sewerage and sewage disposal, Ayr, Cheltenham, Kiveton Park; water, gas and electricity —Birmingham £250,000, Croydon £96,000.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Airdrie T.C. The £11,000 scheme for a hospital and sanatorium is to be reconsidered with a view to the reduction of the cost.

Arbroath T.C.—Mr. Andrew Carnegie's offer of £7,000 for public baths is under the consideration of the council.

Barnsley T.C.—The council have adopted the proposed scheme for the erection of a new town hall at an estimated cost of £15,600.

Belfast T.C.—Consideration is being given to a scheme for extending the [illegible] building.

Bexhill T.C.—The surveyor, Mr. G. Ball, reported at the meeting on Monday last that thirteen intermediate groynes were nearly completed, the total cost being about £1,200. The Sea Defence Committee decided to defer the consideration of a suggestion that each of the groynes should be extended 50 ft. seaward to form low sand groynes. The intermediate groyning work [illegible] new seawall, and [illegible] at a cost of about £4,800.

Devon C.C.—A scheme has been adopted for providing a sanatorium near Bovey Tracey for dealing with [illegible] and [illegible] cases at Exeter, the latter at a cost of £3,250.

Devonport T.C.—The council have agreed to a £70,000 scheme for the erection of a new Guildhall on the glebe site near the Technical College.

Glasgow T.C. A report on [illegible] council regarding the preliminary sketch designs invited from outside architects for the proposed extension of the municipal buildings. Dr. John James Burnet, architect, the assessor in the competition, reported that sketch designs had been received from 100 competitors. Dr. Burnet and the city engineer, Mr. A. B. McDonald, examined the designs in the preliminary competition, and on his recommendation the [illegible] Messrs. Keppie & Henderson, Basil E. Vincent Harris & Moodie, London; Watson Simon, Glasgow; James B. Fulton, London; James Wright, junr, and W. J. Blain, Glasgow.

Grimsby T.C.—The tender of Messrs. J. H. Thompson & Sons, Limited, of Grimsby, at £13,333, has been accepted for the erection of the new school in Victoria-street.

Hunstanton U.D.C.—Shelters are to be erected on the esplanade at a [illegible] cost of £720.

Lanarkshire C.C. The [illegible] of the county buildings [illegible] by a [illegible] of the council.

Lincoln T.C.—The city engineer, Mr. R. A. MacBrair, has been instructed to prepare plans for the extension of the [illegible].

Llanelly U.D.C.—The question of finding a site for the proposed new town hall is engaging the attention of the council, who have a sum of £12,000 in hand for the provision of the building.

Maldens and Coombe U.D.C.—The council have referred to a committee an offer of a councillor, Mr. G. C. [illegible], to present a [illegible] land adjacent to the council offices on condition that they erect upon it, within three years, a hall suitable for public [illegible] and for small private meetings or the [illegible] of [illegible] to workmen's or other clubs.

Northwich U.D.C. Public baths are to be erected at a cost of £9,580.

Ramsgate T.C. A scheme is under consideration for a new shelter on the west cliff.

Sutton-in-Ashfield U.D.C.—A new [illegible] is to be provided at a cost of £550.

Weston-super-Mare U.D.C.—The plans of the surveyor Mr. H. A. Brown, for new public [illegible] have been approved.

HOUSING AND TOWN PLANNING.

Atherstone R.D.C.—The surveyor, Mr. H. J. Coleby, has prepared amended plans for the erection by the council of workmen's dwellings in Stanley-road, and these, with a fresh estimate, have been forwarded to the Local Government Board.

Milngavie T.C.—The council are considering the advisability of taking in an increased area outside the burgh boundaries, in addition to the burgh, in a proposed town planning scheme.

Peterborough R.D.C.—It has been decided to purchase about 5 acres of land and to erect fourteen houses in the parish of Eye. Negotiations are also in progress for the purchase of land for the erection of twenty-four houses at Walton, and also at Castor. The surveyor, Mr. G. A. Penwill, has been instructed to prepare schemes and plans.

Richmond (Surrey) T.C. It has been agreed to include, as part of the town planning scheme, a suggestion of the borough surveyor, Mr. J. H. Brierley, for making a new road to provide a more direct route through Petersham to Kingston, and to obviate the steep gradients and awkward corners of the existing main road. It is proposed that the new road shall be 50 ft. wide, and its construction is estimated to cost about £16,000, towards which the Surrey County Council will contribute one-third, and a grant may also be obtained from the Road Board.

Southmolton T.C.—The surveyor, Mr. H. C. E. Rayner, has received instructions to prepare the necessary plans and specifications for the housing scheme.

Wanstead U.D.C.—The General Purposes Committee have been instructed to consider the question of [illegible] accommodation for the working classes.

PARKS AND OPEN SPACES.

Droylsden U.D.C.—A new bowling green is to be provided at a cost of £615.

Manchester T.C.—The Parks Committee recommend that an offer of £10,000 be made to the War Office for the site of Hulme Barracks and the buildings thereon for the purpose of an open space.

Sunderland T.C.—A municipal golf course is to be [illegible] at Seaton Carew Links, at an [illegible] of £1,500.

REFUSE COLLECTION AND DISPOSAL.

Cosforth U.D.C.—The tender of Messrs. Humphries & Sons, of Chippenham, for two new refuse carts for the sum of £54, has been accepted.

ROADS AND MATERIALS.

Aylesbury U.D.C.—Southern-road and Eastern-road are to be made up with concrete channelling, the former at a cost of £789, and the latter at a cost of £451.

Barnsley T.C.—The tender of the Improved Wood Paving Company, at £1,878, has been accepted for wood paving in Cheapside and Sheffield-road.

Bath T.C.—A scheme for the widening of Brougham Hayes, which is estimated to cost over £3,000, has been referred to the Streets Improvement Committee to report.

Birmingham T.C.—It has been agreed to carry out various improvements to certain of the streets and roads in the city. The most important are associated with the districts of Hay Mill and Erdington. Plans have been approved for the widening of King's-road, Hay Mill, so as to form a useful connecting link between Hay Mill and the adjoining district. In carrying out this work it will also be necessary to [illegible] bridge over the canal. At Erdington [illegible]

decided, among other improvements, to widen and make Wheelwright-road, which connects Gravelly-hill with Bromford-road and the new Salford Bridge-road.

Blackpool T.C.—A considerable reclamation scheme is to be effected on the southern foreshore, with a view to the formation of a promenade. The estimated cost of the scheme is £50,000.

Caerphilly U.D.C.—It has been decided to adopt the system of direct labour in road maintenance, and the Roads Committee have received instructions to go into the question of ways and means.

Chichester T.C.—The city surveyor, Mr. F. J. Lobley, has been instructed to proceed with the making up of Eastcross and Westcross.

Conway R.D.C.—The council are joining with the representatives of the County Councils of Carnarvon and Denbigh, and the district councils, in asking the Road Board for a grant in aid of the construction of the proposed road between Colwyn Bay and Llandudno.

Croydon T.C.—A scheme was adopted by the council on Monday for widening North-end on both sides, and effecting an improvement at Crown-hill, at an estimated cost of £164,000. By this scheme the Whitgift Hospital, built in the reign of Queen Elizabeth, will not be touched.

Devon C.C.—The Road Board have selected the following road improvements for financial assistance: Widening road at corner of Pinhoe and Pinhoe roads, Heavitree, cost £450, proposed grant £150; widening portion of road through Fore-street, Heavitree, £750, £250; widening road between Countess Wear Bridge and its junction with the Exeter-Topsham main road from 13 ft. to 21 ft., and removing two corners by substituting a new road 500 ft. in length, £812, £406; Buckhill cross roads, Axminster, making new by-pass road, 305 ft. in length and 40 ft. wide, and improving radius of three corners, cost £674, alternative scheme suggested by the assistant engineer to the Road Board—viz., lowering of high bank to road level for a length of 250 ft., £250, two-thirds of latter cost not exceeding £170; construction of new bridge at Stoodleigh, Culmpton, £528, £350; altering brow of hill and widening dangerous corner at bottom of Dean Steep Hill, Lynton, £200, £133; new road round brow of hill in place of Beggars Roost Hill, Lynton, including widening road at top of the hill from 14 ft. to 21 ft., £1,200, £400; widening Bank-street, Newton Abbot, to 36 ft., £2,500, £500; widening Penn Inn Bridge, Newton Abbot, and approaches to 36 ft. for a length of approximately 500 ft., £1,200, £400; widening Totnes-road, estimated cost of work, apart from cost of purchase of property, £1,680, £540; widening King bridge, Salcombe road at various points, £689, £460. The council have received replies from the district councils to the letter addressed to them respecting their willingness, or otherwise, to observe the existing suggestions as to the maintenance of main roads. All the replies showed that the district councils were prepared to accept the advice and additional supervision of the county surveyor.

Edmonton U.D.C.—Church-street is to be widened at a cost of £1,487, towards which the Middlesex County Council have decided to contribute £495.

Hackney B.C.—The asphalt paving in Rosina-street, Homerton, having sunk at various places, investigations were made to the cause thereof, and it was found that a large number of runs had been burrowed by rats in the ground beneath the paving. The remains of the adjoining cottages also contained rats. Further investigations showed that the rats came from openings in a sewer which was laid in 1865, and the sewer has accordingly been now reconstructed at a cost of £45.

Hemel Hempstead T.C.—Street improvements are to be carried out at an estimated cost of £2,300.

Hove T.C.—The tender of Messrs. Parsons & Sons at £479, has been accepted for carrying out the proposed new street works in Tennis-road.

Poole T.C.—A number of streets have to be made up under the Private Street Works Act.

Richmond (Surrey) T.C.—The council have under consideration a suggestion of the borough surveyor, Mr. J. H. Rennie, that a grant estimated at £5,121, equal to the amount of the Local Government Board, be spent on reconstructing with a proper foundation and top of a patent road material of three roads in the district, and with a similar coating in the case of a fourth road which already has a satisfactory foundation.

Tyrone C.C.—Mr. J. W. Leebody, county surveyor, reported at the council meeting last week that the Clogher, Cookstown, and Dungannon District Councils had agreed to take up Road Board grants amounting to £214, £250, and £345 respectively. He had been in communication with the Road Board on the subject and was now taking a census of traffic.

Watford R.D.C.—The surveyor, Mr. E. Lailey, has been instructed to interview the landowners concerned in a proposal made by the county surveyor, Mr. U. A. Smith, for the widening of Eastbury-road, leading from Watford to Northwood, at an estimated cost of £1,895. The suggestion is to widen the thoroughfare to 40 ft.

SEWERAGE AND SEWAGE DISPOSAL.

Alsagar U.D.C.—Tenders are to be obtained for a sewage disposal scheme.

Altrincham U.D.C.—Public lavatories are to be established at Kings-way, at an estimated cost of £900.

Cheltenham T.C.—It is proposed to carry out extensive improvements in the sewerage of the Fairview district.

Kirkcaldy T.C.—A sum of £580 is to be spent upon the erection of public conveniences.

Kiveton Park R.D.C.—The surveyor, Mr. F. Hewitt, has received instructions to prepare plans and estimate for extensions at the sewage disposal works.

Pontardawe R.D.C.—Sewerage works are to be carried out at Clydach, at a cost of £631.

Ripley U.D.C.—The council have referred to a committee a letter from the Local Government Board regretting that practically no steps had been taken towards the conversion of the privies to the more sanitary water-carriage system. This could not but be a menace to the public health, and in particular to the infantile population. They therefore urged upon the council the desirability of the speedy conversion into water-closets.

Surbiton U.D.C.—The surveyor, Mr. H. T. Mather, has prepared detailed drawings, specification and bills of quantities for a surface-water drain at Rogers Farm, estimated to cost £209, in connection with the sewerage scheme in hand.

WATER, GAS, AND ELECTRICITY.

Abercarn U.D.C.—A sum of £1,000 is to be spent on gasworks equipment. With regard to the automatic lighting, it has been reported that a saving of £100 to £120 per annum would be effected at the end of three years. The new works proposed include a new exhauster at £100.

Birmingham T.C.—The Electric Supply Committee are giving consideration to a proposal to erect an electricity station at Saltley, at an estimated cost of £250,000.

Bo'ness T.C.—The council have concluded an agreement with the adjoining burgh of Grangemouth to give them an auxiliary supply of water from Bannockburn. The rate fixed is 4½d. per 1,000 gallons up to a limit of £750, and 4d. per 1,000 gallons beyond that; minimum payment in one year, £250. The agreement is for five years. Negotiations are still pending for the purchase by Bo'ness of the Avonbank Waterworks. Connections to which were made at considerable expense during the water famine of 1911.—It has been agreed to spend £1,000 upon extensions of the electric lighting system.

Croydon T.C.—The waterworks are to be enlarged and a reservoir constructed at Russell Hill at an estimated cost of £90,000.

Haltwhistle R.D.C.—The council are giving consideration to a water supply scheme, estimated to cost £4,000.

Hove T.C.—It has been decided to promote a Bill in Parliament for the purchase of the electric lighting undertaking.

MISCELLANEOUS.

Huthwaite U.D.C.—Roadmen, lamplighters and carters in the employ of the council are to receive an increase of 5 per cent in wages.

Troon T.C.—It has been decided to borrow £500 for the extension of the municipal cluibhouse, £150 for new sewers, and £900 for the widening of Fullarton-road and the bridges at Lochgreen.

PERSONAL.

Mr. J. P. Smith has been appointed road foreman to the Jarrow Corporation.

Mr. H. C. Blackburn has been appointed assistant surveyor to the Dartford Urban District Council.

Mr. F. Camble, surveyor to the Tavistock Urban District Council, has been voted £20 for extra services.

Mr. A. A. Goodall, surveyor to the Rhyl Urban District Council, has had his salary increased by £20 per annum.

Mr. W. Terrill, surveyor to the Ashford (Kent) Urban District Council, has had his salary increased to £350 per annum.

Mr. Frank Sumner, engineer to the Corporation of the City of London, has had his salary increased to £1,250 per annum.

Mr. G. Ball, borough surveyor of Bexhill, has been granted £50 by the town council for his services in connection with the construction of groynes on the beach.

Mr. W. Calder, city surveyor of Prahran, has been appointed honorary co-examiner in engineering, part 2 (roads, streets, and tramways), at the Melbourne University. He will act in conjunction with Prof. Payne and Mr. George Higgins, M.C.E.

Messrs. John Ennor, engineer and surveyor to the Newquay Urban District Council; G. R. Folland, borough surveyor's office, Gravesend; F. H. Holden, assistant surveyor, Lytham; J. A. Rodwell, borough engineer's office, Dewsbury; and G. M. Seels, council offices, New Malden, have been elected members of the Royal Sanitary Institute.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CORPORATION OF MADRAS.

SPECIAL WORKS DEPARTMENT.

DRAINAGE SECTION.

CONTRACT M & M No. 18.

The Corporation of Madras is prepared to receive Tenders from competent persons willing to enter into a contract for the Supply and Delivery of English Stoneware Pipes and Specials, varying from 4 in. to 21 in. internal diameter, and aggregating a total length of about 165 miles.

Forms of Tender, prepared by J. W. Madeley, M.A., M.INST.C.E., M.AM.SOC.C.E., Special Engineer to the Corporation of Madras, may be obtained from the undersigned Agents of the Corporation, on payment of five shillings per set, which will not be refunded.

Tenders must be submitted to them at or before noon of Wednesday, the 22nd day of January, 1913.

The Corporation does not bind itself to accept the lowest or any Tender.

JAMES MANSERGH & SONS,
Agents to the Corporation,
9 Victoria-street,
Westminster, S.W.
December 18, 1912.

BOROUGH OF HORNSEY.

Applications are invited for the position of a General and a Junior Clerk in the Engineer's Department.

Preference given to Candidates having some knowledge of shorthand and typewriting, and previous experience in office routine. Salary—General Clerk, £70; Junior Clerk, £40 per annum.

Applications to be made in Candidate's own handwriting, stating qualifications, with two letters of reference, and forwarded to the Borough Engineer and Surveyor, Municipal Office, Highgate, N., not later than Wednesday, 1st January, 1913.

WANTED (for 6 months), Junior Assistant in Mains Drawing Office, accustomed to taking enlargements from Ordnance Maps, and the keeping of usual Mains Records. State salary required.—Apply, with copies of not more than three recent testimonials, to the City Electrical Engineer, Old Town Hall, Wakefield.

FOR SALE OR HIRE—6-ton Barford & Perkins Motor Roller, in first-class working order; just completed large Tar-macadam Contract. Apply Eddison Steam Rolling Co., Ltd., Dorchester.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING: OFFICIAL REPORT.

At a meeting of the council held at the offices of the institution on Saturday, December 7th, there were present: Messrs. R. J. Thomas (president, in the chair), T. W. A. Hayward, J. W. Cockrill, J. S. Brodie, G. F. Carter, W. H. Prescott, A. H. Campbell, N. Scorgie, J. Patten Barber, O. E. Winter, J. L. Redfern, A. D. Greatorex, G. A. Phillips, H. E. Stilgoe, J. S. Pickering, W. Harpur, C. F. Wike, W. T. Lancashire, Thomas Cole (secretary), and H. A. Giles (assistant secretary).

Election of Members.—Messrs. B. J. Wormleighton, engineer and surveyor, Loftus (Yorks) Urban District Council; J. A. Hutchinson, water engineer to the Paignton Urban District Council; J. S. Smith, road surveyor to the Kintyre District Council; R. A. Miller, surveyor to the Seaford Urban District Council; P. M. Hope, engineer and surveyor to West Ward (Westmorland) Rural District Council; W. F. Brindle, engineer and Surveyor, Twrcelyn Rural District Council; J. Ennor, engineer and surveyor, Newquay Urban District Council; J. J. Fleming, borough surveyor, Waterford; A. J. Oborn, engineer and surveyor, Burry Port Urban District Council; H. S. Tebbitt, engineer and surveyor, Tutbury Rural District Council; L. K. Brindley, chief engineering assistant, Zanzibar; R. Arrowsmith, surveyor to the Stoke-on-Trent Rural District Council; O. P. Abbott, engineer and surveyor, Hindley (Lancs) Urban District Council; W. McNeil Shimmin, ASSOC.M.INST.C.E., engineer and surveyor, Failsworth Urban District Council; A. J. Smith, borough surveyor, King's Lynn; C. G. Wellsted, ASSOC.M.INST.C.E., deputy engineer to the Sculcoates Rural District Council; J. Kershaw, surveyor to the Aethwy (Anglesey) Rural District Council; W. A. Rogerson, district surveyor, Norfolk County; F. M. Greenhill, deputy city engineer and surveyor, Cardiff; and D. J. Buckley, surveyor, Fermoy and Marlow Urban District Council.

Election of Associate Members.—Messrs. K. C. Bannerjee, assistant sanitary engineer, Government of Behar, India; T. Palmer, assistant surveyor, Lincoln; H. Anderson, city engineer's office, York; G. R. Folland, borough surveyor's office, Gravesend; B. Archer, assistant surveyor, Wellingborough Urban District Council; W. B. Acton, overseer, Public Works Department, British East Africa; E. Wicksteed, engineering assistant, Hastings; J. Maxwell, second assistant, county road surveyor's office, Hamilton; and D. H. Shaw, chief engineering assistant, Dunfermline.

Transfer from Associate Members to Members.—Messrs. S. C. Lloyd, district surveyor, East Suffolk County Council; and W. S. Lake, ASSOC.M.INST.C.E., Assistant Director of Public Works, Sierra Leone.

Transfer from Student to Member.—Mr. F. H. Holden, assistant surveyor to the Lytham Urban District Council.

Election of Students.—L. C. Blackburn (articled to Mr. G. W. Knowles), Clevedon; T. S. Griffin, assistant surveyor, Penkridge (Staffs); D. M. McBrair, city engineer's office, Lincoln; W. H. Dobson, junior assistant surveyor, Gillingham (Kent); B. F. Cadic (articled to J. L. Redfern), Gillingham (Kent); J. Wrest, assistant surveyor, borough surveyor's office, Dewsbury; and F. M. Copley, assistant surveyor to the Wath-upon-Dearne Urban District Council.

The council learnt, with regret, of the deaths of Mr. W. P. Robinson, late surveyor, Skelton-in-Cleveland, and Mr. W. S. Shell, late surveyor, Consett.

NATIONAL HEALTH WEEK.—Messrs. J. Patten Barber, T. W. A. Hayward, and O. E. Winter were appointed delegates to the General Committee. The president was deputed to represent the institution on the Advisory Committee.

On the recommendation of the Finance Committee it was resolved to print and circulate, for the information of members, a report on "Advertisement Hoardings," presented to the council by Mr. J. S. Brodie, borough engineer, Blackpool.

On the recommendation of the New Offices Committee, it was decided to acquire a suite of offices in Victoria-street, which would give the accommodation rendered necessary by the extension of the work and the growth of the institution.

A joint meeting of the Road- and Standardisation Committees called to consider the standardisation of road-stone was reported. Messrs. R. H. Dorman and

H. E. Stilgoe were elected, and Mr. A. E. Joyce, county surveyor, Mullingar, president of the Association of the County Surveyors of Ireland, was co-opted to the Roads Committee.

On the recommendation of the Standardisation Committee certain amendments to the street lighting specification were deferred for consideration at a special meeting. The second edition of the concrete flag specification, as revised, was ordered to be published, at a price of 2s. 6d. per copy, obtainable from Messrs. E. & F. N. Spon, 57 Haymarket, London, S.W.

The Constitution Committee reported receipt of a letter of thanks for assistance rendered to Mr. William Jones, Colwyn Bay, in the matter of the recent libel action which he had been compelled to bring. A further case of a member who had been libelled had received the careful consideration of the committee. In view of his complete vindication received at the hands of his council, the committee recommended that further action at the present moment was considered unnecessary.

On the further recommendation of the committee, the council resolved that the application of the Association of County Surveyors of Ireland for affiliation with the institution on the same terms as those granted to the Scottish Road Surveyors Association be acceded to, and that steps be taken to complete affiliation accordingly. The council referred back to the committee a suggestion from the Local Government Engineers of New Zealand for affiliation, with an instruction to complete the necessary details to give effect to the suggestion.

Mutual Defence Fund. The committee reported consideration of draft rules. At their request these were referred back for the further consideration of certain points.

On the recommendation of the Town Planning Committee, Mr. H. E. Stilgoe was added to the committee.

METROPOLITAN DISTRICT MEETING.

A Metropolitan District meeting of the Institution of Municipal and County Engineers was held at the offices of the institution on Friday last, at 6 p.m., those present being Messrs. R. J. Thomas (Bucks County, president), J. Patten Barber (Islington, district chairman), O. E. Winter (Hampstead, district representative on the council), G. Sturgess (Chelsea), J. Arthur Jones (Acton), T. W. A. Hayward (Battersea, vice-president), H. A. White (Battersea), W. J. Dresden (Battersea), J. W. Jameson (Stepney), J. Rush Dixon (Woolwich), E. B. B. Newton (Paddington), James Norrington, H. J. Marten, J. C. Radford (Putney), J. Sutcliffe (Deptford), A. W. Currie (Stoke Newington), P. Howard (Tottenham), J. E. Cooke (Islington), Thomas Cole (secretary), H. A. Giles (assistant secretary), H. E. Blain (West Ham, visitor), C. H. W. Biggs (visitor), and Norman Scorgie (Hackney, hon. district secretary). Mr. Patten Barber occupied the chair.

The minutes of the Metropolitan District meeting held on November 20th were read, confirmed and signed. Arising out of the minutes, the hon. district secretary reported the receipt of a communication from Mr. W. P. Wrack (Poplar), regretting his inability to serve on the Executive Committee, and it was resolved that the vacancy should be filled at the next district meeting.

The hon. district secretary also reported that copies of the resolutions adopted at the last meeting in reference to the draft by-laws respecting overhanging lamps, signs, &c., had been forwarded by the secretary of the institution to the town clerks and engineers of the cities and boroughs in the Metropolis, and that a number of replies had already been received.

Letters of apology for non-attendance at the meeting were read from Mr. P. Dodd (Wand-worth) and Mr. C. Chambers Smith (Westminster).

The meeting then proceeded to discuss the question of "The Influence of Motor Traffic on Metropolitan Roads," the debate being opened by Mr. J. Patten Barber (chairman), who exhaustively dealt with the subject from the point of view of the noise, vibration and damage to premises; the effect upon bridges, tar-spraying as a palliative, the use of [illegible] veneers, hard and soft woods, granite setts, and proprietary articles. A very spirited, instructive and [illegible] ensued, during which the [illegible] Heavy Motor Car Order, the limitation of routes, and so forth. The speakers were Messrs. O. E. Winter (Hampstead), J. E. Cooke (Islington), J. W. Jameson (Stepney), E. B. B. Newton (Paddington), J. Rush Dixon (Woolwich), R. J. Thomas (Bucks County), president, and Norman Scorgie (Hackney).

The time for adjournment having now arrived, it was resolved: "That the discussion on this very important subject be now adjourned until the next meeting of the Metropolitan District to be held in January, and that the actual date of the meeting be left to the chairman and the hon. district secretary to arrange."

Those present then proceeded to Lyons' Victoria Mansions Restaurant, Victoria-street, where they were joined at dinner by the following members and friends—viz.: Messrs. A. P. Piggott, A. E. Darby, B. Cooper, P. T. Chew, John Barber, J. Gerald Cocks, John H. Johnson, G. W. Allen, P. Dodd, L. W. Harvey, F. T. Hutchins and others to the number of nearly forty. At the conclusion of the repast, and after the loyal toast of "The King" had been duly honoured, an enjoyable musical and social evening, arranged by Messrs. Newton and Sturgess, took place. Messrs. F. T. Hutchins (piano), L. W. Harvey (violin), J. Patten Barber, O. E. Winter, G. Sturgess, P. Howard, E. B. B. Newton and John Barber were among those who contributed to the programme.

The best thanks of the company having been accorded to the chairman and to those who had assisted, the meeting terminated with "Auld Lang Syne," and a general expression of opinion that many more gatherings of a similar character should be arranged.

NORTH-EASTERN DISTRICT COMMITTEE MEETING AT YORK.

On the occasion of the North-Eastern District Committee meeting of the Institution of Municipal and County Engineers held at York on Saturday, 30th ult., twenty-four members, three associate members and one student assembled at the Guildhall, and were welcomed by the Lord Mayor (Sir Joseph Sykes Rymer).

The District Chairman (Mr. Frank Massie) thanked the lord mayor for the welcome given to the members, and the lady mayoress for her kindness in providing tea.

The election of an executive committee was then proceeded with. It was proposed by Mr. C. Lund (Cleckheaton), seconded by Mr. E. Picker (Beverley), and carried, that fifteen form the Executive Committee. It was proposed by Mr. E. R. Matthews (Bridlington) seconded by Mr. C. F. Wike (Sheffield), and carried, that three associate members be elected on the Executive Committee, one from Yorkshire, one from Northumberland, and one from Durham. It was proposed by Mr. J. H. Drew (Wath-upon-Dearne), seconded, and carried, that the two members of council (Messrs. C. F. Wike and W. T. Lancashire), the two district representatives (Messrs. E. R. Matthews and E. B. Martin), the district chairman (Mr. Frank Massie), and the district secretary (Mr. J. P. Wakeford) be elected ex-officio members of the executive.

A poll was then taken for six full members, when the following were elected: Messrs. J. A. Bean (Northumberland County) A. Beaumont (Yorkshire County, East Riding), C. Lund (Cleckheaton), L. Roseveare (South Shields), F. W. Spurr (York), W. J. Steele (Newcastle).

It was proposed, seconded and carried that Mr. W. H. Goldsmith (Hull) be elected associate member for Yorkshire to serve on the executive. It was proposed, seconded and carried that Mr. G. H. Whitaker (Sunderland) be elected associate member on the executive for Durham. Having ascertained that Northumberland was not represented by any associate member, it was proposed, seconded and carried that Mr. S. M. Senior (York) be elected as the third associate member to serve on the executive.

Mr. F. W. Spurr, city engineer, York, then read his paper on "Works in Hand at York." [Reproduced in our issue of last week.]

Mr. E. R. Matthews proposed, and the District Chairman seconded, a vote of thanks to Mr. Spurr for his paper. Both speakers dealt with various points raised in the contribution, Messrs. S. Dyer (Bridlington), J. H. Drew (Wath-upon-Dearne), W. Fowlds (Keighley), W. J. Hadfield (Sheffield), L. Ives (Wakefield), W. J. Steele (Newcastle), C. F. Wike (Sheffield), and J. W. Hill (Wakefield), student, also taking part in the discussion.

Mr. Spurr afterwards replied.

The question of a Spring meeting at the village of the members of the institution was then discussed, and Mr. W. J. Steele, of Newcastle, kindly promised such a meeting on a date to be hereafter fixed.

Institution of Municipal Engineers.

JOINT WESTERN AND SOUTH-WESTERN DISTRICT MEETING.

(Conclusion.)

The Exeter portion of the joint meeting was held on Saturday, November 30th, the chair being again taken by Mr. Frank Latham, the president of the institution, who delivered the address, of which the text was given in our last issue.

SUPERANNUATION AND SECURITY OF TENURE.

The PRESIDENT, on the conclusion of his address, went on to say that at their meeting at Gloucester the previous day two resolutions, to which reference would be made later, were passed. With regard to the question of security of tenure no official desired that any measures should be sought by the institution which were arbitrary to the local authority. They had no wish to tie the hands of any local authority in a way that would prevent their getting rid of officials who were not satisfactory. What they did desire was a little recognition, and it would be just as easy afterwards for an authority to get rid of a man who did not discharge his duties faithfully as it was at present. They simply asked for fair play, and to have it recognised as it was under the Public Health Act of 1847. They had many members of the institution who held the dual appointment of sanitary inspector and surveyor. A council could take away from their officer his appointment as surveyor, but before he could be relieved of his position as sanitary inspector the grievance had to go to the Local Government Board to receive their consent. They did not put forward their claim for absolute security of tenure; all they asked for was protection as under the Act of 1847, by which a surveyor could not be appointed or relieved of his office without the consent of a higher authority. In 1875, when that condition was omitted from the Act, the duties for which the officers were responsible were very much more onerous than in 1847, which was the transition stage. In 1875 the surveyor was left entirely in the hands of the municipal authority. He had to work with protected officers, and his lot was often made very hard. There was nothing stringent and nothing that any corporation could take exception to in the proposal of the institution, and when the matter was placed before the Association of Municipal Corporations he was sure if they knew how that institution regarded the matter they would support them in every way. He believed they would every chance of bettering what they proposed. They had a strong body behind them. As far as superannuation was concerned, it would be to the advantage of municipal bodies and officials to have a national fund from which superannuation might be drawn. Each municipal corporation would contribute to a central or national fund, *pro rata* to the salary paid to the officials in their own, and from that fund would be obtained the means of superannuation for the officer.

Mr. C. O. BAINES (Paignton) thanked the president for the full and able address he had given the meeting on security of tenure and housing and town planning. He fully endorsed all that had been said as to security of tenure, and he did not think any engineer or surveyor who was a fully appointed officer could doubt the wisdom of such a course, and the necessity for it. They must in the course of their duties have come across things which convinced them of the absolute necessity of pushing this matter home for all it was worth. They had no wish to take any unfair advantage of their employers by forcing them to do things which were unfair to the community; all they wanted was protection, so that they could carry out their duties properly. With regard to town planning, Mr. Aldridge, who delivered an address at the conference on the subject in that city the previous week, gave them some very good advice. It was not the big landowner who was the trouble; it was the small owner who was anxious to screw the last halfpenny out of the poorer people. That was the difficulty they were experiencing in regard to bad housing.

Mr. A. J. REDFERN (Honiton) said that when he came down from the Midlands a few years ago he found Devonshire different from what Birmingham was. He framed the same opinion as the last speaker however, and that was that in housing it was the small owner who was the biggest trouble to deal with. The large owners were fairly easy to get on with, and they could administer the laws very satisfactorily in their case, but when the little owner got on the council very often trouble began. The speaker went on to refer to certain instances of alleged persecution of officials, and said that if they got security of tenure they would have the protection they needed, and they would be able to go on in a straightforward manner without fear. His particular district comprised 73,000 acres, and he consequently had a lot of travelling to do. It was obvious that when a man got old he could not continue travelling hundreds of miles a week. Some provision must be made to keep him from spending his last days in poverty, and therefore it was highly important that the question of superannuation should be settled.

Mr. R. LAKE (Sidmouth) agreed that the main difficulty was with the small owner. He also thought that builders should pass a qualifying examination the same as themselves. Very often a man had no knowledge of masonry or carpentry, and he simply muddled along, while the surveyor had to put in most of his time watching him.

A MUTUAL DEFENCE FUND.

The PRESIDENT said he thought the time had arrived when a mutual defence fund should be established in connection with their institution. At the present time they had no fund devoted to that matter, and any expenditure under that head either came out of the general funds of the institution or from voluntary subscriptions. During the last two years they had had to face several matters. He suggested that if they increased their subscriptions by 2s. 6d. or 3s. they would get a sufficient sum to meet such cases. He invited discussion on the subject.

The SECRETARY read the resolution passed at Gloucester the previous day. It was as follows: "That this meeting of the Western District recommend the council of the institution to take immediate action to form a Mutual Aid and Defence Fund, to which contributions would be compulsory on the part of all corporate members and students."

Mr. BAINES moved that this meeting adopt the same resolution, with the addition of the words "and that a sum of 2s. 6d. be added to the annual contribution from each corporate member, and 1s. to that from each student."

Mr. C. DURIE (Williton) seconded and Mr. R. ELLIS (Tiverton) supported.

Mr. S. ALDAR (Exeter) said that as a young member of the profession and one practising, he saw the need for such a fund, and gave it his warm support.

Mr. T. JONES (Crediton), while fully in sympathy with the proposed fund, did not know whether it was wise to limit the contribution in the way suggested. Would it not be better to leave that point open for the executive to consider?

Mr. F. P. IVEY (Bristol) congratulated the institution on the steps they were taking that day. He thought their by-laws should be amended in such a way as to legalise the action they were taking, and not make it a professional matter. It was a great shame that there were persons going about taking upon themselves the name of engineers and surveyors who were in no way capable of performing the duties and who took time to train outside [illegible] those who had by careful study and considerable expenditure of money obtained their degrees.

Mr. T. G. TAYLOR (Plymouth) said if they got recognition by the Local Government Board, like sanitary inspectors, they would have no need for a defence fund, and what they collected from the members could be employed to help on young students. They must be united and compel recognition just in the same way as other officials were.

Mr. A. TILLOTSON (Honiton) complained of the family influence that was sometimes brought to bear in connection with appointments to public bodies and of offers to accept positions at reduced salaries. That was having the effect of cutting down salaries all over the country in regard to the junior appointments. They found assistant surveyors being

paid £50 a year. It was not a living wage. It was a shame to expect a young man who had served his articles to take up appointments as assistant engineers and surveyors and carry out the responsible duties for £50 a year.

Mr. ALGAR concurred in the opinion that a young man of inferior ability was often pushed into an office by influence, whereas another who had served his articles had to stand down. He should like to see something done to put a stop to this sort of thing.

The PRESIDENT said the council had before them an important matter in connection with the student section of the institution, which would be very much to the students' advantage. It was a very big matter, and was in its infancy at present, but they hoped to develop it into an important scheme. He brought the matter forward in council some time ago owing to the fact that he found there were young fellows whose parents had paid for their articles as students and they were practically left to themselves. There were many cases in which young men applied to them to know what books they should read, and yet it was found they had been pupils of surveyors for over twelve months. There were surveyors who took the premiums and the parents were ignorant that they were articling their sons to men who were too busy to attend to the pupils as they should do. They were often left to assistants in the office who wanted teaching themselves. It was absolutely ridiculous. They must, he added, agitate to get their profession to a better state. He knew of cases in which pupils had paid high premiums and had simply been thrown out on the world afterwards. It was a standing disgrace to the profession.

The resolution proposed by Mr. Baines was unanimously adopted.

The meeting then proceeded to a discussion of the papers on working-class housing, submitted by Messrs. Leonard Caplen and Sidney Palmer. The former has already appeared in our columns, the latter we give below.

WORKING CLASS HOUSING.

By S. PALMER, P.A.S.I.

Having already written a paper on the subject of houses for the working classes, which was read to the institution last May, I am afraid I have nothing much I can add to that paper. However, I will again state my views as briefly as possible.

ACCOMMODATION.

With regard to the accommodation to be provided, I am convinced that before we can build really economic buildings we must get the working classes to dispense with that bogey the sitting-room, which is hardly ever used except for knick-knacks. We must, it seems to me, see that every penny spent is for a useful purpose. I am therefore strongly of opinion that if one good-sized living-room is provided, in addition to a scullery, and three separate bed-rooms, all of which can be entered direct from the landing, those are all the rooms that are really necessary in a working-class dwelling, and all that can be provided of any useful size in a house which is to be let for 4s. or 5s. a week inclusive.

I submit with my paper a plan I have prepared which complies with the requirements I set out.

By keeping the entrances at the back, it allows of the best elevation being presented to the street or road on which the houses abut; it also allows one to dispense with a door out of the scullery, and this permits of the full use of the external wall of the scullery for sink, window and larder.

The coal shed and water-closet are in a small detached building, and a tip-up bath is introduced in the scullery.

SANITATION.

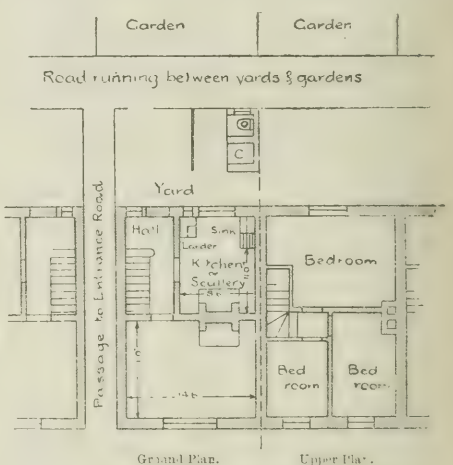
I am strongly in favour of spending more than is usually allowed in buildings of this class on the sanitary arrangements of the houses. These, to my mind, are more important than a larger number of small rooms.

Paving of good, durable quality should be laid to all the entrances and around the backs of the houses. Drains should be laid in as perfect a manner as possible, with proper manholes and glazed channels and barron bends, and good, heavy, airtight covers. Every wall should be rendered perfectly dry by covering with slates or other impervious material, or by building of granite blocks pointed in cement (which in my district would be as cheap as bricks), or hollow walls if necessary, anything rather than have damp walls and defective roofs.

Every ground floor should be covered with concrete, and every room ventilated with some well-devised ventilator that is not likely to be covered up either purposely or by, say, the hanging up of pictures. In the living-room I would suggest an ornamental ventilator in the ceiling over the gas jet, connected with a ventilating brick in the external wall by a tube in the depth of the first floor.

I am strongly of opinion that fireplaces in the bedrooms might well be dispensed with. The projections necessary for fireplaces take up a large amount of valuable room which cannot be spared in such small dwellings. Again, fireplaces in bed-rooms, even in villas, are seldom used, much less are they used in cottages where the man only earns probably 18s. or £1 per week.

Further, the ranges for these rooms and the fixing of them, together with the formation of additional flues and chimney pots, cost probably more than heating the rooms by a hot-water coil from the room below, and if this method is adopted, two of the bed-rooms, at a small initial cost (not exceeding that of grates, &c.), could be kept permanently dry, warm and well ventilated by reason of the air being warmed, and the full dimensions of the room could be utilised.



Of course, ventilation gratings at ceiling level would have to be introduced, as I said before, but this should be done, in my opinion, even when fireplaces are introduced, as fireplaces are not in the right position to act as ventilators, except when a fire is burning, which is very seldom the case in a bed-room.

I do not think I can add to my remarks, except perhaps that I have had considerable experience in dealing with the management of working-class dwellings in an urban district, and am strongly of opinion that good oil paint as internal decoration, although more expensive in the first place, is more economical than paper where there are children, and it is much more sanitary. I am of opinion also that, if possible, some use should be made of the space (often wasted) in the roof.

A long discussion followed, the interest evinced prolonging the meeting until ten o'clock.

SOUTHERN DISTRICT MEETING.

At a meeting of the Southern District of the institution held at 39 Victoria-street on Wednesday, December 11th, Mr. A. Winter Gray read a paper on "Superannuation and Security of Tenure." Mr. John Forrester, surveyor to the Theale Rural District Council, occupied the chair at the commencement of the proceedings, Mr. T. C. Barralet, surveyor to the Godstone Rural District Council, taking it later. At the conclusion of his paper Mr. Winter Gray moved the following three resolutions, which were seconded by Mr. Arthur Palmer, the honorary district secretary, and carried unanimously:—

(1) That this meeting recommends the council of the institution at once to consider the advisability of appointing a special committee to deal solely with the questions of superannuation, security of tenure and legal defence.

(2) That this meeting of the Southern District of the

institution recommends the council of the institution to take immediate action to form a Mutual Aid and Defence Fund, to which contributions would be compulsory on the part of all corporate members and students.

(3) That this meeting strongly urges every member of the institution in the Southern District forthwith to endeavour to form a local association in connection with the N.A.L.G.O. among his brother officers, or to co-operate with officials in the service of neighbouring authorities for the purpose of creating a joint association or guild.

MUNICIPAL WORK AT TIVERTON.

BOROUGH SURVEYOR'S REPORT.

Dealing with streets in his report for the year ended March 31st last, Mr. J. Siddalls, borough surveyor of Tiverton, states that the larger portion of the thoroughfares of the town were surface tarred during that period, partly with ordinary tar and partly with prepared or partially distilled tar, and owing to the long hot summer the advantages of the tarring were obtained to the fullest extent. In Mr. Siddalls' opinion the advantages in the way of economy and comfort derived from tar-spraying are more apparent in the case of the side streets even than on the main thoroughfares.

A length of "Rocmac" was laid down and proved very satisfactory under what, with one exception, is the heaviest and most concentrated traffic in the town, and the council decided to lay down a further portion of the material.

In regard to the sewerage system, the borough surveyor mentions that this has worked quite satisfactorily during the year, although there are signs that before long some improvements in the older portions of the system must be made.

The disposal of house refuse was attended with some difficulty. Owing to serious complaints in the early summer from residents, the deposit of the refuse at the site to which it was taken had to be abandoned. Efforts were made to dispose of it by hauling by means of a traction engine into the country, but it was found too expensive a process to continue, and in almost every case the place of deposit was in a field inaccessible in the winter with the engine. The damage also to the roads was very considerable, and, moreover, complaints were made with regard to the temporary deposit which it was necessary to make. Another site was then obtained. This, as regards capacity, would have served for many years, but here again, legal proceedings having been threatened, it had to be given up. A place of deposit has now been secured elsewhere. This site is remote from dwellings, and it is hoped may continue to serve the purpose for some time to come.

Worcestershire Roads.—The county road surveyor, Mr. C. F. Gettings, in his annual report, states that 1911 was the first year in which work was carried out under Road Board grants. Practically the whole of the strengthening and surface work approved by the board was completed. Although the council had appreciated that it was necessary to increase the estimates to provide for a larger expenditure on foundation work and improved surfaces, the amount allowed was insufficient to keep pace with the damages caused by the traffic referred to. From observations made during the past twelve months there was little doubt that the ordinary water-bound macadam surface was unsuitable for the heavy motor traffic. The Road Board had given grants for resurfacing with improved materials, but the amount allowed was totally inadequate for the requirements, and unless a much larger sum could be obtained the rate of progress made in this direction would be exceedingly slow. The Highways Committee had considered a comprehensive scheme for improving 57 miles of the more important main roads, but this was in abeyance until the programme for the year 1913 was submitted to the Road Board, when it was hoped the Board would be in a position to assist some scheme of this description by giving a much larger grant than had hitherto been received.—It was stated at the last council meeting that it was anticipated the Road Board would contribute not less than £15,000 a year for five years towards the cost of strengthening and improving the surfaces of certain first-class roads, on condition that the county council spent £5,000 annually.

SCOTTISH ROADS.

DEPUTATION TO SIR GEORGE GIBB.

On Friday last at the House of Commons a deputation of members of Parliament and others representing interests in the northern and western counties of Scotland was received by Sir George Gibb, chairman of the Road Board. Sir George was accompanied by Sir J. H. A. MacDonald, K.C.B., and Sir Charles D. Rose, Bart., members, and Mr. W. Rees Jeffreys, secretary of the board.

The proceedings were conducted in private, and lasted several hours. At the close an official account was supplied to the Press by Sir George Gibb to the effect that Lord Lovat and a number of members of the deputation addressed the board and urged the case of the northern counties of Scotland for special treatment from the Road Board.

The chairman replied on behalf of the board, and pointed out that the needs of improvement of roads was as great, if not greater, in the more populous counties in Scotland, and that in administering the Road Improvement Fund the requirements of the most important roads in the country must not be subordinated to the requirements of the more sparsely peopled counties. He, however, promised that the board would give careful consideration to the views of the deputation.

The point especially emphasised by the deputation was that the growth of traffic in the northern counties, and particularly motor traffic, for which outsiders were largely responsible, had very seriously affected the roads, and threw a heavy burden upon the local rates.

SOLVING THE CHRISTMAS GIFT PROBLEM.

Scientific American gives us an example worth emulating in this country of a course followed by a large manufacturer whose habit it is to send out Christmas presents to some of his customers. Assuming such a donor were in this country he would ask us to print the necessary number of cards in the following form:

> We have much pleasure in advising you that THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER will be sent to your address during the coming year, with the compliments of ———.

As our contemporary points out, such a course as this not only saves the worry and bother of having the gifts delivered at the proper time, but the arrival of THE SURVEYOR each week during the year serves to recall to the minds of the recipients pleasant memories of the donor. If it is your practice to give Christmas presents to your customers or employees, a year's subscription to THE SURVEYOR would be a gift of permanent value to the recipient.

WATER-STERILISING PLANTS WANTED.

Mr. R. O. Wynne-Roberts, M.INST.C.E., of Regina, Sask., Canada, is desirous of installing a water-sterilising plant which must be simple, self-contained and reliable. The city can generate electricity with two 80-horse power oil engines, which can be belted to dynamos. Hypochlorite is expensive, costing at least 1d. per lb. Salt can be had at 3½d. per lb., but is of unknown quality. Rock salt can be bought for 1 cent per lb. in bulk. It is desired to treat 2,000,000 gallons per day, and later to increase this to some 4,000,000 gallons. The water is very hard, but clear. We should be glad if firms who handle water-sterilising plants would send particulars of them direct to Mr. Wynne-Roberts, Regina, P.O. Box 65, and we should be obliged if they would at the same time notify us that they have sent such details.

THE CHRISTMAS HOLIDAYS.

Owing to the necessity for going to press earlier than usual, news and advertisement matter intended for insertion in the Christmas-week issue of "The Surveyor" must reach us not later than Tuesday morning, December 24th.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

ELEVENTH ANNUAL DINNER.

The annual dinner of this association was held at the Holborn Restaurant on Thursday night, the 12th inst., Dr. A. Bostock Hill, M.D., D.Sc., F.I.C. (medical officer of health for Warwick), the new president, being in the chair. Among those supporting the chairman were Dr. George Reid (past-president), Dr. Samuel Rideal (past-president), Mr. W. J. Dibdin (past-president), Mr. Sidney R. Lowcock, M.Inst.C.E., Prof. Henry Adams, Lieut.-Colonel A. S. Jones, V.C., Captain Jones, Mr. W. C. Easdale (Westminster), Mr. H. C. H. Shenton (Westminster), and Mr. E. White Wallis (secretary of the Royal Sanitary Institute).

After the customary loyal toast had been honoured,

The PRESIDENT said it was his pleasant duty to make a presentation to their old and revered friend Lieut.-Colonel Jones, V.C. He believed that nothing would be more dissonant to that gentleman's feelings than that he should dilate in an exaggerated form upon the many achievements that had made him one of the remarkable men of the age, but he must at all events say that they bore in mind the great service he had rendered on the field of battle. He referred to the fact that Lieut.-Colonel Jones had received at the hands of his Sovereign the most coveted distinction that any Britisher could have; and since he left the field of war for the fields of peace he had devoted his energies and his mind to a consideration of the principles underlying sewage disposal. Whether as a hero, or as one engaged in the scientific and practical work of sewage disposal, or, better still, as one whom they regarded as an upright gentleman in the best and truest sense of the word, he had the greatest pleasure in asking Lieut.-Colonel Jones to accept from them a small token of the high honour in which they held his services. He would present the gift—a stationery cabinet—with the words: "Titles add naught to his worth who is himself an honour to his title."

Lieut.-Colonel JONES, who was warmly applauded on rising to acknowledge the presentation, remarked that he was utterly floored on such an occasion as this. He could not thank them sufficiently for the great honour they had conferred upon him, but he must add that he felt utterly unworthy of their gift. He thought it must have been suggested by somebody who knew his slovenly writing habit, or somebody with an exaggerated idea of the proverb, "It's never too late to mend." Referring to his sewage farm experience, Lieut.-Colonel Jones said it was true he had left things in good order, but he had not, like his predecessor, to reclaim the land. It was the late James Beckham from whom he learned what he knew of sewage farming. For fourteen years he worked at the reclamation of the land, and he (Lieut.-Colonel Jones) then took up the work and continued it for seventeen years. When he had been in difficulties he was glad to say he had always had friends to help him out of them.

Dr. GEORGE REID, in proposing "The President," said that the name of Bostock Hill was so well known to be associated with the highest traditions and ideals of public health service that it was unnecessary for anything to be said to commend their president to their acceptance and appreciation. It must be a great satisfaction to Dr. Bostock Hill to see the numerous successes which were the direct result of his work and investigations. Since the publication of the last report of the Royal Commission, however, he (Dr. Reid) was afraid they would not be able to do with the local authorities what they had been able to do in the past. Only recently a county authority had received from a rural council a communication stating that they did not propose to proceed with certain projected works, and quoting as their authority the report of the Royal Commission. This particular district happened to be an extremely insanitary one, with a population upon the banks of a pure stream, who were anxious to turn their sewage into that stream. He ventured to suggest that one or some of the report would be greatly to the advantage of the expert witness. The commissioners had so extended the definition of purity, and mentioned so many circumstances that had to be taken into account, that he foresaw a great many opportunities for the intervention of the expert.

The PRESIDENT in response, expressed his high appreciation of the compliment they had paid him, not only that night, but in asking him to preside over this association for the coming year. He might say that the earliest knowledge he had was obtained in medical and public health circles, and almost the first thing he could remember was going, between 1860 and 1870, to take samples at the old Saltley sewage works, in the borough of Birmingham. They were all officers working for the good of the public health by seeking in their various spheres to prove those problems which were waiting for solution, and upon the solution of which would depend their progress in the cause of public health. The association was to be congratulated on the fact that its members gave to each other from the store of their knowledge facts which would otherwise go unrecorded. They must have bases for their theories, and the facts collected by the members and criticised by them were of the greatest value in the progress of the science in which they were all interested. With respect to the eighth report of the Royal Commission, he wished to take the opportunity of saying that after the enormous amount of time consumed by the commissioners, and the vast sums of money spent by them, he thought the results, as summarised, wonderfully small. He really doubted whether they were any advance at all, and he was inclined to believe that they tended to put back the clock rather than advance it.

The PRESIDENT next asked Mr. Daniel Ledsom to accept from the members an illuminated address and a roll-top desk, as part of the debt of gratitude the association wished to pay for his services to it, as well as an expression of regard and esteem.

Mr. LEDSOM returned thanks in a brief speech, saying it had been a work of pleasure for him to act as secretary for the Manchester district.

Dr. SAMUEL RIDEAL submitted "The Association," and incidentally alluded to the report of the Royal Commission. It was interesting to know, he said, that in America, where they had also had a sewage commission holding an inquiry, the commissioners had arrived at almost the same conclusion as the British Commissioners. They had concluded that effluents were not to be judged *per se* as effluents, but that the stream into which the effluent flowed was to be judged as suited or not for the work it had to do. With respect to the association, they had enrolled twenty-one new members since the last annual meeting, and there was now a total membership of 238, which, he thought, was very creditable after an existence of eleven years. He trusted that the status of the sewage manager would be appreciated and grow, and that he would be more and more looked upon as a public health officer carrying out public health work.

Mr. SIDNEY R. LOWCOCK and Mr. J. B. CROLL replied in speeches showing the strength and financial prosperity of the association. There was, it was stated, considerably over £300 in hand, while £150 had been added to the reserve, and a bank balance of nearly £85 had been carried forward.

Mr. GEORGE A. HART proposed "Kindred Societies," remarking that the sewage works manager was necessarily a handy man, as he was supposed to be an expert agriculturist on the one hand, while on the other he might be called upon to give an opinion upon an abstruse matter of mechanical repair.

Prof. HENRY ADAMS, in his response, remarked that kindred societies divided themselves into medical and engineering groups, and there was no rivalry or jealousy between them.

Mr. W. J. DIBDIN gave "The Visitors." They were told, he said, that there was nothing new under the sun. This was proved by the substance of the report of the Royal Commission, which was the same as the substance of the evidence he had the honour of placing before the Royal Commission twenty-eight years ago in regard to the treatment of London sewage. They had, he thought, reason to be satisfied with the result of their treatment of the sewage of London, as they had attained their object, not so much of obtaining drinking water, but of removing from the Thames the horrible impurities which then made the water so black that it was possible to write a letter with it.

Mr. WHITE WALLIS responded.

Bayard Cars.—Messrs. Clement Talbot, Limited, who are the sole concessionaires in the British Isles for Clement Bayard cars, manufactured by Mons. A. Clement Bayard, of Levallois, Paris, have taken premises at 98 High-street, Marylebone, W., for the purpose of handling these excellent French cars, under the name of Bayard Cars, Limited.

SOME RECENT PUBLICATIONS.*

The Geology of Soils and Substrata: With special reference to Agriculture, Estates and Sanitation. By Horace B. Woodward, F.R.S., F.G.S. Price 7s. 6d. nett. London: Edward Arnold.

The range of this important work is correctly indicated by its title, and the subjects which receive special attention are those mentioned in the subtitle, using the three words in a wide significance. While the importance of the book will be best appreciated by those who exercise some superior control over land development and estates management, scientifically or administratively, it will prove stimulating and suggestive to a larger class, including many who are practically engaged on work connected with soils and substrata, and all Englishmen who wish to know their England, for, wide as is the scope of the book, the author's intimate knowledge of his country gives a peculiar charm to those parts of it which deal specifically with places in England. As is customary and desirable in a work of this kind, the illustrations are in many cases *the* illustrations which have passed the test of recognition in scientific journals. Such are the general geological sections, many of which are excellent drawings from "The Geology of England and Wales." The author has, in addition, provided liberally in this matter for the special requirements of the work before us, so that the illustration of the book is throughout excellent.

Engineers must not expect to find more than passing references to roads and to irrigation works, and these references seem in some cases hardly to be called for, since the author is necessarily precluded from going further into the subjects; but in both branches of engineering the book, indeed as a whole, is of much value. An important feature is the continual reference by footnotes, and by lists of papers and books placed at the ends of chapters, to authoritative matter relating to the many subjects briefly dealt with in the work itself, and another valuable feature is an index of seventeen pages.

After a brief introduction the author deals, in three chapters, with the relations between geology and the soil, and the preparation of geological and soil maps. A chapter on subsoils and substrata is followed by an account of weathering and the formation of surface soils, these three chapters forming a group in which the nature of soils and substrata, from this point of view, is dealt with very effectively. Climates and other physical influences are next considered, and a chapter on analyses, soil constituents and plant foods is followed by an excellent summary of the main facts as regards the relation of geology to fertility and barrenness of land. A chapter on drainage and irrigation includes some account of water meadows, which are valuable assets in many pastoral districts in England. The author fails to note, however, that in many cases the usefulness of the water in producing early crops of grass is due, not to its effect in wetting the soil, but to the quantity of heat which it contains in the range of temperature between that of the open soil and that of the underground stores of water which feed the springs. Next follows a chapter on manures, a useful portion of which is the account of natural mineral manures; and the author then deals with forests, orchards, market gardens, and vineyards. The next two chapters, which will no doubt prove of special interest to estate owners, are devoted to a summary of important facts relating to mineral rights and economic materials, sites for houses, farm drainage, and so on, with some very useful remarks as to water supply and drainage. The remainder of the paper is devoted to a summary of the main features of the geological formations of England and Wales in relation to the subject of the book, and here the author is able to make excellent use of his profound study of English and Welsh geology, a knowledge of which is of great value generally as a basis for special studies in other parts of the world.

The subject dealt with is one in which the faculty of judgment in matters of fact, and a good sense of the value of evidence, are of more importance than the literary skill and talent for composition which might otherwise be missed in the volume before us, and the author has succeeded in writing a book which stands as a clear presentment of a subject of great economic importance and as an authoritative marshalling of leading facts.

Structural Economy. By E. A. Slater, Assoc.M. Inst.C.E. Price 6s. nett. London: The St. Bride's Press.

This work, which is based entirely upon the author's practical experience and observation of the matters upon which he writes, must not be confused as regards its scope with the ordinary descriptive text-books on the details of building or engineering construction. Its object is to enable the reader to compare possible alternative methods of construction in any given case as regards economy and efficiency, so that the maximum value may be obtained from the capital sunk in a building. In dealing with various parts of structures from this point of view, the author not only has regard to the first cost of the different modes of construction, but he also takes into consideration their respective costs of maintenance. The book is not confined entirely to those matters which affect the builder and architect, but it also touches on engineering matters—such as roads, tramways and reservoirs. Further, such calculations as are required to enable the reader to follow the argument are set out at the end of the book—and they are all of a simple character. The specific matters dealt with include, among others, foundations, walls, ground and upper floors, roofs and roofing materials, girders, ventilation, heating, drainage, corrugated iron buildings, fencing, planning of buildings, economical planning of an industrial suburb, paving, roads, tramways, quays, reservoirs, bridges and cuttings. The costs of the various alternatives are worked out in detail, with full explanations and notes in each case, so that the value of the book to the engineer or architect will be readily appreciated. An example at random of the method adopted is afforded by the treatment of boundary fencing. A detailed comparison is given of the costs of deal fencing, 9-in. brick wall in cement, unclimbable iron fence, and pier and panel concrete wall; hints on construction are given; and the text is well illustrated. The book will prove an invaluable addition to the library of the engineer, architect, or contractor, and its use as a reference work in daily practice will save many a sovereign which would otherwise have been spent without any corresponding improvement in the building or structure concerned.

The Royal Insurance Company, Limited have issued a sixth edition of their now well-known little red-covered book, "Rules of Golf." We have no doubt our golfing readers can obtain it free of charge on application to the general manager, 1 North John-street, Liverpool.

Skeleton Frame Buildings: District Surveyors' Fees.

On the 9th inst. at Lambeth Police Court Mr. Hopkins, Messrs. Spiers & Son, Limited, builders, of Hill-road, St. John's Wood, the *Times* reports, were summoned by Mr. Bernard Dicksee, district surveyor, for the recovery of £18 19s. 9d., fees alleged to be due to him in respect of a building at New Kent-road. This was a friendly action brought before the court in order to obtain a decision as to the fees payable to district surveyors in respect of skeleton frame buildings. Before the London County Council (General Powers) Act of 1909 all the London building Acts were based on the assumption that the buildings would be of brick construction. In order to meet the case of steel frame buildings the Act of 1909 was passed. Section 26 of that Act provides that the amount of the fee payable to district surveyors in respect of such buildings shall be equal to 2½ times the amount of the fee specified in regard to new buildings in Part I. of the third schedule of the Act of 1894. The contention of Mr. Pasmore, on behalf of the district surveyor, was that that fee was in addition to, and not in substitution of, the fee specified in the Act of 1894. The account of Mr. Dicksee was put in. It included an item of £4 2s. 6d., the fee chargeable under the old Act, in addition to the fee of £10 6s. 3d. payable under the 1909 Act, and it was to the former item that the defendants took exception. Mr. Dicksee, in giving evidence, said the amount of extra work entailed by steel frame buildings was perfectly enormous. On behalf of the defendants Mr. Price argued that the natural interpretation of sec. 26 of the Act of 1909 was that the fee therein stated was in substitution for the fee provided by the Act of 1894. Mr. Hopkins took that view, and gave judgment for the district surveyor for the amount claimed, less the £4 2s. 6d. in dispute.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. THOMAS, M.INST.C.E., County Surveyor, Buckinghamshire.

SCOTTISH DISTRICT MEETING.

A meeting of the Scottish District will be held at Falkirk on Saturday, December 21st.

SOUTH-EASTERN DISTRICT.

A meeting of members of the above district will take place at Sidcup at 2.30 p.m. on Wednesday, January 8th, when the road sections will be inspected.

Mr. Maybury has kindly consented to supply the revised cost of the trial lengths up to December 31st; the meeting will be followed by a dinner at Frascati's Restaurant, Oxford-street, at 6.30 p.m.

MEETING AT SWANSEA.

A meeting of the institution will be held at Swansea on Saturday, January 11, 1913.

NORTH-EASTERN DISTRICT.

A meeting of the institution will be held in the North-Eastern District at Newcastle-on-Tyne on May 2nd and 3rd next.

THOMAS COLE,
Secretary.

11 Victoria-street, S.W.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **THE SURVEYOR** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—December 21st.—Corporation of Ludlow. £200 per annum.—Mr. John H. Williams, town clerk.

SURVEYOR.—December 21st.—St. Bartholomew's Hospital.—Mr. Thomas Hayes, clerk to the governors.

CLERK OF WORKS.—December 21st.—East Suffolk County Council.—Mr. W. Jervis, chief surveyor of main roads, County Hall, Ipswich.

TEMPORARY ASSISTANT.—December 21st.—Corporation of Rotherham. £2 10s. per week.—Mr. Ernest B. Martin, borough engineer.

DEPUTY BOROUGH ENGINEER AND SURVEYOR.—December 23rd.—Corporation of Warrington. £200 per annum.—Mr. Andrew M. Ker, borough engineer and surveyor.

SURVEYOR.—December 27th.—Consett Urban District Council. £175—£205.—Mr. H. Jackson, clerk.

SURVEYOR'S ASSISTANT.—December 27th.—Consett Urban District Council. £52—£67.—Mr. H. Jackson, clerk.

TEMPORARY ARCHITECTURAL ASSISTANT.—December 28th.—Dartford Urban District Council. £2 10s. per week.—Mr. T. E. Tiffin, surveyor.

CLERK OF WORKS.—December 28th.—Hyde Town Council.—Mr. T. Brownson, town clerk.

ARCHITECTURAL ASSISTANT.—December 30th.—Corporation of Nelson. £90 per annum.—Mr. J. H. Baldwick, town clerk.

CLERK OF WORKS.—December 30th.—The Rivers Commissioners of the Manchester Corporation. £3 3s. per week.—Mr. Thomas Hudson, town clerk.

ENGINEER-IN-CHIEF.—December 31st.—Mersey Docks and Harbour Board.—Mr. Alfred Chandler, general manager and secretary.

STEAM-ROLLER DRIVER.—December 31st.—Corporation of King's Lynn. 27s. per week.—Mr. Alfred J. Smith, borough surveyor.

INSPECTOR OF NUISANCES AND SURVEYOR.—December 31st.—Shoreham Urban District Council. £225 per annum.—Mr. H. Brown, clerk.

SECOND ASSISTANT SURVEYOR.—January 3rd.—Cannock Urban District Council. £52 per annum.—Mr. C. A. Loxton, clerk.

ASSISTANT.—Blackwell Rural District Council. £75 per annum.—Mr. H. Silcock, surveyor, 67 Westgate, Mansfield.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **THE SURVEYOR** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

BELFAST.—January 1st.—Designs for 126 houses of two apartments each, and 126 houses of three apartments each, for the corporation. Premiums are offered of £25, £15, and £10.—Mr. R. Meyer, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

HARROGATE.—February 3rd.—Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

DUBLIN.—February 6th.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A.—The Town Clerk.

RANGOON.—March 1st.—Designs for municipal buildings. Premiums are offered of £300, £200, and £100.—The Clerk to the Rangoon Municipality.

WINNIPEG.—March 1st.—Designs for city hall. Limited to British architects in Canada. Premiums are offered of 5,000 dols., 3,000 dols., and 2,000 dols.—The Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **THE SURVEYOR** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

BRAINTREE.—December 21st.—For the erection of caretaker's lodge, and dressing boxes at public baths, for the urban district council.—Mr. H. H. Nankivell, surveyor.

STAFFS.—December 21st.—For the erection of an institute, for the Education Committee.—Mr. G. Balfour, director of education, County Education Offices, Stafford.

WARRINGTON.—December 21st.—For the construction of concrete foundation works, for the corporation.—Mr. James Gray, water engineer.

BRADFORD.—December 21st.—For alterations to schools and erection of a boundary wall, for the Education Committee.—Director of Education, Town Hall.

EXETER.—December 23rd.—For the extension of the isolation hospital, for the corporation.—Mr. H. Lloyd Parry, town clerk.

PRESTWICH.—December 23rd.—For the erection of buildings and walls in connection with the extension of the town's yard, for the urban district council.—Mr. Lewis A. Orford, clerk.

HAMBLEDON.—December 23rd.—For the construction of a reservoir, for the rural district council.—Mr. F. Smallpiece, clerk, 138 High-street, Guildford.

PORTSMOUTH.—December 23rd.—For repairs and alterations at schools, and pulling down four houses, for the Education Committee.—Mr. G. Hammond Etherton, clerk.

TWICKENHAM.—December 27th.—For the construction of a stone-pitched inclined embankment along the river frontage, for the urban district council.—Mr. H. Jason Sanders, clerk.

SOUTHAMPTON.—December 30th.—For the reconstruction of Fore Bridge, for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

ALTRINCHAM.—December 30th.—For the erection of a shelter and conveniences, for the urban district council.—Mr. H. E. Brown, surveyor.

SOUTHGATE.—December 31st.—For the construction of an open-air swimming bath, for the urban district council.—Mr. C. G. Lawson, surveyor.

EAST HAM.—December 31st—January 21st.—For the erection of a school, for the Education Committee.—Mr. F. R. Thompson, secretary, Town Hall.

EAST RIDING.—January 1st.—For alterations to school, and erection of a school and teacher's house, for the county council.—Mr. J. Bickersteth, clerk, County Hall, Beverley.

HERTS.—January 2nd.—For the erection of a police station, for the Standing Joint Committee.—Mr. U. A. Smith, county surveyor, Hatfield.

CHATHAM.—January 4th.—For the erection of a school, for the Education Committee.—Mr. G. F. Bond, High-street, Rochester.

MANCHESTER.—January 8th.—For reinforced concrete work, for the corporation.—Mr. Thos. Hudson, town clerk.

WEST RIDING.—January 10th.—For the erection of a school, for the Education Committee.—Mr. Francis Alvey Darwin, clerk, County Hall, Wakefield.

PEMBROKE.—January 11th.—For the erection of a school, for the Education Committee.—Mr. H. E. H. Jones, clerk, County Education Offices, Haverfordwest.

FLINT.—January 14th.—For the erection of an elementary school, for the county council.—Mr. Sam. Evans, county surveyor, County Offices, Mold.

LANCASHIRE.—January 14th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

MANCHESTER.—January 15th.—For the construction of a public library, for the corporation.—Mr. Thos. Hudson, town clerk.

Iron and Steel.

BRADFIELD.—December 21st.—For the supply of engines and pumps for waterworks at Stratfield Mortimer, near Reading, for the rural district council.—Mr. R. E. Rawstorne, clerk, 4 Bridge-street, Caversham, Reading

SALFORD.—December 23rd.—For the erection of three "Livesey" washers at gasworks, for the corporation.—Mr. L. C. Evans, town clerk.

BURY.—December 27th.—For the supply of iron castings, for the District Joint Water Board.—The Clerk, Bank-street, Bury.

RYE.—January 8th.—For the supply of cast-iron socket pipes and irregulars, for the corporation.—Mr. W. Dawes, town clerk.

SWANSEA.—January 9th.—For the supply of steelwork, for the Harbour Trustees.—Mr. T. Strick, clerk.

Roads.

HAMPSHIRE.—December 23rd.—For the formation of a gravelled footway, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

EGREMONT.—December 23rd.—For works of kerbing and paving, for the urban district council.—Mr. John Nelson, clerk.

SOUTHALL-NORWOOD.—December 24th.—For making up and channelling work, for the urban district council.—Mr. R. Brown, engineer and surveyor.

ELGIN.—December 24th.—For the supply of road metal, for the county council.—Mr. A. Hogg, county road surveyor, 24 Academy-street, Elgin.

MERTON.—December 27th.—For making up a road, for the urban district council.—Mr. G. Jerram, surveyor.

EXMOUTH.—December 28th.—For excavation, sand filling making concrete footpaths, foundations of carriageways, and supply of tar-macadam for finishing coat of carriageways, for the urban district council.—Mr. Samuel Hutton, engineer.

WALMER.—December 28th.—For the supply of clean flints, for the urban district council.—Mr. H. W. Barker, surveyor.

DERBYSHIRE.—December 30th.—For the supply of granite, basalt, slag, limestone, tarred macadam, and tarred chippings, for the county council.—Mr. J. W. Horton, county surveyor, St. Mary's Gate, Derby.

LLANTRISANT AND LLANTWIT FARDRE.—January 1st.—For the completion of the new Ely Valley-road, and branch roads, about 3 miles in length, for the rural district council.—Messrs. Gomer S. Morgan & Thomas Saunders, engineers, School-street, Pontyclun, Glam.

SEVENOAKS.—January 1st.—For the supply of chert, flints and ragstone, granite, quartz, basalt, steam rolling, team labour, cartage and hauling, for the rural district council.—Mr. F. H. Vibert, clerk.

HULL.—January 1st.—For flagging work, for the town council.—Mr. A. E. White, city engineer.

HARWICH.—January 1st.—For the supply of broken granite and granite chippings, for the corporation.—Mr. F. Harold French, borough surveyor.

HOVE.—January 1st.—For laying wood paving, for the corporation.—Mr. H. H. Scott, borough surveyor.

DENBIGH.—January 1st.—For the supply of road stone and tar-macadam, for the county council.—Mr. Ellis W. Jones, county surveyor, Wrexham.

WHITLEY UPPER.—January 1st.—For road rolling and scarifying, for the urban district council.—Mr. Joe Sharp, clerk.

READING.—January 2nd.—For making-up work, for the corporation.—Mr. J. Bowen, borough engineer.

SALE.—January 2nd.—For works of paving and flagging, for the urban district council.—Mr. D. Hallewell, clerk.

DORSET.—January 4th.—For steam rolling on 458 miles of main roads for three years, for the county council.—Mr. W. Townshend Fletcher, county surveyor, Dorchester.

DORSET.—January 4th.—For the supply of granites, basalts, quartzites, limestones and tar-macadam, for the county council.—Mr. W. Townshend Fletcher, county surveyor, Dorchester.

NORTH RIDING.—January 4th.—For work of steam rolling and scarifying, for the county council.—Mr. W. G. Bryning, county surveyor, County Hall, Northallerton.

SUNBURY-ON-THAMES.—January 6th.—For the supply of 4,000 gallons of refined tar, for the urban district council.—Mr. H. F. Coales, surveyor.

GLANFORD BRIGG.—January 6th.—For the supply of granite and slag, for the rural district council.—Mr. Frank C. Hett, clerk.

EASTHAMPSTEAD.—January 7th.—For the supply of broken or unbroken granite, slag, limestone and flints, for the rural district council.—Mr. C. B. Wilson, clerk.

EAST GRINSTEAD.—January 8th.—For the supply of 20,000 gallons of tar, prepared in accordance with the Road Board's specification for tar No. 1, for the rural district council.—Mr. Francis S. White, clerk.

KESTEVEN.—January 8th.—For steam-rolling work, for the county council.—Mr. W. B. Purser, county surveyor, Grantham.

MIDHURST.—January 11th.—For the supply of granite and tar-macadam, for the rural district council.—Mr. A. G. Gibbs, surveyor.

ANTRIM.—January 11th.—For tar treatment and steam rolling in certain roads, for the county council.—Mr. Alexander Millar, deputy-secretary, County Courthouse, Belfast.

GLOUCESTER.—January 13th.—For the supply of road stone, for the county council.—Mr. S. E. Sinnott, county surveyor, Shire Hall, Gloucester.

CHELMSFORD.—January 16th.—For carrying out street work, for the corporation.—Mr. G. Melvin, town clerk.

SCUNTHORPE.—January 29th.—For making up a certain street, for the urban district council.—Mr. W. M. Hett, clerk.

Sanitary.

HARROGATE.—December 21st.—For the supply of disinfectants, for the corporation.—Mr. James Mair, medical officer of health, 33 Swan-road, Harrogate.

COATBRIDGE.—December 21st.—For the construction of sewage disposal works in reinforced concrete, for the corporation.—Mr. John Alston, town clerk.

MIDHURST.—December 23rd.—For the removal of house refuse and street scavenging, for the rural district council.—The Clerk.

LIMAVADY.—December 23rd.—For the construction of sewers, for the rural district council.—Mr. S. H. Crawford, clerk.

KILRUSH.—December 24th.—For the construction of sewerage works, for the rural district council.—Mr. T. J. Kelly, clerk.

LANCHESTER.—December 25th.—For laying pipe sewers, for the rural district council.—Mr. W. H. Ritson, clerk.

BOSMERE AND CLAYDON.—December 26th.—For scavenging work, for the rural district council.—Mr. R. M. Cook, clerk, 6 Providence-street, Ipswich.

FRIMLEY.—December 28th.—For the removal of house refuse for three years, for the urban district council.—Mr. F. T. S. Marsh, clerk, Municipal Buildings, Camberley.

WOKING.—December 30th.—For the construction of sewers and manholes, for the urban district council.—The Clerk.

LEYTON.—December 31st.—For laying stoneware sewers, for the urban district council.—Mr. E. H. Essex, Town Hall.

HARWICH.—January 1st.—For laying sewers and other works, for the corporation.—Mr. F. H. French, borough surveyor.

KIRKCUDBRIGHT.—January 2nd.—For the construction of a drainage scheme, for the county council.—Mr. William McConnel, district clerk, Gatehouse-of-Fleet.

READING.—January 2nd.—For works of sewerage, for the corporation.—Mr. W. S. Clutterbuck, town clerk.

SOUTHWELL.—January 2nd.—For constructing sewerage and settling tank, for the rural district council.—Mr. J. Ellis, clerk.

BUNTINGFORD.—January 8th.—For the construction of a precipitation tank at sewage works, for the rural district council.—Chairman of the Council.

PORT SAID.—March 1st.—For the construction of drainage works, for the municipality.—Mr. A. L. Webb, C.M.G., Queen Anne's Chambers, Broadway, Westminster.

Stores.

DOUGLAS (Isle of Man).—December 27th.—For the supply of stores for the several departments, for the Stores Committee.—Borough Surveyor.

HASTINGS.—December 30th.—For the supply of soap, soda, manhole covers, gullies, brooms and brushes, for the corporation.—Mr. P. H. Palmer, borough engineer.

SLOUGH.—January 4th.—For the supply of stoneware pipes, gullies, Portland cement, tar oil, distilled tar, Tarvia and prepared granite or macadam, for the urban district council.—The surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

BLAYDON.—For works of making-up, for the urban district council:—

J. W. Henderson, Gosforth	£1,880
J. Friend, Blaydon-on-Tyne	1,742
G. Armstrong, Whitley Bay	1,715
G. Dyon, Chester-le-Street*	1,662

Surveyor's estimate, £1,830.

CHELSEA.—For the reconstruction of a portion of the Ranelagh sewer under Chelsea Hospital gardens, for the London County Council:—

Holloway Brothers, Limited, London	£12,420
J. Ford, Willesden	11,698
J. Mowlem & Co., Limited, London	10,823
W. Underwood & Brother, Dukinfield	10,803
E. Bentley & Son, Tooting, S.W.	9,800
Airds, Limited, London	9,498
Griffiths & Co., Limited, London	9,168
J. Cochrane & Sons, Limited, London	7,784

Chief engineer's estimate, £8,600.

HOVE.—For paving and other works, for the corporation.—Mr. H. H. Scott, borough surveyor:—

J. Parsons & Sons, Hove, £479.

ISLINGTON.—For the enlargement of the girls' and infants' playground of the Pakenham-street school, Islington, for the London County Council:—

W. Silk & Son, Homerton	£1,185
A. J. Staines & Co., Limited, London	1,252
E. Lawrence & Sons, Limited, City-road	1,213
G. S. S. Williams & Son, Barnsbury	1,192
W. Benson, London	1,179
W. Lawrance & Son, London	1,120
McLaughlin & Harvey, Limited, Islington	1,093
Stevens & Sons, Crouch hill	1,080
Brand, Pettit & Co., Tottenham†	1,026

The architect's estimate, £1,174.

MATLOCK.—For alterations and additions to the town hall, Mr. J. Turner, surveyor:—

J. W. Wildgoose, Matlock	£243
W. Boden, Matlock	245
F. Hopkinson, Matlock	234
E. W. Tayara, Matlock*	233

PONTARDAWE.—For laying sewers and water mains, for the rural district council.—Mr. John Morgan, engineer, Herbert-chambers, Pontardawe.

Contract No. 1.

T. Walker, Clydach	£546
S. R. Hill, Sketty	466
R. Clarke, Pontardawe*	418

Contract No. 2.

E. J. Hanney, Morriston	£637
T. Walker, Clydach	636
S. R. Hill, Sketty*	631

RHYMNEY.—For works of street improvement, for the urban district council.—Mr. William Lloyd Marks, surveyor:—

Evan & Co., Nelson, £262.

ROCHDALE.—For making-up a certain street, for the corporation:—

R. & Y. Howarth, Rochdale.

STOCKPORT.—For the erection of a shelter, bowl-house and tennis pavilion, for the corporation.—Mr. J. Atkinson, borough surveyor:—

D. Eadie & Co., Limited, Stockport, £785.

TRING.—For street and sewerage works, for the urban district council:—

MAKING UP LONGFIELD-ROAD.

R. W. Swaker, Hounslow	£3,265
W. Wright, Chesham	2,766
Langley & Johnson, Slough	2,681
Exors. of J. Smith, Hughenden	2,606
Green & Co., Aylesbury	2,490
W. Lee, High Wycombe	2,450
H. Williams, St. Albans	2,356
Free & Sons, Maidenhead*	2,293

Surveyor's estimate, £2,263.

SEWER IN BEACONSFIELD-ROAD.

Langley & Johnson, Slough	£152
H. Williams, St. Albans	142
Green & Co., Aylesbury	119
W. Lee, High Wycombe	125
Free & Sons, Maidenhead	125
W. Wright, Chesham*	110
R. W. Swaker, Hounslow	110

Surveyor's estimate, £120.

SEWERS IN MISWELL LANE AND AYLESBURY-ROAD.

Langley & Johnson, Slough	£266
H. Williams, St. Albans	260
Green & Co., Aylesbury	244
Free & Sons, Maidenhead	243
W. Lee, High Wycombe	230
W. Wright, Chesham*	226
R. W. Swaker, Hounslow	226

Surveyor's estimate, £200.

UXBRIDGE.—For the collection and removal of house refuse, for the rural district council.—

Cowley Parish.—R. Martin, Uxbridge, £24.*
Harefield.—C. Filkens, Harefield, £50; H. Tilley, Harefield, £17.*
Hillingdon.—G. Salter, Hayes, £61; F. Whale, Hillingdon, £57*; R. Martin, Uxbridge, £50.
Northolt.—F. J. Reed, Northolt, £32.*
West Drayton.—F. Cook, West Drayton, £49.

WAKEFIELD.—For the execution of private street works, for the corporation.—Mr. J. P. Wakeford, city surveyor:—

Dale-street.—G. Hall, Wakefield, £330.
Jessop-street & Pilkington-street.—Higgins & Pashley, Wakefield, £517.

WEST HAM.—For the erection of fire brigade station and firemen's dwellings at Silvertown, for the corporation.—Mr. J. G. Morley, borough engineer:—

A. & S. Wheater, London	£8,199
Leslie & Co., Limited, Kensington	7,919
Newman, Limited, Ilford	7,705
E. Proctor & Sons, Plumstead	7,699
W. Payne, Watford	7,466
H. C. Horswill, Forest Gate	7,403
F. & G. Foster, Norwood	7,436
F. J. Coxhead, Leytonstone	7,290
S. E. Moss, Southend-on-Sea	7,150
J. W. Jerram, East Ham	6,915
A. E. Symes, Stratford*	6,914
O. P. Drever, Kettering	6,820

WEST HAM.—For the erection of a handicraft centre, for the corporation:—

W. J. Maddison, Canning Town	£919
J. J. Quarterman, Upton Park	900
A. Webb, Stratford	509
J. W. Jerram, East Ham	806
W. J. Clemens, Stratford	833
F. J. Coxhead, Leytonstone	817
Turnbull & Son, London	800
S. Blow, Limited, London	779
A. E. Symes, Stratford	777
J. Barker & Co., Plaistow	745
H. C. Horswill, Forest Gate	737
J. T. Luton, Stratford*	697

The committee rejected one tender which was not sent by registered post as required by the regulations.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

DECEMBER.

21.—Institution of Municipal and County Engineers: Scottish District Meeting at Falkirk.
21.—Institution of Municipal Engineers: Council Meeting.

JANUARY.

8.—Institution of Municipal and County Engineers: South Eastern District Meeting at Sidcup.
9.—Concrete Institute: Mr. W. Valentine Ball, Barrister-at-Law, on "Concrete in its Legal Aspect." 7.30 p.m.
11.—Institution of Municipal and County Engineers: Meeting at Swansea.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. DECEMBER 27, 1912. No. 1,093.

Minutes of Proceedings.

Royal Commission on Sewage Disposal.

The work in general of the Royal Commission, and its recently issued eighth report in particular, was the subject of the paper read by Lieut.-Col. Jones, V.C., M.INST.C.E., at the annual general meeting of the Association of Managers of Sewage Disposal Works. It is satisfactory to note that such an eminent authority as the author of the paper considers the recommendations contained in the report are "a common-sense view of the question, and if carried into effect the expense of much litigation and that of some unnecessary sewage treatment may be saved by ratepayers, besides gaining the advantage to all parties concerned of knowing for certain to what standard they must conform for periods of ten years." The paper was not discussed at any length, but from the brief remarks made upon the eighth report at the meeting and at the dinner which followed it the recommendations of the Commission are not considered satisfactory by medical officers of health and consulting chemists. So far as could be ascertained, this view is not held by sewage works managers and engineers who have charge of sewage disposal works. Everything will, of course, depend upon the manner in which the standards are administered, and, as Lieut.-Col. Jones points out, in the eighth report it is taken for granted that a central board and rivers authorities will be appointed as the commission proceeds to suggest rules for the procedings of such bodies. No definite reasons for their views were given by those who objected to the recommendations of this report, and we should have thought that the prescribing of a general standard by the authorities to be appointed for the purpose of preventing pollution and the fixing of definite periods during which such standards will apply, together with provisions for increasing or relaxing the stringency of the general standard according to the local conditions of particular cases, would have appealed to these objectors as being a fair and reasonable method of dealing with the subject. We shall, however, doubtless hear more of these objections later on.

As might be anticipated by those who are acquainted with the views held by the author of the paper, he regrets that so much of the outlay upon sewage disposal works is expended upon "artificial systems which can bring no money back, while land treatment grows valuable crops." We believe, however, that the idea of obtaining profit from the disposal of sewage is not now entertained to any great extent, and fortunately so, as, although it is not impossible to derive some little income occasionally from sewage works, it is of great importance that these should be operated with the sole view of disposing of the waste liquids without creating a nuisance, and experience has shown that this can only be done satisfactorily when all ideas of showing a profit are put on one side. With Lieut.-Col. Jones's suggestion that the Commission might have advised that sanitary authorities would find it good policy to increase the often inadequate salary of their sewage works managers we have every sympathy, but it would probably have been difficult to accept this as coming under their terms of reference. The only way in which this can be brought about is by educating local authorities to see that the efficiency of their works depends very largely upon the efficiency of their managers, and that efficient managers can only be secured and retained by the payment of adequate salaries. Fortunately the Association of Managers of Sewage Disposal Works is doing good work in this direction, and as it continues its efforts to provide efficient managers so will it have the effect of assisting to produce the adequate salaries which they so well deserve.

* * *

The Control of Advertisements.

The enormous increase in the practice of public advertisement which has taken place in recent years has not unnaturally led to a demand for some public control of a business (for such it is) which, although it has its legitimate uses, can so easily become a nuisance to the community. What are the proper functions of an advertisement? We are reminded of Carlyle's "Hatter in the Strand of London, who, instead of making better felt hats than another, mounts a huge lath and plaster Hat, seven feet high, upon wheels; sends a man to drive it through the streets; hoping to be saved *thereby*. He has not attempted to *make* better hats, as he was appointed by the Universe to do, and as with this ingenuity of his he could very probably have done; but his whole industry is turned to *persuade* us that he has made such!" We venture to say that if all the advertisements whose object is to *persuade* the public of a chimerical excellence were removed from our hoardings, the necessity for public regulation would be gone. The English law, however, is not so concerned with the effect on the national character of what Carlyle called the Deification of Quackery, as on the disfigurement of the landscape by hoardings and other vehicles of advertising. In these practical days we have to take things as we find them; and since the passing of the Advertisement Regulation Act, 1907, it is possible for local authorities at least to protect the amenities of their districts by exercising some control over the choice of sites to be used for advertising purposes. Whether the powers which are conferred by that Act are adequate for the achievement of the object in view is open to some doubt. It does not appear to have been put into force in many districts, only nineteen having made by-laws dealing with the control of advertisements under its provisions.

Mr. John S. Brodie, M.INST.C.E., the borough engineer of Blackpool, has collected very full information on the whole subject in a report which is being circulated for the information of members of the Institution of Municipal and County Engineers. The report will be found in another column.

and it shows what has been accomplished in various places, both under the general Act as well as under local Acts. The subject is one which will increase in importance with the growing complexity of our civilisation; for, as John Stuart Mill points out, if a man sets up business in a great community, "and trusts solely to the quality of his goods, he may remain ten years without a customer; be he ever so honest, he is driven to cry out on the housetops that his wares are the best." In a great community advertising is a necessity for the honest man and an opportunity for the quack. Hence the inevitability of its increase, and the necessity for placing it under public control.

* * *

Sub-Street Pipe Lines.

Municipal engineers in this country have realised to the full the wasteful expenditure and the serious inconvenience of reinstating roadways and footways after their cutting up for laying or repairing the sub-surface pipes that honeycomb them, but we do not remember to have seen the extent of the mischief expressed in exact terms. It has recently been done in America by Mr. George W. Tillson, consulting engineer, of Brooklyn, New York City, for the information of the road congress recently held at Atlantic City, and the figures are indeed striking. In the borough of Brooklyn, in 1911, the Bureau of Highways laid, over openings and trenches that had been made in the streets, sufficient pavements to pave a roadway 30ft. wide and 7 miles long. These facts, Mr. Tillson adds, are not peculiar to Brooklyn, and in other cities the extent of street openings is proportionate. The ideal remedy for this uneconomical process is, of course, subways for all pipes and wires, and it might be well worth considering how far their great capital cost could be lightened by charges to users. Meanwhile, Mr. Tillson points out, in New York a street cannot be paved until water, gas, and sewer mains have been laid and in Brooklyn, when a sewer is laid in an unpaved street, connections are made to the adjoining property, whether occupied or not, and their cost assessed against the lots benefited. In the same city there is a sub-surface bureau which is engaged in plotting accurately the positions of sub-surface structures. All applications for underground work are referred to this department, which, after an examination of the plans, assigns the location in the street for the proposed structure. This not only reduces to a minimum the tearing up of the pavements, but it also conserves the area of the street for future work. By locating the water mains of Brooklyn's new high-pressure system in the light of the knowledge gained from their plans, it is estimated that this department has saved the city an amount considerably more than the whole cost of the bureau to date. It is evidently possible, pending the arrival of the universal pipe-line subway, to do much, on lines suggested by the foregoing, to avoid some of the inconvenience and waste of money due to street openings. From a study of the condition of pavements which have been laid in front of cemeteries, parks, churches and other places where street openings are not often necessary, Mr. Tillson considers that, as a whole, street pavements in the business part of any city are damaged to an extent of 25 per cent of their cost by street openings.

* * *

Some Aspects of the French Highway System.

In a useful paper reproduced on another page of the present issue which he presented at the recent American Road Congress, M. de Pulligny dwelt upon several of the less familiar features of French road administration. While the main characteristics of the French system are well-known to most English highway engineers, we are confident that almost all of our readers will learn something fresh from M. de Pulligny's explanations of the financial arrangements as they have worked in actual practice, and from his lucid account of the measures taken for dealing with exceptional traffic. He also explained the position as regards certain associations which have, nominally, considerable powers in highway matters, though these powers have been exercised to only a small extent. As regards the suggestion that the example of France, in this respect, might be of some value to the United States, the position in the latter country seems to be such that there is, for the present, room for every kind of activity: the educational work of the Federal Government, the organisation of State highway departments or commissions, the local efforts of public-spirited citizens, and the propaganda of good roads associations. At the same time we must not lose sight of the idea so neatly expressed by Prof. F. P. Spalding, in the preface to his book on "Roads and Pavements," in the words: "The improvement of our common roads must come through transferring such work to the charge of those who make it a profession, and not through teaching the public how roads should be constructed." This is a shrewd blow at certain activities in the United States, but a worse thing would be that, in some country not to be mentioned, the public should want to teach the engineer how roads should be made and maintained.

The French system of highway administration is by no means a simple one, and some of the complications of financial adjustment and the apportionment of funds are referred to in M. de Pulligny's paper. It is clear that the example of France in this matter points to the importance of devising some simple method of arranging the finances of road administration in the interests of both economy and efficiency. As regards extraordinary traffic, the conditions in France seem to make it possible to deal with a considerable amount of exceptional traffic in a manner which offers important advantages over our own system. At the same time it is clear that such arrangements would by no means cover all the cases which at present are dealt with, when necessary, by legal procedure in this country. Beyond this we have to take the national temperaments into consideration, not only with regard to matters of this kind, but generally in dealing with proposed changes in highway administration in the light of experience in other countries.

* * *

The Institute of Sanitary Engineers.

An event of more than ordinary significance is the election, reported elsewhere in this issue, of Mr. H. Percy Boulnois, M.INST. C.E., as president of the Institute of Sanitary Engineers. It will be agreed that Mr. Boulnois' long and distinguished career, first as a municipal engineer holding a number of important appointments, then as one of the chief engineering officials of the Local Government Board, and subsequently as a consulting engineer in private practice, render him par excellence a fitting head for the institute in question. He will read his presidential address at Caxton Hall, Westminster, on Monday, January 20th, and a fortnight later the Institute will hold its annual dinner at the Holborn Restaurant. The next few weeks are expected to witness a large accession of new members to support the popular incoming president and strengthen the hands of the council in their work in the interests of the profession.

The council of the Institute have been unsparing in their efforts to promote the study of sanitation in all its branches, and to further the interests of the profession. The sessional meetings during the past twelve months have been of great interest and importance. The papers, covering a wide range of subjects, and by authors exceptionally competent to deal with them, have evoked brisk and well-sustained discussions; and the names of the distinguished men who have presided over the meetings testify to the growing esteem in which the Institute is held. The exacting duties of sanitary engineers, and the many committee meetings which men holding a municipal appointment have to attend, render it increasingly difficult for the provincial members to be present at meetings in town. District

centres have accordingly been established at Birmingham, Manchester, and Northampton to afford more frequent opportunities of foregathering than would otherwise be possible. Good work has already been accomplished as a result of this departure, the several meetings which have since taken place having proved most successful from every point of view.

* * *

County Surveyors and Motor-cars.

As we reported last week, the decision of the Devon County Council to engage the services of a third county surveyor has been confirmed, as has also the recommendation of the Bridges and Main Roads Committee to pay each official an annual travelling allowance in future of £200 instead of £160. It was chiefly this latter proposition that gave rise to some criticism at the meeting of the council, and as usual the statement had to be combated that the use of a motor-car by the road surveyor was a luxury. This is, to say the least, a somewhat perverted view to take, for it seems to imply that in discharging their official duty the surveyors are out for pleasure, which is totally opposed to the real fact of the position: or else that a standard of comfort is lavishly provided at the cost of the rates for which no adequate return is given in the shape of serious and sufficient service. No self-respecting official would admit the validity of such a contention, which is indeed totally negatived by actual experience, which goes to prove that the invariable result of improved conditions of work is an improvement in the quality of the work performed. Our contemporary *The Western Daily Mercury*, in the course of some apt references to the subject, writes: "It is hard to resist Mr. Young's contention that surveyors are none the worse for a little experience of what some cynics call road nuisances. It is all to the good, too, that the surveyor should be as ubiquitous as possible. And is not the motor-car the ideal means of making 'surprise visits'? We do not know whether Mr. Fox would give preference to a flying machine for this purpose. But perhaps too much vol-planing would be objectionable. Earl Fortescue's significant hint was, perhaps, the heaviest weight that affected the balance. The extra outlay would be justified by the extra attention that would be given to the roads, even if the committee were not pledged to a portion of that outlay, 'by the correspondence with the Road Board.'"

* * *

District Surveyors' Fees.

In a case which recently came before Mr. Cecil Chapman at the Tower Bridge Police-court a novel and important question arose concerning the position under the London Building Acts of a local authority executing works of sewerage. It appears that the Bermondsey Borough Council had been laying or reconstructing a sewer in the ordinary course of their duty as the proper authority in such matters, and the district surveyor under the Building Acts contended that in any case where such a sewer passed under a structure or building, or within 3 ft. of it, notice of intention to commence the work must be served on him—and his fees paid. As was pointed out by counsel on behalf of the borough council, such a claim on the part of a district surveyor is a novel one, and if allowed it will be a very serious matter for the Metropolitan borough councils generally. The whole question really turns upon whether anything done to the foundations of a building, or within 3 ft. of a building, must be "work" within the meaning of sec. 145 (*a*) of the London Building Act, 1894, although the interference is only incidental to the execution of other work which is admittedly outside the operation of the Building Acts. Mr. Chapman gave a considered judgment in favour of the borough council, holding that any incidental interference with a building or its foundations which takes place during the execution of sewerage works is not a work for which notice must be given to the district surveyor. It would thus appear that in this matter the conclusions of law and common sense are identical. Inasmuch, however, as counsel for the district surveyor asked the learned magistrate to state a special case for the opinion of the High Court—a course which he consented to adopt—we desire to call the attention of engineers to Metropolitan borough councils to the case, so that they may watch its future progress.

* * *

American Opinions on Road Foundations and Drainage.

Among the subjects discussed under the head of "Road Construction and Maintenance" at a meeting of the American Society of Civil Engineers, reported in a recently published volume of the "Transactions," one of the most interesting was "Drainage and Foundations." We are indebted to Mr. W. W. Crosby, M.AM.SOC.C.E., for a reprint of this part of the "Transactions," from which we have extracted a number of passages that seem likely to be of special interest to our readers. These extracts appear on another page, grouped for convenience of reference under three sub-heads of our own, with a running comment by Mr. Reginald Ryves, M.CONS.E., ASSOC.M.INST.C.E. In road engineering, as in other matters, evolution proceeds partly by the encouragement of the fit, and partly by the discouragement or slaughter of the unfit, and, while the former function is performed in books, in special articles written for technical journals, and in annual retrospects and the like, the latter function, the immediate recognition of what seems wrong in form or unsound in principle, is more especially performed in the editorial and cognate portions of periodical, particularly weekly, journals. It is the function of the daily Press to gape, and that of the weekly and monthly journals to chew, while the swallowing is left to the authors of books, or annual publications. If then we have not, on several occasions, done visible justice to the admirable work which is being performed by American highway engineers, and, we may add, by several influential journals of high standing, it is because we are bound to confine our constructive criticism mainly to matters Brit sh.

* * *

Tendering by Architects.

At a recent meeting of the Royal Institute of British Architects, Mr. Robert J. Angel, the borough engineer of Bermondsey, who is an associate of that body, raised the question of the propriety of architects tendering in competition for the preparation of designs, and so forth. The point at issue was entirely different from anything which concerns the ordinary architectural competition, which is of course well recognised in the profession. Mr. Angel gave an instance where an advertisement had been inserted in a newspaper inviting applications for the office of architect of a public building, and asking candidates to state their qualifications and experience, and the *remuneration* they required. The result of this was that one applicant at least replied offering to undertake the work at a rate less than that specified in the Institute's scale of charges. As a matter of fact this particular candidate was not appointed, but the case cited affords a very good example of what must inevitably happen if such a system of tendering became general. Mr. Angel made it perfectly clear that he brought the matter forward on principle and not with a view to the consideration of any specific case, and on his motion the question was referred to the Practice Committee for consideration and report. He observed that two points arose on the reference—namely, the act of a building owner in publicly advertising for tenders from architects, and the propriety of members of the institute replying to such an advertisement. The matter is certainly one of great importance to architects, and Mr. Angel has rendered a service to the profession in calling the attention of the institute to it.

The Royal Commission on Sewage Disposal.

COLONEL JONES AND THE EIGHTH REPORT.

[At the recent annual meeting in London, of the Association of Managers of Sewage Disposal Works, Lieut.-Col. Jones, V.C., M.Inst.C.E., submitted the following paper as an attempt to express in practical form the effect of the Eighth Report of Lord Iddesleigh's Royal Commission on future arrangements for preventing pollution of rivers by sewage.]

A useful discussion on the fifth report from Lord Iddesleigh's Royal Commission took place at our annual meeting in 1908, and as the eighth and penultimate report was published on November 21, 1912, I venture to open its subject to-day with a few remarks.

Appointed in 1898 in response to appeals from inventors of artificial systems of sewage disposal and from sanitary authorities, all calling for some authoritative guidance in a very complicated technical matter, this commission has during fourteen years been consistent in its resolve not to commit itself to any detailed approval or condemnation of any system, however much such a decision might be clamoured for by interested parties, and by the public at large, despising sewage as an unsavoury subject, but expecting assurance from a Royal Commission that some particular treatment of a nuisance would satisfy sanitary requirements at the least possible cost.

The commission was not long in realising the fact that nothing but a permanent central authority and watershed rivers subordinate bodies can satisfy the public requirements, and in this eight report a recommendation to that effect has been again repeated in terms which must attract the notice of the Government in the next Session of Parliament. The eighth report, indeed, takes it for granted that a central and rivers authorities will be appointed, and proceeds to suggest rules for the proceedings of such bodies.

It will be remembered that the long disputed question of standards for sewage effluents was discussed in the fifth report, wherein it was stated: "The terms of our reference require us to have regard to the economical and efficient discharge of sewage by local authorities, and in view of the importance of not requiring a local authority to incur any further expenditure on sewage disposal than the circumstances of its area require, we feel that the law should be altered so as to allow local circumstances to be taken into account."

The Rivers Pollution Prevention Act, 1876, makes no distinction of that kind with regard to non-tidal rivers, and after four years' study of the question the commission recommends an amendment of that Act, because observation and experiment have led the committee to recognise dilution in river water as a powerful agent in purification, and it now lays down rules under which even raw sewage or tank liquid may be admitted to a river in certain cases, and thus part, or the whole, of our work in sewage purification may in certain cases be dispensed with.

The fifth report introduced a new process of analysis—called the five days' oxygen absorption [illegible] to the Wanklyn ammonia, and the four hours' permanganate tests, to which we have so long been accustomed, and now we see how useful [illegible] in the dilution experiments which have enabled the commission to arrive at a normal standard applicable to ordinary cases and special [illegible] on the ratio of volume of foul waters to [illegible] into which it discharges. The [illegible] proposal is as follows: Suspended [illegible] not to exceed 3 parts per 100,000, and when [illegible] with suspended matter included, not to take [illegible] than 20 parts per 100,000 of oxygen in five days at 65 deg. Fahr.

[illegible] may be as follows: (1) If the [illegible] between 150 to 300 volumes the oxygen [illegible] may be omitted and the suspended matter may reach 6 parts per 100,000; (2) when the dilution ranges between 300 and 500 volumes, no [illegible] matter may be allowed [illegible] parts per 100,000. (3) If the dilution is very [illegible] be suspended altogether. It is pro[illegible] standards be fixed on report of rivers [illegible] by the local authority, and remain in force [illegible] as well as the [illegible] rivers or reaches of [illegible] to be specified. To [illegible] the [illegible], and in case [illegible] into effect the expense of much litigation and that of some unnecessary sewage treatment may be saved by ratepayers, besides gaining the advantage to all parties concerned of knowing for certain to what standard they must conform for periods of ten years.

In 1908 I gave the weight of Blue-books then published by the commission at 40 lb. avoirdupois, and an estimate of the cost for ten years' work of the Royal Commission at £50,000, which has not been disputed, and the latter sum must now be increased to £80,000 at least. It is, however, to be hoped that at last the country may reap practical advantage in improved river water from good administration by the permanent authorities called for which may well repay, not only their current charges, but the accumulated sum, say £100,000, which may, I think, be justly regarded as preliminary educational expenditure. That education has necessarily been destructive as well as constructive—destructive of old ideas and inveterate prejudice, as well as constructive of good sanitary practice—and this fact may account for the long life already passed by Lord Iddesleigh's Royal Commission and for the bulky volumes recording its conclusions, and the evidence of 204 persons called to give evidence before it.

In this connection it should be remembered that the science of hygiene was little thought of until the late Dr. Parkes (in whose memory our Royal Sanitary Institute maintains the Parkes Museum) published "Military Hygiene" about the year 1855, before which date many of our English rivers had been turned into open sewers, and the separate system of sewerage and drainage was not generally recognised in engineering practice until about 1885. Reaction from previous indifference led the public to expect great results from sewage farming, but its initial cost and bad management turned the common mind to chemical precipitation, until universal disappointment prepared ratepayers for submission to the necessary expense of getting rid of a nuisance anyhow they could. This necessary expense is certainly improving our rivers, but one cannot help regretting that much of it is spent on artificial systems which can bring no money back, while land treatment grows valuable crops, and we are told by Mr. Roechling that the municipality of Berlin makes a profit of 11s. per acre per annum on its 40,000 acres of sewage land.

Reviewing the whole ½ cwt. or so of printed matter, there are two or three points to which, I think, with all its just and proper impartiality, the commission might have directed more attention than is apparent—viz.: (1) The fact proved by Dr. Travis, at Hampton, and by Mr. Dibdin's slate beds, that "de-solution" or deposition not only of original solid matters, but also of colloidal matter, is the first and most important step in sewage purification, and that de-solution of colloids is best effected by surface attraction of particulate particles from slowly moving liquid to be subsequently acted upon and transformed by many species of organisms besides those microscopic bacteria, which latter have been expected by their enthusiastic admirers to perform ten times the work that they always do in the land, if confined by artificial means in crowded workshops. (2) That vegetable life affords the only effectual means of [illegible] of sewage. (3) The comparatively [illegible] and the fact that good management is essential to success in sewage works, but has as yet failed to suggest that sanitary authorities would find it good policy to increase the often inadequate salary of their manager and to give him a free hand in the adjustment of wages for the highly skilled labour which he ought to employ if the purification of sewage flowing through in ever-varying volume night and day is to be properly provided for in his work.

Being no longer a manager, I may, without impropriety, offer a strong opinion founded on forty years' experience, that real improvement in our rivers depends very much on the adoption of this policy by the authorities concerned, and I trust it may not be too late for action now by Lord Iddesleigh's Royal Commission.

Recent Advances in the Science of Water Purification.

By ADOLPH KEMNA, D.Sc., Antwerp.

[The subjoined paper, a summary of which appeared in last week's issue, was read at the recent Winter General Meeting of the Institution of Water Engineers.]

Underground waters have been preferred from very ancient times, not only because of the abundance of water obtained in many cases, but also because such supplies are usually characterised by constant temperature and natural purity. It is a fact that many underground waters are excellent and yield plentiful supplies to populous cities, but it is an obvious exaggeration to consider this the only permissible source of public water supply. All underground waters are not abundant, nor are they always chemically pure, nor hygienically innocuous. There are many examples of springs which have become dangerous by contamination and which have spread epidemics of typhoid fever.

In France for several decades the purity of springs was considered as unquestionable, the engineer agreeing with the theoretical hygienist in that opinion. The frequent recurrence of typhoid epidemics in Paris was, however, finally traced to the contamination of first one and then another of the springs from which supplies were obtained, and similar experience was obtained in many other places. A comparison between the health statistics of spring-supplied and surface-supplied towns resulted in favour of the latter, and naturally brought about a change of opinion as to the superiority of underground waters which were no longer considered as the only admissible sources of supply. This change took place between the years 1895 and 1905. At about the same time there was also a change of opinion in Germany, but in the reverse direction. The leading German hygienists took up the exclusive attitude abandoned by the French, and began worrying municipalities who used filtered surface waters. Several large cities replaced, either partially or entirely, their surface-water supplies by those from underground sources, and not always with satisfactory results. In most cases the surface water supplies had been well filtered and the health statistics were good, and although no harm resulted from the change, no advantages were obtained, and it was difficult to justify the costly change enforced by the theorists. Mistakes were often made in the estimation of quantities, and these were always in the same direction, namely, that the actual yield was less than was expected. As to quality, experience was often equally unsatisfactory. The majority of the underground waters in the German or Baltic plain are chalybeates, and, however easy it may be to remove the iron, still the process involves trouble, extra cost, and a tampering with the natural water, which, after all, was one of the grievances against filtration, the only real advantage obtained being constant temperature, which is partly lost when the water has to be heated for the removal of iron.

Breslau, the capital of Silesia, is one instance of how a municipality can get into trouble by a change of this sort. The original supply was obtained from the river Oder, the water being filtered, and although the filtering arrangements might certainly have been better, still their hygienical conditions were normal. Prof. Flügge, the well-known bacteriologist, was mainly instrumental in inducing the municipality to abandon the surface-water supply and to introduce a boasted scheme with [illegible] wells sunk in a district where there was said to be an inexhaustible underground supply. However, instead of the daily supply of 60,000 cub. metres expected, the wells gave a maximum supply of 40,000 cubic metres per day, and instead of tapping an underground river, as was foretold, the supply was found to emanate from a limited and rather shallow basin, absolutely dependent on local precipitation. In March, 1906, a part of this district was inundated, the first effect of which was to dry up the wells. For a period of thirty-six hours nothing but air could be pumped from the wells, and when the water came back, it was found to contain 0·6 grammes per litre of metallic iron, and 0·4 grammes per litre of manganese sulphate. The [illegible] is that large proportion can easily removed, a fact which spoke well for the efficiency of the plant, but the manganese remained, blackening everything with which the water came in contact. Fortunately, all the wells were not affected, and as the filter had not been demolished, the supply was maintained.

Surface-water supplies have the great advantage that the quantity can be correctly estimated. There would be only one way to deal with an engineer who made a gross mistake in gauging a river or in calculating the yield of a gathering ground. There is also another safeguard in connection with surface-water supplies—namely, that, being always open to contamination, they must be treated as if contaminated, and purification is absolutely essential.

In a previous paper the author has given a historical sketch of

SAND FILTRATION,

and has shown how Simpson's first attempt in 1829 proved efficient for the mere clarification which, at that time, was all that was required, and later proved equally efficient to meet the increasingly severe demands of the hygienist; but here a qualification is necessary, and we must say the "reasonable" hygienist.

Thousands of analyses have been made with all sorts of chemicals in strangely-shaped flasks; gallons of broth with gelatine and peptone have been destroyed by the introduced microbes, and the final result of all that labour is simply the confirmation of what every engineer was already fully aware of—that ordinary filtration is an efficient safeguard against water-borne disease. This is also proved by experiments, not only those carried out within the walls of a laboratory and with special apparatus, or by sacrificing a few poor rabbits, but also in the supplies of our large towns and cities, experiments carried out during a period of three-quarters of a century, on millions of human beings, who, after all, are better examples of the species "Homo" than rodents. Here there is no question of drawing inferences from tests made with a few milligrammes of permanganate of potash for organic matter (the real nature of which we know nothing of), or from a variable number of microbes generally nameless; the experiment is a direct one, the information obtained is above cavil, and the engineer and the "reasonable" hygienist were satisfied with the results.

Their rooted conviction of the hygienical efficiency of sand filtration, although fully justified, has had one drawback—namely, the absence of any inducement to improvement. For a period of fifty years the sand filter remained practically unaltered; the only addition to it which has become general was a preliminary treatment by the simple process of decantation. The theorist can certainly claim that he roused the engineer out of this state of torpor. Koch took up the question of filtration from the special standpoint of the bacteriologist, and introduced certain rules for the management of filtering stations. Koch was of a peculiarly practical turn of mind; by profession a medical man, he contended that all scientific studies in this department should only be considered as the means to an end, and especially with a view to practical application. His rules for the conduct of filtration works were the outcome of direct connection with actual practice; he wanted to improve the results, and was fully aware that asking too much was the way to get nothing; therefore he was moderate in his requirements, and even in suggesting a limit of 100 microbes per cubic centimetre he admitted the possibility of varying the standard to meet exceptional cases.

Moderation does not seem to be within everybody's power, and "common sense" is not at all common! This explains how

THE MICROBE CRAZE

started. Let us take a few instances. A medical man, writing on sewage purification, solemnly states that fire is the only absolute safe microbe killer. Six weeks ago, at the Washington Health Congress, Prof. Gaertner, of Jena, the leading hygienist in Germany, referred to an amusing case where ozonisation was applied to a water with 10, sometimes but 3, microbes per c.c.; the learned professor said that he appreciated a joke as much as anyone, but he thought this was

carrying a joke too far. At Antwerp last year an official notice was issued on account of the presence in the water of a few hundredths of a milligramme per litre of free ammonia, and the same bulletin referred to the presence of 1 microbe per c.c.! This was carrying the joke to absurdity, as was pointed out by several papers.

Who is responsible for such silly things? We cannot always discuss each case on its own merits; in the case of Antwerp this would involve us in the intricacies of local politics. The medical profession no doubt has its normal share of unbalanced minds, and among these will be found those who have most conspicuously run amok on microbes; their proportion is numerically small, but their voices are strong, and by taking an extreme view they have obtained the prominence they desire, and have found ready followers. Among these the heartiest supporters are the inventors of patent filters or sterilisers. Absolute sterility—that is, complete absence of microbes—is no doubt a consummation devoutly to be wished, and many people have devised systems by which this can be assured. Through the medium of the patent agent, various forms of filters, applications of ozone in nearly endless variety, quartz lamps for ultra-violet rays, a full set of chemicals to "drug" the water, have been, after due protection was secured for the inventive genius in each case, showered on the engineering world for the immediate benefit of mankind.

A multiplicity of systems is a necessary condition of competition and that struggle for existence which ultimately results in the "survival of the fittest," but in the meantime the existence side by side of so many competitors is a proof that none of them has attained to that degree of efficiency which would ensure its survival and the disappearance of its rivals.

It is only natural that the various inventors should criticise each other's systems and proclaim the advantages of their own. They all, however, agree on one point—namely, that the worst system is sand filtration pure and simple—and as this system is not patented, there is nobody constantly on the watch to defend it and to repel repeated attacks; moreover, it is practically the only system in general use, and the inventor, in trying to push his own patent, is constantly confronted with it; so that, in order to get in himself, he must of necessity endeavour to prove the defects of such a persistent rival. It must be remembered, however, that the inventor enters into this discussion with a decided bias in favour of his own discovery that he cannot be expected to keep an open mind or to judge the question fairly and impartially.

Those who are conversant with biology know how important a matter is the geographical distribution of plants and animals in deciding questions of affinities and parentage, and in disclosing the otherwise unrecorded history of our earth. It has also a certain analogous bearing on the subject of this paper. Take, for example,

THE APPLICATION OF OZONE

to the sterilisation of water. The first laboratory experiments were made in Germany; the first application on a somewhat larger but still experimental scale was made in Holland; the Belgian Government adopted the system to purify the water at Blankenberghe, a seaside resort near Ostend; but it was especially in France that the system was readily taken up and that the technical and hygienical authorities made the most of it. Nice, on the Mediterranean, is at work on it; Paris is fitting up the system at the St. Maur filtering station, which our institution visited in 1908, when comparative experiments with various systems were going on. In Germany there are a few installations, and in Russia the utterly bad system of filtration in use at St. Petersburg has been supplemented by an ozone plant. The English-speaking countries, however, which include more than half the civilised world, seem to be very reluctant to adopt ozone purification, and there appears but little likelihood of their changing their attitude. A leading American paper summarised a report of the meetings of various associations as follows: "Ozone does not appear to be deemed worthy of much consideration by waterworks men in 1910. This is almost as true outside as within convention halls, for although ozone is being given a trial at a few works, almost everyone seems to regard it as being in a rather unsatisfactory experimental stage of development." (*Engineering News*, September 29, 1910).

Ozone is undoubtedly a very powerful chemical agent and for this reason it is the more strange that since its discovery in the forties by Schönbein it has not been turned to practical use. There are obviously objections to its use, and among these the following may be mentioned:—Its production by electrifying air is rather difficult and costly; it cannot be obtained pure; only a small percentage of the air treated can be made into ozone, so that comparatively large volumes of air have to be dealt with. The greatest objection to it seems to be its insolubility. Passing a gas through water is nothing in the laboratory, but on a large scale it is more difficult. Even with an extremely soluble gas, such as ammonia, we find the scrubber the most conspicuous apparatus in gasworks. It is, of course, unfortunate that the use of ozone involves such difficulties, for it readily destroys colour and microbes, and itself turns into ordinary oxygen, so that nothing of it remains in the water. Experience has shown, however, that even with ozone complete sterilisation is practically impossible, and at the same time a certain selective action has become apparent, some microbes being more easily destroyed than others; the more resistant are the ordinary harmless water bacteria, while the pathogenic bacteria are the more sensitive. Now, the detection of the latter in a water is a mere matter of chance, and of very remote chance. For several years past the scientific staff of the Metropolitan Water Board have been making a systematic hunt for the typhoid bacillus in the Thames water; certainly over 1,000,000 microbes have come under notice, but not one single "typhosus" could be detected.

Among the intestinal bacteria there is one, bacterium coli, which much resembles the "typhosus"; that it is quite harmless, and not pathogenic, is obvious from the fact that it is constantly present in the intestine, and that we are still alive, but its presence in water is considered as indicative of pollution, and it has been adopted as a standard test for purity. As the B. coli is somewhat more robust than the "typhosus," it was safe to assume that the destruction of this involved the destruction of the "typhosus" as well. The municipal and other authorities in Paris lay great stress on the presence of B. coli, and wherever this is detected in the effluent from a filter, the filter is shut off. The ozone people at Petersburg felt so sure of being able to destroy the coli that they accepted a clause by which a fine of 1,000 roubles was incurred for each detection, with the result that in June last they had to pay 26,000 roubles. Under such circumstances the harmless coli might prove a valuable asset to the exchequer of a municipality.

The production and working of ozone depend on the instability of the molecular structure. Ordinary oxygen is O_2, represented as O=O, the two atoms being united by their two centres of attraction or atomicities. Ozone is O_3: $\overset{O}{\diagdown\!\diagup}_{O}$, where all the connections are simple, but this is a condition of chemically unstable equilibrium, the tendency of the atom oxygen being to fix each of its atomicities to the other. Ozone decomposes into O_2: O=O and O– a single atom, in the nascent state and apt to combination. Now, ozone is not the only compound which can evolve single atoms of oxygen in the nascent state. A variety of chemicals do the same, with the same sterilising effect. Permanganate of potash has been used at Alexandria (Egypt); the gaseous oxygenated compounds of chlorine, and lately ordinary bleach (chloride of lime), have also been employed.

Strange to say, the chemical nature of this substance is not exactly known. There are various structural formulæ, not one of them fully accounting for all the facts, but there is no doubt as to its hygienical efficiency. A dose or two of three parts per million is sufficient; the one single microbe found in the Antwerp water as mentioned above was the result of its use. Its efficiency has, however, been more effectively demonstrated by the fact of its having stopped epidemics of typhoid. In one case, exactly ten days after starting the application of chloride, an epidemic was suddenly arrested and the diagram showing the number of new cases fell abruply to zero. The three consulting engineers who had been called in, and who immediately and unanimously ordered the use of chloride of lime, certainly expected a favourable result, but not such a striking one as that. A physiologist would not perhaps have shared their astonishment. In experimenting upon small numbers of cases, say 100 people, the results are sometimes obscured by peculiarities in certain constitutions, but with 300,000 people the effect of individual peculiarities is lost by being blended with a mass of normal cases. Another most important result of this experiment is the exact determination of the period of incubation, still a

vexed question with medical men, the mean period being shown to be exactly ten days.

THE APPLICATION OF CHLORIDE OF LIME

is simplicity itself; a solution of the required quantities is made and regularly run into the water, and the plant can be started in a few hours. In some parts of America portable plants have been provided which are let out to municipalities when required. Within a period of five years the use of this system has spread all over the States, and its efficiency is no longer questioned. No trouble has been experienced from taste. Three parts per 1 000,000 of chloride of lime represents only 1 part, or 1 milligramme per litre of chlorine, a quantity which falls within the limits of error of ordinary chemical analyses. The taste (if any) only exists just after the introduction of the reagent and rapidly disappears.

The system has also been applied in Europe, as for example at Paris last year, but chloride of potash (eau de Javelle) was used instead of chloride of lime. Prejudice against "doctoring" the water is very strong in France, so extra precautions were taken. A number of chemists were stationed along the line of main with instructions to test the water with starch-iodine reagent every quarter of an hour, night and day, and to direct the use of chloride by telephone, for which purpose special wires were provided. The daily papers reported on all this, and created quite a sensation, with the result that several people detected the chlorine taste.

In the Rhenish provinces, especially in the district of the Ruhr, several cases are reported where the system was a failure, and had to be abandoned on account of the consumers complaining of the taste. It would be extremely interesting to know details of the way in which the chloride was applied, as this would probably explain the reason why the system failed in these cases and not in others.

Since the year 1904 the author has used chloride of lime in various ways at the various stages of the process of filtration—before decantation; before filtration; after filtration; before and after storage in the clean-water reservoirs. Since December, 1910, chloride has been used regularly and constantly at the Luythaegen auxiliary pumping station of the Antwerp waterworks, where the water is pumped to the town, with a view of still further reducing the number of microbes. The author is distinctly of opinion that there is no hygienical necessity for this in the case of a carefully filtered water, but it is an extra precaution, and is worth while in that it gives the low bacterial "counts" in which some of the local hygienists seem to revel. In the course of the author's experiments a very noteworthy fact was ascertained—namely, that a secondary pullulation of the few remaining microbes may occur; so that, while there may be only a few colonies in samples taken at the inlet to the mains, there are sometimes large numbers found in samples taken in the town. This after-multiplication is distinctly due to the influence of increased temperature. No reference to this will be found in the numerous articles already published, but this may be due to the fact that analyses are generally made at the entrance of the canalisation system, and it is obvious that if the results are constantly favourable here, the higher "counts" in the later stages of the distribution have no hygienical significance. Recently, however, the facts above mentioned have been observed elsewhere, and have been urged as an argument against the use of chloride.

There is not the slightest doubt that the chloride of lime process constitutes the greatest advance which has been made in water purification during recent years. The proofs of its hygienical efficiency are overwhelming. It acts like ozone, without the necessity of complicated machinery; it is soluble and readily diffused through the bulk of the water so that intimate contact is ensured without cumbrous mechanical appliances. As it would be difficult to patent such elementary apparatus as casks and tubs, the chloride of lime process is free from the attentions of the inventor, and can be arranged to suit any special local requirements. Indeed, its simplicity is in some respects a drawback, as the author knows of one case where ozone was adopted partly because the municipality wanted to be able to boast that their water was purified "electrically."

Another "drug" of the water engineer is

SULPHATE OF ALUMINA,

the systematic use of which was introduced with the "mechanical" or "rapid" filter. This also comes from America. It operates by a reaction between the sulphate of alumina and the carbonate of lime present in the water, sulphate of lime being formed; carbonate of alumina ought also to be formed, but as such a combination does not exist, the alumina is precipitated in large sticky flakes which form round the particles of suspended matter and carry them to the bottom. With most waters mere decantation after the addition of the sulphate of alumina is efficient in from twelve to twenty-four hours; anything not deposited then is very difficult to get rid of. In some cases the finer particles remain a long time in suspension, and recent studies in that new and interesting science known as "colloid chemistry" have revealed the existence of material so fine that it does not settle at all, but constitutes a permanent "colloidal" solution.

The waters of the rivers in the western parts of America seem to be of such a nature that nothing else but sulphate of alumina can deal with them. The theory of its action is rather complicated, and to consider it thoroughly would carry us too far into physical chemistry. The main point is that, besides the sticking action of the precipitated alumina, it probably has a "flocculating" action, the very fine particles coalescing, and, as their size increases, either settling out or being easily arrested by filtration.

The author has used sulphate of alumina regularly for several years past, rather for decolourising than for purposes of decantation. The colour of surface water is generally due to vegetable matter, the colouring substance being well known by such names as "humic acids," "crenic" and "apocrenic acids." These, however, are mere words, not warranted by any definite structural formulæ and while we do not know much of the scientific aspect of the subject, it is sufficient for the engineer who has to deal with such a water to know that sulphate of alumina is an effective remedy for his trouble.

The following facts will illustrate the action of alumina. A deep-well water of a brown colour like strong sherry was shaken up with precipitated alumina (not the sulphate) and then filtered. The effluent was beautifully clear and devoid of all colour, but the pure white alumina had become black, all the colouring matter had been abstracted from the water and deposited on the alumina. The latter had been prepared some time before, and the bottle showed two layers, the upper of a creamy character and the lower, where the substance had gone through a molecular condensation, of a more granulated character. The creamy stuff alone absorbed the colour from the well water, so that the sediment showed a black layer at the top and another, pure white, below. This experiment showed that the decolourising effect is not solely a chemical reaction, but that it is dependent also on the physical condition of the reagent.

All along the river from which the water supply of Antwerp is drawn there are extensive tracts of low meadows which can be irrigated. After heavy rain these meadows are flooded, and when this water is discharged the river water is quite clear with scarcely any silt in suspension, but very yellow. At such times the dose of sulphate has to be increased; but on these occasions the water gets much softer, and there is the risk that the quantity of lime present in the water may not be enough to decompose the sulphate. This condition frequently prevails in moorland districts and in some cases lime has to be added.

The use of alumina enables the water engineer to overcome the difficulty of a highly coloured water which, although quite innocuous from the hygienic point of view, is very objectionable to the consumer. The treatment of water with sulphate of alumina is cheap, and easily applied, and is not open to any reasonable objection whatever. The precipitated alumina is retained by the filters and nothing passes into the effluent; the sulphate of lime remains in solution and is perfectly harmless; on the contrary, the casual addition of some lime to very soft waters can only be beneficial. It is, however, important to ensure a uniform distribution of the reagent through the whole mass of the water. Where there is a constant flow at the intake a solution of the required strength may be constantly added in regular quantity, but where the river is tidal and subject to considerable variation in the amount of pollution at the different stages of the tide the intake period may have to be limited.

Under such circumstances it is found that even if the whole quantity of sulphate is added at the same time, the inrush of the water secures its being thoroughly mixed and well distributed. During last summer, on account of the copious rains, the water being clear but very yellow, some trouble was experi-

ceed with the settling of the precipitate due to the difficulty of dissolving the increased quantity of sulphate in the available tanks. The resident engineer made use of a float moved about on the intake reservoirs, from which a supplementary dose of sulphate was added to the water, and it was noticed that this addition of a comparatively small amount of the coagulant produced a marked effect. The explanation may be that suspended matter which normally separates easily from the water may remain in suspension a long time when the size of the particles is diminished, as is the case with cream in milk, which normally gathers at the top, but after the milk has been projected under pressure out of a nozzle against a plate, so that the globules of fat are broken up, the cream does not separate. If, therefore, the rush of the water is sufficient to break up the flakes of alumina, they will remain in suspension, and the addition of another dose of alumina will, after a certain time, gather these flakes together and bring them down.

Another illustration of the peculiar action of suspended particles has been pointed out by Fuller in connection with his experiments at Louisville. In this case small quantities of sulphate produced no effect at all; the sulphate was absorbed by the fine mud and held fast until this absorbent power was exhausted, after which the ordinary coagulating effect was produced. It is therefore a very important practical problem to decide to what extent decantation as a preliminary to chemical treatment may reduce the quantity of sulphate required, that is, to determine whether or no the capitalised value of the daily saving of sulphate will pay for an extra decantation reservoir.

Besides decantation proper, which is merely taking out mud and thus reducing the work of the filters, these reservoirs have also other effects on the water itself. There is a general improvement both in regard to colour, the quantity of organic matter and the number of microbes. Impounding reservoirs for surface waters from gathering grounds have been proved capable of securing a satisfactory condition of the water without any further treatment, but the recent researches of Dr. Houston in connection with the London water supply have, by systematic and extensive study of the question, thrown much new light upon the complex results of sedimentation. It has, for example, been shown that there is a reduction of hardness due to the loss, by dissociation, of carbonic acid, although in some cases the water, on the contrary, became harder after standing. This result was no doubt due to the infiltration of hard underground waters in low-lying reservoirs like those at Surbiton; the water in the Staines reservoir, built up high, showing a constant reduction of hardness.

It should, however, be pointed out that none of these reservoirs were built for purposes of purification, but they are reservoirs in the full sense of the word, creating a reserve for times when there may be a shortness of water in the river, or when floods have impaired the quality. Their limited efficiency as purifying apparatus alone and simply would not warrant their construction for this purpose alone, as there are better and more efficient means of accomplishing that end.

Returning to conditions affecting

UNDERGROUND WATERS

collected in drains, wells or springs, the most common difficulty is insufficient quantity. Many towns have shared the unfortunate experience of Breslau referred to earlier in this paper. At first there may be an abundance of water, and the most optimistic estimates may be surpassed, but gradually there comes a diminution and the trouble begins. This experience is generally due to the fact that there is an accumulation of underground water (called by some the "historic reserve"), and this at first gives an ample supply, but when the rate of abstraction exceeds the yearly amount of percolation it stands to reason that the reserve will ultimately become exhausted. At Brussels the drainage gallery under the Bois de la Cambre can be shut off in addition, so that during the period of increased consumption the water level rises, and provides an underground reserve which can be drawn upon at times of increased consumption.

If a drained district the level of the underground water would be lowered to that of the basin were it not for the constant replenishing from above by the percolating rain water. There is, however, another method of augmenting the quantity of underground water in low-lying areas, and that is by irrigation. The sewage-purifying agricultural purposes, and it is obvious that [illegible] for maintaining underground water supplies. A Swedish engineer, Richert, called attention to this system, which he applied with marked success at Gothenburg. River water is spread over a sandy area and percolates into wells sunk at a certain distance away. One of the great advantages obtained is the equalisation of the temperature of the water during all seasons of the year; but here also the indiscriminate application of an otherwise excellent system may cause failure. At Breslau irrigation of part of the drainage ground was attempted as a means of increasing the yield of the wells, but owing to the gradual choking up of the irrigation channels by the suspended matter in the river water this additional supply soon failed. It therefore seems desirable in most cases to provide for a preliminary filtration of the river water. It is also essential that the subsoil should be of such a nature as to facilitate the circulation of the water; thus very fine sand is an obstacle to circulation. On this account a big scheme proposed for the supply of Amsterdam was condemned by a special commission of engineers, and no doubt their unfavourable report spared that city a large, useless expenditure of money. The author knows of a small town where over £3 000 has been spent in sinking eight large wells in fine sand, all of which had to be filled up. The final report of the engineer states that there is an abundance of water, but that it is held back by capillarity due to the fineness of the sand.

The author has so far referred only to those systems of purification which, like treatment with ozone, have attracted much attention, or those which, after extensive use, have stood the test of time, but he has not by any means exhausted the list. There are many others, some of which have already been experimented with, and others which may ultimately prove to be of value.

The solar spectrum shows a gradation of undulations, with various physiological effects. The red end is chiefly heat, the middle portion is light, and the violet end is mainly chemical, this latter action extending beyond the limits of visibility and constituting the

ULTRA-VIOLET RAYS.

Direct experiments long ago proved that these rays are bactericidal, and the effect of prolonged storage upon microbes is certainly due to a great extent to that action. It is therefore quite reasonable to apply these rays for the purposes of sterilisation.

Some lights contain a great abundance of ultra-violet rays, especially that from the mercury lamp, but ordinary glass being impervious to these rays the lamps used for sterilisation must be constructed with quartz, which is transparent to the rays, but is expensive. To secure effective action the water must be quite clear, which means in the case of any ordinary surface water very complete preliminary filtration, as even a slight tinge of yellow absorbs these rays; a water which although clear has the slightest colour must also be first decolourised. It will therefore be seen that in the case of surface waters the ultra-violet rays do not replace ordinary filtration nor, in some cases, the use of sulphate of alumina, but must be considered as a supplementary treatment of a precautionary nature, exactly as in the case of sterilisation with chloride of lime.

It is not quite clear how these ultra-violet rays act; there is certainly a direct physiological effect on the living protoplasm as is the case with Finsen's light cure for lupus and kindred skin diseases, but they are also known to ozonise the air, so that after all part of their sterilising power may be of the same nature as that of other processes evolving nascent oxygen. The process would, of course, be most suitable in the case of a water (such as that from chalk springs) which is originally clear and colourless, and where electrical current or motive power to produce it is cheap. The process is not, however, yet out of the experimental stage.

Dr. Houston, in one of his reports, has suggested

THE USE OF LIME

as a sterilising agent. This substance has been used for many years to soften hard waters, the dose being calculated according to the amount of dissolved bi-carbonate to be precipitated, and being itself neutralised in the process. To sterilise much more lime must be added, and after having exerted the sterilising action this excess can be neutralised by mixing it with a certain volume of untreated water. There would also be a reduction of hardness, which would be beneficial to water such as that derived from the Thames. At first sight there seems to be an inconsistency in sterilising a part of the water and then

mixing it with unsterilised water, but Dr. Houston only considers the application of the process to cases of emergency, when only a part of the supply would require the special treatment.

Over-saturation with lime was proposed as early as 1883 by a Brussels chemist, who proposed the removal of the excess of lime by a current of carbonic acid, a process similar to the treatment of beetroot juice in sugar factories. An independent but similar system it at work at the town of Ghent, in Flanders, where permanganate of potash is added with the lime. A very bad water is there made quite clear and satisfactory. The present supply is, however, only a temporary one, the town having joined the Brussels suburbs in a scheme for taking water from springs in the valley of the Meuse, the works being not yet completed.

Speaking broadly it may be said that all these systems apply only to surface water, but this is due to the fact that generally spring waters are naturally pure and do not require any treatment. A few only of the various systems are intended to replace the time-honoured sand filtration, but most are intended to be supplementary to it. The contention is that sand filtration alone is not absolutely reliable, and therefore something more must be done, but it is with the same purpose in view that many water engineers have undertaken the closer supervision of filters, frequent chemical and bacterial analyses of the water and the erection of laboratories, &c. It must be borne in mind that the reduction or elimination of bacteria is not the only or chief object in view, but rather the maintenance of health and the prevention of cases of water-borne diseases. The author has stated what has been done at short notice by the use of chloride of lime, but it must not be assumed that the distribution of untreated river water should be considered as a normal proceeding. He firmly believes that with ordinary and reasonable care sand filtration is a sufficient safeguard against the distribution of polluted water, and such was the view of Dr. Koch when he formulated his conclusions on the immunity of Altona from cholera in 1892. Supplementary treatment and scientific control are improvements on older methods, and there is a moral obligation upon the water engineer to do his best in the interests of his consumers, but the intelligent adoption of improved methods and new processes does not necessarily involve the disparagement of older methods which have stood the test of time.

ROYAL SANITARY INSTITUTE.

THE HENRY SAXON SNELL PRIZE.

The subject given in 1912 for the essay in competition for the prize was "The Ventilating, Lighting, Heating, and Water Supply Appliances and Fittings for an Operating Room for a General Hospital." Ten essays were sent in, and they have been brought under the consideration of the council. The adjudicators for the competition were Mr. Edwin T. Hall, F.R.I.B.A., Dr. Louis C. Parkes, and Mr. A. Saxon Snell, F.R.I.B.A.; and they had the advantage of the very valuable criticisms and suggestions made by Sir Frederick Treves, Bart., G.C.V.O., who kindly acted as consulting referee.

Acting upon the advice of the adjudicators and of the consulting referee, the council have decided to divide the prize of fifty guineas, giving one half the sum to Mr. John Darch, M.R.SAN.I. (Wandsworth), writing under the motto "Aseptos," and the other half to Mr. H. F. V. Newsome (Manchester) and Mr. John G. Cherry, M.R.SAN.I. (Manchester), writing jointly under the motto "Magnum Bonum." The adjudicators consider that there are many excellent suggestions in each of these essays, but, on the other hand, there are some which they consider would prove unsatisfactory in practice.

A bronze medal of the institute will be awarded to each of the successful competitors. The adjudicators also desire to commend the essays sent in under the mottoes: "Science moves but slowly, slowly creeping on from point to point," "Ajax," and "Tout bien ou rien."

Hospital Stoves.—Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester, have received repeat order to supply their double-fronted patent Manchester stoves with descending smoke flues to the Napier Hospital, New Zealand.

LYE BUILDING LINE DISPUTE.

Mr. Justice Joyce on Friday last delivered judgment in the action in which the Attorney-General, at the relation of the Lye and Wollescote Urban District Council, sought by mandatory injunction to compel Mr. Thomas Parish to pull down and remove so much of a house erected by him in Perrin's-lane, Lye, as was in defiance of a building line prescribed by the urban district council. The case was commented upon in The Surveyor last week.

Mr. Justice Joyce, in giving judgment, said it went without saying that the order to set back the house 100 ft., when made under sec. 155 of the Public Health Act, must be properly communicated to the owner. In other words he must have plain and definite notice of what the authorities required, and it must be given in due time. It was agreed that the authorities could not prescribe the line under the 155th section until the building had been pulled down, and they must do so before rebuilding commenced. As to the time at which compensation should be tendered, he was not going to lay down any general rule, but it appeared to him to be the natural thing to tender the compensation at the same time the notice was given under the section. He thought that the tender ought to be made before the owner commenced to rebuild. So, without going so far as to lay down that it was necessary in point of law that the notice should refer to the section and mention it in the notice, it would be only right, in his opinion, that the council should do so. It seemed to him that the owner was entitled to know and to be told what the powers were under which the council were acting. In the present case it was not a new street, and he was not aware of any statutory authority enabling the council to make a general order with regard to an old street. If the lane had been widened and a new street formed it might have been reasonable to order that the owner should set the front of his building back, but no proceedings had yet been taken to widen the lane under sec. 154, which would have involved the council purchasing and paying for the land they took. After dealing with the evidence as to the discussions which had taken place on the subject between the council and the defendant, his lordship said that the council had not offered or agreed to pay compensation, and his opinion was that it was necessary that the council should have done everything necessary to put themselves right, and this they had not done. He thought no sufficient and proper notice had been given by the council or their officials. The conduct of the council could not be justified. In other words, it was unreasonable, unless they were going to widen Perrin's-lane. The defendant was at all events entitled to compensation, and the offer should have been made contemporaneously with, if not before, the notice was given. In these circumstances he declined to make a mandatory order compelling the defendant to pull down the building. That, under the circumstances, would be unjust to the defendant, who, he thought, had not been properly treated by the council, and all he could do was to dismiss the action with costs.

An application for a stay of execution was refused.

City of London Street Widenings.—With respect to the projected rebuilding of the General Post Office at St. Martin's-le-Grand the Improvements Committee of the City Corporation suggested that Cheapside should be widened to 95ft. at "Sweeting's Corner." That would involve the acquisition of additional land belonging to the Post Office and the setting back of Nos. 157, 157A, and 158, Cheapside. The committee recommended that that course should be taken, subject to the London County Council's paying half the net cost, and this the Court of Common Council agreed to.

Road Repairs in London.—In the House of Commons recently the President of the Local Government Board was asked whether he possesses any power to insist that when operations are in progress necessitating the taking up of the roadway of a London street these operations should be prosecuted vigorously and continuously until effected, in order that the inconvenience, danger, and disturbance caused may be as limited as possible. Mr. Burns replied in the negative. He added that he quite agreed that it was very desirable that works of this kind should be carried through as expeditiously as possible. He was glad to say local authorities were becoming increasingly alive to the importance of this being done.

D*

INSTITUTION OF MUNICIPAL ENGINEERS.

COUNCIL MEETING.

At a meeting of the council of the Institution of Municipal Engineers held on December 21st the following applicants were recommended for admission:—

To Membership: Messrs. A. Culkin, highway surveyor, Sculcoates Rural District Council; W. N. Hoskins, engineer for thoroughfares and waterworks, Pietermaritzburg; M. J. McMaking, assistant engineer, Boksburg Municipality; W. Wright, municipal engineer, Lagos; R. E. Jackman, sanitary surveyor and water engineer, Williton Rural District Council; R. Laycock, surveyor, Farsley Urban District Council, and C. W. Kendrick, sanitary surveyor, Bingham Rural District Council.

To Associate-membership: Messrs. W. C. Robson divisional surveyor's office, Warwickshire County Council; S. J. Kelly, Haxby-road, York; R. Claiborne-Dixon, 160 Warwick-street, S.W., and W. T. Hogben, assistant surveyor, Sandgate Urban District Council.

Transfer to Associate-Membership: Mr. H. W. Lovelock, assistant surveyor, Godstone Rural District Council.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

Elected to Studentship: Messrs. R. R. Hogsden, surveyor's office, Midhurst Rural District Council; P. L. Stephens, surveyor's office, Llanelly Urban District Council; F. A. W. Clarke, main roads surveyor's office, East Suffolk County Council, and G. L. Bowron, surveyor's office, Darlington Rural District Council.

New Members, &c.—From the applicants recommended for admission at the last meeting three members and one associate-member were elected, and two transfers were made to the membership class.

Defence Fund.—The council considered certain resolutions which had been passed at district meetings requesting them "to take immediate action to form a Mutual Aid and Defence Fund, contributions to which would be compulsory on the part of all corporate members and students," and it was decided to take a postal vote upon the matter. Papers will be sent out with the report of the next council meeting.

Examinations.—Certain modifications were made to the syllabus for the General Paper, and a copy of this paper will be circulated later.

National Health Week.—Mr. Henry C. Adams was appointed to represent the institution on the Advisory Council of the National Health Week Committee.

Provincial Council Meetings.—It was decided that these be held as follow: Newcastle, February 22nd; Manchester, May 28th. The next London council meeting will be held on January 29th.

The attention of members is directed to the subjoined letter.

B. Wyand,
Secretary.

[COPY OF LETTER REFERRED TO.]

Dear Sir,—You may doubtless have read in the columns of the technical Press a circular letter, dated November 11, 1912, issued by another municipal engineering society. Since the alteration in its title this society has so often been mistaken for the Institution of Municipal Engineers that the council deems it imperative to issue a "disclaimer." The letter in question contains the following passage:—

"The council would be much obliged if you could assist them in reaching and influencing members of your technical staff with a view to their enlistment on the roll of the association and to this end I am enclosing a form of enquiry which the council trust you may be good enough to fill up in order that a personal communication may be forwarded to those members of your staff who are not yet connected with the institution."

The most unbiassed mind must read into this a direct invitation to the chief of a municipal engineering department to furnish a list of his technical assistants, in order that they might, with his assistance and "influence," the good offices of more than one intermediary be compelled to enrol themselves as members of the body from which the circular emanated. It is extremely doubtful if any junior official could reasonably be expected to ignore a hint (which in some cases would probably amount to something more) thrown out by his chief as to the advisability of joining the professional society of which such chief might be one of the pillars of strength. To do justice to the majority of the members of that society, however, there is little doubt that the suggestion will in most quarters be rejected.

It is a matter for extreme regret that any professional society should have recourse to such methods in order to increase its membership.

In the circular letter under review it is admitted that the erstwhile "association" has been in existence since 1873. The number on its roll at the present moment is, approximately, 1,250. The Institution of Municipal Engineers was founded only five years ago, and it now has a membership of nearly 900. Comment would surely be superfluous!

The Institution of Municipal Engineers has facetiously been described as the "Junior Institution," and no more flattering tribute could have been paid to it! At any rate, the "Junior Institution" has been responsible for the rejuvenation (so far as has been possible) of its aged relative. Every forward step taken by the latter during the last four years has been but a following of the lead of the infant. The institution does not deny that, to a great extent, it *has* catered for the younger members of the profession, having recognised on its inception that the assistants of to-day are the chiefs of to-morrow.

The Institution of Municipal Engineers has discouraged the reading of papers of purely local interest, papers in which prominence is given to the lengths of sewers, the mileage of roads and details of the daily routine work of a municipal engineer. It has taken the initiative in the giving of serious and prolonged consideration to such vital questions as superannuation, security of tenure, legal defence, fair competition for appointments, adequate remuneration and assistance of necessitous brethren. It has evolved, too, a professional society with clearly-defined objects and an absence of innumerable grades of members, and the work that it has done has been largely the work of its members.

Although the council of the institution deems it unnecessary to exhort you to use your best efforts to increase its popularity and usefulness, it has been thought advisable, in the face of the circular letter referred to, to request that you will bring to the notice of your professional brethren and the members of your staff the undoubted advantages to be derived from membership of the institution. It is felt that it would be equally superfluous to suggest that, in so doing, you would refrain from anything in the nature of coercion. The council hopes, too, that this single lapse from that originality which has hitherto marked the course of the institution will be pardoned.

One other matter! To remove any misapprehension which might exist as the result of certain correspondence and comments which have appeared of late in the technical Press, it may be necessary to state that the Institution of Municipal Engineers has never discussed the question of amalgamation, it having been felt that the success which has hitherto attended its efforts is the strongest possible guarantee of its stability and its continuance as a permanent institution.

(Signed)
B. Wyand,
Secretary.

39 Victoria-street, S.W.
December 21, 1912.

Preliminary Studies in Bridge Design.—This little book† a reprint of articles which appeared in The Surveyor and Municipal and County Engineer, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . *Engineering News*, New York.

The Road System of France.

HIGHWAY ADMINISTRATION: SYNDIC ASSOCIATIONS.

By M. de PULLIGNY, a Chief Engineer on the Ponts et Chaussées.

We are [illegible] *Engineering and Contracting* for the text of the following interesting paper. The interpolations in square brackets are made for the convenience of English readers, and cross-headings have been inserted to facilitate reference to the different parts of the subject dealt with.

The highways of France are divided into seven classes—viz., national roads, departmental roads, main traffic roads, roads of common interest, ordinary local roads, country roads, recognised and not recognised [local] and streets. [(1) Routes Nationales, (2) Route Departmental, (3) Chemins de Grandes Communications, (4) Chemins d'Intérêt Commun, (5) Chemins Vicinaux ordinaires. The last being divided as explained below in the text, and streets reckoned as a class, make seven classes.]

The first two classes constitute the main roads (grande voirie), and the five others the lesser roads (petite voirie). Under the present condition of things the departmental roads are gradually being absorbed into the main traffic roads and the roads of common interest, which, however, are controlled in about the same way with the exception only of certain proceedings.

Since the national roads are the property of the State, their classification is vested in the State, and, when they are declared to be of public utility by a decree of the council of State, they are established and maintained at the expense of the federal treasury [Treasury of the State, or the Republic]. They are controlled by the Minister of Public Works, and work on them is performed by the engineers of bridges and highways. In January, 1911, the extent of the national roads was 23,760 miles, which were [illegible] at the expenditure of $6,501,205 [£1,354,400.]

The Councils General have control over the next three classes of French roads, including the departmental roads, the main traffic roads, [main feeder roads, or main connecting roads], and the roads of common interest. The departmental roads belong to the departments, and are maintained at their expense, while the local roads are the property of the communes and are maintained by them. Departmental roads are authorised by State decrees declaring their practical need, but main traffic roads and roads of common interest require only the authority of the Council General.

All of these kinds of roads are under the jurisdiction of the prefects, [maires], who are represented in the actual work by highway overseers (agents-voyers), though the local road service is at present maintained by the federal [State] engineers of bridges and highways in forty-four departments. Within the [illegible] have thus come under the federal [State] control has increased by seventeen. In other words, the [illegible] of the departmental roads which was about 12,430 miles in 1811 and about 29,615 miles in 1869, has been reduced in the most recent census to about 8,142 miles. On the other hand, the total length of local roads of all descriptions, which was about 341,767 miles in 1868, had increased to 395,633 miles on January 1, 1911.

Between the years 1868 and 1911 the total development of classified roads increased 53,805 miles, while the [illegible] traffic is greater now by 136,136 miles. Moreover, in the same period of time 21,131 miles were removed from the classification of departmental roads. During [illegible] classes of local roads amounted to $37,537,018 [£7,820,000.]

THE LAW OF 1836.

The fundamental law which governs the network of local roads was passed on May 21, 1836. By its provisions the municipal councils are authorised to require for the maintenance of local roads, in case the ordinary funds of the commune are insufficient, [illegible] in kind or not more than 5 per cent in addition to the principal of the four general taxes [illegible]

Every inhabitant on the direct tax list is required to pay taxes as follows: (1) For himself and for each man between the ages of 18 and 60 years who is a member of his family or a servant, and who resides in the commune; (2) for each cart or carriage, and for each beast of burden, and draught and saddle animal in the service of the family. The tax may be paid in money according to rates fixed by the General Council, or paid in labour according to rates fixed by the Municipal Council. The general councils may divide the taxes, both cash and labour, between the main traffic roads and the roads of common interest. This is being done more and more frequently because of the increase in the mileage of these roads, and the consequence is that the greater part, sometimes the whole of the resources created by the law of 1836, are also used by the departments and nothing or not enough is left to the communes for the maintenance and improvement of the ordinary local roads. Nevertheless, while new legislation is needed on this point, excellent results have been produced for a long time in the development of the secondary road system of the country.

EXTRAORDINARY TRAFFIC.

The provisions of the law of May 21, 1836, concerning the use of local roads by heavy enterprises, such as mines, forests, quarries, &c., and the subsequent payment of extra taxes in labour or money for damages caused by such heavy works, have also been of great assistance in keeping the condition of the roads at a high standard. It has not been easy, however, to settle some of the points brought up by this law, for example, just when traffic becomes extraordinary so as to fit into the category that should be taxed by extra payments, and again the amount of taxes to be collected. For this latter point the practice has grown up of considering—(1) The state of the road before the beginning of the work; (2) the number of draught animals used by the exploiters; (3) the weight of the materials transported; (4) their nature; (5) the kind of conveyances and the method of loading them; (6) the distances passed over; (7) the season of the year during which the transportations are made.

[illegible] must not be forgotten that the roads may be used normally, and that, besides the extraordinary wear and tear produced by special enterprises, there is the ordinary wear caused by general traffic. The difference is to be noted only at the moment that the traffic is taking place. The simplest means of settling the difficulty is always to make a reduced advance payment whenever agreement can be reached between the Government and the individual engaged in the business. In general, a price is fixed per kilometre ton, but in the departments near Paris these tolls vary from $\frac{1}{2}$ to $\frac{3}{4}$ of a cent per kilometre ton [0·64d. to 0·96d. per ton-mile, or, say, ¾d. to 1d. per ton-mile], according to the nature of the commodities transported. Formerly the valuation was obligatory, but since the law of July 22, 1889, it is no longer required, and must be demanded by one of the parties.

In spite of the difficulties arising under application of parts at least of the law of May 21, 1836, the arrangement for paying for these improvements has given, and still gives, the greatest help in maintaining the local roads of France. It strikes directly the person using the road and causing the extra wear and tear, and creates special resources for restoring the road to its previous good condition. It has contributed [illegible] roads which each year are damaged by industrial enterprises, as, for example, the transportation of crops in the autumn when the roads are in a soft condition because of the rains. The communes would be utterly unable to make these heavy annual repairs without this extra assistance.

ASSISTANCE BY THE DEPARTMENT AND THE STATE.

It is necessary to mention the fact also that various laws promulgated at different times since 1836 empower the departments to assist in the maintenance of the main traffic roads and the roads of common interest. This assistance can be given only in the case of roads especially named in the text of legislative act. Moreover the departments can intervene

only when assurance is given by the communes that the usual maintenance will be given to their ordinary local roads, and that all their available funds will be applied to the works in question. The poorer departments are favoured by the State under such circumstances.

Until this year the fact that the State could assist the departments and communes only on their local road offered serious inconvenience, owing to the development of the tourist traffic, especially automobiles, in the last few years. Roads which formerly were but rarely used in the transportation of agricultural produce, especially mountain roads, are now used during the touring season by great numbers of automobiles. These roads have thus acquired a general interest, but the departments and communes did not have available the funds required by the increase of traffic, and consequently Parliament has passed an Act by which assistance for maintaining tourist roads may be given from the federal treasury.

With this purpose in mind the National Bureau of Tourist Traffic has this year undertaken a census of all classes of vehicles on certain roads in order to establish the respective amounts of local and tourist traffic.

Country [local] roads, in spite of their great mileage, are of less importance than the other classes of roads because they serve only the local needs. Their maintenance is, like that of city streets, entirely dependent on the communes.

SYNDIC ASSOCIATIONS.

One other feature of French legislation is to be found in the Syndic Associations which are authorised by various laws, for the purpose, among other things, of maintaining, establishing and widening roads. It does not appear, however, that many of these organisations have turned their attention to roads. According to the statistics of 1901, the latest available, less than 300 out of 7,000 have taken up highway work. The organisation is very similar to the drainage associations existing in central and western States of the United States, except that these latter are confined to the one purpose. In France there are two kinds of organisations—the free organisations, which are formed only by the unanimous consent of the persons interested, and the authorised organisation, formed by a decree of the prefect, either by change from free organisations or directly.

In the case of the authorised organisations the majority always rules. The landowners interested are united in an authorised syndic association by a decree of the prefect either at the request of one or more among them, or upon the initiative of the "maire" or the prefect, when the roadwork has been recognised to be of public utility by a decree of the Council of State. The work cannot start without the authorisation of the prefect, and this may be given only in case three-quarters of the persons interested, representing more than two-thirds of the land, and paying more than two-thirds of the land tax, or two-thirds of the persons interested, representing more than three-fourths of the land, and paying more than three-fourths of the land tax, join in the association. The prefect may also not give his authorisation until after the payment of the costs of condemnation and the guarantee by the organisation that all expenses incidental to the work will be paid. In case of the insolvency of the organisation, the persons who have suffered loss have recourse against the Government which has benefited by the works, whether it be commune, department, or the State.

The syndics or directors of the enterprise are elected by the members of the association, but in case of a subsidy by the State, the department, the commune, or a chamber of commerce, the prefect, the departmental commission, the municipal council, or the chamber of commerce, according to the circumstances, is granted the right to nominate a number of syndics according to the part that the subsidy represents in the total amount appropriated for the enterprise. The organisations have been placed on a better basis by the law of March 9, 1894, but various laws, even as far back as before the Revolution, were passed dealing with certain phases of the plan. As has been said, these organisations have not, up to the present time, been the means, to any great extent, of improving the public road, but there are great possibilities in such associations. In France the fact that the roads have been so thoroughly improved by the authorities is very likely [illegible] the work has been done by the public authorities. In the absence of central road work by the Federal Government and by some of the States of the United States, the information concerning these organisations is offered as possibly containing suggestions for securing road improvements in those States which have failed to secure it otherwise.

INSTITUTE OF SANITARY ENGINEERS.

ELECTION OF OFFICERS.

The general meeting of the members of the above institute was held on the 19th inst. at the offices, 120-122 Victoria-street, Westminster, when the president, Mr. A. J. Martin, M.INST.C.E., took the chair.

The report of the council stated that during the year 1912 the institute has materially improved its position in regard to the status, its influence, and particularly its finance.

The statement of accounts, balance-sheet, and auditors' report for last year were received and approved, the figures showing a very material reduction in the outstanding liabilities, and it was intimated that the council anticipated the financial results of the present year would show a still further improvement.

For the president for the coming year the council had nominated Mr. H. Percy Boulnois, M.INST.C.E., past-president of the Institution of Municipal and County Engineers and chairman of the council of the Royal Sanitary Institute. His election was carried with acclamation. Mr. Boulnois will give his presidential address on Monday, January 20th, at Caxton Hall, Westminster.

Mr. E. R. Palmer was re-elected to the office of treasurer, and Messrs. McPherson, Timmins and Ednie, chartered accountants, were elected the professional auditors.

The election of councillors was by postal ballot from all members of the institute residing in the United Kingdom. The counting of the votes was entrusted to four pairs of scrutineers, and the result was the election of the following candidates to fill the sixteen vacancies, for which there were thirty nominations.

Councillors to retire in 1915: Mr. Fred W. Mason, of Enfield; Mr. Harold S. Couchman, of Tottenham; Mr. Edwin H. Blake, of Westminster; Mr. George B. Hall, of Hornsey; Mr. Albert W. Sweetland, of Kensington; Mr. Walter E. Markham, of Essex-road, N.; Mr. William E. Farrer, of Birmingham.

Councillors to retire in 1914: Mr. William H. Wise, of Ennismore-gardens, W.; Mr. A. A. Kemp, of Whitstable, and Mr. E. E. W. Berrington, of Wolverhampton.

Councillors to retire in 1913: Mr. Henry T. Sidwell, of Hatfield; Mr. Guy B. Grave, of St. John's Wood; Mr. John D. Kendall, of Paddington; Mr. Herbert Freyberg, of Cromwell-place, S.W.; and Mr. Oswald J. Edwardes, of Surbiton, Surrey.

The council for the year 1913 will include the president, the vice-presidents, and the hon. local secretaries of districts, in addition to the elected members whose names are given above.

A special vote of thanks to Mr. Martin for the very great interest he had shown in promoting the welfare of the institute during his two years' presidency was carried enthusiastically, and the proceedings ended with the president's reply.

Royal Institute of British Architects.—The president's address to students and presentation of prizes have been fixed for February 3rd next.

Mechanical Filters for Morley.—The adoption of a mechanical filtration plant at the Wythens reservoir was unanimously approved at the last meeting of Morley Town Council. The expenditure is estimated at £9,500, and application for sanction to borrow this amount will be made to the Local Government Board in due course. "Turnover" filters, made by Messrs. J. Blakeborough & Sons, Woodhouse Works, Brighouse, for the Turnover Filter Company, 39 Chichester-street, Belfast, are to be installed, and it was stated in the course of the meeting referred to that the selection of this type had been decided upon after the most careful consideration. The Waterworks Committee had seen in operation one filter which had been at work for ten years without having been taken out, dealing with a much discoloured water and discharging quite clear and pure.

ADVERTISEMENT HOARDINGS.

REPORT TO THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

[The following report, prepared by Mr. John S. Brodie, M.INST.C.E., borough engineer, Blackpool, was presented recently to the council of the Institution of Municipal and County Engineers. Some comments on it appear in "Minutes of Proceedings," in the present issue.]

The Advertisement Regulation Act, 1907, was passed presumably with a view to embody in a general Act clauses which had been obtained by municipalities in local Acts from time to time during the past few years.

Sec. 2 of this Act enables any local authority to make by-laws, which must be confirmed by the Secretary of State, for (1) the regulation and control of hoardings and similar structures used for the purpose of advertising, when they exceed 12 ft. in height, and (2) regulating, restricting or preventing the exhibition of advertisements in such places and in such manner or by such means as to affect injuriously the amenities of a public park or pleasure promenade, or to disfigure the natural beauty of the landscape.

So far back as 1893 the corporation of Blackpool obtained a clause in their Blackpool Improvements Act, 1893, sec. 61, regulating advertising on bridges, vehicles, &c., and this clause has been of very considerable service in preventing unsightly advertisements on blank walls and vehicles used for advertising, as no such advertisements are allowed unless approved in writing by the corporation. This power appears to be incorporated in sub-sec. (2) of the General Act above referred to.

Again, a clause was obtained in the Blackpool Improvement Act, 1901, sec. 45, which is practically embodied in sub-sec. (1) of the Public General Act.

Following on the passing of the Act in 1907, Model By-laws were issued by the Secretary of State. These Model By-laws are subdivided into three parts.

Part 1 deals entirely with the structural details of all advertisement hoardings when they exceed 12 ft. in height.

Part 2 suggests by-laws for the regulation of advertisements when they are visible from any public park or pleasure promenade, or where they may disfigure the natural beauty of the landscape in certain specified areas or districts.

Part 3 provides that no existing advertisement hoardings shall be interfered with until after a period of five years has elapsed from the time of the making of the by-laws.

I find that the Administrative County of Southampton has obtained a by-law, which was confirmed by the Home Secretary on September 27th, 1911, as follows:—

No advertisement shall be exhibited on any hoarding, stand or other erection visible from any public highway (whether carriageway, bridleway or footway) and so placed as to disfigure the natural beauty of the landscape.

I also find that the following by-law was obtained by the County Council of the Administrative County of Surrey, and confirmed by the Home Secretary on May 22, 1912—viz.:—

No advertisement shall be exhibited on any hoarding, stand or other erection so as to be visible from any public highway (whether carriageway, bridleway or footway) or from any public waterway (whether river, river-tributary or canal) or from any railway, and to disfigure the natural beauty of the landscape.

The application of these by-laws is confined to such parts of the Administrative Counties of Southampton and Surrey as are not within any urban district containing a population, according to the last census for the time being, of over 10,000. The usual condition of five years' exemption for existing hoardings is imposed on these by-laws.

The above two examples are typical of the nineteen county boroughs and urban district councils who have had by-laws confirmed by the Home Office.

The Corporation of Edinburgh, however, appear to have obtained—in the Edinburgh Corporation Act, 1899, sec. 45, amended by the Edinburgh Corporation Act, 1906, sec. 77, sub-sec. (8)—the following clause:—

"For the purpose of protecting the amenity of the city, and of enabling the corporation to exercise control over any sites or hoardings to be erected and used for the purpose of advertisements, the following provision shall have effect:—

"(1) No person shall erect, exhibit, fix, maintain, retain or continue any advertisement, whether now existing or not, upon any land, house, building or structure, except on such sites, hoardings or other structures as the corporation may in writing license, and such licence may be granted for any period not exceeding four years."

To this general clause there are the following exemptions:—

(1) Window exhibitions.

(2) Signs in connection with trade or business carried on within the land, house or building upon which the same are placed, including sale or letting notices.

(3) Railway companies' business.

(4) Notices within any railway station, but not on the surfaces of walls or property fronting any public street.

(5) For a period of five years from the passing of the Act, of advertising hoardings then in use.

As the council are probably aware, there has been and there is much controversy in regard to this subject.

In Paris the Chamber of Deputies passed a Bill, on July 8th of this year, imposing a further very heavy tax on advertisement hoardings that disfigure the scenery of France, particularly along the chief railway lines. Hoardings will be taxed £2 per square yard if not over 6 yds. in area. If above that size, a graduated scale up to £16 per square yard will apply on advertisement panels larger than 20 sq. yds.; and the rates per square yard will be doubled, tripled and quadrupled if the panel contains two, three, four or more advertisements.

At Potsdam, near Berlin, no advertisement hoardings are allowed within 400 yds. from a railway under very heavy penalties.

All are agreed, I think, on two things—viz.: (1) That an abuse at present exists in regard to unsightly advertisements; and (2) that the powers conferred on local authorities by the Advertisements Regulation Act, 1907, are inadequate and insufficient to deal effectively with the evil.

I am strongly of opinion that nothing short of the powers conferred by the Edinburgh clause will enable local authorities, irrespective of population, satisfactorily to preserve the amenities of their districts, and I suggest that a model be adopted embodying the views of the council on the subject.

RIVER TRENT PROTECTION WORKS.

REINFORCED CONCRETE CONSTRUCTION.

The City Corporation of Nottingham have accepted the tender of Messrs. G. Bloms & Turner, of Nottingham, licensed contractors for the "Piketty System" of reinforced concrete, for the execution of the above, in accordance with the plans of Mr. Arthur Brown, M.INST.C.E., city engineer.

The whole of the work is to be carried out on the "Piketty System" of reinforced-concrete construction, which has been selected in competition. Full particulars of this method can be obtained from Messrs. Piketty, 14-18 Bloomsbury-street, W.C.

Seaham Harbour Housing Scheme.—Seaham Harbour Urban District Council have adopted a scheme for the erection of sixty-nine workmen's dwellings, and decided to proceed with the erection of forty-eight of them at once, on the sanction of the Local Government Board has been obtained for the borrowing of the necessary money. The site, on the south of the town, covers 2·874 acres, and is offered by Lord Londonderry at £550 per acre. The houses will be twenty-four to the acre, self-contained in blocks of five and six. Access to back doors will be through passages between each block. Each house will have a back garden 26 ft. by 16 ft., and the backyards will have a clear paved area of 130 sq. ft. The houses will consist of a living room 15 ft. 3 in. by 14 ft. on the ground floor, and also a scullery. Room has been left in the scullery for the insertion of a bath. On the first floor will be two bedrooms, one 15 ft. 3 in. by 12 ft. 3 in., and the other 11 ft. 9 in. by 12 ft. Joint wash-houses will be provided, well away from the dwellings. The rents will be 6s. per week. The total loan required for the sixty-nine houses will be £14,909, and the scheme will not become a charge on the rates.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

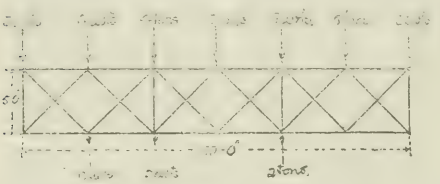
This week answers are invited to the following questions:—

294. Traction.—Compare the tractive force required for heavy vehicles over roads of various surfaces and grades, and show how this affects the cost of transport. (H. V. O., *West Bromwich.*)

295. Air Compressors and Ejectors.—Of what horse-power will an electric motor require to be to work an air compressing plant and ejectors to raise 100,000 gallons of sewage a height of 15 ft. in six hours? Show stages of calculations, and state the probable mechanical efficiency of air compressors and ejectors. (D. G. B., *Darlington.*)

296. Tides.—Please explain clearly what is meant by "H.W. of ordinary spring tides" and "L.W. of ordinary spring tides." Also state how the height of ordinary spring tides is arrived at, and over what period the observations or calculations are made. In what respect does an ordinary spring tide differ from an equinoctial spring tide? (Perplexed.)

297. Lattice Girder.—How would you obtain, graphically and by calculation, the stresses in the members



of a lattice girder braced and loaded as shown in sketch? (T. H., *Leicester.*)

298. Gauging of Streams.—In gauging the quantities of water in small streams over a rectangular notch 3 ft. 9 in. wide (taking the velocity of the stream into consideration) is there any known connection between the velocity of the stream immediately above the gauge and the height of the water above the sill, taking no other quantities into consideration? If there is no general connection between the two is there any within certain limits, and, if so, what are the limits? (E. K., *Sutton Coldfield.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the monthly Premium.]

REPLIES TO QUESTIONS.

292. Foundations.—Sheet piling is required round the foundations of a warehouse to hold in the soil, which is of a loose, sandy nature. Give neat sketches showing how this would be carried out. (T. R.)

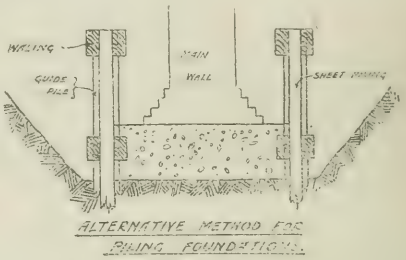
Where a building is to be erected upon soft soil, sand, loose gravel or mud, the whole of the site is sheathed in piles to confine the soil so that it may act as a homogeneous block, being unable to spread laterally, as it certainly would do were it not confined.

The method of sheet piling is as follows: The whole site is excavated to a suitable depth, say 2 ft. or more, and guide piles, 9 in. by 9 in. to 12 in by 12 in., grooved on two opposite sides, except for corner piles which are grooved on adjacent sides, are driven in 6 ft. to 8 ft. apart all round the site, and left projecting 2 ft. above the bottom of the excavations. Wallings about 9 in. by 6 in. are notched and bolted on to both sides of these piles in two pairs, one pair at the top of the piles and the other pair at the bottom of the excavation. These wallings act as guides for the sheet piling, and should be [illegible] between each pair equal to the thickness of the sheet piling to be used, say 4 in.

Sheet piles, say 9 in. by 4 in., birdsmouthed at edges, pointed at bottom on one side, and shod with sheet iron, are then driven in between the guides close together into the solid strata and left all flush along the top edge.

The whole of the site is then covered with a bed of concrete to prevent the soil from oozing up under the load.

As an alternative method a double row of sheet piling could be used with a clear space between equal to the width of concrete foundation, in order to confine only the soil immediately below the founda-



tion. The effect of this method would be to prevent the escape of the soil to either side when under load.

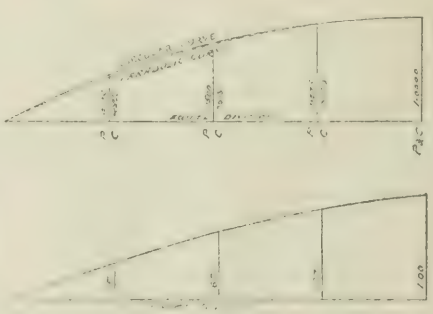
For a choice of method to be adopted in practice regard must be had to the size of the building and the purpose for which it is required. Either method will give stability, but from the point of view of economy the area of concrete must be considered in the one case as against the linear measurement of sheet piling in the other case, as an additional row of piling around the inside of the foundation, if at not too great a depth, may be cheaper in construction than covering the whole site with concrete of sufficient strength to withstand the upward thrust of the soil.

Interlocking steel sheet piles are extensively used in America, but the experience as yet obtained of their durability is not sufficient to warrant their unqualified recommendation. (D. G. B., *Darlington.*)

293. Road Making.—State the advantages claimed for the parabolic camber over the circular camber in road construction, and give a sketch with figured dimensions of a camber which produces the best results. (A. S. C., *Hove.*)

The advantages claimed by a parabolic camber over a circular camber in road construction are:—

(1) The cross gradient towards the channel is not



[illegible] steep, although the same total cross fall is obtained.

(2) The formation of the curve allows of a greater

depth for wear before water will stand in the centre of the road.

The following sketch shows two curves, a parabolic curve and a circular curve, on each of which the respective ordinates are calculated and figured, and upon comparing these ordinates it will be seen that the difference between the two curves is very slight, and the advantages claimed are to a great extent more theoretical than practical.

In roads having channels at different levels, thereby causing the crown to be situated more towards the higher side, the length of the circular curve becomes somewhat greater, and the advantages of the parabolic curve in this case are more prominent.

In actual practice the true parabolic curve has not altogether given the best results. Telford recommended a very flat ellipse, and Walker preferred two straight lines connected by a short curve at the crown, but a modification of the latter section has generally been accepted as giving the best results, and the curve adopted by the late Mr. J. Price, of Birmingham, shown in the accompanying sketch, has proved highly satisfactory both from points of view of wearing capacity and cross drainage. (D. G. B., *Darlington*.)

Penwortham Sewerage and Sewage Disposal.—The Penwortham Parish Council have instructed Messrs. Taylor & Wallin (Mr. Harry W. Taylor, ASSOC.M. INST.C.E.), of Newcastle-on-Tyne and Birmingham, to report upon the sewerage and sewage disposal of their parish.

Housing at Shipley.—At a meeting of the Shipley District Council on Monday attention was drawn to the scarcity of houses for the working classes in the district, and the opinion was expressed that unless builders bestirred themselves it would be necessary to go in for a municipal housing scheme. A member stated that the industrial development of the town would be hindered if house accommodation were not provided.

Motor 'Buses at Todmorden.—At Todmorden Town Council meeting on Monday night a proposal was submitted to purchase additional motor-'buses. Alderman Isaac Dawson said it had cost £7,000 to keep running 'buses, which only cost £4,000, and they had cost the rates nearly £8,000. Mr. Rigby Dawson said Todmorden and Eastbourne had lost heavily by being the pioneers of motor-'buses, but the makers had profited by their experience. The council had better have spent money on pioneers to run trackless cars, which would cost a 2s. rate. The proposal was not adopted.

CORRESPONDENCE.

"We aim at argument, not victory, and court correction, for truth is our victory."—MARCUS TULLIUS CICERO.

THE CONTOUR SURVEY OF BUSHEY, HERTS.

To the Editor of THE SURVEYOR.

SIR,—Mr. Lange's article in your issue of the 6th instant is of great interest now that the importance of an altitude survey is being recognised as the first indispensable step in any comprehensive scheme for town planning purposes.

As regards the method to be adopted in the field for such a survey, it is not possible to lay down any hard and fast rule; it will depend largely upon two points—(1) The instructions which may be given as to the requirements—viz., the difference in altitude between the contour lines and the additional spot-levels which may be considered necessary; and (2) the nature of the country—viz., the frequency and variation in the undulations, the presence or absence of existing buildings, crops, standing timber, slow undergrowth, &c.

Assuming that the work is to be laid down upon a correct ordnance map, so that no survey beyond that of the contours or spot-levels will be required, and the instruction given that the contours are to be set out and surveyed for transfer to the map, then the first—or what may be termed the "chain"—method mentioned by Mr. Lange is probably the most practical. The chain lines need not necessarily run in a direction generally parallel to the contours, but should be determined by the regularity of the contours, their distance apart, and the size and shape of the enclosure to be surveyed.

If, however, the instruction given is that a spot-level survey is to be made and a contour plan prepared therefrom, then undoubtedly a tacheometrical survey would give the quickest and most satisfactory results, provided that the country will allow of the effective use of a tacheometer.

If it is proposed to use the plan for estimating purposes as well as for the general design of the lay-out, then a spot-level survey is certain to be the most satisfactory, sights being taken at every change in the ground, and the levels preserved for future use. With contours even at every 5 ft., the results—for estimate purposes—may be deceptive. This method has the further advantage that the spot-levels having been once obtained and plotted, the contour lines to be traced—not necessarily at regular intervals—can be determined when the requirements are better known. Although in the case of Bushey it appears that the tacheometer work was found to be quicker than the chain survey, it is obvious that, in many cases, to take a large number of spot-levels with a tacheometer (having regard to the great amount of office work involved in reducing) merely for the purpose of tracing contours therefrom would not be so satisfactory as to do the work by level and chain survey.—Yours, &c.,

J. F. JOBBETT REYNOLDS.

BITUMINOUS MATERIALS.

To the Editor of THE SURVEYOR.

SIR,—That the recent correspondence on this subject should have elicited such an excellent contribution as that from "Original" is an achievement in itself.

I agree with "Original" that the adjective "pure" as frequently applied to Trinidad, Bermudez, Cuban, and such-like individual asphalts as found in their natural states is somewhat ambiguous, inasmuch as that word is not intended to convey that such asphalts are chemically pure, but merely free from adulteration. I suggest that

(1) The word "asphalt" (without the "e") which is to-day recognised commercially as relating to (amongst others) the above-mentioned natural materials, be retained and construed to mean any natural mineral bitumen, either pure or mixed with foreign matter, in either a liquid or semi-liquid form, or from which, through natural causes in the process of time, the light oils have been driven off until it has become solid in consistency.

(2) The word "asphalte" (with the "e") relate only to natural rock asphaltes.

(3) The word "asphaltum" relate to liquid, semi-liquid or oxidised residuums obtained by the careful distillation of asphaltic or semi-asphaltic base petro-

lenins only, and not to paraffin residuums; further, that such asphaltums should only be regarded as of any real value when used as a flux or as an amendment to a limited extent to some of the natural asphalts in the manufacture of paving materials.

(4) The word "asphalt" never be associated with coal-tar products, and that paving materials manufactured from aggregate bound together with refined, fluxed natural asphalt be known as asphaltic paving mixtures as differentiated from bituminous paving mixtures in which coal tar products have formed the matrix.—Yours, &c.,

Cecil Nathan.

3 London Wall Buildings,
E.C.

To the Editor of The Surveyor.

Sir, I may say it was not my intention to enter further into this discussion, as it is my contention that the correct meaning of the words "bitumen," "asphalt" "asphaltum," &c., have been known since the introduction of these materials many years ago, but I feel obliged to congratulate "Original" on the very clean way he states his case in his interesting letter you published in your last issue. It seems strange that some of your correspondents should have put forward such peculiar definitions of asphaltum, &c., when it would have been a simple matter to ascertain from books of reference that asphalt—as "Original" points out—is the English spelling, and asphalte and asphaltum the French and Latin words respectively.

At the same time I do not agree with "Original" that Trinidad asphalt, either in its raw or refined state, means "asphalt formed by the artificial admixture of sand, &c., with Trinidad bitumen." The Trinidad Lake material is described by the Government whose property it is, and by the concessionaires of the lake, as "asphalt," and it is sold in its crude state as "raw Trinidad asphalt," so there is no doubt whatever that the Trinidad material alone is already an asphalt without the addition of any sand, &c. If, however, I have not understood "Original's" letter correctly, and he refers to a composition prepared from Trinidad asphalt, sand, &c., then this is, of course, another matter, and the preparation he mentions would be a "Trinidad asphalt composition" or "an artificial asphalt."

I also do not agree that bitumen and asphalt should be placed in two distinct classes, as nearly all native bitumens can rightly be termed asphalts, but these are, of course, quite different from the rock asphalt found in France, Germany, Sicily, and elsewhere.

I am sorry there is not time on this occasion to deal with this more fully, but as the native bitumens of Trinidad, Venezuela, Cuba, Turkey, and other countries can all rightly be termed asphalts, it is much more simple therefore, and at the same time quite correct, to place all natural materials of this kind in one class and rock asphalt separately in another.—Yours, &c.,

A. E. H. Dussek.

INTERCEPTING TRAPS IN HOUSE DRAINS.

To the Editor of The Surveyor.

Sir, In reply to the letter of Mr. Walter Jennings in your issue of the 20th inst., I was under no misapprehension as to the action of the "Closet of the Century." I merely called attention to the indistinctness of his illustration published in The Surveyor of the 6th inst., where the flush pipe and air outlet pipes are somewhat mixed. I accept unreservedly his assurance that after six years' constant use the closets were found to be in "a perfectly clean condition," but it seems to me that this result was arrived at by the use of a very large quantity of flushing water, certainly more than any waterworks could afford for general application.—Yours, &c.,

R. Read.

Guildhall,
Gloucester.

THE INSTITUTE OF SANITARY ENGINEERS: ELECTION OF COUNCIL.

To the Editor of The Surveyor.

Sir, I very much regret that Mr. Chilvers should feel regret at my letter re the above. Mr. Chilvers is a vice-president, and as such was not amongst those nominated or balloted for, and so he was not intended to be included in my remarks. I accept Mr. Chilvers' statements, and tender him my sincere thanks for his services.

I have personally written to Mr. Chilvers.—Yours, &c.,

Fellow.

December 21, 1912.

SOME RECENT PUBLICATIONS.*

Transactions of the Institution of Municipal and County Engineers (Vol. xxxviii., 1912—13). Edited by Thos. Cole, assoc.m.inst.c.e., secretary. London: E. & F. N. Spon.

Over 500 pages are taken up by the latest volume of Proceedings of the Institution of Municipal and County Engineers. In addition to the annual meeting held at West Bromwich in July of last year, thirteen district meetings are fully reported in the volume, the value of the papers read at the various gatherings being enhanced by the inclusion of a large number of explanatory drawings and photographic views. While, as stated, the proceedings at the annual and district meetings have received due attention, we note with some surprise that the interesting visit which was paid to Paris at Whitsuntide is dismissed in a seven-line paragraph which forms part of the annual report presented at the last annual meeting. In all other respects, however, the publication may be described with accuracy as a faithful and altogether admirable record of the doings of the institution from 1911—12; the arrangement of the contents is excellent, and its general appearance in every way up to the standard of previous volumes. A portrait of Mr. A. D. Greatorex, whose year of office is covered by the volume under notice, appears in the form of a frontispiece.

Applied Mechanics and Mechanical Engineering. Vol I.: Applied Mechanics. By Andrew Jamieson, m.inst.c.e. Price 6s. London: Charles Griffin & Co., Limited.

The popularity of this well-known work has become greater than ever since it was divided into five volumes, each of which is devoted to a particular branch of the subject. One evidence of this is the frequency with which new editions of one or other of the volumes is called for. This is the ninth edition of the first volume that on Applied Mechanics—which has once again been most carefully revised. The latest examination papers of the various examining bodies have been incorporated, together with answers to many of the questions. The book will be found of special value to the student preparing for the examinations prescribed by the Board of Education, the City and Guilds of London Institute, and the Institution of Civil Engineers.

Local Legislation (Supplement for 1912). By F. N. Keen, ll.b., Barrister-at-Law. Price 3s. 6d. nett. London: Walter Southwood & Co., Limited.

Mr. Keen's works on local legislation are of proved value to those who are concerned with the promotion of Bills in Parliament for municipalities. The present volume is supplementary to that which was noticed in The Surveyor some time ago, and it is designed upon the same plan. The clauses of Acts which were obtained during the session 1912 are collected and classified according to their subject matter. To those who are interested in the local legislation of the coming session, therefore, this supplement to Mr. Keen's work is indispensable as affording the readiest possible access to the latest precedents of clauses in regard to such subjects as streets, buildings, sewers and drains, sanitary matters, water, electricity, tramways, railless traction and many others.

Diaries and Calendars.

The London and Lancashire Fire Insurance Company, 45 Dale-street, Liverpool, issue a most dainty diary for a month's memoranda, and a desk tablet of tear-off sheets with, under each day's date, a half-page for notes.

We have to acknowledge, from Messrs. Shand, Mason & Co., of 75 Upper Ground-street, Blackfriars, S.E., the famous makers of fire engines and all other fire-fighting apparatus, a wall calendar for 1913, printed in two colours.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction — i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used

BY-LAWS: CESSPOOL.—"Rusticus" writes: I should be very much obliged if you would give me your opinion on the following question as to the application of the by-laws with respect to new buildings. An owner about eighteen months ago deposited plans with this council for the erection of two cottages (semi-detached) showing the drains to empty into a cesspool on his own land, which cesspool complied with the by-laws as to distance from the nearest house and well to be provided for the use of the occupiers. These plans were approved, and the cottages erected in due course. The same owner has now deposited plans of two similar cottages to be erected on the adjoining site with the drains to discharge into the existing cesspool above mentioned, and with a new well to be dug for the use of the new houses. The new well will be about 35 ft. from the existing cesspool, and the nearest new house about the same distance. You will observe that the by-laws with respect to cesspools provide that the latter shall not be constructed at a less distance than 50 ft. from a house or 60 ft. from a well. Can the council disapprove the plans by reason of the new houses and new well being shown to be at less distances from the existing cesspool than required by the by-law for the construction of a new cesspool? I forward a copy of the by-laws in force in the district. By-laws Nos. 90 and 91 apply to the distance of cesspool from buildings and well. A short time ago another instance occurred which involves the same principle, but from a different point of view. An owner deposited plans of a house in a small paddock adjoining the premises attached to two existing cottages. The block plan showed the new house to be placed about 20 ft. away from the curtilage of the cottages, and also showed approximately the position of the cottages, but did not show any cesspool belonging to them. As everything appeared to be in order, the plans were approved and the building was proceeded with, but just before the new house was completed it was found that the slop drainage of the cottages discharged into a small covered cesspool at the corner of one of the cottage gardens nearest to the new house. As a matter of fact, the council, and, I believe, the owner of the new house, were unaware of the existence of the cesspool at the time that the plans were deposited.

By law 9 prohibits the construction of a cesspool within 50 ft. of a house, and by-law 11 prohibits the construction of a cesspool within 60 ft. of a well. But there does not appear to be anything in the by-laws to prevent any one from building a house or digging a well within any particular distance of an existing cesspool. In my opinion the council cannot disapprove of the plans of the new houses on the grounds suggested.

HOUSING AND TOWN PLANNING ACT, 1909: INSPECTION OF DISTRICT.—"Ynys" writes: Your help in the past has been much appreciated, and I shall be glad of your advice on the following: I have made certain inspections under sec. 17 of the above Act, and produced reports to my Health Committee, the consideration of which have been adjourned pending further inquiries as to the mode of procedure to be taken by the council. As I understand the Act, a record of each house as regards its sanitary condition must be kept, whether any defects exist therein or not, and I have adopted the card system for that purpose. Will you kindly advise whether: (*a*) The original Inspectors' Journal must be maintained, for ordering defects, which should be remedied without making a closing order? (*b*) Whether closing orders are only to be brought into operation when the usual measures to obtain the remedy of sanitary defects have failed? The defects referred to are dampness in dwelling-houses, leaky roofs, defective drainage, windows not opening at top, and defective backyards, which may, I assume, be remedied after notices served under sec. 94 of the Act of 1875. (*c*) Further, I think that the provisions of secs. 15 and 17 apply to houses which are in a state so dangerous or injurious to health as to be unfit for human habitation, and inasmuch as such conditions do not exist in the cases reported, that it is only necessary for the council to peruse my records, and order that notices as to the sanitary defects be served under sec. 94 of the Public Health Act, 1875. I shall be exceedingly obliged if you will favour me with your advice on the points stated, together with any other information that may be of service.

(*a*) There does not appear to be anything in the Act of 1909 superseding the provisions of the Act of 1875 as to nuisances which do not render premises unfit for human habitation, and presumably the existing practice as to such nuisances is to be continued. (*b*) If the house is in such a state as to be unfit for human habitation a closing order must be made. See subsec. (2) of sec. 17. When the house has been rendered fit for habitation the order must be determined. See subsec. (6) of sec. 17. (*c*) The act appears to draw a distinction between a house which is not "in all respects reasonably fit for human habitation" and a house "in a state so dangerous or injurious to health as to be unfit for human habitation." Sec. 15 deals with the former, and is restricted in its operation to houses the subject of such contracts as are specified in sec. 14. From a comparison of the two sections I think it is clear that there may be defects not so serious as to necessitate a closing order, which nevertheless bring such houses as are within sec. 14 into the operation of sec. 15. As regards such houses the procedure would be under that section. As regards others, if not bad enough for a closing order, the procedure would presumably be under the Act of 1875.

COMBINED DRAIN.—"South Cone" writes: I should be much obliged if you or one of your readers who knows the law would give an opinion on the following point: "A client of mine has a house in a row of four others, all drained into a common drain at the back, joining into a public sewer at the end. The houses belong to different owners. The district is an urban district, and the houses were built forty years ago. For many years they have been subject to flooding by reason of storm water backing up into the main sewer, and have had a flood ball-trap placed, without, however, removing the trouble. The sanitary inspector is threatening proceedings, and the district council are making improvements in their sewage storage. Is the district council liable, or are the owners? I think the London County Council lost a similar case two or three years ago."

The combined drain is a "sewer" vested in and repairable by the district council, subject, however, to this: that if the Public Health Acts Amendment Act, 1890, has been adopted, the council could exercise the powers of sec. 41 of the Public Health Act, 1875, in the event of a nuisance being caused by the condition of the drain itself. I do not think, however, that the latter section would apply in the case of flooding from the main sewer, assuming the drain itself to be sufficient for effectual drainage.

CONVERSION OF WORKSHOP INTO A CINEMATOGRAPH EXHIBITION.—"Ynys" writes: Your reply to the following query will be esteemed: A local joiner has made application to the county council for a licence to hold cinematograph exhibitions in a workshop (joinery) belonging to him, and I shall be much obliged if you will advise me whether he has a right to do so without first submitting plans of proposed conversion to my council. I shall be glad if you will favour me with your valuable advice and general comments at your earliest convenience.

This depends upon whether the alterations in the building amount to the erection of a new building. If such is the case, plans must be submitted. If the alterations involve the pulling down of the building to or below the ground floor this will amount to the erection of a new building under sec. 159 of the Public Health Act, 1875. But this clause does not exhaust the definition of a new building, and it is a question of fact in each particular case whether alterations constitute a new building (per Lord Coleridge in *James* v. *Wyvill*, 48 J.P., 725). In the present case it is difficult to express a decided opinion without knowing the precise nature of the alterations: it would be a question for the magistrates to decide.

PUBLIC HEALTH (BUILDINGS IN STREETS) ACT, 1888.—"R. W. T." writes: At the last meeting of this council a plan was submitted for the addition of a bay window to an existing house. As the building is in the main road, it was disapproved under sec. 156 of the Public Health Act, 1875. The building in question is situate on the corner of a cul-de-sac, and has a forecourt. I should be glad if you would express an opinion as to whether the council are correct in disapproving the plan.

Sec. [illegible] of the Public Health Act, 1875, was repealed by the Public Health (Buildings in Streets) Act, 1888, which re-enacts it in an amended form. The house appears to front towards the main road, and I think there can be no doubt that it is in that road for the purposes of this Act. The council therefore are, in my opinion, justified in disapproving the building of a bay window projecting beyond the front main wall of the adjoining house.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bradford T.C. (December 13th. Mr. T. C. Ekin).—This was an inquiry into an appeal by the Low Moor Company, Limited, and others against a number of charges made by the corporation in respect of street improvements at Low Moor, on the ground of the unreasonableness of the charges and the non-necessity of the work carried out. Mr. Richard Watson, for the memorialists, said that, generally speaking, the condition of the properties concerned at the time the notice of repair was given was satisfactory, both from the point of view of the public health and convenience for traffic. Also, if the board could be convinced by the corporation that improvements were necessary, it would have been sufficient to carry out the repairs in a more modest way. Another point was that the principle of apportioning the cost was wrong and inequitable, as the amounts had been fixed per lineal yard of frontage, irrespective of the width of the road. In that particular district many of the main roads, over which heavy traffic passed, consisted of macadam, whereas the corporation demanded the streets, &c., to be paved. The freehold capital value of the property was £2,400 while the amount of contribution to the cost of repair was over £1,000 altogether.

Colne T.C. (December 11th. Mr. T. C. Ekin).—£2,100 for purposes of water supply, and £14,873 for works of paving in Burnley-road, Keighley-road and Queen-street.—The town clerk, Mr. A. Varley, stated that the first part of the application was for £450 for the installation of the Deacon system for detecting waste of water, and £1,650, the cost of the purchase of Laneshaw Bridge Corn Mill and water rights, and the purchase of water-pipe line easements through Barnside estate. With respect to the second portion of the application the borough surveyor, Mr. T. H. Hartley, stated that the amount was made up as follows: £13,950 for granite paving of roadways and flagging of footpaths on county main roads known as Burnley-road and Keighley-road, and £923 for reconstruction of Queen-street by paving with granite setts on a concrete foundation in lieu of local grit setts. Keighley-road and Burnley-road were main roads maintained by the county council, but the corporation, under the Local Government Act of 1888, claimed to retain powers of repairs. The total length of main roads in the borough was 4 miles 4 furlongs 99 yds., and at present there were 3 miles 2 furlongs 5 yds. macadamised, and 1 mile 2 furlongs 89 yds. paved, and the present macadamised surface and foundations were found to be insufficient for the present traffic. The proposed scheme was for the granite paving of the carriageways and flagging of footpaths in Burnley-road (White-street to the borough boundary) and Keighley-road (end of paving to car-shed), these lengths being as follows: Burnley-road, 5 furlongs 155 yds.; Keighley-road, 3 furlongs 46 yds.; total 1 mile 201 yds. When this length was complete there would then be [illegible] macadam road.

Dewsbury T.C. (December 13th. Mr. Courtenay [illegible]).—£1,000 for the purchase of property [illegible] posed to widen Bradford-road and Foundry-street, and erect new premises on an entirely new building line in Northgate. There was no opposition at the inquiry.

Downpatrick R.D.C. (December 13th. Mr. Barnewell [illegible]).—£475 for the erection of [illegible] Mr. A. [illegible]

East Ham T.C. (December 12th. Major J. Stewart).—£1,[illegible]42 for the purchase of a portion of the conveniences at the junction of Central Park-road, Barking-road and Beckton-road, and for the [illegible] The borough engineer, Mr. J. E. W. Birch, stated that [illegible] there was abundant evidence that it would serve a very useful purpose. The smaller convenience, it [illegible]

Harrogate T.C. (December 18th. Mr. H. R. Hoopers).—£[illegible] for the purchase of the Harrow Inn [illegible] consisting of 59 acres of land, including the pine woods, eight sulphur springs, an hotel, cottages, and [illegible] baths. Mr. J. Turner Tay[illegible] (town clerk) stated that the purchase was considered by the ratepayers to be a wise step. The corporation had tried to buy it for over twenty years, and in 1888 the price was the same as they were now giving—£8,000. In 1897 the owners asked £17,000. He did not think that there was any likelihood of the corporation running the hotel or becoming the tenants, and the present tenant had been told that the corporation hoped he would continue as tenant. Dr. Neville Williams said he believed the waters at Harlow Car were the most valuable alkaline mineral springs not only in England but in Europe, and were of immense value for certain diseases. There was no opposition.

Leiston U.D.C. (December 18th. Mr. Courtenay Clifton).—£500 for the purchase of the ground and for laying out a cemetery.—Evidence was given as to the extent of the ground, the right-of-way to the proposed cemetery, the sub-soil, the wells in the locality, the laying out of roads and the planting of trees.

Littleborough U.D.C. (December 12th. Mr. Courtenay Clifton).—£2,350 for purposes of street improvements at the corner of Hare Hill-road and Church-street.—The clerk, Mr. C. H. Wild, stated that the roadway had been very narrow for some years, and there had been no footpath on the westerly side, and on the easterly side the footpath was only 3 ft. wide. In November, 1900, the council approached the then owners of the property on the westerly side with a view to the purchase of the property, and the price put upon it was £2,058, which the council considered was too much. The property had now changed hands, and after several interviews the council had made a provisional agreement with the owner to purchase the whole of the property for £2,300. Councillors Taylor and Ashworth gave evidence of the value of the site, and also of the necessity for the improvements.

Merthyr T.C. (December 17th. Mr. E. Leonard).—£12,250 for the purchase of the Galon Uchaf estate, Gellifaelog, as a site for the erection of working-class dwellings and for purposes of small holdings and allotments, and £10,250 for the erection of working-class dwellings at Thomastown, Merthyr.—The town clerk, Mr. T. A. Rees, stated that since the notice of the inquiry had been received the council had decided to abandon the Thomastown scheme. The council, however, hoped to go in for another scheme which would be cheaper. The medical officer of health, Dr. Duncan, gave evidence as to the lack of houses and overcrowding. In Dowlais, he said, there were about 300 houses that were unfit. A number of houses had been closed, and if there was further accommodation for displaced tenants a number of other houses would be closed. The inspector: What kind of house do you suggest? I suggest one with a kitchen and scullery behind and two or three bedrooms. The rental should not be more than 18s. to 20s. a month for the class of people for whom the houses are wanted.

Pembroke (Co. Dublin) U.D.C. (December 16th. Mr. [illegible] F. McCo[illegible]).—£8,600 and £12,000 for the erection of working-class dwellings. It was explained that the first application was for a loan of £8,600 for the purpose of erecting forty-three houses at a place called Beattie's Field, in the Ballsbridge part of the township. The council had been able, by agreement with the owners of this place, to avoid the expense of compulsory purchase. It was proposed upon this site to erect twelve cottages of the A type, at a cost of £[illegible] each, and thirty-one cottages of the B type, at a cost of £145 each. It was proposed to let these cottages in the compounds at 5s. and 4s. 6d. respectively per week. The other part of the application was for a loan of £12,000 for the acquisition of Donnybrook Castle, at the Lower end of the township, and the erection thereon of forty-nine houses. Twenty-[illegible] of these houses would be what were called the B type, costing £136 each, and they would be let at 4s. 9d. per week; nine cottages of the C type, costing £150 10s., and proposed to be let at 6s. 3d. weekly; six cottages of the D type, costing £160 2s., to be let at 7s. 3d. per week; and thirteen cottages of the G type, costing £115 6s., to be let at 3s. 10d. weekly.

Portsmouth T.C. (December 18th. Mr. R. H. Bickmell).—£3,745 for works of [illegible] ment. The work in question is distributed over the northern [illegible] part of the town, some of the streets being [illegible]89 in Lyndhurst-road, £330 in Westbourne-road, £317 in Victoria-road, £358 in St. Piran's-road, and £253 in Kensington-road. Other amounts were £260 in

Dartmouth-road, North End, and £230 for Wharf-road, Rudmore. Evidence with respect to the proposed works was given by the town clerk, Mr. A. Hammond Etherton, and the borough engineer, Mr. A. Ward.

Portslade U.D.C. (December 15th. Mr. E. Dudley).—£1,000 for the purchase and adaptation of 17 Station-road as council offices. The clerk, Mr. Ernest H. Kempe, stated that the accommodation required was a large public office in front, a private office for the joint use of the clerk and surveyor, a surveyor's public office, and a suitable council chamber, which would provide accommodation for the public, and in which meetings of all sorts could be held. They also required accommodation for storing records and papers. The purchase price of the freehold of 17 Station-road was £800, with £25 in addition for costs; and the remainder of the money was for adapting the premises and for furniture and contingencies. The surveyor, Mr. A. Taylor Allen, said the cost of the land was assessed at £300, and of the building itself at £525, for the purposes of the inquiry, although it was considered that the actual value of the land was much more, £10 a foot, and even above that being mentioned as the price of land along this road.

Preston T.C. (December 18th. Mr. M. K. North).—£4,700 for the completion of the laying out the land presented to the town by Miss Haslam as a recreation ground.—It was explained that a loan for the purpose of £6,000 had already been sanctioned, and that a sum of £4,804 had been expended, the council not exercising their borrowing powers with respect to the remainder. Miss Haslam had supplemented her original gift by presenting a further 33 acres to the town, which permitted of a more comprehensive scheme being carried out. Towards the laying out of part of this land Miss Haslam offered £4,000, and the loan now asked for was to cover the remainder of the cost.

Stourport U.D.C. (December 19th. Major J. Stewart). £1,400 for the purpose of carrying out works for obtaining a water supply from Bewdley Corporation in lieu of the present supply from Kidderminster Corporation, whose contract with Stourport Council expires on March 5th next.—Mr. C. H. Watson, clerk to Stourport Council, said the proposal was to borrow £1,400 for thirty years. If the loan were sanctioned the work could not be carried out in time to supply the water to Stourport by the time the agreement with Kidderminster expired, but Stourport would trust to the neighbourly [illegible] of Kidderminster to continue the supply for a short time. Mr. R. Coventry, in a further statement, said Kidderminster Corporation had supplied water for [illegible] years at 6d. per 1,000 up to 20,000,000, and 5d. per 1,000 gallons afterwards. Stourport asked for reduced terms, telling Kidderminster it was also approaching the Bewdley Council. Kidderminster declined to make any reduction. Bewdley offered 5d. per 1,000 gallons up to 20,000,000 and 4½d. per 1,000 beyond that. The Bewdley supply would be both more economical and more efficient than that of Kidderminster. For the Kidderminster Corporation Mr. Willcox, engineer to the Kidderminster Corporation, said the present main from Kidderminster to Stourport was sufficient. The [illegible] was not laid to any [illegible] Kidderminster [illegible] valves at Stourport. Kidderminster spent £20,000 in [illegible] injustice to Kidderminster if Stourport ceased to take its supply from Kidderminster.

Wimbledon T.C. (December 5th. Mr. W. O. E. Meade-King).—£3,180 for the purpose of laying out part of the [illegible] (Mr. A. Steele Sheldon) stated that the proposal was [illegible] portion of the land acquired for sewage farm purposes. Mr. Booth, deputy borough treasurer, said the grave spaces which the extension would provide, together with those available in the present consecrated portion, would serve the necessities of the borough for twenty years. The unconsecrated portion would last for fifty years. There was no opposition.

Wirral R.D.C. (December 13th. Mr. Thomas Adams).—This was an application for permission to prepare a town plan for the parishes of Heswall-cum-Oldfield, Pensby, Barnston, and Gayton.—Mr. W. W. Shennan, surveyor to the council, said the main road to Chester from West Kirby ran right through the centre of the area it was proposed to plan, and the main county road from Birkenhead and Wallasey also passed through the district. Development was taking place very rapidly in Heswall, but they had difficulty in getting a uniform lay-out of the land on account of the operation of the existing by-laws. Large houses were mixed up with small cottages, and there were many owners, each desirous of developing his own land in his own way, and the council could not interfere so long as the owner conformed with the by-laws. In the course of the inquiry the inspector asked if it was not dangerous for a district with the contour of Heswall to be without light on the highways. Mr. J. T. Thompson (who appeared for the council) said he thought it was extremely dangerous. The inspector: You ought to have a lighting system of some kind. Mr. T. Davies, chairman of the council, said his authority and the parish council might take the matter up and see what could be done.

Worcester T.C. (December 11th. Mr. H. R. Hooper).—£7,900 for the electricity undertaking.—Mr. R. Clarke, chairman of the Electricity Committee, stated that there had been an increased demand in the city, following the change over to the polyphase system, and additional plant was necessary. The inspector remarked that the general information he had received showed the progress of the undertaking, which appeared to have been very hard hit by the metal filament lamps. There were reasons why they should expect the loss which had occurred. He thought that in two or three years' time they would be round the corner.

APPLICATIONS FOR LOANS.

Abingdon R.D.C.—£2,700 for a water supply scheme.

Bridlington T.C.—£5,000 for electrical plant.

Bridlington T.C.—£5,000 for extension of the electricity plant and engine-house.

Chelmsford R.D.C.—£5,860 for the Broomfield water supply.

Dartmouth T.C.—£140 for works of flood prevention.

Farnham U.D.C. [illegible]

Radcliffe U.D.C.—£1,000 for the purchase of electric [illegible]

Scarborough T.C.—£1,535 for alterations to school [illegible]

Tiverton T.C.—£1,600 for a site for workmen's dwellings.

LOANS SANCTIONED.

Abergavenny T.C.—£18,000 for waterworks extensions.

Alsager U.D.C.—£330 in connection with a water scheme.

Ashbourne R.D.C.—£1,300 for workmen's cottages.

Cosport U.D.C.—£1,673 for the introduction of the water-carriage sanitary system.

Keighley T.C.—£7,500 for public baths, and £7,795 for [illegible] grounds.

FORTHCOMING INQUIRIES.

JANUARY.

2.—**Manchester.** For the purpose of including Heaton Norris in the city boundary (Mr. E. A. Sandford Fawcett).

2.—**Stockport.** For the purpose of including Heaton Norris in the borough boundary (Mr. E. A. Sandford Fawcett).

7.—**Scarborough.** For authority to prepare a town [illegible] (Mr. Thomas Adams).

Crystal Palace Engineering School.—The "Wilson Prize" [illegible] Crystal Palace Engineering Society (affiliated to the Society of Engineers (Incorp.) during the present session has been awarded by the council to Mr. J. R. M. [illegible] "Water Tube Boilers." Other papers read during the session were "The South-Eastern Coalfield," by Mr. B. L. Rigden; "Compressed Air," by Mr. H. M. Jordan, and "Reconstruction of Komati Poort Bridge," by Mr. J. E. Thomas. The premium was presented to Mr. Chalon by Mr. R. Elliott-Cooper, president of the Institution of Civil Engineers, on the occasion of the 120th Distribution of Certificates of the above school on Thursday, the 19th inst., at which he presided.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Newport (Mon.) £49,000, Renfrewshire, housing and town planning—Falmouth, Stafford; roads and material—Aberdeen, Cardiff; sewerage and sewage disposal—Camberwell, Rochester, Truro, Whitby; water, gas and electricity—Ebbw Vale £125,000, Widnes £36,000, Bridlington £5,000, Chelmsford £5,860.—Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Marylebone B.C. Additional means of exit are to be provided at the public baths, Marylebone-road, at a cost of £150.

Machynlleth R.D.C.—The surveyor, Mr. Richard Williams, at the recent council meeting reported that the building of the new Walton Bridge had been completed and that the wooden framing would be removed about February 1st, when the bridge would be ready for testing by the passing of a road roller over it.

Newport (Mon.) T.C.—Mr. J. J. Webster, M.INST.C.E., has prepared a report with respect to the proposed reconstruction of Newport Bridge. This shows that fifteen schemes were submitted by four firms, and that of Messrs. L. G. Mouchel & Partners (Mouchel-Hennebique) had received the highest number of marks, and Messrs. The Considere Construction Company the second highest number. Messrs. Mouchel's design is for the construction of a ferro-concrete bridge at an estimated cost of £49,000, or with granite parapets £50,500. Messrs. Mouchel have written that in order to demonstrate their complete confidence in ferro-concrete as a structural material, and in their ability to utilise it, they agreed that the bridge should be handed over complete and tested before any payments were made on account of its construction, and also to hand, after completion, a policy of insurance at Lloyd's on the structure. The cost of a new stone bridge over the river is estimated at £80,000. A committee of the corporation have considered these details, and are of opinion that none of the schemes submitted fully meet their requirements. They recommend that the Parliamentary Committee adhere to their decision to construct a ferro-concrete bridge with improvements on Messrs. Mouchel's design, including a temporary footbridge over the river while the new bridge is being constructed. They add that in due course arrangements should be made with Messrs. Mouchel & Partners for carrying out the scheme under the supervision of the borough engineer, Mr. H. Tremelling, and a specially qualified resident engineer. The matter is still under consideration.

Renfrewshire C.C.—A resolution has been passed to make provision at Spiersbridge for a fire brigade station with the necessary accommodation for the staff, a justice of peace court-house, a small office for the district sanitary inspector in lieu of the one formerly occupied at Pollokshaws, a mortuary and house accommodation for the superintendent, and such other portions of the police force as may be afterwards decided upon, and at Giffnock for two cottages for married constables near the present police station.

HOUSING AND TOWN PLANNING.

Caistor R.D.C. Plans have been approved for the erection of a pair of cottages on the council's land at Grasby, being the first of about sixty which it is intended to erect in the district under the Housing and Town Planning Act.

Chester T.C. A special committee has been appointed to carry out such of the powers and provisions of the Housing of the Working Classes Act, 1890 to 1909, as relate to the housing of the working classes.

Denbigh T.C. The question of providing workmen's dwellings has been referred to the General Purposes Committee.

Falmouth T.C. The borough surveyor, Mr. J. S. Wethey, has now submitted a provisional plan of the proposed estate for the erection of twenty-two workmen's dwellings, showing an increase in the cost, owing to the rise in the price of materials. It was originally considered that the houses could be built at £150 each. The council have authorised the General Purposes Committee to visit Truro, St. Austell and Yeovil for the purpose of inspecting the houses erected in those places. It was stated that the rent proposed was 5s. 3d. per week.

Clitheroe T.C.—The Town Planning Committee and the General Finance Committee have been authorised to select a suitable site and prepare plans and estimates for the erection of about twenty houses suitable for working men's families.

Cwyrfai R.D.C.—It has been agreed to proceed with a scheme for providing dwellings at Clwtybont.

Stafford T.C.—A scheme is to be prepared for the erection of forty working-class dwellings, in addition to the twenty already proposed, at rents of 5s. and 6s. a week, twenty of the houses to be erected in Blakiston-street and twenty in Harrowby-street, on land belonging to the town.

PARKS AND OPEN SPACES.

Oldham T.C. The council have approved the plan of the surveyor, Mr. E. C. Foote, for laying out the land at Snipe Clough, which was gifted to the council as an open space by the Misses Wright. The donors have also contributed £250 towards the cost of the work of laying out.

Edinburgh T.C.—It has been referred to the Parks Committee to consider and report upon the provision of a bowling green upon ground belonging to the corporation in the neighbourhood of the existing bowling green at Portobello.

REFUSE COLLECTION AND DISPOSAL.

Cardiff T.C.—The report of the city engineer, Mr. W. Harpur, with respect to the cleansing and watering of the streets, recites the various activities of the cleansing department for several years back, and makes recommendations for carrying out the work more thoroughly. Mr. Harpur reported that the work could not be done with greater efficiency than at present except by incurring the following expenditures: Twelve additional street sweepers for the main thoroughfares; twelve additional street watervans; twenty additional street hydrants; and the employment of a cleansing detective. These represented a capital charge of £1,084, and an estimated annual charge of £1,642. A return prepared by the city engineer also showed that, taking representative cities and large towns in the country, the cost per mile of scavenging varied from £50 to over £200. Cardiff was the lowest but one on the list, with £74. The chairman of the Health Committee, whose members considered the report last week, said a better way of keeping the streets clean would be to go in for more tar spraying. In any case, he did not think the committee could recommend the extra expenditure suggested by the city engineer, except that involved by the engagement of twelve additional street sweepers. It was agreed to engage the sweepers, at an estimated capital charge of £84, and an estimated annual charge of £814.

Hunstanton U.D.C. It has been decided to provide a new vertical boiler with a steel chimney for the refuse destructor at a cost of £235, and to utilise the present destructor boiler as an additional one for the pumping station.

Tutbury R.D.C.—The surveyor, Mr. H. S. Tebbitt, has recommended a house-scavenging scheme for Stretton, and the council have asked the parish council to give the matter their consideration. Taking the average cost of each house per annum to be 5s., the cost is estimated to be £75 a year.

ROADS AND MATERIALS.

Aberdeen T.C.—It has been agreed to pave Stirling-street with wood, and carry out repairs in several other streets.

Berwickshire C.C.—It has been agreed by the Eastern District Committee to make up the road over Whiteburn Hill from the Weir Burn to the

Duns-road, provided that land and stones are given free, that no fencing is required, and that a sum of £150 is subscribed locally.

Bodmin R.D.C.—Delegates have been appointed to a conference with the St. Columb Rural District Council on the subject of the main roads contracts between the rural councils and the county council, it being considered that these should be made more equitable, or the county council should take over the management of the main roads in the eastern division of the county.

Bourne R.D.C.—In reply to a question at the council meeting last week, the clerk quoted figures showing that the expenditure of the council in highway matters had risen since 1908 by £1,600, the surveyor, Mr. T. Lake, stating that a considerable amount of that sum was in respect of road improvements in the district.

Cardiff T.C.—Plans of three schemes, estimated respectively to cost £2,060, £4,450 and £6,530, for widening Edward-terrace and Pembroke-terrace by covering the feeder and making a bridge, were submitted last week by the city engineer, Mr. W. Harpur, to the Public Works Committee. The main object of the suggested improvement is to provide increased facilities for vehicular traffic to and from the Taff Vale Railway Station. The committee agreed that the question was too large a one to be decided in a hurry, and referred the plans to a sub-committee to consider and report fully upon the advantages offered by the schemes.

Cannock U.D.C.—Another application is to be made to the Road Board for a grant for carrying out the widening of Stafford-road, near the Royal Oak, and for the widening of the Stafford-road near Hatherton Wharf. The estimated cost of the former improvement is £409, and of the latter £1,075. The board is also to be asked to give a grant towards the estimated cost of £934 for the widening of Mill-street, Cannock.

East Ham T.C.—It has been agreed to support a proposal to urge upon the Government the desirability of an authority being constituted to decide what ought to be the main roads of the country, and which of those main roads should be trunk roads; also that the State should contribute towards the cost of the main roads the actual half of the cost of maintenance (as was understood to be intended in 1888); and that, with regard to trunk roads, special additional grants should be made, subject to inspection by the central authority.

Edinburgh T.C.—The Streets and Buildings Committee have sanctioned a road improvement scheme involving a continuation of the widening of Ravelston Dykes from the Caledonian Railway Bridge westwards to a point opposite Murrayfield-avenue. At present the road is 20 ft. wide and it is to be increased to 60 ft.

Kingston (Surrey) T.C.—Woodbine-avenue is to be made up under the Private Street Works Act. £291 is to be contributed towards the cost of laying new wood blocks on the margins of the tramways in Richmond-road, in order to satisfactorily fit in with the new wood paving there. The remaining three-fourths is to be paid by the tramway company.

Plymouth T.C.—The tender of Mr. T. Doney, at £250, has been accepted for making up Compton Park Villas-road, and the tender of Messrs. Pearn & Bros., Limited, at £168, for making up Penrose Villas-road. The Road Board have promised a grant of £2,000 towards the £10,000 necessary to widen Weston Park-road from 15 to 40 ft.

Wincanton R.D.C.—A special committee has submitted a report recommending that, as from March 31st next, the manual labour on both the main and district roads be carried out by direct labour. By including the main and district roads in the direct labour scheme more men, they consider, could be employed in a smaller area, which would compromise by minimising the distance the men would have to travel to their work. The report is to be considered at the next monthly meeting of the council.—The Somerset County Council have proposed a widening improvement at Yenston Bridge between Templecombe and Henstridge, including the rebuilding of the bridge, at an estimated cost of £2,470, exclusive of the cost of land required. This council are considering the matter with a view to ascertain whether financial support can be obtained locally for the scheme.

Woodford U.D.C.—Improvements are to be carried out on Lea Bridge-road, in aid of the cost of which a contribution will be received from the Road Board.

SEWERAGE AND SEWAGE DISPOSAL.

Acton U.D.C.—The plan of the surveyor, Mr. F. Sadler, for the provision of a public lavatory for women, at an estimated cost of £700, has been approved.

Camberwell B.C.—It has been agreed to pay one-fourth of the cost (£2,403) of the underground convenience to be erected at Crystal Palace-parade, the other contributory districts being Lambeth, Croydon, and Penge.—The borough engineer, Mr. W. Oxtoby, has prepared a plan for a public convenience on Goose Green, at an estimated cost of £900.

Norwich T.C.—The city engineer, Mr. A. E. Collins, has received authority to erect a sanitary convenience for each sex at Sewell Park, at an estimated cost of £101.—The tender of Mr. W. J. Hannent, at £267, for the erection of a shelter and lavatory at the cemetery in accordance with the city engineer's specification has been accepted.

Paignton U.D.C.—The tender of Mr. W. Smaridge for a public convenience and shelter at Preston, at £273, has been accepted, subject to the Local Government Board granting the £73 additional to the £200 already sanctioned.

Rochester T.C.—A deputation has been appointed to meet representatives of the Chatham Town Council to discuss the question of a joint drainage scheme with the outfall works at or near Whitewall.

Truro T.C.—The borough surveyor, Mr. F. A. Barnes, has been instructed to report on a further alternative site for a sewage disposal scheme.

Whitby R.D.C.—The clerk has been instructed to obtain information with respect to plans and estimates for a sewerage and sewage disposal scheme for Sleights.

Woolwich B.C.—The tender of Mr. J. W. Ellingham, of Bexley Heath, at £567, has been accepted for the construction of a public convenience. The East Ham Town Council have agreed to contribute one-third of the cost.

WATER, GAS, AND ELECTRICITY.

Banbridge U.D.C.—A memorial to the Board of Trade has been approved for the grant of a Provisional Order in connection with the electric lighting scheme.

Bridlington T.C.—Authority has been given to the Electricity Committee to erect a new steam generating set at the electricity works, at an estimated cost of £5,000, subject to the Local Government Board sanctioning a loan for the purpose.

Chelmsford R.D.C.—An amended scheme has been prepared by Mr. J. Dewhirst, sanitary surveyor, for the supply of water to Broomfield, which is now estimated to cost £5,860.

Ebbw Vale U.D.C.—The council have decided to promote a Parliamentary Bill next Session to construct additional waterworks. Powers are to be asked to borrow £125,500 for the purchase of lands and wayleaves for and for the construction of the waterworks. Out of the sum the council are to pay off £43,224 which they have already expended on the adit into the Llangattock Mountain. The whole sum of £125,500 is to be repaid within sixty years from the date of the borrowing.

Keighley T.C.—In connection with the water supply scheme, the council have accepted the tenders of Messrs. W. Morley & Sons, of Keighley, at £2,359, and Messrs. Guest & Chrimes, of Rotherham, at £376.

Lowestoft T.C.—There was a deficit of £2,384 on the working of the tramway undertaking last year.

Marston Sicca R.D.C.—Messrs. Willcox & Raikes, engineers, have submitted a report with respect to a water supply for Long Marston from the mains of the Evesham and Pebworth Joint Water Committee, the total estimated cost being £690. The matter is under consideration.

Selby U.D.C.—The purchase has been effected for £600 of a tract of high ground near Selby for the protection of the water supply.

Widnes T.C.—Gas and waterworks extensions are to be carried out at a total estimated cost of £36,000.

MISCELLANEOUS.

Hunstanton U.D.C.—With the object of increasing the productive capacity of the gasworks, it has been decided to erect a new exhauster with a capacity of 10,000 cub. ft. per hour, and also a naphthalene extractor, at a total estimated expenditure of £212.—The water pits at the waterworks are also to be altered at a cost of £60.

Okehampton T.C.—It has been decided to provide oilskins for the outdoor employees.

Sunbury U.D.C. The wages of roadmen earning under 23s. per week have been increased by 1s. per week, and the sewermen have received a similar increase.

PERSONAL.

Mr. J. Johnson, surveyor to the Dulverton Rural District Council, has been appointed surveyor to the Keynsham Rural District Council.

Mr. Arthur L. Parker, surveyor to the Oakham Urban District Council, was married last week to Miss Annie E. Shepherd, of Ruskington.

Mr. J. L. West, chief assistant to the Berks county surveyor (Mr. J. F. Hawkins), has been appointed surveyor for the west district under the Essex County Council.

Mr. A. F. Wickenden, A.R.I.B.A., of Ilford, has been selected by the Improvement Committee of the Birkenhead Corporation as assistant to the borough surveyor.

Sir John H. A. Macdonald, K.C.B., member of the Road Board, gave an address before the Edinburgh Philosophical Institution last week on "The Road: What it was, is, and should be."

Messrs. Dodd & Dodd, MM.INST.C.E., civil and consulting engineers, of 37 Waterloo-street, have removed to more spacious offices at County Chambers, Corporation-street, Birmingham.

Mr. Chas. J. Conquest, engineer and surveyor to the Sandgate Urban District Council, is the engineer to the water supply scheme promoted by the council, including the construction of two reservoirs, one to hold 200,000 gallons and the other to hold 150,000 gallons.

Mr. George Smith, chief assistant to Mr. H. C. Fread, A.R.I.B.A., engineer and surveyor to the Urban District Council of Esher and the Dittons, Surrey, was appointed by the Eton Urban District Council as town surveyor at their last meeting. Mr. Smith has passed the examination of the Institution of Municipal and County Engineers, the Surveyors' Institution and the Royal Sanitary Institute.

Mr. J. A. Brodie, city engineer of Liverpool, arrived at Bombay on the 13th inst., en route for Delhi. Mr. Brodie, with his co-members of the Government Commission appointed to lay out Delhi as the new capital of India, will be away for two or three months, by which time the great scheme of town-planning, commenced earlier in the year, will, so far as the preliminary designs are concerned, be completed.

"The Civic Engineer's Who's Who."—The first issue of "The Civic Engineer's Who's Who" (London: St. Bride's Press, Limited, 24 Bride-lane, E.C., 2s. 6d. nett) gives wonderfully complete lists of the engineering officials of England and Wales. For a first issue [illegible].—*Glasgow Herald.*

Colne Corporation Bill.—The Colne Corporation Bill for 1913 deals mainly with the purchase of the undertaking of the Colne and Trawden Light Railways Company. In addition to the purchase of tramways, it is proposed to supply energy by means of the Bill to extend the area of supply of the electricity undertaking of the corporation to the districts of Trawden and Foulridge.

Reconstruction of Chertsey Lock. The Thames Conservancy have adopted a scheme for the reconstruction of Chertsey Lock, among a plan having for its object the widening of the existing lock, the work to be carried out in steel piling, faced with concrete, at an estimated cost, including the cost of [illegible] of £9,250. The new sluice at Hampton Wick is also to be extended at a cost of £150.

WATER-STERILISING PLANTS WANTED.

Mr. R. O. Wynne-Roberts, M.INST.C.E., of Regina, Sask., Canada, is, as we stated last week, desirous of installing a water-sterilising plant which must be simple, self-contained and reliable. The city can generate electricity with two 80-horse power oil engines, which can be belted to dynamos. Hypochlorite is expensive, costing at least 1d. per lb. Salt can be had at 3½d. per lb., but is of unknown quality. Rock salt can be bought for 1 cent per lb. in bulk. It is desired to treat 2,000,000 gallons per day, and later to increase this to some 4,000,000 gallons. The water is very hard, but clear. We should be glad if firms who handle water-sterilising plants would send particulars of them direct to Mr. Wynne-Roberts, Regina, P.O. Box 65, and we should be obliged if they would at the same time notify us that they have sent such details.

Proposed Liverpool Improvements.—A special meeting of the Liverpool City Council was held on Monday last for the purpose of considering the provisions of an Omnibus Bill to be promoted in the next session of Parliament. The objects of the Bill are described as being to empower the corporation to make new streets, make better provision for the health, local government and finances of the city, to provide for the granting of superannuation allowances to certain officers and servants of the corporation, and other purposes. After a good deal of discussion the meeting was adjourned to January 2nd.

FOR OTHER ADVERTISEMENTS
See End of Paper.

TO CONTRACTORS.

THE COUNCIL OF THE METROPOLITAN BOROUGH OF WANDSWORTH is prepared to receive Tenders for the Making Up and Paving of the following new streets—viz.:—

(*a*) That part of Salterford-road, Streatham, which lies between Southcroft-road and Welham-road.

(*b*) Otterburn-street, Tooting.

The Specifications and Drawings may be seen, and Forms of Tender obtained of the Borough Engineer, Mr. P. Dodd, M.INST.C.E., at the office of the New Streets Department, No. 56 East-hill, Wandsworth, S.W., between the hours of 10 and 4 (Saturdays 10 and 12), upon payment of a deposit of Five Guineas in each case.

Tenders, enclosed in Separate Sealed Envelopes, and endorsed "Tender for Paving ——," must be delivered at the Council House, East-hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose not later than four o'clock in the afternoon of Monday, the 20th January next.

Persons tendering must, in the case of all workmen employed by them in and about the execution of the contract, pay wages at not less and observe hours of labour not greater than the rates and hours recognised by the Associations of Employers and Employees and in practice obtained in the district where the work is to be executed.

No Tender will be received unless it be made upon one of the forms provided for the purpose. The council does not pledge itself to accept the lowest or any Tender. If required, the Contractor must provide two sureties for the due execution of the Contract.

D. A. NICHOLL,
Town Clerk.

Council House, Wandsworth, S.W.
December 23, 1912.

CAMBRIDGESHIRE COUNTY COUNCIL.
TENDERS FOR ROAD MATERIAL.

The above Council invite Tenders for the Supply of Broken Granite, Basalt, Slag and Tarred Macadam for use on the Main Roads during the year ending March 31, 1914.

Particulars and Forms of Tender may be obtained from this Office, where Tenders are to be delivered on or before Wednesday, January 1, 1913.

J. E. BLACKWALL,
County Surveyor.

County Surveyor's Office,
54 Hills-road,
Cambridge.

Road Drainage and Foundations.

[Extracts from an informal discussion at a meeting of the American Society of Civil Engineers, held in January last, with Notes and Comments by Reginald Ryves, M.Cons.E., Assoc.M.Inst.C.E.]

The subject under informal discussion at a meeting of the American Society of Civil Engineers held last January was "Road Construction and Maintenance," the following notes and comments relating to Part I., "Drainage and Foundations." The full report will be found in vol. lxxv., 1912, of the "Transactions" of the society.

For the present purposes the references made can be conveniently grouped under three heads, but it must be borne in mind that this grouping and the selection of only the most important of the remarks or opinions expressed may not in all cases present the particular speaker's views in true perspective, or do full justice to his attitude on the subject.

DRAINAGE GENERALLY.

The discussion was opened by Mr. J. Owen with a just and very important observation as to the attitude which ought to be taken up in the matter of drainage generally.

"On the question of drainage it may be recalled that at one of the National Road meetings the Minister or Commissioner of Roads of Ontario laid down three fundamental principles of road construction: First, drainage; second, drainage; and third, drainage. He was asked afterward what he would do if he lived in Arizona, where there is no rainfall. From this it can be reasonably understood that drainage is: First, a matter of climate; second, a matter of topography; and third, a matter of soil. In discussing these subjects it is best to consider the question of drainage *per se*."

Another matter to which the same speaker directed attention is that of the difference between water levels and rates of ground water flow before the road is made, and the levels and rates of flow after the road is made. He pointed out that in many cases "the first rush of water is merely a lowering of the water level to the new grade, and that frequently within a year or two such springs disappear entirely. Consequently the money spent to take care of them was practically wasted. Therefore the topography of a locality where there are springs should be considered, and judgment should be used in determining whether a spring is permanent or whether it is merely due to changing conditions in constructing the road."

This is an important matter. In some cases a whole series of springs may be tapped, or the water level throughout a long stretch of road may be lowered by making one good outlet at a suitable spot, depending upon the lie of the strata. In other cases very small drains, or a drainage course, may seem to be inadequate as a means of dealing with the large volume of water, but may ultimately prove to be of ample dimension and of a suitable character to deal with the rate of flow when accumulations of water in the soil are no longer formed.

Considering the great importance of the type of road referred to, the wide range of soils and climates to which it is suited, and the enormous mileage of efficient and economical roads so constructed, the following passage (Mr. T. S. Oxholm, New York) is a welcome item in the discussion:—

"It has been found in this borough that large sums, formerly spent for unnecessary drainage, could be saved by constructing the road, in most cases, where the conditions appear to be favourable, without any special provisions for drainage other than well-cleared ditches at the sides, having suitable outlets at the foot of grades, and by noting frost heaves or other damaged sections during the winter and spring, and in these places, which are comparatively few, building blind drains of stone from the centre of the road diagonally to the ditches or culverts."

Even when elaborate drainage ensures against failures, it may not be the only way or the most economical way of doing the work. On this point Mr. J. A. Johnston, of the Massachusetts Highway Commission, said: "In beginning its work the commission constructed some rather elaborate systems of trench drains and telford paving for foundations. Where such work was done there were no failures, but the cost was excessive."

In this connection it may be noted that in many parts of the world drought is a far worse enemy than wet.

Other remarks made by Mr. Johnston suggest the consideration that in some cases works of drainage or of foundation are alternatives, and he points out that the effect of a drain may to a large extent be nullified by the puddling of the road surface under traffic.

With respect to drainage through the crust, as distinct from drainage off the surface, it may be pointed out here that a passage quoted from THE SURVEYOR relates to the problems for economical and efficient maintenance of certain classes of roads carrying heavy traffic, the immediate "problem" referred to being a main road problem. The road with a pervious crust on a pervious subsoil, or provided with a good drainage course, and the road which effectually rids itself of water trickling through a pervious crust and off a cambered road bed, the flow being usually aided by a lengthwise slope—such a road is a type of much importance in many climates and under varying conditions. A crust with these characteristics is an element of one of the main types of tertiary or by-roads, and plays a not unimportant part in some secondary road systems.

As regards the manner in which drainage problems may be affected by the construction of really waterproof road crusts, the following passage is of interest:—

"The New York State Highway Department is now working on a scheme whereby a trench will be dug next to the macadam, and nothing will be put in that trench but a series of vertical plates made either from clay of the same kind as the soil pipe, from asphalt and clay mixed, or, in fact, from anything which can resist the disintegration which will take place in the ground. The water will meet that plane, follow it down to the pipe and run off."

This device would not in all cases prevent water from getting under the crust, while in most other cases the provision of a drain along the edge would seem to be sufficient to ensure that no excessive quantity of water would reach the subsoil under the crust. A great many soils are most stable when somewhat damp.

THE NATURE OF FOUNDATIONS.

On the whole, it may be suggested, it has been a weak point in American road-making work during recent years that where foundations of the telford type have been provided there has frequently been some error in construction which has largely reduced the service value of such bottoming. In many cases the wearing crust has been too thin, or, having regard to the circumstances, the total thickness has not been sufficient; or the deposition of the materials has not been such that the bearing area of a wheel-load on the subsoil is great enough to keep down the pressure below a suitable limit. For instance, Mr. T. S. Oxholm, in referring to roads with telford foundations, said: "When repairs were made to these latter roads, it was found that the upper or wearing surface, composed of the smaller sizes of stone, was badly worn where it came in contact with the telford; this appeared to indicate that the wearing surface was being worn, both at the top by vehicles and at the bottom by the impact on the heavy telford stone, thereby causing an increased expense for maintenance."

If a telford pavement is properly made, and the wearing crust above it is of sufficient thickness, no such action should occur, or, if it does occur, the top and bottom wearing should not amount to more than the top wear alone of a crust not subjected to such action. Again, as regards the draining effect of a telford pavement, or a good alternative, it is surely intended to drain sideways as well as downwards, and is designed to deal either with the water near the surface of the subsoil, when that soil is both receptive and retentive of water, or to deal with water in a road crust which is not itself permeable sideways. To serve either of these purposes cross-drains would have to be very close together, or, assuming the soil to be permeable, very deeply laid. These remarks are suggested by several passages which seem to show that the functions of a foundation of the telford type were confused in the minds

of the speakers with the functions of drains proper. Mr. J. Owen said, however, "The telford pavement has, or should have, of the construction a fairly good, a system of drainage of its own. Such a pavement is supposed to be in reality a culvert to the bottom, after which the water has to be carried away to the lowest point."

From other passages, and, indeed, from one's knowledge of the recent history of road making in the United States, it may be gathered that, although full justice has not been done to the telford type of pavement in that country, it has proved very serviceable on a large mileage of roads.

As regards foundations of other types, the following passage (Mr. Owen) deserves attention:—

"In the speaker's district there is plenty of stone, and telford roads are built as cheaply as macadam roads within the same locality; but any frostproof stone can be used in foundations, and the speaker has laid many miles of sandstone foundation and obtained good results from the roads."

Many kinds of sandstone are very useful for foundations, one of the most important features of such stone as regards economical maintenance being that when the wearing crust has worn right down to the sandstone foundation the road still wears smooth and is not likely to become muddy, the sandstone often possessing most of the chief features desirable in a wearing crust, except durability.

As regards the relation between drainage and foundation, attention may be directed to the following passage (Mr. J. A. Johnston):—

"Under most conditions, a 10-ft. foundation of stone, even 6 in. deep, which will seldom cost more than 25 cents per lineal foot of road, is of immeasurably greater benefit than a single drain which will cost more money. To hold up a road surface by strengthening the foundation may not sound as scientific as by the more indirect method of drainage, but it is none the less successful. By a stone foundation is not meant the hit-or-miss dumping of stone into mudholes, nor, at the same time, is it essential to hit each stone on three sides with a hammer and wedge it in places as telford paving. The dirt surface of the roadbed should be smoothed and properly graded to run off the water, the stone should be placed by hand, with the smaller stones on top to close the crevices, and the whole should be well rolled. It is not always necessary to have a great depth of stone; it should be varied according to conditions, being in some places 18 in., and in others only 6 in. It is by no means essential that the foundation should extend the full width of the macadam. On most of the roads in the speaker's division the foundations are only 10 ft. wide, while the macadam is 15 ft. In the case of [illegible] the average width of travel is rarely more than 10 ft., and, though [illegible] the foundation, there have been no breaks and no trouble from this practice."

I may be suggested, however, that in most cases it would be better practice to use the same quantity of material in the shape of a much wider edge of the crust proper, and extending beyond it. On some soils a still better arrangement would be to provide [illegible] 2½ ft. wide and 12 in. deep at the edges, and [illegible] extending beyond the edge of the [illegible] purpose. When "the eye can readily detect the line of the ridge on the inside," there is [illegible] wrong, and such a road in many soils or with certain classes of traffic would have a [illegible] to the surface of the general pavement.

Road engineers generally would attain to a great [illegible] of the subject of foundations if they were [illegible] that it is not the road crust itself which [illegible] a foundation is required to [illegible] load. It is the given pressure allowed on the [illegible] the angle of spread. This angle depends upon the way in which the crust is made, the nature of the materials, the extent to which the stones interlock, and so on; and it depends to a large extent upon whether the crust can be kept within certain limits as regards proportion of moisture. Since the thickness depends upon the spread and the spread depends upon drainage in some cases, it is clear that in those cases thickness depends upon drainage. This is the reason why a foundation course may be required for drainage, in some cases, even when the subsoil is hard and strong. Sometimes, too, a foundation course of material not suitable for the wearing crust, but providing an effective cushion between the crust and the very hard subsoil or rock, is a useful feature. In other cases a single homogeneous crust may serve the whole purpose of spreading the wheel-load to the necessary extent and at the same time perform the other duty of resisting wear and weathering action.

As regards the foundations, then, the three determining factors are: the allowance pressure on the soil, the wheel-load, and the angle of spread. These decide the thickness of the effective load-sustaining crust, whatever it is, or whichever it is. Drainage may be carried out to increase the angle of spread, to reduce the area necessary to sustain the load upon the subsoil, and for the other and distinct purpose of reducing the amount of wear in the upper course of the road crust. Drainage, however, does not always increase the sustaining power of a soil; it reduces that of sand to a very great extent, and in a less degree reduces the sustaining powers of soils which are sandy in character, and some others. In this connection the following passages are to the point. Mr. H. P. Willis said: "The speaker believes that the subsoil must be considered as the real foundation of the road, and that before the road problem is solved everybody will come to this conclusion."

With respect to the rolling of the subsoil Mr. S. Whinery said: "Plastic clays in excavations, for instance, if they are not disturbed, are about as thoroughly compacted by Nature as they can be. Whenever a heavy roller is put on such a surface, and it is rolled too much, a condition of plasticity is produced. The speaker thinks that very frequently clay foundations are over-rolled, and that the remedy is to stop the rolling the moment one notices a tendency of the surface to wave, either behind or before the roller. In his experience in preparing street foundations in excavation, a 4-ton roller has often given very much better results than a 10-ton roller."

If a pastic soil is to act effectively as a support to the crust, without a reduction of effective crust thickness by the penetration of its lower course into the soil, it may be advisable as has often been done in this country and in some European States—to prepare the surface in some such manner as that suggested in the following passage (Mr. W. W. Christy):—

"This tricky condition may be overcome satisfactorily by spreading a layer of sand, cinders, or stone dust, as may be convenient, on top of the sub-grade, to a thickness of from 2 in. to 6 in., and then compacting this layer, with the roller, so as to secure an entirely satisfactory surface on which the macadam can be placed without danger of its being mixed with the sub-grade material and thus losing any portion of its effective depth.

"Still another method, which has been found to be quite successful, is to use for the first course of macadam crusher-run stone containing all the fine material. Such stone, placed on a poor sub-grade previously put in the best possible condition, is then thoroughly harrowed. The effect of the harrowing is to deposit the fine material in the bottom of the stone layer and produce apparently about the same effect as the application of a layer of sand or screenings placed by itself on the sub-grade as previously described."

SURFACE DRAINAGE AND CAMBER.

As regards camber, it is interesting to note that Mr. J. Owen varies the amount of camber not only according to the location and grade, and the character of the traffic, but also according to the amount of the traffic. "On a country highway with a single line of travel," he said, "the best practice has always been to built the crown about 2 in. higher than is ultimately desired, as by work is given to a certain extent, and if allowance is not made for the first settlement, there is a likelihood of a flat surface in the centre where water will collect."

In this country a similar practice seems to have been of doubtful advantage, particularly on roads which are intended to accommodate only a single line of traffic with provision for careful passing. Further, there seems no reason why the middle of such a road crust should be more compressed than the haunches, unless it is thicker; and there seems to be no good reason why it should usually be thicker. When the soil is compressed the compression is usually greatest under the wheel-tracks. The opinion may be offered that it is the one curve or barrelled camber which tends to flatten in the middle, as well as sometimes to become steeper near the edges owing to the rapid flow of the water in this steepest part; the better form from the present point of view is that of two slopes joined by a curve, a form which, under some circumstances, has a tendency to reduction of camber rather than to its increase. To prevent the formation of a flat in the middle of the road the joining curve should be an arc of relatively small radius. Referring to the relation between grade and camber, Mr. Owen said: "As a rule, it must be understood that the steeper the grade the greater the crown. If there is a 10 per cent grade, with an ordinary flat crown, the tendency of the water in a heavy rainfall is to follow the grade rather than the crown, or at least to make a curve in its final discharge; but in such cases it is always better to make a rather higher crown."

This is the usual view. It seems to be overlooked that as long as there is any camber at all there will be at least some tendency for the water to flow to the side; and it is also overlooked that the ordinary camber, without any increase on account of the grade, is usually sufficient to prevent the formation of water courses along the carriageway. As a matter of fact, a smaller camber than that used on level stretches of the same road is usually sufficient for this purpose. Suppose that the camber on a road 24 ft. wide is 1 in 24, and the grade of the road is 1 in 24; the water will tend to run off down the diagonal with a fall of 1 in 17 rather than across or along the road down a slope of 1 in 24. Suppose the grade to be steeper, the water will flow at an angle more acute with the direction of the road, through a distance somewhat greater than 17 ft., and there seems to be no good reason why it should not do so. If on account of rutting there is a strong tendency for water to flow down the road, this will not be counteracted by any possible camber, and other remedies must be sought. Practically, the engineer actually in charge of the road will soon find what camber is needed to prevent the formation of watercourses, or whether on very steep hills any camber at all is worth having. In any case, a sharp camber on steep hills is to be avoided on account of its danger; the creation of a grade steeper than either the longitudinal or the cross-wise slope of the road is a serious matter in some cases. Apart from all this there are roads of such a character that they require little or no camber on fairly steep hills, and there are several classes of road which are better without any camber at all on hills of more than moderate steepness. Generally, with a saving clause as regards certain heavily cambered roads, one feels inclined to support English district and county municipal surveyors in their actual practice in this matter against the theorists who come to conclusions on insufficient premises, and some of whom seem to think that it is a matter of the utmost importance that the water on a hill road should be shed, theoretically, at an angle of exactly 45 deg., although they know perfectly well that this would not be the case in practice.

In the vital matter of the undulation of roads, or the avoiding of dead flats, Mr. Owen made a timely and important observation to the effect that dead flats should always be avoided if possible. He said: "In regard to grades, the speaker has always insisted that a flat road should never be built. In some localities it is almost impossible to accomplish this; but where it is possible—and in ninety-nine cases out of a hundred it can be done—it is better to build the road so as to shed the water longitudinally rather than continuously sideways." And again: "In a long stretch of level country it is sometimes difficult to undulate the road from point to point with a minimum fall of 5/10 in. in 100 ft., but it is better practice than to have a level surface."

But why, it may be asked, should there be any difficulty at all in undulating a new road from culvert to culvert even in a dead flat country?

SOME OTHER POINTS.

In many parts of the United States the depth to which frost penetrates the ground makes it necessary to drain to a much lower level than that needed in this country, in most parts of which, though not everywhere, the effects of frosts upon road surfaces are much more important than their action in heaving up the crust. In this connection the following passages are of interest. Mr. Owen said: "Where the frost is 4 ft. or 5 ft. deep, breaking up the homogeneity of the road and coming out at the surface, with, say, 1 ft. of melted earth on the top and 2 ft. of hard frozen ground below, it makes the most undesirable proposition that can be considered, and these conditions will obtain almost all over the northern part of the United States."

Mr. Johnston said: "It has been the speaker's practice to locate carefully every frost break and soft spot which shows on the road in the spring, and to remedy such places as promptly as possible."

In a passage already quoted, Mr. T. S. Oxholm referred to a similar practice, such places being provided with drains of stone from the centre of the road diagonally to the ditches or culverts.

A reference made to bog roads should not be missed. After describing a method adopted in widening an old road across a bog (a mattress of boughs covered with gravel being put down before the bank was made), Mr. P. D. Sargent said: "In work of this kind it is absolutely necessary that the turf or sod be not cut. If it is, and much of a load is superimposed, settlement will almost certainly occur."

This is in accordance with the best British practice, as recently exemplified in Ireland.

THE COLLECTION OF REFUSE.

AN IMPROVED TYPE OF BIN.

Dealing at the last meeting of the Institute of Sanitary Engineers with the drawbacks common to the bins generally in use in connection with the collection of house refuse, Mr. J. O. Neumann stated that he had recently devised a bin in the endeavour to obviate these difficulties, and to meet the great objection which is always made to the introduction of the duplicate bin system—namely, the cost of transport and storage.

This bin has a separate bottom fitted to the cylindrical part by means of a double bayonet fastening. When the bin is turned upside down in the cart the bottom is removed easily, and the contents, aided by the air, come out easily; it is not necessary to bang the bin about. The cart, which is generally wider at the top than at the bottom, has an iron rod along each side. By means of a ring fixed to the side the bin bottom is slid on the rod on one side of the cart, and a clean one taken from the others and placed on the bin. On return to the yard these—the only parts of the bin which really get foul—can be soused with a hose, and placed on the carts ready for the next collection. By these means cost of carriage and storage is avoided, the bin will be clean instead of foul, the cleansing will be under supervision, the bins will last longer, and no effluvia will escape, because the lid will keep fitting.

The "Lightning" File.—Manufacturers in Sheffield are displaying marked activity and enterprise in producing files of high efficiency, and to an increasing extent users are buying these goods on the basis of the amount of work they do under mechanical [illegible] rather than merely accepting the lowest tender. American competition in this important industry was practically eliminated from the home market several years ago, and Sheffield makers have gone well ahead of their Transatlantic rivals in developing what is known as the "high-speed" file. A report has been issued of a test by the Sheffield Testing Works, Limited, of the high-speed "Lightning" file which has lately been placed on the market by Lockwood Brothers, Limited, of Sheffield. According to this, a 14-in. file tested on both sides, made 120,000 strokes, and in that distance had removed 7880 in. of metal weighing 22 lb. from an inch-square bar. At the conclusion of this severe trial the tool was reported to be "slightly worn." The makers claim the result of the test to represent the highest point of working efficiency ever attained by a file under similar conditions. It may be of interest to state that the Admiralty require the files they buy to make only 20,000 strokes and to remove 6 in. of material. In round figures, the "Lightning" file is capable of doing treble the amount of work that can be got out of an ordinary file, and as the increased price is inconsiderable, it must be highly economical in use.

ROAD IMPROVEMENTS IN AND ADJOINING COUNTY BOROUGHS.

ROAD BOARD CIRCULAR.

The Road Board announce that they are prepared to consider applications from the councils of county boroughs in England and Wales for grants, or short loans for terms not exceeding five years, towards works of road improvements.

In order to assist councils in making their proposals the board think it desirable to give the following indications of their views as to the kind of works to which they will be disposed to give most favourable consideration:—

(1) They do not encourage proposals relating to the widening of streets in fully built areas which are crowded and congested mainly with local traffic, as they do not consider that such works are fairly within the scope of the Road Improvement Fund.

(2) They will give special consideration to proposals for the reconstruction of road crusts, especially in cases where these require immediate reconstruction in consequence of motor traffic. But they are of opinion that grants should not be sought from them for the more expensive forms of road construction for which it is customary to borrow the initial cost on long term loans. The money available for grants can, they suggest, be spent more usefully and more beneficially in the interest of existing ratepayers on reconstruction works for which there is an immediate need, but for which the council cannot get sanction to borrow for a term which would spread the initial cost over a large number of years.

(3) In selecting the roads, the reconstruction of which they will assist, they will give prior consideration to those roads which form part of important through routes, carrying a considerable volume of long-distance traffic, and also those roads which, although not strong enough for the purpose, are now being extensively used by heavy motor vehicles.

(4) They will favourably consider proposals which will facilitate the execution of town planning schemes, so far as these contain provision for the improvement of through road communication.

(5) They will give special consideration to proposals for the acquisition of vacant land required or likely to be required for widenings of important roads in cases where it can be shown that the prospect of building is imminent.

(6) Having regard to the amount for which applications are likely to be made grants will be made for a proportion only of the cost of works proposed, the proportion being fixed by the board after consideration of the circumstances of each case.

(7) The works selected for applications to the board should not include any that have been commenced or for which financial provision has been made.

In connection with works of the character indicated in (4) and (5) it has been intimated to the board that there is considerable difficulty in dealing with such works in the area immediately outside the boundaries of county boroughs. Improvements on approach roads outside borough boundaries are frequently required more in the interests of the borough than in the interests of the adjoining urban or rural district. Consequently, district councils are unwilling to promote or finance such schemes, and there are difficulties in the way of borough councils paying for or contributing to improvements outside their area, however desirable in the interests of the borough traffic such improvements may be. The board are, therefore, prepared to give consideration to joint applications from a county borough, and adjoining authorities, and to apportion their grants so as to enable such cases to be dealt with.

The aggregate amount which the board are prepared to treat as available at the present time for grants or short loans to county borough councils is £[illegible].

The board are unable to assist county borough councils in the selection of the works to be proposed for grants by indicating the amount likely to be granted to each council, as they are not prepared to allocate the total sum on any fixed principle. The grants will be settled after consideration by the board of the applications which may be received. The board regret, however, that it would be impossible for each county borough council to calculate what percentage of the aforementioned sum of £[illegible] could be allocated to them if the allocation were made in the ratio of the population of county boroughs, inasmuch as any council would be unlikely to get more than a share on population basis, except for some work of exceptional public value. The grants which may be made for such special works will necessarily reduce the amount available for other works, and may result in the board being unable to make any grants at the present time to a considerable number of county boroughs.

ROAD BOARD ADMINISTRATION.

In the House of Commons on Friday last Mr. Bridgeman (Oswestry) raised the question of the administration of the Road Board. Mr. Bridgeman contended that the relief to agricultural rates through the operation of the Road Board had not nearly reached the amount which the Chancellor of the Exchequer led them to expect. When the board was established the Chancellor estimated that, including old age pensions, the relief to rates would be 4d. in the £, but his calculation was that the relief given was not more than 2¼d. The Road Board had only expended £250 000 in grants to local authorities, and had piled up an unexpected balance of £1,800,000. The policy of the Road Board in making grants was to require the local authorities to expend money additional to the grants upon road improvement for the benefit of motorists, and this was strongly resented by the local ratepayers.

Mr. Macpherson (Ross and Cromarty) also complained of the refusal of the Road Board to make grants to local authorities to relieve the rates. This was felt to be a great grievance in the poor districts of the Highlands, where the cost of road maintenance had much increased in consequence of motor traffic.

Mr. Masterman (Financial Secretary of the Treasury) said the House deliberately adopted the principle, when the Road Board Act was passed, that the responsibility of the recommendation of grants from the fund should be on the Road Board and not on the Government, and therefore it would be altogether outside the intention of Parliament if he made any kind of representation either to Sir George Gibb or to the board as to the policy of the allocation of these special grants. The bulk of the grants given, or those that were in negotiation, were not so much for improvements in connection with new construction or the widening and improvement of curves and corners as for the improvement of the road crusts. The additional expenditure to which the hon. gentleman had referred was not owing to any exalted standard of efficiency which had been laid down by the Road Board, but was due to the requirements of the traffic which would have had to be met, in any circumstances, by the road authority, even if no Road Board had existed. The Road Board was called into existence to meet the transition from one sort of traffic to another, and a very large proportion of the work would have to be carried out by the local authorities if there had been no Road Board at all. Under these circumstances it was not fair to say that the board was forcing work upon a county that it would not otherwise have undertaken. The total amount received by the board up to the end of last month was £2.748.000. Of that £1,200.000 had been practically allocated in grants; £459.000 had been allocated in loans; and, in addition, the board had intimated its readiness by general circulars to make grants to the aggregate amount of £1,050.000, and was now receiving applications to enable them to settle the details of the work. There were two main reasons why more money had not been spent. The schemes had not gone through with the rapidity that had been expected, and even where they were completed the money was being advanced as the scheme progressed. The second reason was one of some importance. Under the Act the grants through the Development Commissioners and the Road Board were to be used, except in matters of great urgency, to standardise outside employment. They had been passing through a time of an enormous "boom" in trade, and in the last few months there was practically no unemployment. They anticipated the time when unemployment would rise with trade depression, and there would be a demand for this kind of more or less unskilled work which the Road Board and local authorities could furnish. They hoped to be able to accumulate before the bad time came a reserve of something like £1.000.000 with which to [illegible] the outside market. He happened to know that the Departmental Committee on Local and Imperial Taxation was very vitally considering the whole subject especially in connection with the main roads, and he hoped that when their report was published it would be found that very full consideration had been given to the question.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. THOMAS, M.INST.C.E., County Surveyor, Buckinghamshire.

SOUTH-EASTERN DISTRICT.

A meeting of members of the above district will take place at Sidcup at 2.30 p.m. on Wednesday, January 8th, when the road sections will be inspected.

Mr. Maybury has kindly consented to supply the revised cost of the trial lengths up to December 31st; the meeting will be followed by a dinner at Frascati's Restaurant, Oxford-street, at 6.30 p.m.

SOUTH WALES DISTRICT MEETING.

District Chairman—Mr. W. HARPUR, M.INST.C.E., Cardiff.

A meeting of the institution will be held in the South Wales District at the Guildhall, Swansea, on Saturday, January 11th next.

PROGRAMME.

11.30 a.m.—Meeting of members of South Wales District at the Guildhall, Swansea, for the purpose of electing a district committee.

12 noon.—General meeting at Guildhall, Swansea, where the members will be received by the mayor. Proceed to Castle-street and inspect street widening and construction of tramways by the corporation and erection of new buildings. Thence to Hotel Cameron.

1 p.m.—Luncheon at Hotel Cameron, High-street (tickets 2s. 6d. each).

2 p.m.—Drive by way of High-street, where tramways recently constructed will be inspected, to destructor (tickets 1s. 6d. each). Inspection of the Pentre Valley, Burlais Brook culvert, the destructor and its recent improvements, the slab-making plant and the houses erected by the corporation.

4 p.m.—Return to Hotel Cameron. Light refreshments provided by the borough surveyor. Discussion on paper entitled "Swansea Tramways, Past, Present and Future," by Mr. G. Swarbrick, deputy borough surveyor (member), and the paper entitled "The Development of the Pentre Valley in Relation to the Destructor," by Mr. G. H. Bell, assistant borough surveyor (Assoc. Member).

Papers will be taken as read.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than Saturday, January 4th, when copy of the papers will be sent in due course.

H. ALEX. CLARKE,
Hon. District Secretary.

Council Offices,
Briton Ferry,

NORTH-EASTERN DISTRICT.

A meeting of the institution will be held in the North-Eastern District at Newcastle-on-Tyne on May 2nd and 3rd next.

Notice is hereby given that, under the provisions of by-law 14, nominations for the council of 1913-14 must be received by me not later than February 1, 1913.

Each member or Associate member of the institution is entitled to nominate one member or associate member for the council. Nominations must be accompanied by the consent of the nominee.

SOUTHERN DISTRICT MEETING.

A meeting of the Southern District will be held at Southampton on Saturday, February 22nd next.

THOMAS COLE,
11 Victoria-street, S.W. *Secretary.*

The King's Hall, Ilkley.—On Wednesday, the 18th inst., Mr. F. S. Jackson, J.P., chairman of the Ilkley Urban District Council, laid the foundation stone in connection with the erection of the annexe to the King's Hall, Ilkley. Mr. Jackson was presented with a silver trowel by the architect (Mr. Henry West, Ilkley).

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but these responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

SURVEYOR.—December 27th.—Consett Urban District Council. £175—£205.—Mr. H. Jackson, clerk.

SURVEYOR'S ASSISTANT.—December 27th.—Consett Urban District Council. £52—£67.—Mr. H. Jackson, clerk.

TEMPORARY ARCHITECTURAL ASSISTANT.—December 28th.—Dartford Urban District Council. £2 10s. per week.—Mr. T. E. Tiffin, surveyor.

CLERK OF WORKS.—December 28th.—Hyde Town Council.—Mr. T. Brownson, town clerk.

ARCHITECTURAL ASSISTANT.—December 30th.—Corporation of Nelson. £90 per annum.—Mr. J. H. Baldwick, town clerk.

CLERK OF WORKS.—December 30th.—The Rivers Committee of the Manchester Corporation. £3 3s. per week.—Mr. Thomas Hudson, town clerk.

ENGINEER-IN-CHIEF.—December 31st.—Mersey Docks and Harbour Board.—Mr. Alfred Chandler, general manager and secretary.

STEAM-ROLLER DRIVER.—December 31st.—Corporation of King's Lynn. 27s. per week.—Mr. Alfred J. Smith, borough surveyor.

INSPECTOR OF NUISANCES AND SURVEYOR.—December 31st.—Shoreham Urban District Council. £225 per annum.—Mr. H. Brown, clerk.

BOROUGH ENGINEER'S CLERKS.—January 1st.—Hornsey Borough Council. General clerk £70 per annum, and junior clerk £40 per annum.—Borough Engineer and Surveyor, Municipal Offices, Highgate, N.

SECOND ASSISTANT SURVEYOR.—January 3rd.—Cannock Urban District Council. £52 per annum.—Mr. C. A. Loxton, clerk.

BRIDGE AND ROAD SURVEYOR.—January 18th.—Devon County Council. £400 per annum.—Mr. F. Bailey, clerk, The Castle, Exeter.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but these responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

BELFAST.—January 1st.—Designs for 126 houses of two apartments each, and 126 houses of three apartments each, for the corporation. Premiums are offered of £25, £15, and £10.—Mr. R. Meyer, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

SWAFFHAM.—January 25th.—Plans, specifications and estimates for workmen's dwellings, for the rural district council. A premium of £10 is offered to the selected plan.—Mr. Sydney Matthews, clerk.

JAMAICA.—January 31st.—Plans for municipal buildings to cost £9,000. A premium of £100 is offered. Messrs. Young, Limited, 60 Fenchurch-street, London, E.C.

HARROGATE.—February 3rd.—Designs for a council school, for 675 children.—Mr. C. E. Rivers, ASSOC.M. INST.C.E., borough engineer.

DUBLIN.—February 6th.—Designs for municipal buildings for the corporation. The proposed expenditure is £50,000, and the author of the design placed first will be appointed to carry out the scheme on a 5 per cent basis. Premiums of £150 and £100 are offered. The assessor is Mr. Albert E. Murray, F.R.I.B.A. —The Town Clerk.

RANGOON.—March 1st.—Designs for municipal buildings. Premiums are offered of £300, £200, and £100.—The Clerk to the Rangoon Municipality.

WINNIPEG.—March 1st.—Designs for city hall. Limited to British architects in Canada. Premiums are offered of 5,000 dols., 3,000 dols., and 2,000 dols.—The Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, but *those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

SOUTHAMPTON.—December 30th.—For the reconstruction of Fore Bridge, for the county council. Mr. H. Barber, clerk, The Castle, Winchester.

ALTRINCHAM. December 30th.—For the erection of a shelter and conveniences, for the urban district council.—Mr. H. E. Brown, surveyor.

SOUTHGATE.—December 31st.—For the construction of an open-air swimming bath, for the urban district council.—Mr. C. G. Lawson, surveyor.

EAST HAM.—December 31st—January 21st.—For the erection of a school, for the Education Committee.—Mr. F. R. Thompson, secretary, Town Hall.

EAST RIDING.—January 1st.—For alterations to school, and erection of a school and teacher's house, for the county council.—Mr. J. Bickersteth, clerk, County Hall, Beverley.

HERTS.—January 2nd.—For the erection of a police station, for the Standing Joint Committee.—Mr. U. A. Smith, county surveyor, Hatfield.

NEWRY.—January 3rd.—For additions to the town hall, for the urban district council. Mr. William Cronin, clerk.

CHATHAM.—January 4th.—For the erection of a school, for the Education Committee.—Mr. G. F. Bond, High-street, Rochester.

MANCHESTER.—January 8th.—For reinforced concrete work, for the corporation.—Mr. Thos. Hudson, town clerk.

WEST RIDING.—January 10th.—For the erection of a school, for the Education Committee.—Mr. Francis Alvey Darwin, clerk, County Hall, Wakefield.

CORNWALL.—January 11th.—For building a school at Tintagel, for the Education Committee.—Mr. F. R. Pascoe, secretary, County Hall, Truro.

PEMBROKE.—January 11th.—For the erection of a school, for the Education Committee.—Mr. H. E. H. Jones, clerk, County Education Offices, Haverfordwest.

FLINT.—January 14th.—For the erection of an elementary school, for the county council. Mr. Sam. Evans, county surveyor, County Offices, Mold.

LANCASHIRE.—January 14th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

MANCHESTER.—January 15th.—For the construction of a public library, for the corporation.—Mr. Thos. Hudson, town clerk.

Iron and Steel.

RYE.—January 8th.—For the supply of cast-iron socket pipes and irregulars, for the corporation.—Mr. W. Dawes, town clerk.

SWANSEA.—January 9th.—For the supply of steel work, for the Hafodyrynys Tinplate Co.—Mr. T. Struck, clerk.

CHORLEY.—January 13th.—For the supply of two gas engines and two pumps, loan of portable boiler, and laying cast-iron mains, for the rural district council.—Mr. P. J. Aspden, clerk.

MADRAS.—January 22nd.—For the supply of [illegible] pipes and specials, varying from 4 in. to 24 in. internal diameter, and aggregating a length of about 100 miles, for the corporation.—Messrs. James Mansergh & Son, agents, 5 Victoria-street, Westminster.

ELLESMERE.—January 31st.—For providing and laying 9,000 yards of 4 in. and 3 in. cast-iron mains, sluice valves, fire hydrants and air valves, for the rural district council.—Mr. H. R. Gibbs, clerk.

Roads.

EXMOUTH.—December 28th.—For excavation and filling, making concrete foot paths, foundations, [illegible] and supply of tar-macadam for finishing coat of carriageway, for the urban district council.—Mr. Samuel Hillier, engineer.

WALMER.—December 28th.—For the supply of clean flints, for the urban district council.—Mr. H. W. Barker, surveyor.

DERBYSHIRE.—December 30th.—For the supply of granite, basalt, slag, limestone, tarred macadam, and tarred chippings, for the county council.—Mr. J. W. Horton, county surveyor, St. Mary's Gate, Derby.

SHOREHAM.—December 31st.—For the supply of 20,000 gallons of dehydrated tar or other bituminous material, for the urban district council. Mr. Harold Brown, clerk.

LLANTRISANT AND LLANTWIT FARDRE.—January 1st.—For the completion of the new Ely Valley-road, and branch roads, about 3 miles in length, for the rural district council.—Messrs. Gomer S. Morgan & Thomas Saunders, engineers, School-street, Pontyclun, Glam.

SEVENOAKS.—January 1st.—For the supply of chert, flints and ragstone, granite, quartz, basalt, steam rolling, team labour, cartage and hauling, for the rural district council.—Mr. F. H. Vibert, clerk.

HULL.—January 1st.—For flagging work, for the town council.—Mr. A. E. White, city engineer.

HARWICH.—January 1st.—For the supply of broken granite and granite chippings, for the corporation.—Mr. F. Harold French, borough surveyor.

HOVE.—January 1st.—For laying wood paving, for the corporation.—Mr. H. H. Scott, borough surveyor.

DENBIGH.—January 1st.—For the supply of road stone and tar-macadam, for the county council.—Mr. Ellis W. Jones, county surveyor, Wrexham.

WHITLEY UPPER.—January 1st.—For road rolling and scarifying, for the urban district council.—Mr. Joe Sharp, clerk.

CHESTER-LE-STREET.—January 1st.—For making up three private streets, for the rural district council. Mr. R. V. Dickinson, clerk.

READING.—January 2nd.—For making-up work, for the corporation.—Mr. J. Bowen, borough engineer.

SALE.—January 2nd.—For works of paving and flagging, for the urban district council.—Mr. D. Hallewell, clerk.

RAMSGATE.—January 2nd.—For the extension of Victoria-parade, including sewering, road and footpath making, for the corporation.—Mr. T. G. Taylor, borough engineer.

DORSET.—January 4th.—For steam rolling on 458 miles of main roads for three years, for the county council.—Mr. W. Townshend Fletcher, county surveyor, Dorchester.

DORSET.—January 4th.—For the supply of granites, basalts, quartzites, limestones and tar-macadam, for the county council.—Mr. W. Townshend Fletcher, county surveyor, Dorchester.

NORTH RIDING.—January 4th.—For work of steam rolling and scarifying, for the county council.—Mr. W. G. Bryning, county surveyor, County Hall, Northallerton.

SUNBURY-ON-THAMES.—January 6th.—For the supply of 4000 gallons of refined tar, for the urban district council.—Mr. H. F. Coales, surveyor.

GLANFORD BRIGG.—January 6th.—For the supply of granite and slag, for the rural district council.—Mr. Frank C. Hett, clerk.

EASTHAMPSTEAD.—January 7th.—For the supply of broken or unbroken granite, slag, limestone and flints, for the rural district council.—Mr. C. B. Wilson, clerk.

EAST GRINSTEAD.—January 8th.—For the supply of 20,000 gallons of tar, prepared in accordance with the Road Board's specification for tar No. 1, for the rural district council.—Mr. Francis S. White, clerk.

KESTEVEN.—January 8th.—For steam-rolling work, for the county council.—Mr. W. B. Purser, county surveyor, Grantham.

LLANTRISANT AND LLANTWIT.—January 9th.—For making up private streets, for the rural district council.—Mr. Thomas Saunders, surveyor, School-street, Pontyclun.

MIDHURST.—January 11th.—For the supply of granite and tar-macadam, for the rural district council.—Mr. A. G. Gibbs, surveyor.

ANTRIM.—January 11th.—For tar treatment and steam rolling in certain roads, for the county council.—Mr. Alexander Millar, deputy-secretary, County Courthouse, Belfast.

"The Surveyor" Supplement.

For Architects, Quantity Surveyors, Contractors, and all Users of Reinforced Concrete.

Leigh-on-Sea New Council Offices and Fire Station.

An important event in the annals of the Leigh-on-Sea Urban District Council was celebrated recently, when the new public offices and fire station were formally opened by the chairman of the council, the Rev. R. Stuart King, M.A., J.P., in the presence of a large assembly. Councillor S. F. Johnson, chairman of the Highways Committee, opened the proceedings, and in doing so alluded to the rapid development of the town as sufficient justification for the erection of the new buildings, and referred to the possibilities upon that historic past that they built up their hopes for the future. From a village they had developed to town life, and they commenced in the new buildings with a feeling of hope that they were going on to greater things. In conclusion, he congratulated the surveyor to the council, Mr. J. W. Liversedge, on the design, and Mr. Davey, the contractor, on the manner in which he had executed the commission.

The Mayor of Southend (Mr. Charlton Hubbard, J.P.), Mr. James Tabor, J.P. (High Sheriff of Essex),

Frost Phot. LEIGH-ON-SEA COUNCIL OFFICES AND FIRE STATION. *A. J. Pudgett, Leigh-on-Sea*

Mr. John W. Liversedge, Assoc.M.Inst.C.E. Engineer and Surveyor to the Urban District Council, Architect.

Leigh had at rivalling Southend as a health resort. In the latter connection he spoke of a suggestion for the linking of Canvey Island with the mainland at Leigh by means of a promenade pier, and giving an approach to the sea at all states of the tide.

A description of the new buildings was given by the architect, Mr. John W. Liversedge, A.M.Inst.C.E., borough surveyor to the council.

Mr. F. P. Wheatley Down, clerk to the council, handed a silver key to the chairman of the council, who then formally opened the offices. Speaking subsequently in the council chamber, he observed that Leigh was one of the oldest places in Essex, and was mentioned in the Domesday Book, adding that it was Alderman John Burrows, and Mr. F. W. Senior, J.P., each made a few remarks appropriate to the occasion, after which tea was provided at the rectory. The guests included the Mayor and Mayoress of Southend, the High Sheriff (Mr. James Tabor), the town clerk of Southend (Mr. H. Worwood), the borough engineer of Southend (Mr. E. J. Elford), members of council, council officials, and others.

The following is a description of the new council offices and fire station.

COUNCIL OFFICES.

The buildings are centrally situated on the west side of Elm-road, and adjoin the new post office,

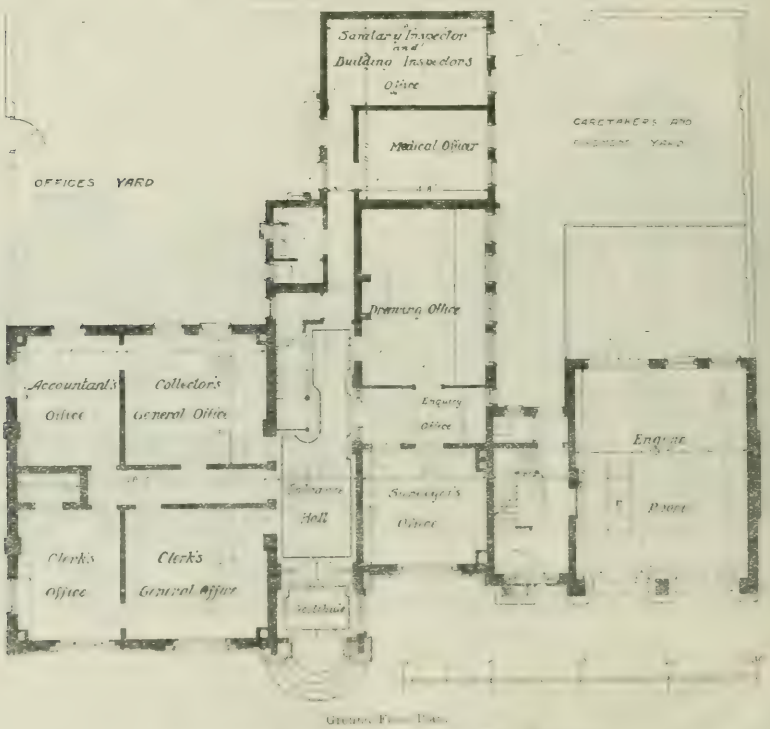
The site was purchased in 1906, has a frontage of 95 ft., with a depth of 250 ft., one-half of the area being used for the offices, and the remaining portion at the rear as the council's depot and town yard.

FAÇADE.

The main façade is constructed with best quality red facing bricks with Bath stone dressings in the free Renaissance style. The main entrance has been

leading to the entrance hall. The outer and inner doors are in polished teak, the outer being solid, moulded and panelled, the upper portion of the inner door being fitted with polished plate glass, with lead lights on each side and over transom. The vestibule floor is laid with mosaic tiling, and the hall with Minton tiles. The walls of the hall have a 6-ft. dado, with glazed wall tiling and suitable plinth and capping. Immediately on the left on entering is the

Front Elevation.



Ground Floor Plan.

Lighting, Central Heating and Fire Station.

The fire station is attached to the offices, but a little lighter treatment has been given to this portion of the design. The building is well set back from the road and approached by a semi-circular drive, with front areas fenced, kerbed and turfed.

The offices are approached by a flight of steps leading to the entrance with double folding doors

with a central corridor leading to the clerk's private and the surveyor's office, on the right is the surveyor's department, this including the surveyor's private office, an enquiry and clerks' office, and drawing office. Immediately in front is the staircase leading to the council chamber, and a corridor leading to the medical officer of health's office, the sanitary in-

telephone box. There are three departmental stores and strong room in the basement.

FIRST FLOOR.

This is approached by the main staircase leading from the entrance hall, lavatory and cloak accommodation being provided at the half-space landing. The staircase is lighted from a central dome and a side window fitted with leaded lights. Glazed tiled pump ventilator. The chamber has been fittingly furnished, with floors laid with cork lino. A raised dais accommodates the chairman and officials, and a central table of horse-shoe pattern is provided for eighteen councillors, this being fitted with a separate desk for each councillor. The whole of the fittings are in oak, with leather dressings and upholstering.

The committee-room is 23 ft. 6 in. by 13 ft., and is

Section.

First Floor Plan.

LEIGH-ON-SEA COUNCIL OFFICES AND FIRE STATION.

dadoes are carried forward along the staircase. The council chamber, 34 ft. by 18 ft., leading from the landing at the head of the stairs, has a semi-circular ribbed roof, with panelled and moulded ceiling. All windows are of the iron casement type, fitted with leaded lights of special design.

The [illegible] simple but effective. Ventilation [illegible] special inlets and a central outlet air suitably furnished. The caretaker's quarters lead from the first-floor landing, and include living-room, scullery and bathroom, with two bed-rooms on the second floor over the firemen's club-room.

FIRE STATION.

The fire station is approached from the main street through [illegible] oak double-leading doors [illegible]

with patent automatic spring-opening gearing. The station is 23 ft. 8 in. by 19 ft. 6 in., and has dado in glazed bricks and Fletton facings above. The floors are laid in wood blocks, with granite runners for the wheels. A sunk pit is provided for cleaning purposes. Provision is made for a steam fire engine and horsed escape, with the usual fittings. Over the fire station is arranged the firemen's club-room, with accommodation for a billiard table. The caretaker's and firemen's entrance is on one side, the stairs giving approach to the basement. The first and second floors are arranged around a well, which is designed for use as a hose-drying tower. Suitable hoisting tackle is provided in the roof, and there is a ferro-concrete tank in the basement for washing purposes. The heating arrangements are in the basement. A yard is provided at the rear for practice purposes and escape drill.

GENERALLY.

The building is heated with hot water throughout on the low-pressure system, sectionalised by valves capable of dealing with the various parts of the building. Radiators are provided with suitable regulators. The floors to the ground floor of offices are pitch-pine wood block on concrete, all other wood floors being pitch-pine narrow widths. Kentobin patent flooring is used for lavatories. Sirapite has been used for the plastering, and Westmorland green slates for roofs.

The contract for the erection of the buildings has been carried out in a satisfactory manner by Mr. F. Davey, contractor, Southend, and Mr. E. T. Bradshaw has acted as clerk of works.

The following firms have supplied special goods under the contract: Sanitary fittings, Messrs. Doulton & Co., London; iron casements, Messrs. Crittal, Braintree; tiling, Messrs. Carter & Co., Poole; patent flooring, Messrs. G. Kent & Co., London; heating, Messrs. Hayward Brothers & Eckstein, London; lighting, Messrs. Hulett & Co., London; locks and fittings, Mr. J. Gibbons, Wolverhampton; ventilation, Messrs. Ewart & Son, London; decorative glazing, Messrs. J. Hall & Sons, London; furnishing, Messrs. Hampton & Sons, London.

The contract for the building, exclusive of the cost of land and furnishing, is £4,570, or 9¾d. per cubic foot.

MUNICIPAL ICE MAKING AT BOLTON.

INAUGURATION OF NEW PLANT.

A constant supply of good, hard, crystal ice at a low price has long been recognised as a necessity in all large industrial centres, and the Corporation of Bolton was among the first public bodies in the early days of refrigeration to establish an ice and cold storage plant. This was placed in the basement of the market hall in the centre of the town, and was readily accessible to the various tradesmen. They installed two machines, each having a total producing capacity of 10 tons of ice per twenty-four hours, but one of these was used only for cooling a number of rooms for storing perishable goods of all varieties. The machine in use for ice-making was greatly appreciated, and the demand increased until the plant was insufficient to meet the present requirements. It was therefore decided to extend the plant and bring it thoroughly up-to-date. During recent years scientific research and new methods of working metals have enabled manufacturers vastly to improve the design of these plants, both as regards reliability and efficiency of operation, and a sub-committee was therefore appointed to inspect the latest installations to ensure that the new plant should be of the latest design. It was finally decided to replace one of the old machines with a new machine capable of producing 30 tons of ice in twenty-four hours, partly because the old machine was in need of a thorough overhaul, but chiefly because the large machine would reduce the operating cost to a minimum. After careful consideration the Markets Committee recommended modern cell ice-tanks to produce the ice in blocks of the best quality, and a refrigerating plant on the carbonic anhydride (CO_2) system, so that the plant should be similar in design to the new Longsight and Ashton plants, and thus become a good reserve. Until recently the only available under the market hall for the machinery purposes which required a plant working on the ammonia system, but recently the other types on the market. It was also felt that it would be necessary to use gas which was preferable to ammonia, as the plant is situated under the market hall.

The new plant was inaugurated, which was performed on Thursday of last week by the Mayor of Bolton (Dr. James Young, J.P.)—has been supplied by the Haslam Foundry and Engineering Company, Limited, of Derby.

THE REFRIGERATING PROCESS.

The ice tanks consist of wooden tanks well insulated with slab cork to reduce the heat losses, and are fitted with hollow galvanised wrought-iron slabs, through which is circulated cold brine supplied by the refrigerating machine. The water for making the ice is first cooled to a low temperature in a "fore" cooler, and then run into the spaces between the slabs and frozen into solid blocks of ice. During the process the water is continually agitated by a plunger moving up and down in a compartment at one side of the tanks, to liberate the globules of air and ensure the ice being transparent. The town's water is used for ice-making. Any impurities are separated from the water when it freezes, and, owing to the action of the plunger, are carried into a space at the bottom of the tank, and then run off before the tank is refilled. By this means the ice produced is quite clear and pure. After the water is frozen solid the cold brine is shut off and warm brine is circulated through the cells to liberate the ice, and the blocks are then withdrawn, an electric traveller being provided to save labour. The blocks weigh 5 cwts. each, but a special ice saw is supplied, by means of which the ice can be cut into blocks weighing 1, 2, 3 or 4 cwts. each. The heat eliminated from the water is carried away by the cold brine which returns to the refrigerating plant, where it is again cooled to a low temperature. The cold is produced by the evaporation of liquid CO_2, the vapour being compressed and again liquefied under a high pressure in wrought-iron pipes cooled by well water circulated over the outside, the liquid CO_2 then passing into the refrigerator coils, where it again evaporates at a temperature far below freezing point. The plant works on the closed principle, and the same CO_2 is re-used continually.

The whole of the coils in the plant are made in continuous lengths and are welded up by electricity. The connections and compressors are made from solid steel ingots to avoid the possibility of any leakage, and all parts subject to the pressure of the CO_2 are tested to 3,000 lb. to the square inch (four times the working pressure) by water, and afterwards by means of compressed air, before leaving the makers' works. The plant is arranged so that any portion can be shut off if necessary. The CO_2 compressor and the pumps for circulating the cold and warm brine are driven by independent electric motors so that the plant can be worked to the best advantage. The whole plant is designed to reduce the working expenses to the lowest possible figure consistent with the production of good, clear ice. Crossover connections are also supplied so that the plant can be worked in conjunction with the existing plant, and either machine can be used for ice-making or for cooling the cold stores as required in order to avoid the possibility of any stoppage and also to enable the machines to be overhauled when required.

The whole of the new installation has been erected and completed at a cost of about £7,700.

The erection and insulation of the ice tanks, &c., has been carried out by Messrs. R. C. Eskrigge & Sons, of Seaforth, Liverpool, and the motors and crane have been supplied and fitted up by Messrs. Newton Bros., of Derby, under the direction of Messrs. the Haslam Foundry and Engineering Company, Limited. The electric wiring and lighting has been supplied and fitted by the Bolton Corporation, electric fittings department.

The whole of the works have been carried out from the specifications and under the superintendence of Mr. E. L. Morgan, Assoc.M.Inst.C.E., borough engineer, and Mr. Robert Pike, superintendent of markets and cold stores.

Thrift and Footpaths. *Engineering and Contracting* (Chicago) reports the case of a certain Arkansas city which wished to extend a cement footpath, and, having no funds for the purpose, sold advertising space on each square of the footway. The city secured a list of the names of the town and county officials, the various industries, the population and other data, and the remainder of the squares were sold to local merchants. The advertising was done by forming letters in the top coat of the cement before it finally set. We can probably safely quote the report without risk of the proceeding being emulated in this country.

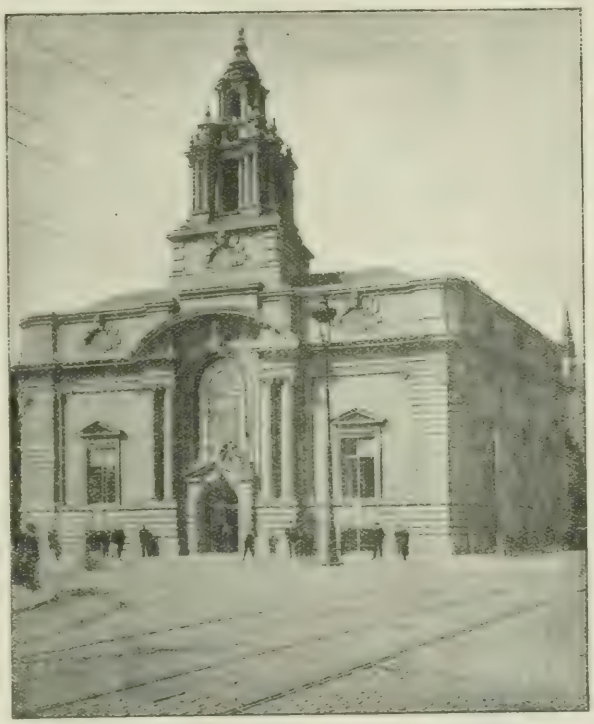
"The Surveyor" Supplement.

FOR ARCHITECTS, QUANTITY SURVEYORS, CONTRACTORS, AND ALL USERS OF REINFORCED CONCRETE.

Dundee's New Central Reading Rooms.

Mr. James Thomson, the city engineer, is the architect of the new central reading rooms which have recently been erected in Dundee in connection with a scheme of library extension.

The structure, of which, by the courtesy of Dr. Millar, the chief librarian, we are enabled to give an illustration, may be characterised as an adaptation of free English Renaissance, and the interior is commanding in its aspect and beautiful in its details.



CENTRAL READING ROOMS, DUNDEE.

An ample staircase leads from the corridor to the first floor, on which there are three rooms. As first designed, the news-room was on the north side of the building; but as it was soon found that the light there was not altogether satisfactory, the flat was re-arranged, and the news-room, fitted with ample reading-desks, is now placed in the central apartment, amply lighted by the dome above. The room on the south is devoted to magazines. The north room is partly occupied by ladies and juveniles. A separate entrance for juveniles is provided. By having a half-sunk storey excellent storage accommodation has been obtained for newspaper-files, magazines and pictures. For the convenience and safe handling of the last-named a swing-window and grating have been placed on the street level, thus obviating any unnecessary carrying and risk, and the floor has been fitted with convenient picture-racks, which permit of classification of the pictures. The heating chamber is also placed here, and an efficient system of heating is carried through the building.

At the first landing the stair divides into two portions, north and south, meeting at the east beneath a large staircase window, and thence rising to the west main landing. The central room, which is lighted from the dome, is devoted exclusively to pictures of old Dundee and portraits of eminent Dundonians. There are two sculpture galleries on this floor, one to the north being set apart for classical work, while the southern gallery is reserved for Celtic, Italian, French, and German sculpture, of which characteristic examples are displayed. Especially noteworthy is the fine series of casts of the principal sculptured stones of Scotland. The Parthenon Frieze in the classical gallery is set out in (as near as possible) its actual position on the great temple at Athens, and a fine papier-maché reproduction indicates the successive order of each plaque. Full-sized fragments of figures from the wonderful group above the main entrance to the temple are shown in their actual position, and set out upon a platform. Examples of classical sculpture, from the primitive "Charioteer" to the Venus di Milo, are arranged in such manner that the gradual development of the sculptor's art may be easily studied.

New pedestals of stained and polished wood have been provided. A very striking effect has been obtained by covering the walls of the sculpture galleries with a delicately-tinted cloth, which throws the figures into bold relief. The system of electric lighting introduced consists of inverted arc-lamps, which diffuse the light

without casting heavy shadows. The sculpture was never properly seen in its former position in the Central Museum; but these galleries have been specially constructed to display the casts to the best advantage, and the result is eminently satisfactory.

ACCOMMODATION SUBWAYS FOR PIPES AND WIRES.

The most extensive placing of underground structures in galleries is, of course, to be found in Paris and London, the sewers being used in Paris, while in London the county council has constructed pipe galleries under a number of new streets. The trouble in America has not been due to a lack of study of the subject; for the best-designed galleries actually planned anywhere appear to have been those proposed by the late Rapid Transit Commission for the subway in Lower Broadway, New York. These galleries, it may be remembered, had seven separate divisions, with the electric ducts of the street railway company in the centre, chambers for pipes on each side of the street, and separate ducts for high and low tension conductors, also on each side, with separate manholes for each class of wires, and distribution passages from manholes along in front of buildings. Long openings for handling pipes and ventilation were also provided, and it was a great setback to the progress of street engineering (says *Scientific American*) when the idea of building the galleries had to be abandoned. Various types of galleries, based on the New York type, were suggested for Boston, when the Washington-street subway was proposed, but nothing resulted beyond the plans.

The chief reason for the failure to build the Lower Broadway galleries was said at the time to be a difference of opinion as to what city department was to have charge of the galleries, and unfortunately the completion of the subway could not be delayed for the settling of the question. In Boston there were several objectors. The municipal engineers consulted wanted their pipes above the subway, while the railway company objected to any construction which would lower the station platforms a foot more than was absolutely necessary. The city engineer, moreover, objected to any placing of pipes (water, sewer or gas) in an open gallery, no matter how well designed, on the ground that the character of municipal employees had so deteriorated that it was unsafe to place the maintenance in their hands of pipes in a common gallery.

"While," remarks our contemporary, "it is well to err on the side of safety before making radical changes, there appears to be ample testimony that the placing of pipes in galleries would make for greater safety instead of greater danger. In the London galleries large gas mains are found close to electric light cables, and yet no explosions have occurred, whereas gas mains buried under streets have caused constant explosions in different cities."

Royal Institute of British Architects.—Mr. Reginald Blomfield, A.R.A., the president, will deliver the opening address of the session at a meeting to be held on Monday, November 4th, at 8.30 p.m.

Hospital Accommodation at Stafford.—The Stafford Rural District Council have decided to call upon Stafford Corporation to extend at once the isolation hospital in accordance with the agreement entered into in 1903 by the two. The application arose out of a case of enteric fever which could not be received into the hospital from the rural district because there was no room for it, notwithstanding that the rural district council have agreed to pay £300 a year for the use of the hospital.

New Secondary School for Clitheroe.—Lord Derby on Saturday laid the foundation-stone of a new secondary school which is being built at Clitheroe by the Lancashire County Council and the local authorities, at a cost of about £20,000. The building is designed to [illegible] school, the sexes will be in separate wings for teaching purposes, but will have the common use of the assembly hall, science, and other [illegible]. The building, which will also be used for evening classes, will accommodate 128 boys and 120 girls. The contract has been let to Messrs. J. Bleazard & Sons, Clitheroe, to the design by Mr. H. Littler, county architect. It is being erected on an ideal site, in the centre of the town, hitherto occupied by the old Clitheroe Royal Grammar School, which was founded in 1554.

SOUTH FIFE DEVELOPMENT.

NORTH QUEENSFERRY AND BRUCEHAVEN TOWN PLANNING SCHEMES.

The preliminary statutory conference of owners in connection with the North Queensferry and Bruchaven town planning schemes was held in Dunfermline on the 13th inst.

These two schemes, promoted by the Fife County Council, are the first brought forward by Mr. J. E. Wilkes, Assoc.M.Inst.C.E., who is designing the naval port of Rosyth, and who also has charge of the four town planning schemes in the vicinity of this new naval base.

Lord Bruce, chairman of the Fife County Council Town Planning Committee, said that although by law they were not required to put forward detailed plans at the first owners' conference, he had previously felt, when being at such conferences in the capacity of a landowner, that it was rather foolish to invite those most interested to give sanction to the planning of a mere area without showing them something of the actual scheme; hitherto he had been told that the preparation of such schemes as he had desired would occupy too much time, but owing to the manner in which the present schemes had been handled he was enabled to submit to them not only the altitude surveys, but definite proposals. North Queensferry, being a hilly district, had to be planned to a large extent as the levels demanded, but the residential part had been so arranged as to command beautiful views of the Forth. On the east side two esplanades had been located, a lower one just above the level of the sands of Port Laing, which at the present time was the Admiralty hydroplane station; this esplanade was arranged to lead by inverse curves to two pavilions, each located at the end of a straight length. This should be one of the most beautiful of promenades, as it commanded very delightful views of the Forth towards the open sea. At the top of the cliffs another promenade had been arranged, and it was hoped that shortly the intervening space would resemble the Leas at Folkestone. Houses for workpeople had been arranged near the works area, which was alongside Inverkeithing Bay and the railway. The town centre had been arranged between the residential and the workpeople's areas, so that people from both would have equal facilities for reaching public buildings and the locality for shopping.

As the district would depend largely for its population on the naval base, it was proposed to construct a new approach road from the west gate of the Admiralty's territory. This road would entail the erection of a steel bridge of 100 ft. span and 50 ft. in width; also for some length the road would have to be carried between rather high retaining walls. It was understood that the Burgh of Inverkeithing had expressed willingness to share the costs of this scheme, as it would be of great benefit to them.

The Bruchaven scheme lay to the west of the new naval base, and had been laid out almost entirely for residential purposes. An esplanade had been planned on the foreshore, which would require a considerable amount of reclamation. It was also proposed to dredge a channel to the east of the present pier, and to construct a considerable length of quay wall. This esplanade was necessitated by the fact that the new road from Dunfermline would open directly out on to it; thus people coming by tramway from the inland and mining districts would obtain not only a pleasant impression of the new town, but also of the old-world village of Limekilns to the west. As in the North Queensferry scheme, the heart of the new town was arranged to come within easy reach of the working class and of those who could afford to live in the better type of house. Sites had been reserved for churches. With regard to details, the roads would be of either tarred stone or radial sett paving. Sewers and water mains would be kept out of the streets and behind the houses, the ensuing not only economy in construction, but the avoidance of breaking up the roadway. Not a single sewer manhole cover would be located in the carriageway as these had proved dangerous to traffic and difficult to maintain in satisfactory condition. The tramways were to be constructed on a ballast foundation, and laid on pressed-steel sleepers, and would be separated from the roadway by a grass verge, in which a line of trees would be planted.

No opposition was offered.

New Fire Station for Hackney. A new fire station is to be built at Hackney at a cost of £11,549.

TOWN PLANNING PROGRESS.

THE BLUNDERS OF THE PAST.

Sir George McCrae, Vice-President of the Local Government Board for Scotland, who was delegated by the Government to represent Scotland at the International Congress on Hygiene and Demography at Washington, read a paper at the congress on "Modern Town Planning." Town planning, he said, to be of real scientific value, must not only regulate the development of future communities; it must also, so far as possible, retrieve the blunders of the past. The latter was generally a most expensive business. Still, it must be faced. But hitherto there had been no scientific and considered line of advance. It was not too much to say that it was costing Britain millions of pounds sterling to clear away slum areas for the improvement of the conditions under which the poorer classes live, due to the defective town planning of the past, and yet in many cases they had missed the opportunity afforded them when new developments took place. They had, unfortunately, not appreciated the inestimable advantage of being able to deal with the problem on virgin soil, unhampered with the complications of vested interests, unless, perhaps, in respect of land.

THE PRICE OF LAND.

The two great barriers to progress were—first, the prohibitive price of land, with the attendant expensive forms of procedure necessary for its acquisition for public purposes; and, secondly, the hard-and-fast line of demarcation between town and county areas of administration. Under the Town Planning Act of 1909 a new departure of great importance was made, the far-reaching importance of which few even in this country yet appreciated. The inevitable effect of the Act would be a reduction in the price of land for working-class houses. Nowhere had they more striking examples of the need for cheaper land than in his own city of Edinburgh. The poorer classes not only paid comparatively more than the richer classes; they did actually pay more for the same area of land on which they live. This they did in increased rents far above the competitive rent, apart from the monopoly value of the land they occupied. Ground rent in Scotland was in the form of an annual rent charge, called a feu. In Edinburgh land restricted for the sake of amenity for the erection of villas for the richer classes could be got at a land rent of from £20 to £40 per annum. But for the same land, if available for the building of working-class tenement houses, the ground rent was as much as £250 per annum, simply because under the old laws people could build so many houses to the acre. Little surprise need be felt when he said that in the centre of Edinburgh city there were districts as many as 200 persons to the acre, with a correspondingly high death-rate.

THE ROSYTH SCHEME.

The progress under the Act had been most gratifying. The most interesting scheme of all was one at present being considered by the Scottish Board. Unique in its features, it was perhaps the greatest opportunity ever presented in an old country of town planning on absolutely free conditions and on virgin soil. The great North Sea naval base at Rosyth was nearing completion, and there a new town would arise numbering, to begin with, a population of 30,000 within the next two years. This would gradually increase. The Admiralty had requested the Scottish Local Government Board to supervise the creation of this new community, and this interesting experience was being watched with close attention by town planners everywhere as an experiment big with results for the future of the movement. When he said that the scheme under consideration embraced an area of 6,000 acres, an idea would be had of the future magnitude of this new area. The scheme was being prepared by the city of Dunfermline, and was to be submitted for approval or amendment to the Local Government Board for Scotland. Although the Act had only been in operation for little over two years in Scotland, no less than twenty-three schemes were in various stages of progress. In England the success had been equally marked. But the progress of town planning in Britain was not to be judged merely by the number of schemes coming officially before the Local Government Boards for approval. The very fact that the central authority had power under the Act to compel a local authority to make a scheme had had the effect of raising the standard of building and roadway conditions all round.

REINFORCED CONCRETE.

ATTITUDE OF THE LOCAL GOVERNMENT BOARD.

The following letter from Mr. Lucien Serraillier, Queen Anne's Chambers, Westminster, appears in the *Times Engineering Supplement* of Wednesday last:

"The action of the Local Government Board in restricting the application of reinforced concrete by a discrimination (to the detriment of this mode of construction as compared with the older forms of construction) in the periods they allow for the repayment of municipal and local loans has been the cause on many occasions of protests from those who are suffering from this attitude. It is a common occurrence for reinforced concrete schemes to be turned down in favour of brick, steel frame, or even timber construction, because the Local Government Board will allow only ten or fifteen years for the repayment of the loan for reinforced concrete schemes, as compared with the usual term of thirty years for the other forms of construction.

"The President of the Local Government Board is, of course, entirely guided in these matters by his technical advisers, and apparently those gentlemen still consider that reinforced concrete is in an experimental stage, notwithstanding the vast amount of work which has been done in America and France, and the increasing amount of work which is being done in this country. The result of this attitude is that when, as is generally the case, the reinforced concrete scheme is cheaper than the alternative schemes, it has to be abandoned owing to the greater cost of procuring the money, and the taxpayer does not get the benefit of the cheaper construction.

"I will not dwell upon the wisdom of the policy of long terms for the repayment of local loans, and the equity of throwing this financial burden upon a future generation. It savours of the policy of the British railways, which have generally paid for improvements out of capital instead of out of revenue.

"There is a large consensus of opinion in favour of short-term loans, and there is no doubt that if reinforced concrete were considered by the Local Government Board to be worthy of the same financial treatment as other forms of construction, its cheaper cost would in many cases benefit the taxpayer immediately. The attitude of the Local Government Board is utterly illogical, since one of the properties of reinforced concrete is that its strength increases with age, as against other forms of construction which deteriorate with age. It also is based on certain failures which have occurred in reinforced concrete, and probably on ignorance of their true causes.

"A reinforced concrete failure is at once advertised, but there are plenty of instances of failures in other forms of construction which, like the birth of Jeames Yellowplush, are 'wropped in mistry'! Failures in reinforced concrete are usually due to the premature removal of the falsework or to bad construction, and one of the features of reinforced concrete which the technical advisers of the Local Government Board apparently do not realise is that if a reinforced concrete building is going to fail it will fail at once. In that case it seems illogical—does it not?—to give it even a ten-year loan, for it is perfectly certain that if it will stand for two years it will stand for ever, which is more than can be said of a timber or a steel frame building.

"I do not think there is any single example extant of a reinforced concrete structure having failed after it had been up two years. Can this be said of any other form of construction? It is a remarkable fact that the Admiralty, the War Office, the Office of Works, and other Government departments are all using reinforced concrete, and that the only department which has no need of structures is the one that is arresting the development of this form of construction. Certain regulations for standardising and safeguarding the construction of reinforced concrete structures have been drafted by the London County Council in conjunction with the representative technical bodies. These regulations are now pigeon-holed at the Local Government Board. When shall we get them?

"I trust that these remarks may produce some correspondence on the subject, and that some joint action may be taken by those interested in the reinforced concrete industry, and also by the ratepayers, to make another attempt to induce the President of the Local Government Board to adopt a more conciliatory attitude towards reinforced concrete schemes."

REINFORCED CONCRETE RESERVOIR AT EAST COWES.

The October issue of *Concrete and Constructional Engineering* contains an interesting description of a reinforced-concrete reservoir which has lately been completed for the East Cowes Urban District Council.

Some months ago the council instructed their water engineer and surveyor (Mr. Albert E. Barton, M.I.MUN.E.) to prepare plans for a brick reservoir capable of holding 1,000,000 gallons. Upon the completion of these plans it was found that the cost was prohibitive, and on the recommendation of Mr. Barton the council decided to construct it in reinforced concrete, the result being that the cost worked out at considerably less than half the cost of the brick-built reservoir.

Tenders were advertised for, several well-known reinforced-concrete engineering firms submitted designs, and the council, after careful consideration, adopted the "Kahn" Trussed Bar System, submitted by the Trussed Concrete Steel Company, Limited, Caxton House, Westminster.

The internal dimensions of the reservoir are 100 ft. by 100 ft., with a clear height of 17 ft. between floor and roof slab; the overflow provides for a maximum depth of 16 ft., the total capacity being 1,000 000 gallons. The reservoir is divided into two parts, having a division wall in the centre, which can be worked independently of each other.

The floor slab consists of 6-in. concrete interlaced with ⅜-in. rib bars, spaced in both directions at 14-in. centres. The wall slabs between vertical buttresses or piers have horizontal reinforcing bars spaced 4 in. to 12 in. apart at varying heights from the bottom proportionate to the pressure; the vertical bars are placed in the centre of the bay, the panels and piers are flush on the inner side. The centre division wall has the panel in the centre of piers; the thickness of the slab is from 5 in. at the floor level to 4 in. at the top.

The roof slab is 3 in. thick, with ⅜-in. cup bar, 10½-in. centres, the maximum size of slab clear of beams being 5 ft. by 16 ft. 8 in.; 12 in. of surface soil is placed on the top, with the usual ventilators for each bay.

The east and west outer walls consist of seven 26-in. by 12-in. vertical buttresses reinforced with "Kahn" trussed and cup bars opposite the cross line of columns, and twelve 24-in. by 9-in. intermediate buttresses, all standing upon a continuous beam 24 in. by 10 in., into which the roof beam and slab tie bars are hooked. The remaining outer walls are constructed in a similar manner with nineteen 24-in. by 9-in. buttresses and 4-in. to 5-in. wall slabs between; no cross beam at head is required.

The dividing wall is formed of five 27-in. by 12-in. and twelve 25-in. by 12-in. vertical buttresses of similar construction to the last, with 5-in. to 4-in. slab spanning between these buttresses.

The materials used consist of "Needles" shingle and sea sand mixed with best Portland cement, the principal portions being five parts shingle (¾ mesh) and clean, sharp sea sand to one part of Portland cement. The internal walls are coated with 1 in. of cement rendering gauged three sand and one cement, and mixed with "Ceresit" waterproofing composition; the rendering is done in three coats and finished with plain floated surface.

Messrs. W. H. Brading & Son, East Cowes, were the contractors.

Public Libraries for Bethnal Green.—It was decided at the last meeting of Bethnal Green Borough Council to adopt the Public Libraries Act, and a special committee was instructed to report upon the establishment of public libraries in the borough.

Hackney Branch Libraries.—The foundation-stone of the second of the three branch libraries being provided at Hackney, through the munificence of Mr. Andrew Carnegie, was laid on Saturday afternoon at Brooksby's-walk, Homerton, by Councillor D. W. Marpole, chairman of the Public Libraries Committee. The site was purchased by the borough council for the sum of £1,300, and the library, which is intended to serve the eastern division of Hackney, is estimated to cost £5,280. The first of the branch libraries, situated in Woodland-road, Dalston, will be opened by the mayor (Councillor W. Hammer, J.P.) to-morrow (Saturday), and the plans of the third building, to be erected in Northwold-road, Upper Clapton, have just been approved by Mr. Carnegie.

ROOFING MATERIALS.

BRITISH FIRE-PREVENTION COMMITTEE'S TESTS.

The British Fire-Prevention Committee last week conducted a further series of fire tests in respect to roofing materials, the coverings under investigation being corrugated sheets of asbestos-cement made in Canada, and produced in such a manner that they can be applied in the same way as the well-known corrugated-iron sheets, while having great advantages as to non-conductivity against heat and fire.

It will be realised that these tests were of particular importance to Indian and Colonial authorities, as the difficulty of finding suitable materials to meet the climatic conditions has always been great.

Mr. Edwin O. Sachs, F.R.S.ED. (chairman of the executive), Major O'Meara, C.M.G. (General Post Office), Mr. Horace S. Folker, F.A.I. (hon. treasurer), Mr. Percy Collins, F.S.S., and other members of council, received the members and visitors attending at the committee's Regent's Park Testing Station, and the operations were conducted by a sub-committee under the direction of Mr. C. T. Cuss and Mr. Ellis Marsland (district surveyor).

The roofing material under test was tested at different angles, fire being applied in different forms, such as bonfires, fire brands, and so on, and certain of the roofs were also subjected to water from a steam fire engine when they were in a heated condition.

The visitors, as usual, comprised representatives of the principal Government departments concerned, including the War Office, H.M. Office of Works, Home Office and Admiralty, but on this occasion also the representatives of the various Colonial Government agencies were present, and there was also a considerable attendance of insurance surveyors, engineers of railway companies, and fire brigade officers.

Waterproofing of Buildings.—"Pudlo," the widely used waterproofing material, has been specified for the whole of the cement work in connection with a new library at Huthwaite.

Housing in Scotland.—A Royal Commission has been appointed to inquire into the housing of the industrial population of Scotland, rural and urban (with special reference in the rural districts to the housing of miners and agricultural labourers), and to report what legislative or administrative action is, in their opinion, desirable to remedy existing defects.

A Sanatorium for Lincoln.—The Lincoln City Council have decided that the memorial to the late Mr. John Dawber, who left a large sum of money to the city for charitable purposes, shall take the form of a sanatorium. A sum of £7,500 had been set apart for the memorial, and it is expected that a Treasury grant of £2,777 will be obtainable, so that the council will have an available fund of £10,277.

Business Announcement.—Messrs. Herbert Morris, Limited, Empress Works, Loughborough, announce that the increasing volume of business reaching them from the Yorkshire ground has made it necessary for them to open offices in Leeds. These, we are given to understand, are situated on the ground floor of Standard Buildings, City-square; telephone, 2968 Central; telegrams, "Comorris, Leeds." The new branch will be under the management of the firm's Yorkshire representative, Mr. O. J. Wendlandt, and its opening has followed rapidly on the opening of an office at 30 George-square, Glasgow, as the centre of Messrs. Morris's Scottish business, which is under the management of Mr. A. Hatfield Acres.

Sheffield Society of Architects and Surveyors.—In his inaugural address to the members of the body on the 10th inst., Mr. J. B. Mitchell-Withers, the president, put forward the suggestion that it would tend to the benefit of the architectural profession as a whole of it were possible to have more intercommunication between the provincial societies and to obtain a greater and more permanent representation on the council of the Royal Institute. Some of their younger members were arranging this session to hold lectures of their own, and his hope was that the scheme would be well supported. The remarkable scarcity of young men entering the profession was the subject of comment by a subsequent speaker. In regard to this the president observed that it must be remembered that a great deal of important work was now undertaken by public bodies, though, he believed, at much greater cost than formerly.
